The cost of running the double-deckers was 42 cents per mile. The cost of running the single-deckers over the same route is 32 cents per mile. We did not alter the headways from the six-minute peak and the eight-minute off-peak, except that on Saturdays from 12 o'clock noon headways are on a five-minute basis. Since the effective seating capacity of the double-deckers was only 22, we really increased the number of seats available by confining ourselves to the 25 and 29-seat single-deckers. The running time between terminals is 26 minutes, which corresponds to a schedule speed of 11½ m.p.h. Earnings in December, 1926, were 54 cents per mile, which was 20 per cent more than in December, 1925.

RAISING THE STANDARD IN OTHER WAYS

In our endeavor to give the autoist something good enough to tempt him from the use of personal cars during busy hours, we have made several changes in other directions. In body color, we are changing from a yellow to a rich and dignified combination of dark gray below and sapphire green above the belt line.

In seating, the scant dimensions and rather stiff upholstery of the buses have been succeeded by twin chairs on one side of a 16½-in. aisle and single instead of double seats on the other side, all spaced on 30 in. centers for real knee-room. These chairs are upholstered in air-cushioned Spanish leather. The single chairs are 23 in. wide over the arm rests, the double chairs 35 in. A set of air-cushion seats extends across the back of the coach.

Appreciated features are the mirrors on the posts between the extra long windows and the eight 21-cp. dome lights, which eliminate former complaints about light too dim for reading. The better riding quality of the coaches also makes it easier to "read as you ride, while we do the driving."

In fare collection, we have tried to avoid the eyesores and earsores of register rods, cords and bells. The passenger simply drops his fare into a locked box finished to correspond to the interior trim of the coach. There are no cords or rods to irk the eye. Only an inconspicuous cord for signaling the operator is carried along the side of the coach within convenient reach of the rider. We display no printed matter whatsoever.

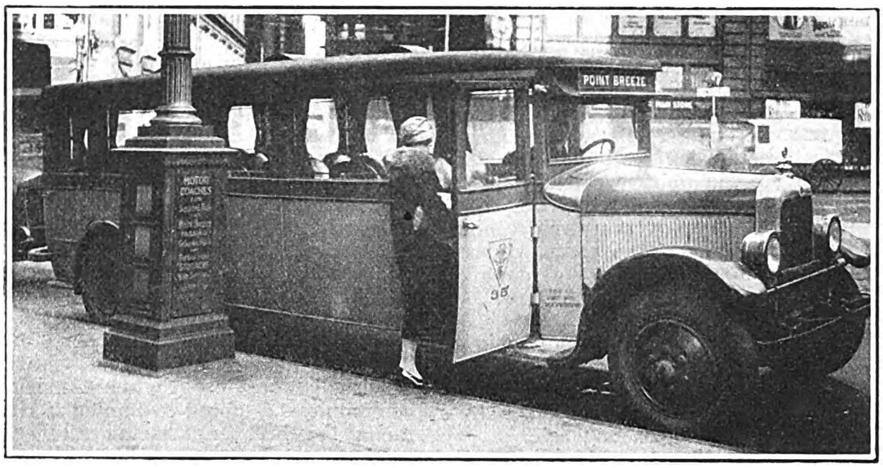
The bonus and free uniform features given originally in addition to a wage scale of 50 to 55 cents an hour were eliminated in favor of a wage scale corresponding to that of the Pittsburgh Railways.

We duplicated the 1½-cent increase of the railway, made on Jan. 1, so that the present scale is 61½ cents for the first three months; 66½ cents the next nine months and 68½ cents after the first twelve months. The first result has been a complete absence of turnovers since Nov. 1. A second result has been a decrease of 35 per cent in accidents per vehicle-mile.

Our first publicity for the improved Point Breeze service was to run the first two coaches in with the others, but the chauffeurs gave each patron a card stating that a full service with coaches of the same design would be inaugurated on Dec. 6; also that the new schedule would be handed out with them. On Dec. 2 we mailed a letter to 3,200 householders in the Point Breeze area, the names being selected from the customer list of the associated Duquesne Light Company.

It is hardly necessary to add that news of the de luxe coaches on the Point Breeze route spread quickly to the customers on the Squirrel Hill and East Liberty routes. We have been asked by them when will they be favored likewise.

Our present plans contemplate the purchase of ten more coaches, making a total of sixteen. Two of the new ones would be added to the Point Breeze route to permit 100 per cent operation of such coaches on a 7½-minute headway instead of the present ten-minute off-peak headway. The remaining eight will be put on Squirrel Hill in preference to East Liberty, because of the more industrial character of East Liberty riding, but eventually this type of coach will be our standard except for the possible use of the larger buses during peaks.



Panel Attached to Lamp Standard Shows Where Coaches Stop in the Business District

Create the Demand for Modern Street Cars*

By M. B. Lambert

Transportation Sales Manager Westinghouse Electric & Manufacturing Company

THE American electric railway industry has a more intimate responsibility to the public than any other industry. The nature of its service brings it into more intimate contact with a larger part of the public than do the steam railroads or any other public utility. Hence the electric railway executive has a far greater responsibility to his community than any other citizen in that community. The industrial and social progress of every community depends to some degree upon the vision and enterprise of its electric railway executive. The character of the support and co-operation that he enjoys from the public he serves also depends very largely upon the spirit and enterprise that he imparts to his entire organization and the character of service rendered to the public.

The exhibition of modern street cars

---

*Address presented before Central Electric Railway Association, Toledo, Ohio, Feb. 3, 1927.

and other developments in the art of transportation at our annual conventions brings before every electric railway executive once each year all of the advances the manufacturers and operating engineers have evolved for the betterment of community transportation. Every electric railway company that has developed improvements in car design owes it to itself and the industry as a whole to exhibit these at the annual convention. It is largely through such co-operation and exchange of ideas that the industry advances. The progressive executives must of necessity carry the burden of encouraging and exciting interest and enthusiasm in the others, because if they do not their own efforts and that of the industry, as a whole, are materially hampered.

THE CO-OPERATION OF THE MANUFACTURERS

The manufacturers serving the electric railway industry are enjoying a very extraordinary co-operative set-up, fostered by the American Electric Railway Association and the technical press. In spite of this there is a feeling in some quarters that the manufacturers are not doing all they might do to promote the welfare of the industry to the degree that it justifies.

What are the extraordinary things the association and the technical press are doing to encourage the manufacturer? The most outstanding are:

The American Electric Railway Association provides for membership of operating companies and manufacturer companies on an equal basis. Buyer and seller are brought together in a common co-operative plane.

The association has established the manufacturers' co-operative committee, the chairman of which reports at all its executive committee meetings and has the privilege of the floor at annual conventions to submit a complete report of progress.

The association president and the managing director have for several years past devoted considerable time and effort in calling together numerous manufacturing representatives, urging them toward greater co-operative effort in promoting the adoption of modern equipment by the industry; in fact, helping the manufacturers to increase their sales.

The association set up an engineering committee to study and promote modern standard city and interurban cars, and, with association funds, published in book form the report of this committee.

The ELECTRIC RAILWAY JOURNAL staff, co-operating with the association executives, have called conferences of manufacturers at recent conventions and displayed charts and data showing the opportunities for replacement of the old with the new, modern equipment. In addition they have had these studies printed in attractive pamphlet form and distributed throughout the country—*Electric Traction* and *Forbes* offer prizes annually for special operating accomplishments.

In general, the situation is unique in that the progressive electric railway executives and their national association executives for the past several years have been the "loud speakers" in urging the adoption of modern cars and equipment in a much more pronounced way than the manufacturers themselves have been. This year the association has broadened the scope of the manufacturers' co-operative committee, perhaps with the idea that this may arouse greater interest among all manufacturers to assume to a greater degree their own part in adequately promoting the development and sale of cars that will attract greater riding and reduce operating costs.

FACING A NEW SITUATION

The electric railway industry is no longer a monopoly in the sense that it is without competition. The private automobile is a formidable competitor, and in another sense the auto bus is a competitor to many electric railway manufacturers, while it at the same time opens up new markets to the larger electric railway manufacturers. Every electric railway manufacturer could consistently take his hat off in deference to the commercial progressiveness of the automotive manufacturing group. They have displayed in good measure the enthusiasm, courage and salesmanship that a youthful industry in this era may consistently possess. The electric railway manufacturers may with profit imbibe much of this enthusiasm and courage. As Admiral Schley said, "there is glory enough for all." The auto bus is here to stay, and so is the electric railway. Each has a service to perform distinctly its own, and the demand for transportation service in our progressive American communities is going to command right along the best engineering and sales talent that both forms of transport have to offer.

The chairman of the manufacturers' co-operative committee of the American Electric Railway Association has laid down a program for this year's activity, in addition to its publicity functions. The plan is to drive home in the minds of every manufacturer that it is to his interest to excite interest in and promote the sale of modern cars. The demand for all devices and appliances sold to the electric railway industry is increased with the adoption of modern cars. Every salesman serving the electric railway should keep that fact constantly before him. The more new cars that are sold and the better the service that is offered the public the greater will be the demand for both new cars and new buses. Let the slogan among the manufacturers in selling transportation be: "One for all and all for one." Sell modern street cars.

Kentucky Association of Public Utilities Meets February 18-19

"CITY and Interurban Transportation" will be discussed by W. H. Sawyer, guest of honor at the tenth annual meeting of the Kentucky Association of Public Utilities, held at the Brown Hotel, Louisville, Ky., on Feb. 18 and 19. Other subjects of interest on the program are: "Twenty Years of Utility Growth in Kentucky," by Harry Reid, president National Electric Power Company, New York City; "Humanitarian Aspects of Safety," by Neil W. Funk, director of safety, Louisville Railway, Louisville, Ky., and "The Man May Pay, but Remember, It's the Woman Who Buys," by Helen E. Steiner, divisional chairman women's committee East Central Division, National Electric Light Association, Cleveland, Ohio.

Increasing Speed and Comfort by Modernization of Equipment*

BY E. A. PALMER

Westinghouse Electric & Manufacturing Company

OPERATING organizations of our electric street railway companies and equipment manufacturing organizations are devoting particular attention to those items which contribute to fast, comfortable service and thereby attract more patronage to the electric railway business.

High schedule speeds on city surface lines are a function of the rate of acceleration, free running speed and rate of braking of the rolling equipment. Quadruple equipments of high-speed motors for double-truck cars during the past four or five years have comprised about 80 per cent of the installations, being preferred to double motor equipments because of the more rapid acceleration possible. Theoretically the energy consumption is lower for two motors than for four, because larger, more efficient units are involved and the weight efficiency is higher. Maintenance of the motors should be less because only half the number are involved and a part of the maintenance expense is nearly independent of the size of the motor. However, the majority of experienced operators feel that these theoretical advantages of the two-motor equipment are overcome by the waste of energy and excess stresses caused by wheel slippage and by the superior acceleration of the four-motor car.

The low floor car has been adopted by the industry almost universally. Since the innovation of this idea in 1912 a complete line of motors up to 60 hp. has been developed for use on wheels up to 28 in. diameter. During the last three years 85 per cent of all cars for which the Westinghouse company furnished the electrical equipment had wheels of this size or smaller.

One-man operation of street cars is now an established practice. The use of one-man cars has extended steadily during the last ten years. Frequently two-man cars can be so arranged that they may be operated by one man if the occasion arises. Whether cars should be single or double end depends on whether wyes and loops are available for turning. Approximately 80 per cent of all equipment furnished over a number of years has been double end.

Considerable study is being given at the present time in some large cities to multiple-unit two-car train operation.

---

*Abstract of a paper presented at a meeting of the Electric Railway Association of Equipment Men, Southern Properties, held at Memphis, Tenn., Jan. 26-28.

The permanently coupled articulated train has been very successful on some properties.

New cars must be adequately ventilated during the winter season. The majority of the men in the industry are quite satisfied with the arch roof and ventilation construction at present standard with all car builders. A heating system that will maintain a comfortable temperature is necessary. Electric heat seems to be specified on most new city cars where the winters are moderate.

A good proportion of cross seats properly spaced insures comfort. Practically all the plans of new cars specify all the cross seats possible. Safety devices interlocking the controller, line switch, doors and steps, and brakes are being used on practically all cars for one-man operation and most cars for two-man operation. Cars should be efficiently illuminated so that passengers may read without eyestrain even on rush-hour voltage. There is opportunity for the use of beautiful yet useful fixtures. The ceiling finish should reflect rather than absorb light.

New light-weight, one-man, two-man low-floor cars generally weigh less per seat than the cars replaced. The energy saving is generally in direct ratio to the reduction in weight. This is considerable where maximum demand energy contracts prevail.

Maintenance of equipment per car-mile should be less the first few years even though the new cars be kept in almost continuous service in the non-rush period of the day. The platform time savings will be very substantial if a change is made from two-man to one-man operation with the introduction of the new cars.

The Brooklyn City Railroad showed 28 per cent increase in traffic on one line with new cars and Thomas Fitzgerald, vice-president Pittsburgh Railways, advises that during recent years every time new cars replace old cars on a line the receipts increase substantially.

Without cheap and reliable electric railway transportation it would be impossible for the large business organizations in the congested sections of our cities to exist. Let us therefore all boost for the modernization of our rolling equipment.

Birney Club Discusses de Luxe Cars

LIVELY discussion of car modernization and the present-day tendency toward the inclusion of more luxurious seats and accommodations for the comfort of passengers took place at the regular monthly meeting of the Birney Club of St. Louis held on Feb. 7 at the Missouri Athletic Club. There was general agreement of the need and importance of modernizing car equipment to meet the level of present-day transportation demand. Differences of opinion were expressed as to just what steps in car design and construction are needed to fulfill this demand and to increase the popularity of street car riding.

L. F. Stoll, assistant vice-president McGraw-Hill Publishing Company, Inc., and Charles Gordon, editor ELECTRIC RAILWAY JOURNAL, were called on for short talks by President Richards. Mr. Stoll discussed the significance of the fundamental changes taking place in the transportation industry and indicated that these changes are perhaps taking place faster than the industry itself realizes. Mr. Gordon spoke on the electric railway equipment situation and pointed out that the present widespread tendency to repaint and rebuild existing equipment is an index of the general interest being taken in car improvement. He held that this activity offers the equipment manufacturers an opportunity so to improve the performance and the ride merchandising appeal of their product as to demonstrate conclusively the desirability of replacing old equipment with new cars instead of rebuilding.

Bus Drives Compared

RELATIVE advantages of mechanical and electrical drive for buses were discussed at considerable length at the February meeting of the New England Street Railway Club held at the Copley Plaza Hotel, Boston, Feb. 3. This topic aroused much interest on the part of the members and evoked many questions. Charles Froesch, engineer Mack Trucks, Inc., reviewed the technical features embodied in the gas-electric drive and showed by means of lantern slides the latest practice in adapting this drive to the new buses now in process of development. R. E. Fielder, sales engineer Yellow Truck & Coach Manufacturing Company, spoke briefly from his experience, running back over a period of twenty years of bus operation, and said that the future is promising for electric control. He stressed, in particular, the economics of operation, based on experience with crowded thoroughfare operation of buses in places where electric drive has proved both economical and desirable. Where the traffic averages four passengers or more per bus-mile, he said that electric control has an undoubted advantage. On the other hand, both speakers were of the opinion that on long suburban runs, where few speed changes are necessary, mechanical drive is superior in certain respects.

J. C. Thirlwall, engineer General Electric Company, added to the opinions of the previous speakers by citing the experience of the Philadelphia Rapid Transit Company. Greater ease in riding, less annoyance from speed changes, more comfort in every respect are features of electric drive that attract passengers. The speaker concluded that large operating companies are inclined to turn toward electric drive almost without exception. The Boston & Maine and the New England Transportation Company were cited as local companies favoring this method of drive.

In the discussion that followed the remarks of the speakers it was brought out that the recent acceptance of $2,000,000 of equipment bonds issued for electric drive buses to be purchased on a ten-year life period is perhaps the most marked acknowledgment of the dependability and practicability of the electric drive.

Speaking at the close of the dinner, Ralph S. Bauer, Mayor of Lynn, Mass., advocated closer co-operation and stronger partnership on the part of public service companies in the solution of many problems confronting municipalities today.

New York Railroad Club February Meeting

"TRAINING Understudies for Official Positions in Railroad Service," will be the subject of discussion at the meeting of the Railroad Club on Feb. 18, to be held at the Engineering Societies Building, at 8 p.m. Prof. William J. Cunningham, who is the James J. Hill professor of transportation at Harvard University Graduate School of Business Administration, will be the principal speaker. He advocates the creation of a corps of cadets, graduates of universities and technical schools, and those without college training who have shown exceptional promise in their work. Men who graduate from the course with high standing, according to Professor Cunningham, should form the group from which one-half or more of the minor officials for the various departments should be selected.

American Association News

American Executive Committee

STANDING and special committee reports occupied the attention of the executive committee of the American Electric Railway Association at a regular meeting held in Toledo, Ohio, on Feb. 4, 1927. Members in attendance were President W. H. Sawyer, Managing Director Lucius S. Storrs, Executive Secretary J. W. Welsh, R. P. Stevens, J. H. Hanna, F. R. Coates, L. E. Lippitt, C. B. Proctor, Daniel Durie, J. V. Sullivan, E. P. Waller, B. A. Hegeman, Jr., G. A. Richardson, S. J. Cotsworth, C. R. Ellicott, H. L. Brown, E. B. Meissner, C. L. Henry and K. A. Simmon representing M. B. Lambert. Representatives of state and sectional associations present by invitation included E. T. Chapman, president of the Connecticut Company section; G. K. Jeffries, president of the Central Electric Railway Association; C. R. Phenicie, for the Wisconsin Utilities Association; A. E. Reynolds, president Mid-west Electric Railway Association; C. F. Handshy, president Illinois Electric Railway Association; J. J. Coleman, for the Pennsylvania Street Railway Association; W. V. Griffin, president Chicago Rapid Transit Company section.

In addition to routine business, Thomas Fitzgerald, chairman of the committee on the Anthony N. Brady award, outlined the conditions which have been fixed this year for judging accomplishment in the interest of safety. It was recommended that a gold medal be given to that property which had made the most outstanding accomplishment in the class operating 5,000,000 or more vehicle-miles per year. A silver medal will be given to the winning company operating between 1,000,000 and 5,000,000 vehicle-miles, and a bronze medal to the property having made the greatest contribution to safety in the class operating less than 1,000,000 miles per year. In the classification of properties for the award bus mileage is to be included with car mileage.

F. R. Coates, reporting for the committee on co-operation with state and sectional associations, recommended that the presidents of all sectional and state railway associations be made members of the American Association Executive Committee, without voting power. In the case of a combined utility association, this privilege would be extended to the chairman of the railway division or to the railway member designated by the sectional association. There was some discussion regarding the matter of membership in the American Association on the part of such sectional associations, and an alternative suggestion made that the presidents of these associations be invited to attend executive committee meetings. The matter was referred to the committee on revision of constitution and by-laws for further consideration.

H. L. Brown, chairman of the subjects and meetings committee, reported the result of a preliminary survey of the industry for opinion regarding the most valuable form of meeting and the character of subjects considered of most interest for an annual convention. Replies received indicate a preponderance of opinion in favor of comparatively short sessions with a few prominent speakers supplemented by group conferences on current operating subjects.

A preliminary report of the committee on revision of the constitution and by-laws was read by Charles Gordon, representing James H. McGraw, chairman of the sub-committee on association dues.

Since the action of this committee is contingent on the work of the policy, finance and other committees the report was principally in the nature of reporting progress and of informing the executive committee regarding the work which had been undertaken. A schedule of proposed dues was submitted for the purpose of establishing the basis on which the association's expense would be divided between companies of various sizes and classifications, the final schedule to be determined after various studies of association activity are completed.

Resolutions regarding the holding of demonstrations outside of regular exhibits, the setting aside of a day for inspection of exhibits and inspection of manufacturing plants during the annual convention, were passed. These were similar to resolutions on these matters adopted in previous years.

REPORT OF POLICY COMMITTEE

The report of the policy committee, read by Chairman R. P. Stevens, was as follows:

"Questions which have been referred to this committee for study and recommendation as to policy include the association's publishing plan, its statistical service and its Washington office.

"A recommendation was made by the publications committee that rates for advertising in *Aera* be increased. In bringing this specific question before the policy committee the president asked that a review be made of all phases of the association publishing plan with particular reference to possible co-ordination of this effort with the similar work of the business publications serving the industry.

"There was no thought that *Aera* should be done away with but that this committee should consider whether some change in its general character might better serve the interests of the association, avoid duplication and effect economy. There was also no thought that this review should in any way reflect unfavorably on the work of those who have been responsible for producing the magazine *Aera*. They have done a commendable job of carrying out the present publishing policy. The question is whether this policy should now be somewhat revised.

"After some investigation by the finance committee, the policy committee was asked to consider whether the services of the bureau of information and service might to advantage be expanded, or whether these might be somewhat curtailed in the interest of economy without serious detriment; also, whether co-ordination between the association's statistical work and that of the business press might be effected with economy and with strengthening of the facilities for securing and presenting these data. Again, this committee understands that there is no idea of doing away with the association's statistical service. The question did not arise through suggestion of dissatisfaction with the work of those in the headquarters staff assigned to this task, but only because the president has felt it wise that from time to time we should have a review of all major phases of the association work. It is only in this light that this committee understands its study is to be made.

"The finance committee has also questioned the necessity of the association continuing to retain an exclusive Washington office, as has been desirable heretofore. It was started as a war-time necessity. The policy committee was directed to give consideration to all phases of this question.

"On none of these three matters has this committee carried its study far enough to be able to make any recommendation at this time. It is desired only to report progress."

The report was signed by G. A. Richardson, C. R. Ellicott, H. L. Brown, J. P. Barnes and R. P. Stevens, chairman.

Presidents of the affiliated associations reported on the progress of their work, and visiting presidents of sectional associations expressed their desire to co-operate with the American Association.

The next meeting of the executive committee was fixed for Friday, April 1, at association headquarters in New York.

Co-operation with State and Sectional Associations

PLANS for getting better accord between the various associations occupied the members of the committee of the A.E.R.A. on co-operation with state and sectional associations held at Toledo, Ohio, on Feb. 4. Members present were F. R. Coates, chairman; R. F. Carbutt representing T. R. Langan, A. E. Reynolds, W. A. Alexander, W. V. Griffin, E. T. Chapman, C. R. Phenicie representing J. P. Pulliam, R. McGregor, C. F. Handshy, J. J. Coleman, W. W. Holden, W. R. Robertson and Charles Gordon.

Mr. Coates called on representatives of the various associations, who spoke regarding the development of some means of keeping each local association as well as the national association informed of what the others are doing.

New Association Members

FOUR operating electric railways, two manufacturers and ten individuals were elected to membership in the American Electric Railway Association at the executive committee meeting held at Toledo on Feb. 4. Following is a list of companies elected:

Alton Railway, Alton, Ill.

Illinois Power & Light Corporation, Chicago, Ill.

Jamestown Street Railway, Jamestown, N. Y.

Youngstown Municipal Railway, Youngstown, Ohio.

H. K. Ferguson Company, Cleveland.

J. D. Wallace & Company, Chicago, Ill.

Getting On with the Public

UNDER the general subject of "The Transportation Man and His Job" a meeting of the Metropolitan Section of the American Electric Railway Association, held on Feb. 4 at the Engineering Societies Building, New York City, resolved itself into a discussion of how to get on with the public. G. T. Geer, secretary Third Avenue Railway, emphasized the importance of courtesy and co-operation. He said that these come naturally to some men, but not to others. The latter, however, can at least adopt the outward form and in due time this will beget the proper spirit, he said.

Isabell Davie, secretary women's committee, Public Relations Section, National Electric Light Association, spoke about "The Woman in the Utility Field." She told how women can make themselves useful, particularly in the electric light industry.

"What the Public Thinks of the Transportation Man" was the subject of a talk by Major J. S. S. Richardson, director Public Service Information Committee of Pennsylvania. He pointed out that it does not always matter whether or not a thing is true; if the public believes it, it might as well be true so far as public relations are concerned.

The meeting was conducted under the sponsorship of a committee consisting of H. F. Merker, Brooklyn City Railroad; W. S. Keller, Third Avenue Railway; K. S. Lewis, Interborough Rapid Transit Company, and H. R. Sisson, Sisson Supply Company.

The News of the Industry

Eight Cents in St. Louis—Fares Fight Likely

Acting under a temporary restraining order issued by United States District Judge Reeves at Kansas City, Mo., forbidding the Missouri Public Service Commission or any state officer from interfering, the United Railways St. Louis, Mo., on Feb. 7 put into effect a new schedule of fares. Under the new rates adults must pay 8 cents for a single cash fare but may buy two tokens for 15 cents. The railway is giving each patron a receipt for 1 cent for each cash fare or every two tokens purchased. These receipts will be redeemed if the increase is held later to have been unjustified. Children's fare remains at 3 cents. The order issued by Judge Reeves is returnable within ten days. At that time it is probable arguments on the merits of the company's demand for the higher fare will be heard by two federal district judges and one circuit judge. Provision for this is made in the order of Judge Reeves, and this board would decide whether the higher fares should be made permanent.

In its appeal to the federal court the United Railways claimed that the valuation of its properties is $75,000,000 instead of approximately $58,000,000, allowing for additions made since 1919. In 1923 the Public Service Commission fixed the valuation of the property at $52,000,000 as of 1919. The company says that the 8-cent cash fare for adults with two tokens for 15 cents will yield it only 5.8 per cent upon the valuation of $75,000,000.

The action of the railway in applying to the federal courts for relief has been anticipated for some time. The action by the commission that forced Receiver Wells to go into the federal courts came on Feb. 4 when the commission suspended until June 7 the new schedule of fares the company had filed with the commission to take effect on Feb. 7. That forced a continuation of the 7-cent fare, under which it was claimed the railway was losing $160,000 a month.

Prior to taking its case to the federal courts the company exhausted other methods of obtaining aid from the state commission. On June 3 last, Receiver Wells, with the permission of the United States District Court in St. Louis, applied for an increase in fares, but did not state the exact amount desired. Upon the request of the city the state commission then ordered an audit of the company's books to determine whether an increase was needed. The commission then delayed until September before attempting to start the audit. In October Receiver Wells again requested the commission to grant a temporary increased fare pending the final audit. Hearings were held and again the commission took the matter under advisement. On Jan. 7 the receiver made the final move possible under the state laws, the filing of a new schedule of fares to take effect on Feb. 7 unless suspended by the state commission. The commission then suspended the new rates, contending that the company having first followed the method of applying for an increase should have awaited a decision on that application. The commission admits that its audit of the earnings of the railway will not be completed before March 1.

Ten Cents Cash in Syracuse

Review of Facts Which Led Commission to Advance Fares in Salt City—Company Earning Less than 4 Per Cent—New Rate Not Likely to Return 8 Per Cent

THE Public Service Commission on Feb. 4 authorized the New York State Railways, effective on Feb. 10, to establish new fare rates on its Syracuse Lines, ten tickets for 75 cents; single cash fare, 10 cents, the new rates to continue in effect until the commission shall otherwise order. The present cash fare is 7 cents.

While no valuation was fixed by the commission the rates were determined upon a tentative rate base of $9,426,739 as of Sept. 30, 1925. Based upon revenue passengers carried for the year ended Sept. 30, 1925, and under the new fare rates authorized, estimating a 2 per cent decrease in travel, 70 per cent of riders using tickets and 30 per cent paying cash fares, the increased revenue, based on the tentative valuation of $9,426,739, will give an estimated return of 7.58 per cent upon such value of the property used in giving service on the Syracuse Lines.

The tentative rate base established was based on a valuation by the commission in its decision on April 19, 1921, of $8,554,240 plus additions to property since that date and allowances for materials and supplies and working capital.

The order was based upon a memorandum by Chairman Prendergast, who said:

> Even on such a tentative rate base, the rate of return enjoyed by the Syracuse Lines of the petitioner during the year ended Sept. 30, 1925, was less than 4 per cent. Further, that the increased rates prayed for will likely provide a rate of return of considerably less than 8 per cent.
>
> Petitioner has failed for many years to pay dividends and has certainly exhausted every reasonable expedient in endeavoring to effect economies so as to continue operations at the rates fixed by this commission in 1921. The financial results have been at least as disappointing as those set forth in a table covering 1925 revenues and expenses.
>
> Therefore, upon this record and without a formal fixation of valuation, it is determined that the rates prayed for by petitioner will in no event be unreasonable and they should be permitted to file, to be effective as of Feb. 10, 1927, and continue thereafter until the commission shall otherwise order or direct.

Evidence showed that the actual passenger revenue for the year ended Sept. 30, 1925, was $2,254,085 and the estimated increased revenue, due to the increased fare rates, will be $346,023. This estimate took into consideration a 2 per cent decrease in the number of car riders due to increased fare.

Five valuation estimates were submitted on the hearing, as follows:

> Commission's valuation, estimated present-day costs, less observed depreciation and not including organization expense and working capital, $8,485,168.
>
> New York State Railways, estimated reproduction cost, new, no depreciation, $15,658,081, and valuation used by Public Service Commission as of Dec. 31, 1921, with net additions to Oct. 1, 1925, $9,601,534.
>
> City of Syracuse, estimated original cost, less accrued depreciation, $5,105,316, and as reported to State Tax Commission, reproduction cost, new, $9,395,447, and present value, $6,337,895.

Chairman Prendergast, in discussing the valuation figures presented, said:

> Here, as is usual in rate proceedings, there was considerable dispute and variance of opinion as to the value of the petitioner's property, the existing depreciation and the rate of return to which the petitioner may be legally entitled. In view, however, of the conclusions reached in this memorandum, it will be unnecessary, as hereinafter shown, to enter into an extended discussion of any of these questions except that of valuation.
>
> Petitioner presented a reproduction cost new, valuation of its property as of Sept. 30, 1925, and also another valuation arrived at by taking the amount determined by the commission in the last rate case and bringing it down to date by including additions to property since Dec. 31, 1921.
>
> The city of Syracuse offered exhibits showing values based on estimated cost, less depreciation, and also on reports made by petitioner to the New York State Tax Commission for 1925, to which certain amendatory and adjusting figures were applied.
>
> In addition, engineers of the commission prepared and submitted a statement of values based on present-day costs less depreciation.
>
> The city's cost less depreciation figures have certain inherent disabilities, which in our opinion, render them useless as an aid in the fixation of values. Their apparent source was Exhibit "E" in Case No. 7938, April 19, 1921. Referring to the opinion of Commissioner Kellogg in that proceeding, it appears that Exhibit "E" was in part at least based on reports made to state officials by some of the predecessor companies prior to the establishment of the Public Service Commission.
>
> We have already referred to the complex and involved corporate consolidations culminating in the establishment of petitioner. The network of relationship, together with the methods of bookkeeping pursued, and the absence of many basic records, all tend to render it well-nigh impossible to find the original costs of much of the property acquired in the earlier days of street railway operation in Syracuse. In Case No. 7938 Commissioner Kellogg found:
>
> "That it is not possible . . . . to make an accurate statement of the actual original costs of all the property" and

"For these reasons, the estimate of the city of the actual cost to the company cannot be taken . . . because there are no complete data from which such cost can be entirely computed."

The precise situation still exists as to original cost estimates. Prior to Dec. 31, 1908, there were no regulations governing the keeping of uniform accounts by electric railways and neither books nor records can now be found (nor could they be found at the time of the investigation in Case No. 7938) to show complete cost figures of the properties of the Syracuse & East Side Railway, which succeeded to the property and rights of the Syracuse, Eastwood Heights & Dewitt Railroad and in Exhibit "E" $53,000 was set forth as being its original cost. But the company had 7½ miles of track, eleven cars and a power house. Obviously its value was and is much more than the amount stated. Further, certain amounts, concededly upon the company's books and aggregating nearly $1,000,000, had to be omitted because there was no means by which they could be checked. The data with respect to other constituent electric railways was also shown to be based on incomplete records and statements of account.

In such a situation and upon such a record, it is apparent that these estimates of original cost cannot be safely made the basis of any finding of value.

Neither can city exhibit valuation—$9,395,447 or the $6,337,895—be used. It is based in part upon reports made to the State Tax Commission as of Dec. 31, 1925, with amendments and changes. Different bases of valuation for tax purposes and rate-making purposes have been uniformly recognized.

Reproduction cost, new, figures submitted by the New York State Railways as of Sept. 30, 1925, were prepared by Henry G. Throop, an appraisal engineer. He based his inventory and appraisal upon one made by McClellan & Campion and used in a former proceeding. Values were attempted to be brought down to date by the application of Oct. 1, 1925, prices and also by the use of index number percentages. After adjustments of account for retirements and additions, a total of $15,658.081 was reached. The commission said further:

> The valuation made and submitted by engineers of the commission was based on estimated present-day costs, less observed depreciation. The figure stated, $8,485,168, contained no allowance for organization, for cash working capital or for going value. If allowances be included for these items, such valuation would be upward of $9,425,000.
>
> There was also received in evidence the rate base fixed in the opinion of the commission of Sept. 21, 1922, $9.038,050. If to such base be added net additions to fixed capital, Jan. 1, 1922, to Sept. 30, 1925, of $540,565, as shown by the company's exhibit, or of $406,724 in the commission's exhibit, the rate base of Sept. 30, 1925, would be either $9,578,615 or $9,444.774.
>
> These valuations, with the exception of the commission's $8,485.168 and the company's $9.601,534, and the one referred to above, $9,578,615 or $9,444,774, are unsatisfactory and certain *indicia* of disability, which render them impossible and improper of use.
>
> In any view of the matter, if a valuation were required to be found in this proceeding, it would necessarily be in excess of $9,425,000.

Relative to the question of jurisdiction of the commission to fix fares, Chairman Prendergast says:

> The city of Syracuse argues that the commission is without authority to increase fares because of limitations affecting fares contained in franchises granted to the petitioner and its predecessors. This question was passed upon in the opinion of Commissioner Van Voorhis on Sept. 21, 1922, wherein it was stated, referring to opinion of the Public Service Commission, 2nd District, April 19, 1921:
>
> "There were no franchises granted between Jan. 1, 1875, and July 1, 1907, which limited the jurisdiction of the former Public Service Commission, Second District. (Matter of the United Traction Company vs. P. S. C. et al. App. Div. 3rd Dept., January term, 1927: and People ex rel. Garrison vs. Nixon, 229 N. Y. 575, as well as matter of Evans vs. P. S. C. 214, App Div. 122, seem authoritative, and it must be held that the commission has jurisdiction over the rates of fare in this proceeding)."

The fare was 5 cents prior to Nov. 26, 1918. It was then increased by the Public Service Commission, Second District, to 6 cents and in 1921 the Public Service Commission, Second District, authorized an 8-cent fare, four tickets for 29 cents, and a children's fare of 4 cents.

The city on Dec. 15, 1921, asked a reduction and on Oct. 1, 1922, the Public Service Commission directed a 7-cent fare.

Chairman Prendergast reviews the history of the New York State Railways, stating that that part of the system known as the Syracuse Lines involves a track mileage of about 98, of which about 74 miles is in paved streets. In 1912 the New York State Railways purchased the Syracuse Rapid Transit Railway. The latter leased and owned the East Side Traction Company and had succeeded under mortgage foreclosure to the properties and franchises of the Syracuse Street Railway and the Syracuse Consolidated Street Railway. The East Side Traction Company was the successor of the Syracuse & East Side Railway, which in turn had succeeded the Syracuse & Eastwood Heights & Dewitt Railroad. The Syracuse Street Railway was the successor of the Peoples Railroad, which had acquired all the assets of the Central City Railroad and the Syracuse & Onondaga Railway. The Syracuse Consolidated Street Railway was formed by the merger of nine street surface railroads operating horse car systems at the time of acquisition. The memorandum of the commission says that this series of mergers, consolidations and purchases becomes more than historically important because of the effect upon the original cost estimates of the petitioner's properties.

Final Arguments on "L" Lease

The Public Service Commission of Pennsylvania on Feb. 7 took under final consideration the application of the Philadelphia Rapid Transit Company and the city of Philadelphia for approval of the 30-year Frankford elevated and Bustleton surface line lease. While the city and the company made almost identical requests for approval of the lease, opponents contended the lease would work a hardship upon the city, the taxpayers and the car riders.

City Solicitor Gaffney said the lease as it is drawn is only an amendment of one approved in 1922 by the commission. Instead of the graduated plan of paying an annual percentage up to 5 until 1957, the company under the new lease will pay the fixed charges, including sinking fund, interest and state tax and an amount equal to that contemplated by the 1922 lease.

C. Oscar Beasley, appearing for the United Business Men's Association, said the car rider and taxpayer would pay for the "L" and continue to pay. Harold Evans, representing J. Henry Scattergood, a former Public Service Commissioner, who has always been an enemy to the lease, also argued against the "L" lease approval.

Decries City Attitude in Buffalo

A growing understanding among thinking people of the basic facts of the transportation situation in Buffalo, N. Y., was recently urged by Elliott C. McDougal, chairman of the Marine Trust Company, in an address decrying the attitude of the city toward the International Railway and the downtown station plan of the New York Central. It was his belief that the best results were obtainable only by cooperation and by bargains mutually beneficial. On this point he says:

> Every business man knows this by experience. He cannot quarrel with his customers; both buyer and seller must be pleased. Should the present battle continue, the city as a corporation would lose because its share of the company's receipts cannot increase those receipts increase. The company would lose even after curtailing its service to the utmost possible limit. The car riders would lose because of the curtailed service on the old lines and because of the stoppage of the opening of new lines. With present conditions all three lose; with co-operation and fair dealing all three would win.

With reference particularly to the transportation problem in the city, he said that the city was in need of good electric railway and bus service and that it was better to be served by a company financially strong than one financially weak. Continuing, he said:

> We appear to be doing everything that we can to weaken the present company and to compel it to spend, in defending itself against unwise legislation, money that would much better be spent on track, pavements and service.

Another Subway Plan Suggested for Providence

Expenditure of the sum of $17,000,000 would furnish Providence, R. I., with a system of equipped subways which would eliminate all surface cars from the business section of Providence and provide a safer, speedier and more comfortable means of travel at an increase of 1 cent in the present fare rates. This was the opinion expressed by William M. Lewis, assistant engineer in the Boston Transit Department, at a meeting of the Providence Engineering Society recently.

Mr. Lewis was associated with the building of the Tremont Street subway at Boston in 1894. He is the second speaker to discuss traffic problems of Providence at the Engineering Society during the last two months, the previous authority being Robert H. Whitten, city planning consultant. Mr. Lewis stated, however, that his subway proposition was not suggested to displace the Whitten plan, but was to be used in conjunction with it.

The plan as outlined by Mr. Lewis would provide for two subways, each running through Exchange Place, where a transfer station would be built. They would be laid with double tracks, would accommodate all traffic brought into the down-town district by electric cars, with two exceptions. In commenting on the change that would be wrought in traffic conditions by the removal of surface cars in the business section of Providence, Mr. Lewis held up Exchange Place as an example. By nature, he said, Exchange Place was a beautiful square, but now it was little more than a railroad yard most of the time.

Paving Relief Measure Introduced in New Jersey

In a modified form there has been introduced in the Legislature of New Jersey by Senator Abell of Morris County the bill to relieve the electric railways of the obligation to pave between tracks. Last year's bill failed to pass over Governor Moore's veto. It provided that the company be relieved of the entire cost of this paving. Senator Abell has explained his bill as follows:

> The purpose of this bill is not to relieve railways of all paving obligations but rather to readjust those obligations so as to bring them into harmony with modern economic conditions and make them uniform throughout the state. Under this bill such companies at their own expense will have to restore all pavements they may disturb in connection with trackwork and in addition will be obligated to repair at their own expense damage heretofore or hereafter done to streets.

Fort Wayne Company at Home to Public

Proud of the completion of its construction program for the year, the Indiana Service Corporation, Fort Wayne, Ind., decided recently that it would be a good plan to exhibit the whole plant to the public. This it did on Nov. 21 between the hours of 2 and 5 p.m. The response on the part of the public was most gratifying. To the end that the tour might be conducted to its own best advantage and the best advantage of the public, the company had about fifteen platform men in uniform act as directors of traffic or guides. In addition other men were in attendance from different departments to answer questions and to direct the public once they were inside the building. As an extra precaution the company strung ropes around certain places, notably in the power houses and to some extent around the car pits in the shop, so as to minimize the element of danger that adheres in all such plants.

In anticipation of the event, the company advertised its invitation to the public to inspect the property, in the newspapers and with car cards. It is, of course, the regular practice of the company to display car cards in all its city cars to advertise its own business and to call attention to civic events of importance. These cards are changed weekly. One of them, in which the text and the illustration have been placed side by side merely for convenience of reproduction, is shown in the accompanying illustration. In addition to this, the company issued a pamphlet to every one who visited the plant. This was a 24-page publication, 5 x 8 in., on tinted paper describing the activities of the company. In addition to this each visitor to the plant was presented with a small souvenir in the form of a holder in which to carry the weekly pass.

As to the work which was done during the year, the company moved into its new shops, which have been described previously in the ELECTRIC RAILWAY JOURNAL, and did a very large amount of remodeling of small buildings to take care of bus repairs. Added to all this the company built a cyclone fence around the whole Spy Run yard and improved the appearance of the surroundings by sodding the grounds close to the buildings and otherwise improving the landscape. In addition a building was put up for storage in connection with the power house. This is called the pipe storage building.

2 to 5 p. m.
EVERYBODY WELCOME

Car Card Used by the Indiana Service Corporation to Invite the Public to Visit Its Plant

Chicago Street Traffic Article Reprinted

SEVERAL requests have been received for additional copies of the article entitled "Street Traffic Analyzed in Chicago," appearing in the ELECTRIC RAILWAY JOURNAL for Jan. 8, 1926. The JOURNAL has therefore had a limited number of reprints made and these are available in lots of 50 or more at 10 cents a copy.

Reorganization of New York Commissions Unlikely

Governor Smith of New York has practically abandoned his plan for reorganization of the Public Service Commission and the Transit Commission. When he was asked if he intended to appoint a successor to Commissioner Van Voorhees, whose term is about to expire, the Governor said he expected to do so.

The Governor's proposal to the legislative reorganization commission was in effect to separate the transit commission of New York and the up-state commission, which were consolidated by the reorganization laws, and not appoint a successor to Mr. Van Voorhees, so that there would be three members on each commission.

Wheeling Weekly Passes Made More Popular

As of Jan. 10 the Wheeling Traction Company, Wheeling, W. Va., made an immediate and large increase in sales of its weekly passes through certain consolidations and reductions. From a total of nineteen varieties, eighteen of which were in use since May 3, 1926, there are now eleven, although only three were eliminated.

In the new line-up, the $1 Wheeling and $1.25 Greater Wheeling passes have been merged into a single $1 Greater Wheeling pass. The $1 Brookside and $1.25 Martin's Ferry passes were merged into a $1 pass. The $1.50 McMechen and $1.75 Ohio passes were merged to a $1.50 pass called McBell, as it includes both McMechen and Bellaire. The $3 Moundsville and $3 Ohio Terminals passes were merged into a $3 pass. The $2 Linwood pass was cut to $1.75. The $2.50 Wellsburg, $2 Briliant and $1 Mingo passes were eliminated.

The McBell and Moundsville-Ohio Terminals consolidations greatly stimulate riding between the West Virginia and Ohio portions of the property, while the new Greater Wheeling pass makes one pass good for Wheeling and its immediate suburbs.

Attack on Indiana Commission

A new attack on the Indiana Public Service Commission is probable in the state House of Representatives. Two representatives have prepared a measure identical to the Cann Senate bill to abolish the commission and restore utility regulation to the agencies that existed before the law was enacted.

In all, five bills dealing with the commission are pending in the Indiana Senate. Their provisions range from complete abolition of the body to removal of municipally owned utilities from commission control.

Rules Off Obtrusive Fenders in St. Louis

Projecting fenders of the cars of the United Railways, St. Louis, Mo., must be discarded within 60 days, the Missouri Public Service Commission ruled on Feb. 1. The ruling follows a complaint filed by the St. Louis Safety Council that the projecting fender is a menace. Company officials also favored the substitution of safety devices of the type now in use in many other cities, but a city ordinance requires the use of the overhanging type of fender and a ruling from the state commission for their removal was necessary. Evidence showed that this type of fender had been abandoned in many other cities.

Fare Increase Sought in Utah

The Bamberger Electric Railroad has applied to the Utah Public Utilities Commission for a 10 per cent increase in rates of its first class one-way and round-trip fares between Ogden and Salt Lake City and intermediate points. The application declares that the one-way fare now charged between the points named is based on a charge of approximately 2¾ cents per mile, with a minimum fare of 15 cents, and that the round-trip fares are based on a charge of 180 per cent of the one-way fare, with a minimum of 25 cents. It is pointed out that the Denver & Rio Grande Western Railroad first class one-way and round-trip fares between Salt Lake City and Ogden and intermediate points are based on a charge of approximately 3.6 cents per mile. For more than six years past the revenue from passenger travel on the Bamberger has shown a yearly decrease of $35,000, or a total of $214,039, and that in order to enable the petitioner to continue to give the public adequate and efficient service additional revenue must be obtained.

The application also states that in the event the request is granted for increased fares the road will resume operation of bus service between Salt Lake City and Ogden and intermediate points in co-ordination with the other service. It also states that, providing the increase is allowed, the fares will be applicable to bus lines also. Under the proposed increase, the first class one-way fares will be based on a charge of 3 cents per mile, with a minimum fare of 20 cents, and the first class round-trip fares will be based on a charge of 180 per cent of the proposed first class one-way fares, with a minimum fare of 30 cents.

Pittsburgh Railways Officials Entertain Former Employees

There gathered in Pittsburgh, Pa., on Feb. 2 a group of men, all former Pittsburgh Railways employees, who are eminently successful in electric railway affairs. These guests of the railway included J. H. Alexander, B. J. Yungbluth, G. C. Hecker and J. W. Welsh. The *Sun* thus summarized their careers:

> Mr. Alexander started work for the Pittsburgh Railways in 1910 at $85 a month. He was a colonel in the United States army for two years during the war and now is president of the Cleveland Railway.
>
> Mr. Yungbluth commenced his railway experience as a $15-a-month oil room employee of a Mexican railroad and shortly afterward came to the Pittsburgh Railways, where he remained ten years. Today he is president of the International Railway, Buffalo.
>
> Mr. Hecker worked nights for the Pittsburgh Railways in 1910 in the load dispatcher's office and attended classes at Carnegie Tech. From 1912 to 1917 he was chief electrician for the company at Pittsburgh, later becoming electrical engineer. Now he is special engineer for the American Electric Railway Association at New York.
>
> Mr. Welsh worked in 1906 as car tester at the Homewood carhouse. In 1918 he was electrical engineer and traffic manager for the Pittsburgh company. He came back today for a visit as executive secretary of the American Electric Railway Association at New York.

A. W. Robertson, president of the Pittsburgh Railways, entertained the group.

Reunion at Pittsburgh Brings Former Employees Together

Schenectady Railway Seeks Rehearing

The Schenectady Railway, Schenectady, N. Y., filed a petition on Feb. 1 with the Public Service Commission for a rehearing of the proceedings before the commission on the application of Bohl Brothers and John Coons for the transfer of certificate for the operation of a bus line between Schenectady and the hamlet of Guilderland. At the first hearing in this proceeding, the railway advised the commission it had no objection to the transfer. Subsequently Bohl Brothers operated the line as a through route from Schenectady to Albany, they already having acquired the right of D. C. Main to operate between Albany and Guilderland. To this method of operation, the Schenectady Railway objected.

The appeal for rehearing refers to the order of the commission denying a certificate to David W. Jeram and David W. Jeram, Jr., for operation of a through bus line between Albany and Schenectady on the ground that the Schenectady Railway and the New York Central Railroad were rendering adequate service.

Concern in San Francisco

A steadily growing deficit in the San Francisco Municipal Railway, San Francisco, Cal., due to falling receipts and increased expenses has greatly alarmed city officials, who recently voted the platform men a raise in pay. Practically all the officials are in favor of the men getting a $6 a day wage, but many of them are wondering where the money is coming from if the 5-cent fare is to be maintained and the tax rate not raised.

It has been estimated that receipts have fallen off approximately $100,000 and that operating expenses have been increased $182,000, due chiefly to increases in pay granted the men since last May.

According to the books of John Hannan, accountant for the Board of Public Works, the actual deficit of the operation of the lines from May 1 to Nov. 30 was $38,000. But added expenses went into effect the first of the year and now officials are unable to predict just what the deficit will be by June 30.

Many causes are cited for the falling off in revenue—automobile competition, the fact that some lines operate in undeveloped territory which has not been fully settled and from which no great increase in revenue can be expected, and several others.

A 40-cent raise in daily pay was granted the men last May, when city officials fixed $3,500,000 as about the amount of revenue that would be taken in by Dec. 1. The actual receipts, however, proved to be only $3,101,346. It is not believed that the December receipts were more than $300,000, which leaves a discrepancy of about $100,000.

Late in December a second raise of 20 cents a day was voted for platform men.

Accountant Hannan declares that either an increase in fares or a resort to the tax rate for funds is the only way out of the dilemma.

Edward Van Deleur, president of the carmen's union, said:

> If the supervisors will give the railway system credit for what it earns, I believe it will take care of most of the increases in pay.
>
> By this I mean the interest on the daily balances of Municipal Railway funds should be credited to the railway account. The money now goes into the general fund and is used like other funds.
>
> There is $80,000 still due the municipal funds from money borrowed to pay the shortage in the cost of the Twin Peaks and Stockton Street tunnels.
>
> There is $125,000 in an old compensation insurance fund that we believe should be made available for the payment of our increases.
>
> Then there is the $200,000 of the earnings of the road that go each year to the retirement of bonds. No other road is ever expected to pay off the original investment. If these items are placed to the credit of funds necessary to meet the increases granted us there will never be any need to raise the fares.

T. A. Reardon, president of the Board of Works, in justifying the second raise granted the carmen said:

> The street car men all started off on a $3 a day basis. During the war the car repairers and others got increases which were refused the platform men owing to their numbers. We have been trying to equalize them. Mayor Rolph is insistent that the platform men have the greatest amount of responsibility and should receive as much as the others. When the supervisors raised the car repairers and provided $50,000 we also raised the platform men.

Franchise Negotiations in Canton

Canton, Ohio, is now in the throes of a transportation problem. The Northern Ohio Power & Light Company, the local operator of railway service, will not consider continued operation unless the company is given the entire transportation privilege. A. C. Blinn, general manager of the company, has made it plain at all times to the City Council committee that the company was willing to quit if the Council could get some other responsible concern to take over the business and supply satisfactory service for less money. He said that whoever undertook the job should have all the business. There are thirteen independent, competing bus lines in the city.

The problem presented itself in Canton about a year ago when Mr. Blinn went there and in a conference with the Council suggested that it might be well to take up the question of the new franchise contract in view of the expiration of the old one in February, 1928. This conference led to the employment of the Beeler Organization by the city. Mr. Beeler and his assistants made a survey and filed a report suggesting a co-ordinated bus and rail system. The report provided for retaining the main car line arteries and for bus feeders.

Since the filing of the report, Mr. Blinn has had two or three conferences with the city relative to some plan for the continuation of service. The Chamber of Commerce and other organizations in the city do not want the car lines removed, but Mr. Blinn said that it was perfectly satisfactory to the company if the city could find some responsible concern to take over the city system. The city is not inclined to give the contract to any other company, but it has not indicated that it is willing to give the Northern Ohio exclusive operating rights.

The present fare is 6 cents with six tickets for 35 cents. There has been no discussion of future fares while negotiations are still in progress.

Service News, the official paper of the Northern Ohio Power & Light Company, compares the situation in Canton with that in Akron, solved a few years ago by the co-ordinated systems supplied by the Northern Ohio Power & Light Company.

$4,500,000 Railway Budget for New Jersey Company

Upward of $57,000,000 is available this year for new construction, extensions and improvements by the Public Service Corporation of New Jersey in the territory which that company serves. Of this sum $31,064,381 was authorized in the 1927 budget, the other $26,000,000 having been authorized in previous budgets and covers work now in progress. The electric operating department's portion of this year's budget is $25,461,578, of which sum about $2,500,000 will be used for the installation of the fifth unit of boilers, consisting of three of 2,360 hp. each, for the Kearny generation station. There are twelve boilers at the station now and the extra three will provide for the maximum output planned for the first unit of the plant.

The railway and bus transportation companies will spend about $4,500,000 for upkeep of properties, additions and alterations to plant and equipment. The largest item authorized is an appropriation for the purchase of about 200 new buses, contracts for which have not yet been awarded. The railway will spend approximately $1,500,000 for track reconstruction in various parts of the state and 450 new electric fare boxes will be bought for the transportation company.

Safety First in Booklet for Children

School boys and girls in Milwaukee, Wis., are being taught through a 32-page booklet that health, helpfulness and happiness are dependent, in a large measure, on safety first rules and their practice. The booklet, called "Safe at Play with Ned and May," has been prepared in the hope that it may show the children the way in which to avoid dangers of present-day traffic. While playing ball, the game of chase, coasting or roller skating, Ned and May and others learn how to play with safety. The booklet is replete with rhymes such as:

> M is for Mindful
> Of danger around,
> So always be careful
> Wherever you're bound.

The booklet concludes with a safety song, the last verse of which says:

> Now our song is ended,
> And if you are wise
> You'll make a pledge to safety
> And use your ears and eyes.

News Notes

Back to Five-Cent Fare.—The Public Service Commission of Kansas recently approved the return by the Union Traction Company of the 5-cent fare at Coffeyville. Application for such permission was made by Receiver Layng. About a year ago the rate was boosted to 8 cents, but the revenues of the company did not increase with the increased fares.

Twenty-five Cents in Conscience Fund.—Following Mel Trotter's spiritual meetings in Grand Rapids, Mich., the so-called conscience fund of the Grand Rapids Railway was increased by 25 cents. This amount came from a woman who wrote that she had ridden at one time on the cars without paying. Her decision was to pay the amount with interest. L. J. DeLamarter, vice-president and general manager of the railway, publicly acknowledged the amount with thanks.

Through Service Contemplated. — Negotiations are under way between the Milwaukee Electric Railway & Light Company and the City Council of West Allis, Wis., looking toward the establishment of a rapid transit line between West Allis and Milwaukee, together with the introduction of co-ordinated cross-town bus line service which would connect with the railway lines of the north and south sections of the city. The high-speed line project would give through transportation service with no stops once the car left the Milwaukee or West Allis city limits. This change would cut the running time considerably between the two cities. Under cross-town bus line service, the present time-consuming circuitous route between downtown Milwaukee and West Allis would be eliminated.

Engineer Opposes Shorter Headway. —A public hearing was held before the New York Transit Commission on Feb. 8, 1927, on the petition of Jamaica Central Railways, Inc., to modify the commission's order requiring a ten-minute headway on the Jamaica-Far Rockaway route. Ira W. Fisk of Fisk & Roberts testified as the company's consulting engineer to the impossibility of operating the ten-minute headway with existing sidings and introduced traffic analyses showing that present service was more than ample. The commission reserved decision.

West Penn Adds Another Weekly Pass.—The West Penn Railways on Jan. 17, 1927, installed the weekly pass at Uniontown, Pa. The pass sells for $1, against a cash fare of 8 cents and a ticket fare of 6¼ cents. This makes the third installation of local city weekly passes along the West Penn system. The first was put on at Connellsville on June 1, 1925 and the second at Greensburg on March 1, 1926. Weekly and Sunday passes have also been used for several years at other points of the West Penn and subsidiary railways, including a zone-pass installation between Kittanning and Ford City since Sept. 20, 1925.

New Rates in Fort Worth.—The City Council of Fort Worth, Tex., recently authorized the Northern Texas Traction Company to put into effect a new schedule of fare rates. This includes a 10-cent adult cash fare, three tokens for 25 cents and a weekly ticket for 40 cents plus 5 cents for each ride. Children, entitled to half fare, will ride for 5 cents and school children may purchase six tokens for 25 cents. The old cash fare in Fort Worth was 7 cents for adult cash passengers. In its application for a revision of its rates, the company explained that it was earning a net return on its investment of less than 2 per cent and that new money could not be secured with that meager showing of earnings.

New Contract Between Two Boston Companies.—An operating agreement has been entered into between the Eastern Massachusetts Street Railway and the Boston Elevated Railway, Boston, Mass., governing the use of the lines between Maverick Square in East Boston and Revere Beach. It provides for the operation of Eastern Massachusetts cars over the Boston Elevated rails into Maverick Square and by Eastern Massachusetts crews. The fare is to be 15 cents between that terminal and Revere Beach, and of this amount the Elevated is to have 10 cents and the Eastern Massachusetts 5 cents, but this fare carries with it a free transfer privilege to all the other sections of the Boston Elevated. So that these cars shall not take any of the exclusively Elevated company business, they are to operate without stops between Gladstone Street and Maverick Square.

Recent Bus Developments

Status of Purple Swan to Be Determined

Whether the United States District Court for the Eastern District of Missouri or the St. Louis Circuit Court shall determine the question of appointment of a receiver for the Purple Swan Safety Coach Lines will be determined by the federal court after a transcript of the record of the Circuit Court in the litigation involving the company's finances is filed. The transcript is now being prepared for the federal court. In the meantime the temporary receivership, which resulted from a suit filed against the company by the Seiberling Rubber Company of Akron, Ohio, has been lifted and the lines have continued operation under their own management.

The question of whether a permanent receiver for the company should be appointed was set for hearing on Jan. 6, but prior to that date the bus company filed a motion for removal of the case to the federal court. As a result the hearing of Jan. 6 was continued indefinitely. Recently Circuit Judge Hartman ruled against the petition for removal for transfer to the federal court. Following his ruling on this point the bus company ordered a transcript of the record in the proceedings so that the federal court can pass on the same question.

Officials of the bus company have denied that there is any occasion for the appointment of a permanent receiver for the company, saying that the lines have been successfully managed and are in good shape financially. They want the question passed on by the federal court because of the diversity of citizenship involved.

Some of the Purple Swan lines were operated in competition with the Blue Goose line, run by the East St. Louis & Suburban Railway.

Buses in Hudson

The Public Service Commission on Feb. 3 granted the petition of the Eastern New York Utilities Corporation (formerly the Albany Southern Railroad) and the Eastern New York Transportation Corporation for the abandonment of its railway lines in the city of Hudson and substitution of bus service thereon. A certificate was also granted for the operation of bus lines in Hudson and the town of Greenport and authorization was given for the issuance of $25,000 capital stock for the transportation company and its acquisition by the utilities company. Commissioner Lunn's memorandum accompanying the order said that the substitution of buses appeared to be a solution of an unfortunate situation and would enable the railway to discontinue a portion of its system that has for a number of years failed to meet operating expenses and at the same time furnish a service acceptable to the people of Hudson. At the hearing an exhibit was introduced showing that the local lines in the city of Hudson during 1926 earned $20,500 gross with total expenses of $28,693.

Washington-Annapolis Service Planned

The Washington, Baltimore & Annapolis Electric Railroad, with headquarters in Baltimore, Md., plans to start a bus service between Washington and Annapolis within the next few weeks. The service will be in addition to the rail service now in operation. Permission to establish the bus line has been granted by the Public Utilities Commission of the District of Columbia and the Maryland Public Service Commission. Three buses will be ordered, all of them of the latest de luxe type. At first it is planned to make three round trips daily from both cities, but officials of the company said that if necessary the number of trips will be increased. The service will be over the new National Defense Highway, which is nearing completion, and will provide bus transportation between all points along the thoroughfare.

Would Run Buses in Scarsdale

The Westchester Street Transportation Company, Inc., subsidiary of the Third Avenue Railway, New York, N. Y., on Feb. 3 petitioned the Public Service Commission for permission to operate buses on a portion of its route in the village of Scarsdale, Westchester County. This company operates the railway lines in White Plains and Scarsdale. On Oct. 18, 1926, White Plains consented to the substitution of bus service for street cars in that city for a period of five years and on Dec. 9, 1926, the commission granted an order approving the substitution. On Dec. 28, 1926, Scarsdale also granted similar consent, which the company now submits to the commission for approval.

The petition says that the proposed bus route and bus route of the Eastchester Transportation Company, another subsidiary, connect with each other at the dividing line of Scarsdale and the town of Eastchester. An arrangement has been made for through operation from White Plains and Scarsdale through the town of Eastchester, Tuckahoe and Winter Hill to Yonkers Avenue between Main Street and Bronx River. A public hearing will be held on the application.

Bill to Permit New York City to Fix Bus Fares

Under the provisions of a bill introduced in the Assembly on Feb. 2 by Emory F. Dyckman, Republican, of Brooklyn, a new section 68 is added to the transportation corporations law, providing when New York City consents to operation of bus lines for not exceeding ten years, including all renewals or extensions, such local authorities and person or corporation receiving such consent may, by agreement, fix rates of fare to be charged. The object of this measure is believed to be to overcome the provisions of a gratuitous opinion recently written by former Justice Hughes that even if a city entered into a contract with a transportation company on the matter of the fare to be charged the carrier could later appeal to the utility commissions for relief if it found the original fare condition to be onerous.

Detroit Mayor After Competing Buses

In an attack on buses which compete with the municipal service of Detroit, Mich., made by Mayor John W. Smith while speaking before city officials and members of the Grand River-Redford federation, the Mayor invited the City Council to oust the Detroit Motorbus Company from Detroit streets by abrogation of the day-to-day agreement under which it operates.

In reply to statements made by one of the Councilmen to the effect that the Department of Street Railways should use buses only as feeders for its street cars, and that paralleling of street cars and city bus service was unwise, the Mayor cited that the Detroit Motorbus Company was operating on a day-to-day agreement, which was entered into with the Common Council and stated that he would like to see "some big red-blooded friend of the people in the Council move to have that agreement abrogated." The Mayor further pointed out that privately owned buses and jitneys were running beside the city street cars, and furthermore, they were allowed to charge a 10-cent fare. Referring to the Street Railway Department, the Mayor pointed out that the department was giving fine service, that it paid its employees the highest wages in the country, and that for 7 cents a passenger might ride 37 miles. The Detroit Municipal Railway was meeting its financial obligations, including payments on the purchase contract for the system.

Accepting the Mayor's challenge to abrogate the agreement with the Detroit Motorbus Company, the City Council unanimously adopted a resolution asking the Mayor and the Street Railway Commission for information as to the negotiations being carried on between the city and the bus company. In introducing the resolution, one of the Councilmen expressed the opinion that it was for the Mayor and his Street Railway Commission to decide and inform the Council whether the day-to-day agreement with the Detroit Motorbus Company should be discontinued.

A later announcement attributed to Mayor Smith was to the effect that he was not advocating at this time the removal of the buses operated by the private bus company. Also, that the Councilmen were just as much a part of the city administration as was the Mayor's office, and had as much to do with the operation of buses of the private company on the streets as had the executive end of the government.

Would Run Two Lines.—The County Transportation Company, Inc., Port Chester, N. Y., filed a petition on Jan. 31 with the Public Service Commission for a certificate for the operation of two bus lines in Mamaroneck, N. Y. The petition alleges that the New York & Stamford Railway intends to acquire all of the capital stock of the company and that the New York, Westchester & Boston Railway is committed to the financing of requirements of the County Transportation Company, Inc.

Reports on Bus Situation.—E. R. Baker, accountant in the public utilities department of St. Paul, Minn., has presented a report of 150 pages on the bus and taxicab situation in the city to the bus committee of the City Council. Data are to be employed as a basis for recommendations for the Council on bus and taxicab routes and fares. The report includes data on the history of the newest subsidiary of the Twin City Rapid Transit Company, Minneapolis, Minn., as affecting St. Paul, a corporation which has taken over most of the taxicabs in the two cities, in Duluth and in Rochester, Minn.

Bill Would Increase Gasoline Tax.—On the ground that it now costs the state of Wisconsin about $550,000 to collect $9,000,000 in license fees, whereas it costs only about $10,000 to collect the $5,000,000 obtained in gasoline taxes, a bill is being prepared for presentation to the Legislature providing for an increase in gasoline tax from 2 to 5 cents. With the 5-cent tax a law, the registration fee would be reduced to $1 and the personal property tax abolished. Electric railway and independent bus operators are now paying the 2-cent tax.

New Bus Schedule in Effect.—The Illinois Traction System on Jan. 16 put into service a new schedule on its bus line between Edwardsville, Ill., and St. Louis, Mo. Several buses have been eliminated. The new schedule is as follows: Edwardsville to St. Louis, 8 a.m., 10: 50 a.m., 4: 50 p.m., 7: 30 p.m. and 10:50 p.m. St. Louis to Edwardsville, 6: 45 a.m., 12: 15 p.m., 3: 30 p.m., 6: 05 p.m. and 9: 30 p.m.

Transfers on "Beauty Specials."—To allow students of the Girls' High School at Atlanta who live in the territory served by the Morningside and Virginia-Highland coach routes of the Georgia Railway & Power Company to use the "Beauty Special" coaches, as the special coaches to and from the Girls' High School are called, transfers are being issued on all of the regular coaches which are accepted on the "Beauty Specials." Transfers are also being issued from the specials to the regular coaches. The plan was started with the recent reopening of school for the spring term. Already it has proved very popular with the students. The "Beauty Specials," which were started when the Girls' High School opened for the current year, have proved a good supplement to the regular railway service. The schedules are arranged so that the buses arrive at the high school just before opening time and leave shortly after closing. The coaches have proved a great convenience to students.

Financial and Corporate

Net Income of Texas Electric Decreases

The gross earnings from operation on the Texas Electric Railway, Dallas, Tex., for the year ended Dec. 31, 1926, were $2,036,859, compared with $2,362,114 for 1925. The gross earnings were made up from the following principal items:

Passenger transportation	$1,692,142
Mail	26,827
Express	258,279
Rents of tracks and terminals	32,005
Rents of buildings and other property	14,395
Miscellaneous	13,209

Operating expenses and taxes for the year totaled $1,360,118, compared with $1,524,615 for 1925. Included in this decrease is an allowance of $15,000 made to the company by the Texas Power & Light Company upon power bills for the last half of the year. The item of taxes included in the above figures was $99,725 for the year, compared with $122,123 for the preceding year. The net income for the year was $250,769, compared with $411,763 for the year of 1925. These facts are contained in the annual report to the stockholders for the year ended Dec. 31, 1926.

INCOME ACCOUNT OF THE TEXAS ELECTRIC RAILWAY FOR YEAR ENDED DEC. 31, 1926, AND SUMMARY OF SURPLUS ACCOUNT

INCOME ACCOUNT		
Gross earnings from operations		$2,036,859
Operating expenses and taxes		1,360,118
Net earnings from operations		$676,740
Add-Interest on bank balances		1,853
Total net earnings before depreciation		$678,594
Interest deductions		427,825
Surplus net income before depreciation		$250,769
SUMMARY OF SURPLUS ACCOUNT		
Balance Jan. 1, 1926, per previous report		$1,354,614
Add: Surplus net income before depreciation for the year ended Dec. 31, 1926, as above	$250,769	
Less—Provision for depreciation (retirements)	100,000	
	$150,769	
Sundry direct items—		
Discount on Texas Traction Company bonds purchased doe sinking fund	$13,688	
Less—accrued rent for express terminal charged off	4,875	$159,583
	$8,813	$1,514,197
Deduct:		
Dividends declared on first preferred stock		29,957
Surplus balance, Dec. 31, 1926, per balance sheet		$1,484,240

Despite declining receipts and the necessity for the most rigid economy, the physical condition of the property was well maintained during the year. Under its mortgage the company is required to spend annually 15 per cent of its gross revenue for the maintenance of roadway and equipment. During the year expenses for these purposes were $351,950, or $46,421 in excess of the mortgage requirement. The company spent for additions, renewals and improvements to its property the sum of $95,477, including construction work and renewals of poles and cars. There was taken out of property value the price of $1,000 for certain lots sold and the sum of $1,368, representing certain railway construction abandoned in the city of Sherman.

Changes have occurred in the securities of the company during the year as follows: The outstanding underlying Texas Traction Company 5 per cent sinking fund bonds were reduced by the amount of $93,000 by the purchase of that amount through sinking fund accumulations; the company has now outstanding 6 per cent gold debentures to the amount of $1,348,000, a reduction of $2,000, representing an exchange during the year of debentures for first preferred stock; this exchange increased the amount of outstanding first preferred stock to $1,712,000; Texas Traction Company bonds in the amount of $4,000, par, held by the trustee of Texas Electric Railway mortgage and pledged under that mortgage were sold to the sinking fund of the Texas Traction Company; second preferred stock of the company in the par amount of $47,000, heretofore sold by the company to employees, has been repurchased by the company.

During 1926, the company discontinued railway service at McKinney and upon Mulberry Street in Sherman because the receipts therefrom were insufficient to provide for the service given.

Bus competition continued throughout the year upon substantially the same basis as it was at the close of the preceding year. The company experienced competition of this kind paralleling its lines between Dallas and McKinney, a distance of 32 miles, and between Waco and Hillsboro, a distance of 33 miles. The fare charged by bus service between Waco and Hillsboro is the same as the fare by interurban. Between Dallas and McKinney the bus fare during the year was advanced from 50 cents to 75 cents, while the interurban fare between these two points has been maintained at $1.

The address to the stockholders by Jack Beall, president, made a plea for legislation exempting interurban and street railways from a tax upon their gross receipts, legislation, calling for regulation of truck and bus operation and legislation requiring automobiles to stop before going over the railway crossings.

The report also estimated cash requirements for 1927, which, without considering the floating indebtedness of approximately $164,000, totals $1,871,718. This includes operating expenses, of $1,230,000; taxes, $100,000; interest, $409,855; sinking fund requirements, $81,550; payment of Denison & Sherman Railway bonds due July 1, $50,313. In addition it includes approximately $100,000, required during the year to take care of renewals and replacements and for new construction. In other words, there will be required during the year to pay operating and other necessary expenses and charges, including renewals and replacements and improvements, approximately $1,971,718. For the company to meet these charges and to enter 1928 free of floating indebtedness about $2,135,718 will be required, whereas the gross receipts for the year were $2,036,859.

California Railways Hit by Tax Ruling

Unless a tax decision rendered in Sacramento, Cal., on Jan. 27 by Superior Judge Peter J. Shields is upset by appeal, many electric railways in California may be seriously embarrassed. Judge Shields held that the separate class taxation is unconstitutional and ruled that all steam and electric lines should pay the 7 per cent rate. The decision was the result of a suit brought by the Southern Pacific on behalf of some of its electric lines to reduce the state tax rate for those lines. Under the King bill, which has been a law since 1921, electric lines have been assessed at the rate of 5¼ per cent, while steam lines and former steam lines have been assessed 7 per cent. The Southern Pacific in its suit sought to put its electric lines, which were formerly steam lines, under the lower tax rate.

The back taxes due the state under this decision amount to more that $2,500,000. A meeting of electric railroad men from all parts of California was held in San Francisco on Jan. 31 and a committee was appointed to study the situation and report at a future date.

Valuation of Capital Traction Cut

The valuation of the Capital Traction Company, Washington, D. C., for rate purposes was fixed at $25,756,880 by a decision of the District Court of Appeals rendered on Feb. 7. The appellate tribunal, through Chief Justice Martin, modified the decision of Justice Hoehling of the District Supreme Court by disallowing a claim of the company for $5,150,000, for the purchase price of the franchises and good will of the old Washington & Georgetown Railroad by the Rock Creek Railway, from which merger the Capital Traction Company was created in 1895. Justice Hoehling had sustained the claim of the company and had fixed a total valuation of $30,906,880.

The Public Utilities Commission had noted an appeal from the decision of Justice Hoehling and contested the allowance of the $5,150,000, which the commission had refused to consider when, in September, 1919, the commission reported its finding fixing the company's valuation as of June 30, 1919, at $14,270,495. This valuation was based on the normal prices as of July 1, 1914.

In disallowing this amount Chief Justice Martin declared it was a speculative price paid for the stocks and bonds of the company and should not have been paid for the franchise and good will of that corporation any more than should payment have been made to the holders of the securities of the Rock Creek Railway for its good will and franchises. The court declared it made no charge of bad faith respecting the merger, but pointed out that $8,000,000 was paid for the outstanding bonds of an issue of $4,000,000, three-fourths of which were redeemable within four years and one-half of the remainder in less than eight years thereafter.

Taking up the claim of the commission that Justice Hoehling had not provided any deduction for depreciation, which the experts for the commission had estimated at $2,000,000, the appellate tribunal adopted the decision of Justice Hoehling that no depreciation figures be set. The court ordered the commission and its successors in office to modify forthwith its former valuation and order in accordance with the decision of the appellate tribunal.

George E. Hamilton and G. Thomas Dunlap, counsel for the Capital Traction Company, announced they would take an appeal to the Supreme Court of the United States.

Receiver Appointed for Cincinnati-Portsmouth Road

The Cincinnati, Georgetown & Portsmouth Railroad, Cincinnati, Ohio, was placed in the hands of L. E. Woster as receiver when Judge Struble acted upon a suit brought by the Union Trust Company, holder of the trust indenture and first mortgage given by the company when it issued $1,000,000 in 5 per cent bonds. Mr. Woster is superintendent of transportation of the company.

J. P. Longon, attorney for the Union Trust Company, alleged in the suit that the railroad had failed to meet installments of interest, aggregating a large sum, due on its million-dollar bonded indebtedness. The petition said:

> For more than a year past the earnings of the company from all sources, in excess of the cost of operation, maintenance and other necessary expenses, have been far less than the amount required to enable it to pay the interest upon the bonds and other obligations.

Because of the alleged insolvency of the railroad there was danger of disruption of the system, the trust company asserted in its suit. In this connection it explained that:

> It is of vital importance not only to the holders of the bonds and of the other obligations of the railroad, but also to the public that the operation of the system should not be interrupted or disorganized until the rights of the various bondholders and creditors can be ascertained and an opportunity given for some reorganization or readjustment of the properties.

Increase in Revenue Passengers in Syracuse

The Syracuse lines of the New York State Railways carried a total of 33,458,417 passengers during 1926, an increase of 250,000 revenue passengers over the preceding year, according to a report issued by Benjamin E. Tilton, vice-president and manager. The report covered both the electric railway and bus systems. While the annual financial report is not completed, Mr. Tilton said the gross passenger revenue for electric cars would reach $2,222,000 and for buses the figure was set at $132,770, a total of $2,354,770.

Street cars carried 31,604,430 and buses 1,853,987. The street cars traveled more than 5,000,000 miles and the buses 525,000 miles. Total number of transfers issued was about 6,000,000.

Mr. Tilton announced that the chartered bus business instituted by the Syracuse lines during the year had proved profitable. Buses were chartered on 72 occasions, or about twice a week since the system was installed. Parties were taken to Binghamton, Buffalo, State College, Pa., northern New York and many other points.

Sale of Indiana Road Approved

The Indiana Public Service Commission has approved the purchase of the property and franchises of the Fort Wayne, Van Wert & Lima Traction Company, Fort Wayne, Ind., by the Fort Wayne-Lima Railroad. The road was bought recently at receiver's sale by Edward Hopkinson, Jr. The commission authorized an issue of $100,000, par value, of 6 per cent fifteen-year first mortgage bonds; $441,000, par value, of general mortgage bonds, and 10,290 shares of no par common stock.

In this connection it is interesting to note that in a recent opinion to John W. McCardle, chairman of the Indiana commission, Arthur L. Gilliom, Attorney-General, held that state laws provide sufficient authority for one utility to take over the property and franchises of another public utility operating in Indiana and an adjoining State, and that the only authority necessary from the commission in such a case is approval of any bond issue asked by the purchasing utility.

Mr. McCardle based his question on a petition by the Fort Wayne-Lima Railroad to purchase the Fort Wayne, Van Wert & Lima Traction Company and to issue $641,290 in securities. Mr. Gilliom pointed out that since the railway was recently sold at a judicial sale and that since the law requires the purchaser at a judicial sale, if not a corporation, to organize one, the law gives the new corporation authority and the matter does not rest with the commission.

Hydro May Take Windsor, Essex & Lake Shore

Announcement that the Windsor, Essex & Lake Shore Electric Railway, Windsor, Ont., plans to shut down within 60 days has provoked much comment in the border cities. Following a recent meeting at Kingville attended by civic leaders it was decided that a complete survey of the situation be made with a view toward its possible purchase by the Ontario Hydro-Electric Commission for operation as a part of the Hydro radial services. A tentative price was not mentioned. W. R. Robertson, superintendent of the Hydro lines, reviewing the situation and contrasting bus operation with radial service, believed the Hydro department could operate the Lake Shore road at an estimated annual saving of $100,000. He cited the reduced cost of power as an important consideration. He set the costs of bus operation at 40 per cent higher than radial overhead.

Chicago "L" Issue Going Well

The sale of the new issue of $1,500,000 of prior preferred stock of the Chicago Rapid Transit Company, operating the elevated lines, is now in progress through the Utility Securities Company, Chicago. The new stock, which pays a rate of return of 7.2 per cent, or 60 cents a share a month, is proving a popular investment with middle class investors. It is being sold on the monthly payment plan, as was the former issue, 7 per cent interest being allowed on partial payments. The monthly payment is $10 a share and the stock is being sold at $100 a share. The previous issue of prior preferred is now quoted on the Stock Exchange at several points above par.

Power Equipment of Detroit United Sold

One of the largest sales of its kind in recent years has been announced in Detroit by the receivers for the Detroit United Railway, who have disposed of idle equipment, including four power houses and twelve substations, to the Woodmere Scrap Iron & Metal Company, Detroit, for $800,000. An order in federal court disposing of the equipment was signed by Judge Charles C. Simons.

The steam and electrical power equipment included in the deal was valued at several million dollars when installed many years ago. The main power plants have been idle for the past two years. They are located at Monroe, Rochester, Farmington and New Baltimore. The substations are at Oxford, Conger, South Rockwood, Erie, Earthville, Roseville and two at Atlas.

New Incorporation at Rockford

The Rockford & Belvidere Railway has been incorporated with $300,000 capital. The stock includes 3,000 shares of common at $50 a share and 1,500 shares of preferred at $100. T. M. Ellis is president, William D. Bangs vice-president, Paul V. Harper secretary and John P. Brown treasurer. Offices of the company are at 128 Kishwaukee Street, Rockford, Ill. The corporation is operating the former Rockford-Belvidere branch of the Rockford & Interurban Railway, which, with the Rockford City Traction Company, went into bankruptcy a year ago. Both units were taken over by the Ellis interests.

Net Profit $5,271 in 1926.—The net profit of the Worcester Consolidated Street Railway, Worcester, Mass., dropped from $349,735 in 1925 to $5,271 in 1926, principally because of decline of patronage of its lines and increased operating expenses, according to a report filed with the Massachusetts Department of Public Utilities. In 1925 the railway carried 36,781,407 revenue passengers, while in 1926 the total was only 33,870,220. The railway shows that its operating revenue for the year 1926 amounted to $3,338,544, compared with $3,595,403 in 1925. Although operating revenues declined, operating expenses increased nearly $160,000, being $2,903,725 in 1926 compared with $2,745,002 in 1925. All items of expense except conducting of transportation, which includes wages, increased in 1926 over 1925. As a result of the diminution of profits the railway paid no dividends in 1926, while $348,750 was distributed in dividends in 1925.

The Situation in Chicago Traction Negotiations

Failure of the Chicago Railways to pay off the principal of $55,655,000 of its first mortgage gold bonds on Feb. 1, the date its 20-year franchise with the city of Chicago expired, resulted in the initiation of proceedings the following day in the Federal District Court for the foreclosure of the mortgage by the Harris Trust & Savings Bank, acting as trustee for approximately 50 per cent of the bondholders. There was no contest against the contentions of the bill and the foreclosure was immediately ordered by Judge James H. Wilkerson. The petition asked the court to declare the first mortgage claim a valid first lien and sell the property as an entirety to satisfy it. In the meantime, the court was also asked to have the receivers hold all profits for the trustee and to restrain the company agents and receivers from transferring the property.

In granting the application, Judge Wilkerson also ordered consolidation of the proceedings with the receivership suit of the Westinghouse Electric & Manufacturing Company, which on Dec. 15 appealed for appointment of the present receivers on account of failure to pay a bill of $67,000. The same receivers—John J. Mitchell, Frederick A. Rawson and Henry A. Blair—were reappointed.

Although the court took no legal action on the application for sale of the properties, the natural sequence of this petition is that the company will be given 20 days to make answer. During that time, a formal hearing will be held on the merits of the appeal. With no funds in the treasury to meet the principal of the bonds now due, the property will be ordered sold at the expiration of this period.

Reorganization of the system contemplated by the controlling bondholders, however, will have to wait until the city either passes a new ordinance or the state Legislature passes the necessary legislation, it is believed. If the city grants a new franchise, of either terminable or fixed duration, the main problem is one of refunding. Under existing laws the city may only grant a twenty-year franchise. The companies contend it is impossible to fund present indebtedness under a limited grant. If the city is willing to coincide with that view, then it is predicted both parties will join in a plea of the state Legislature for the necessary enabling laws to permit the granting of an indeterminate permit.

Holders of some $40,000,000 par value of junior bonds of the Chicago Railways and of $39,455,000 first mortgage bonds of the Chicago City Railway and Calumet & South Chicago Railway, which also fell due on Feb. 1, as yet have made no formal demands for payment of their investments.

The aggregate funded debt of the Chicago Railways Company, as shown in its latest published report, is as follows:

First mortgage	$62,785,000
Consolidated mortgage Series A.	16,703,800
Consolidated mortgage Series B.	17,164,475
Purchase money mortgage	4,073,000
Adjustment income mortgage	2,500,000
Underlying securities	1,980
Total	$103,228,255

Of this amount, approximately $8,594,000 of bonds are unsold and still remain in the company's treasury, leaving a total of $94,634,185 in the hands of the public.

Because the bondholders will be interested in protecting their property, the local transportation committee of the City Council recognized their right to be represented at future hearings on all traction ordinances by postponing further sessions until after the bondholders come into control of the property. That numerous aldermen are now in the midst of heated campaigns for re-election on Feb. 22 is also given as another reason for the recess.

Petition Dismissed.—The California Railroad Commission has dismissed the application of the Union Traction Company for authority to abandon its stage lines operated between Santa Cruz and Capitola and intermediate points and between Santa Cruz and Twin Lakes and intermediate points.

Deficit on Lake Shore.—The gross earnings of the Lake Shore Electric Railway, Cleveland, Ohio, for the period from Jan. 1 to Nov. 30, 1926, was $2,947,274, against $2,924,613 for a similar period the year previous. Operating expenses and taxes increased from $2,416,604 to $2,554,098. After the consideration of interest the company concluded the eleven months period with a deficit of $14,197, against a surplus the year previous of $113,496. The Lake Shore Electric Railway has asked permission of the Ohio Public Utilities Commission to discontinue railway service on its line from Sandusky to Norwalk, Ohio.

Net Income Lower.—The operating revenues of the Eastern Massachusetts Street Railway, Boston, Mass., for December, 1926, were $927,815, compared with $850,448 for December, 1925. The net income for December after taxes, charges and depreciation was $102,548, against $112,711 in December, 1925.

New Preferred Stock Issue.—The directors of the Midland Utilities Company, Chicago, Ill., on Jan. 17 authorized the issuance and sale of $1,000,000 of its 7 per cent cumulative class A preferred stock. Public offering of this stock will be made at once by the Utility Securities Company, Chicago. The Midland company owns or controls companies serving 201 communities in northern Indiana and western Ohio with an estimated population of 850,000. The total investment of the subsidiary companies in properties is $94,318,673. The chief transportation subsidiaries of the Midland Utilities Company are the Chicago, South Shore & South Bend Railroad, Gary Railways, Shore Line Motor Coach Company, Indiana Service Corporation and the Marion & Bluffton Traction Company.

Book Reviews

Accounting Procedures for Public Utilities

By Warren G. Bailey, M.A., and D. E. Knowles, C.P.A. Chicago and New York: A. W. Shaw Company. 459 pages. Price, $7.50.

This is a massive volume. It runs to the extent of 459 pages. This is not said as a deterrent, but is intended merely to convey an idea of the extent to which the authors have gone in covering their subject. To do the contents of the book full justice in a review of this kind would be impossible. Limitations of space make a critical summary of the volume out of the question. It seems better unequivocally to indorse the work as a whole and then to attempt to summarize the purpose of the authors and to convey an idea of the contents of the volume.

The present volume is the first of the series of so-called Public Utility Text to be published under the auspices of the Institute of Research in Land Economics and Public Utilities with Richard T. Ely, editor-in-chief, and Herbert B. Dorau, managing editor. This series is intended to cover the entire field of public service company operation and management. One finds himself heartily in agreement with the editors that as a study in a special aspect of public service company business administration "Accounting Procedures for Public Utilities" represents a real and valuable contribution to the literature on utilities.

As for the authors, who dedicate the volume to the public utility accountant, whose importance in the industry has been underestimated and whose work is essential to the proper management of utility companies, they have sensed the need for a reference book that would in a satisfactory manner review briefly the accounting practices in utility companies. As they point out, the compilation of accounting and financial data is logically the function of the accountant. To assemble these data accurately, the forms, methods and procedures he uses must be appropriate and complete. To this end the authors have attempted to describe the accounting records that have been found necessary, to explain briefly the manner in which the records are kept and to indicate the purposes for which the accounting information is used. In most instances the procedures presented are a composite of those used in various companies. In a few instances only are more or less specific practices discussed. It has been felt by the authors that procedures discussed or presented in a general way would be of greater assistance to executives and students of accounting than would procedures of particular companies. The authors warn the reader, however, that few records and practices used effectively in any one company can be used successfully *in toto* in another company.

There is, of course, a certain futility about giving a list of chapter headings. Yet in a review, fixed as to space limitations, there is, perhaps, no better way to convey an idea of the contents of a volume of this kind, particularly a business book. So the headings of the chapters are appended:

(1) Introduction; (2) Place of Accounting in Public Utilities; (3) Uniform Accounting for Utility Companies; (4) General Accounting Books; (5) Expense Accounting; (6) Timekeeping and Pay-Roll Methods; (7) Distribution of Labor Charges; (8) Departmental Responsibilities in Accounting for Materials; (9) Accounting for Materials and Supplies; (10) Plant Accounting; (11) Current Liabilities; (12) Revenues from Utility Services; (13) Revenue Accounting for Electric, Gas and Water Services; (14) Accounting for Merchandising Sales; (15) Accounting for Revenue of Electric Railways; (16, 17, 18 and 19) Customers' Accounting; (20) Accounting for Customers' Payments and Petty Cash; (21) Accounting for Refunds and Adjustments with Customers; (22) Auditing Procedure; (23) Budget Procedure; (24) Interpretation of Financial and Operating Statements; (25) Public Utility Construction and Extensions; (26) Accounting for Capital Stock and Dividends; (27) Accounting for Capital Stock Sales.

As a piece of bookmaking the volume is in consonance with the text. All in all, the book reflects great credit on the authors, the editors and the publisher.

Notes on the Collection of Transfers

By Frank Folupa. Philadelphia, Pa.: Dorrance & Company. 306 pages. Price $2.

Are you a peridromophile? You need not consult the psychoanalysts or the behaviorists for an answer to this question, for its field is new even to them. Only you yourself can settle the mooted point. Did you ever impulsively or with studied malice pay an extra fare on the street cars rather than relinquish the orange-colored, mysteriously marked and deliberately punched transfer? If so, you are a believer in the science of "peridromophily," the name assigned by Frank Folupa in his "Notes on the Collection of Transfers" to the habit of collecting transfers.

Few people in this workaday world see anything of beauty in a street car transfer, evidenced by the various drastic changes the forms undergo before being deposited in the hands of the waiting conductors or receptacles. Not so do these specially colored slips, with their listings and punches, affect the transfer collector. This particular one has more than an academic interest in the origin of transfers. He is especially intrigued with their destiny—namely, personal collection—and this hobby he constantly reminds his readers is not for fraudulent purposes but rather as an honest avocation. Why, he wonders, should not the collecting of transfer forms be just as interesting as collecting coins and stamps. Besides, transfer collecting has this advantage—it can never be commercialized, "since trading in transfers is illegal. . . . Therefore, collectors must always be amateurs collecting for the intrinsic interest in it."

And if the avocation of the collector is honest, it is delightful, too, he finds. On transfer forms one can be transported into the unbounded realms of history and knowledge, although these same slips appeared at first commonplace and stodgy. On this point he says: "A trolley ride along the traditional route or close to it, with a souvenir in some such form as a transfer used in Lexington, can add some interest to the history of Paul Revere's ride. A collection of Washington transfers seems to make news from the capital seem a bit more realistic, especially such forms as mention well-known places like the Capitol, the Treasury, Pennsylvania Avenue."

To one concerned in transportation questions or to one who has already acquired an interest in collecting transfer forms, this book should be of inestimable value. It is a carefully prepared, technical treatise on transfer privileges and classifications. Fare limits, overlaps, reversibility, direction punches, square box type, Ham type, Pope type and other equally perplexing terms to the layman are treated at considerable length. Supplementing the text are appendices dividing the United States into geographical divisions and subdivisions as a sample of a code notation of transfer systems.

But granting the reader has never found inspiration in transfers and will likely never indulge in the transfer-collecting hobby, the book contains entertaining and instructive matter. Even a cursory glance may be productive of reminiscent moods in which transfers played some part, though that part was negligible. Some such nostalgia affected one reader of a review published in a New York daily. Through the reviewer he subsequently offered to the author of "Notes on the Collection of Transfers" his own collection dated 26 years ago. Just a mention of this hobby was enough to carry him back to the days of his boyhood, when he and other kids in the neighborhood awaited the return of their traveling salesmen fathers, who in a big-hearted way dumped out of their pockets transfers from San Francisco, Louisville, Boston, St. Louis and several other cities. If the wandering transfers could have told their tales, . . . when will we have the autobiography of a transfer?

The Rapid Transit Situation in Greater New York

Many persons other than New Yorkers will be interested in this booklet of 70 pages, which contains the open letters of G. M. Dahl, chairman of the board of the Brooklyn-Manhattan Transit Corporation, on the Greater New York transit situation written during December, 1926, and January, 1927, to the Transit Commission of the State of New York and the Board of Estimate & Apportionment of the city of New York.

Mr. Dahl explains that the letters were written with the sole purpose of creating constructive discussion of local transit matters, and to aid in bringing about a co-operative effort on the part of existing transit companies and city and state officials for a solution of the transit problem, equitable alike to all interests—the public, the city and the companies.

Personal Items

Luke C. Bradley Heads New Providence Company

Luke C. Bradley, Richmond, Va., has accepted the invitation of the board of directors to become president of the Rhode Island Public Service Company, Providence, R. I. He will succeed Louis C. Gerry, and will assume his new duties about Feb. 20.

Mr. Bradley has resigned as president of the Virginia Electric & Power Company to accept this position. As head of the Service Company he will supervise the operations of the Narragansett Electric Light Company and the United Electric Railways, which have been merged under the Service Company.

Mr. Bradley has been associated with Stone & Webster, Inc., for the past 22 years in executive capacities. As president of the Virginia Electric & Power Company he had direct oversight of the electric light and power properties, electric railway lines, bus systems and gas properties in Richmond, Norfolk, Portsmouth, Peterburg, Fredericksburg and other cities in Virginia and extending into northeastern North Carolina.

The Virginia Electric & Power Company is controlled by the Engineers Public Service Company, and is under the executive management of Stone & Webster, Inc. Stone & Webster are also interested in the New England Power Association, which controls the Rhode Island Public Service Company. Mr. Bradley will be elected a director of the New England Power Association. He has been executive vice-president and division manager of the utilities properties under the management of Stone & Webster in Louisiana, Texas, New Mexico, Wisconsin, Nebraska, Wyoming and Colorado, serving about 100 cities and towns in these states. He is severing his connection with Stone & Webster in becoming connected with the Rhode Island Public Service Company.

Fred Hamilton President in Omaha—Other Changes

At the annual meeting of the Omaha & Council Bluffs Street Railway, Omaha, Neb., held on Jan. 10, a change in officers was effected as follows:

Fred Hamilton was elected president, succeeding W. A. Smith.

R. A. Leussler, formerly a vice-president and the general manager, will continue as general manager and assume the first vice-presidency.

J. A. Munroe, formerly vice-president, is now designated as second vice-president.

The new president, Fred Hamilton, has been a member of the board of directors of the company for the past seven years, and during 1926 was first vice-president. He is well known in banking circles, being president of the Merchants National Bank until the consolidation of that bank with the Omaha National Bank last April. He is at present vice-president of the Omaha National Bank.

M. Ackerman Heads C.E.R.A.

Martin Ackerman, general manager the Lake Shore Electric Railway since Feb. 1, 1926, was elected president of the Central Electric Railway Association at its meeting in Toledo, Ohio, on Feb. 3-4, 1927. Mr. Ackerman is well known in the Central West, particularly for his affiliations with the Cincinnati & Dayton Traction Company and the Lake Shore Electric Railway.

In accepting the general managership of the Cleveland interurban a year ago he returned to the property on which he obtained his early electric railway experiences. Here he started at the bottom, receiving in the course of time many advancements. Early in his career he was identified with the Youngstown & Ohio River Railway, and later with the Springfield & Xenia Railway and the Interurban & Terminal Company at Cincinnati. As a result of his efficient handling of the latter property Mr. Ackerman was made general manager of the Cincinnati & Dayton Traction Company in July, 1918. He encountered many difficulties, but his efforts at restoration did bear much fruit. He remained with this railway until Feb. 1, 1926, when he went to Sandusky as head of Lake Shore. At that time his career was reviewed in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 6, page 268.

Martin Ackerman

Changes in Personnel of American Light & Traction Company

Alanson P. Lathrop, president of the American Light & Traction Company, New York, since 1909, has been elected chairman of the board of directors. R. B. Brown, who had been vice-president and general manager of the Milwaukee Gas Light Company several years, has been made president to succeed Mr. Lathrop.

W. E. Wood Made President at Richmond

William E. Wood, who has served as vice-president and general manager of the Virginia Electric & Power Company, Richmond, Va., since operation and control of the properties were taken over by Stone & Webster, Inc., Boston and New York, in 1925, will become president of the company, succeeding Luke C. Bradley. J. Frank McLaughlin, in charge of the company's Norfolk division, will succeed Mr. Wood as first vice-president, retaining his headquarters in Norfolk.

Mr. Wood joined the Stone & Webster organization immediately on graduation from the Georgia Institute of Technology. After a few months in the company's Boston offices he was sent to Jacksonville, Fla., where he eventually became superintendent of transportation. His promotion was rapid. Both Mr. Wood and Mr. Bradley came to Richmond in June, 1925, from highly successful management of the Stone & Webster properties in Texas, and they are now completing a $20,000,000 program of improvements and extensions for the Virginia Electric & Power Company in Tidewater Virginia and northeastern North Carolina.

Changes in Personnel of the Capital Traction Company

Edwin P. Goucher, formerly assistant engineer, has been appointed engineer of way and structures, and Joseph H. Dierken, formerly head of the electrical department, has been made electrical engineer of the Capital Traction Company, Washington, D. C.

Mr. Goucher has had charge of track construction for the Capital Traction Company for several years and has started some very valuable methods of construction which have materially reduced costs. His application of labor-saving tools in this work has shown remarkable results. He is a graduate of public schools and technical high school of Washington, D. C. For six years he served as assistant engineer in the surveyor's office in the District of Columbia. In 1917 he worked as assistant engineer at the United States Naval Academy, Annapolis, Md., on construction work and joined the engineering force of the United States Navy in 1918 as inspector of construction, Philadelphia Navy Yard. A year later Mr. Goucher was appointed assistant engineer in the way department of the Capital Traction Company.

Mr. Dierken entered the service of the Capital Traction Company in 1909 in the electrical department. He was appointed chief electrician in 1917. During the past five years he has had entire charge of the electrical department. Mr. Dierken is a graduate of Georgetown University Preparatory School, St. John's College, and Bliss Electrical School of Washington, D. C. In 1906 he served with the J. G. White Company and in 1907 and 1908 with the Westinghouse Electric & Manufacturing Company's construction department.

E. J. Anderson Advanced at Davenport

E. J. Anderson, formerly general superintendent of the Tri-City Railway, Davenport, Iowa, has been made general superintendent of both the Tri-City Railway of Illinois and the Tri-City Railway of Iowa, with offices in Rock Island.

Arthur Grunwald, formerly assistant superintendent in Davenport, is made division superintendent of the Iowa lines under Mr. Anderson.

John Arnell continues as division superintendent of the Illinois lines.

Frank V. Skelley, for several years an assistant under T. C. Roderick former general manager of the Illinois lines but now at Ottumwa, is made transportation engineer for the entire Tri-City Railway lines.

H. W. Blake Goes Abroad

Henry W. Blake, senior editor of the ELECTRIC RAILWAY JOURNAL, sailed for Europe on Feb. 10 on the *Conte Biancomano* on a business and pleasure trip that will extend over a period of several months. He expects to arrive in Naples on Feb. 22 and will proceed thence to Rome, Florence, Milan, Nice, Paris, Brussels, Berlin, Hamburg and London. Mr. Blake will travel leisurely, as bespeaks the scholar that he is, studying and drawing upon the background of previous trips and the inherent culture that is his. He will contribute to the JOURNAL some of his observations on public utility practices, particularly in the field of city railway operation and heavy electric railroading.

D. A. Powell at Muskegon

D. A. Powell was recently elected vice-president and general manager of the Muskegon Traction & Lighting Company, Muskegon, Mich. From November, 1925, until his recent appointment Mr. Powell was employed by the American Light & Traction Company, as traveling engineer. He is a graduate of the University of Wisconsin, 1907, with a degree of bachelor of science, school of electrical engineering. Upon graduation, he entered the employ of the Madison Gas & Electric Company as chemist, cadet engineer, and engaged in construction work and plant appraisal for rate-making purposes. In 1910 he was transferred to the Milwaukee Gas Light Company and was employed by this company until 1925. During that time he acted in the capacity of construction engineer and later he served as engineer of distribution.

R. R. Cheever, associated for many years with the Pacific Electric Railway, Los Angeles, Cal., was recently appointed to the position of the assistant chief clerk in President William Sproule's office. For the past six years he had been secretary to Mr. Sproule. He entered the service of the Pacific Electric Railway in Pasadena in 1906 as stenographer in the superintendent's office and was advanced to similar positions in the general manager's office and later in the office of the vice-president. Subsequently he was secretary to Paul Shoup, at that time vice-president of the Pacific Electric. Following this assignment he became chief clerk in that office. Before going to San Francisco, in 1920, Mr. Cheever was secretary to H. B. Titcomb, who was then vice-president of the Pacific Electric Railway.

Lewis E. Gettle, chairman of the Wisconsin Railroad Commission since 1922, at which time he succeeded Carl D. Jackson, resigned, has been reappointed by Governor-elect Zimmerman. His new term will expire in 1933.

Ray A. Poteracke, head bookkeeper of the Grand Rapids Railway, Grand Rapids, Mich., has been promoted by Vice-President and General Manager DeLamarter to chief clerk in charge of accounting. Mr. Poteracke entered the service of the company ten years ago as a storeroom clerk.

T. F. Gnevo, former general agent of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has assumed the duties of assistant general passenger agent of the North Shore Line with offices at Milwaukee, Wis., to which position he was recently appointed. Mr. Gnevo succeeds R. S. Amis, who has been promoted to general passenger agent. The new assistant general passenger agent has served as passenger traffic representative on various steam and electric railways for the past eighteen years.

Hazen J. Payette has resigned as secretary to Mayor John W. Smith of Detroit, Mich., to become chief trial attorney for the Detroit Department of Street Railways. Following the close of the World War, Mr. Payette joined the claims department of the Detroit United Railway and when the Detroit United lines were taken over by the city of Detroit he entered the employ of the city, serving the Department of Street Railways in a legal capacity. He remained with the department until nine months ago, when he became secretary to the Mayor. He is 28 years old. He was graduated from the University of Detroit law school.

R. E. Jamieson, for the past year district passenger agent for the Chicago, South Shore & South Bend Railroad, South Bend, Ind., was recently appointed district passenger agent with offices in Chicago. Mr. Jamieson's experience in railroading began in 1911 with the Grand Trunk System at London, Ont. Since that time he has been engaged in various capacities in passenger solicitation work. He was connected with the Canadian Pacific Railroad in Chicago prior to his service with the South Shore Line. He was elected president of the Chicago Passenger Club, an organization of electric and steam railroad and steamship passenger agents, at its annual meeting in December, 1926.

James H. Powell, formerly assistant superintendent of transportation of the Scranton Railway, Scranton, Pa., has been appointed superintendent of transportation. He succeeds in that capacity George C. Towle, recently resigned. Mr. Powell has risen from the ranks.

A. I. Hunter has replaced L. Stinson as vice-president of the Grand Forks Street Railway, Grand Forks, N. D. He was formerly treasurer.

Joseph M. Nolan has succeeded James H. Powell as assistant superintendent of transportation of the Scranton Railway, Scranton, Pa. Mr. Nolan has been an employee of the company for more than twenty years.

A. J. Goedjen, manager of the Menominee & Marinette Light & Traction Company in Menominee, Mich., and Marinette, Wis., has been named manager of the northern division of the Wisconsin Public Service Corporation under a rearrangement of divisions. Mr. Goedjen's supervision over the operation of the corporation's properties will be widened to include twelve more communities.

Obituary

William L. Schulz, formerly claim agent for the Washington, Baltimore & Annapolis Electric Railroad, with headquarters in Baltimore, Md., died on Jan. 10 at his home in West Annapolis. Mr. Schulz went with the company in 1908 and remained there until his health forced him to retire.

Alfred J. Becht, active in civic affairs of Cincinnati, Ohio, and identified with traction interests, died recently. On Nov. 14, 1910, Mr. Becht became secretary of the Cincinnati Street Railway, succeeding James A. Collins. He served in this capacity until Jan. 1, 1926, when he resigned to devote his time to his various personal interests. Prior to the sale about four months ago of the Toledo, Bowling Green & Southern Railroad Mr. Becht was its secretary. He also served the Cincinnati-Hamilton Traction Company in a similar capacity until it was taken over recently by the Cincinnati Street Railway.

W. C. White, superintendent of the western division of the Pacific Electric Railway, Los Angeles, Cal., for many years, died recently. He had been a resident of Los Angeles for more than 30 years.

William Wright, auditor for the Washington, Baltimore & Annapolis Electric Railway, with headquarters in Baltimore, Md., died suddenly on Jan. 5. He was found unconscious at the wheel of his automobile in his garage. His death was due to apoplexy. Mr. Wright was 65 years old.

William H. Hodgins, secretary of the Okonite Company, died recently at his home in Glen Ridge, N. J. Mr. Hodgins had been associated with the Okonite Company for more than 40 years and served for many years as a director in addition to his office as secretary. During his long connection with the Okonite Company he had seen the wire and cable industry develop from its earliest application to its present tremendous proportions.

George William Norwood, 83 years old, Kokomo, Ind., one of the promoters and builders of the interurban line of the Marion & Bluffton Traction Company, Bluffton, Ind., died recently in Lebanon.

$5,000,000 for Steel Equipment

Long Island Railroad Outlay Includes 60 Motor and 30 Trail Cars for Electric Service

George Le Boutillier, vice-president of the Long Island Railroad, announced this week that by the end of 1927 every passenger-carrying car operated in both steam and electric train service on the Long Island Railroad system will be of steel construction. This means that the Long Island will be the first Class I railroad in the United States to retire all remaining wooden cars and place its passenger-carrying equipment on a 100 per cent steel basis.

Orders will be placed immediately for 127 new steel passenger cars. Of these 117 will be coaches and ten combination baggage and passenger cars. As wooden cars have not been operated in electric passenger train service for many years, the new steel cars to be ordered will be used on steam trains, although they are of such a type as may readily be converted into electric motor or trail cars. This new equipment represents an investment of $2,114,188. In addition to the cars covered by the new authorization, the company will put in service this year 114 new steel passenger cars which are now under construction at a cost of $2,902,286. The latter order includes 60 motor cars, 30 trail cars for electric service and 20 coaches and four combination cars for steam service. The outlay for new equipment to be placed in service during 1927 will therefore amount to more than $5,000,000.

Upon delivery of the 127 cars just authorized and the 114 now being built the Long Island will have a total of 1,411 steel passenger-carrying cars and no wooden cars.

Hyatt Names New Sales Manager and Chief Engineer

H. J. Forsythe, president of the Hyatt Roller Bearing Company, Newark, N. J., announces the appointments of H. O. K. Meister as general sales manager and A. W. Scarratt as chief engineer.

Mr. Meister joined the Hyatt forces more than fourteen years ago, locating first as an engineer at the home office in Newark. Later he was transferred to the Chicago office, where, after a few years, he took over the supervision of Hyatt sales work in the Western territory.

Eighteen months ago Mr. Meister was appointed assistant sales manager and remained in the headquarters at Newark, where he will continue to be located as general sales manager.

Mr. Scarratt is well qualified to take over the duties of chief engineer on account of his past experience in the design and construction of automotive, tractor, railroad and industrial equipment. He joined the Hyatt engineering staff a few months ago as assistant chief engineer. Mr. Scarratt will remain at the headquarters in Newark.

Both Mr. Meister and Mr. Scarratt are members of the Society of Automotive Engineers and have held important offices in the sections where they were previously located.

Supplementary Compensation for General Electric Employees

Supplementary compensation totaling $1,358,669.89 was distributed in February to 30,518 factory and office employees who have been in the employ of the General Electric Company for five years or more. The distribution was based on 5 per cent of the employee's earnings for the six months from July 1 to Dec. 31, 1926. Payments were made in General Electric Employees' Securities Corporation bonds or in cash, as the employees desired. The largest amount was paid to Schenectady employees, who received $452,489.

Large Terminal for Watertown

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has two electric railway improvements under consideration for Watertown, Wis., provided authority to carry them out is received from the City Council. One plan calls for the removal of the company's tracks on Main Street to Western Avenue and Second Street and the other the building of a large terminal to which point all lines would run directly. These two proposals, which were circulated by the Council among business men of the city in the form of ballots on which to indicate their approval or disapproval, found 63 business men who favored removal of the tracks and 27 against it. To these ballots was attached another proposal, requesting that the company replace the railway service with buses.

Metal, Coal and Material Prices

Metals—New York	Feb. 8, 1927
Copper, electrolytic, cents per lb	12.30
Copper wire, cents per lb	14.50
Lead, cents per lb	7.425
Zinc, cents per lb	6.90
Tin, Straits, cents per lb	69.50
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.95
Somerset mine run, Boston, net tons	2.30
Pittsburgh mine run, Pittsburgh, net tons	1.95
Franklin, Ill., screenings, Chicago, net tons	1.875
Central, Ill., screenings, Chicago, net tons	1.425
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.50
Weatherproof wire base, N.Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb	10.9
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.78

New Equipment for Cincinnati, Hamilton & Dayton

In line with its extensive rehabilitation program the Cincinnati, Hamilton & Dayton Railway has placed an order for ten all-steel high-speed interurban cars with the J. G. Brill Company. Each car will seat 50 passengers—sixteen in a smoking compartment and 34 in the main section. Delivery is expected about May 1, at which time the present interurban equipment will be retired.

With a lower center of gravity, the car floor 1 ft. nearer the ground, and three easy steps in place of the four steep risers on the present interurban equipment, the new cars will provide every comfort from the passengers' standpoint.

Specifications call for an extensive finish in Duco, the color scheme a brilliant Tuscan red with black and gold lettering and striping to conform with company's standards for maximum visibility and elegance. The interior finish will be in rich mahogany, set off by rubber tile flooring and Pullman type dome lights. All cars are to have Hale & Kilburn deep cushion, double spring, curved back, leather seats, and will be equipped with water flush toilets and wash basins, and sanitary water coolers of the indirect icing type, all of the very latest models.

In order to minimize the possibility of accidents while operating in the city, a concealed group of lights over the front dash of the cars has been specified. The front end of each car will be lighted in this manner when the headlight is dimmed while running through city streets. In addition to a red tail light there will be a stop light which is to function when the brakes are set, thus giving motorists a caution signal that a stop is about to be made.

To insure the maximum comfort for trainmen, permanent sun visors over the motorman's window, automatic window cleaners, comfortable leather chairs, and special electric heaters have been specified.

Of the ten cars, seven will carry baggage compartments, the other three being designed for double-end operation. An automatic coupling device provides for connecting the air line and for making all necessary electrical contacts for motor control. Each car will be equipped with four 60-hp. Westinghouse ventilated motors.

Spanish Northern to Extend Electrification

The Spanish Northern Railway is about to electrify its lines, starting from Barcelona, through all of the section Barcelona-Manresa and the line Lerida-Varagoza, as well as the section running toward San Juan de las Abadesas in the Pyrenees. On all these lines direct current of 1,500-volt tension will be used.

Rolling Stock

Mississippi Valley Public Service Company has added two new one-man safety cars to its equipment. These cars embody the latest developments in street car design and have been placed in service in La Crosse, Wis.

Fageol Company, Kent, Ohio, reports delivery of two buses to the Scranton Railways and fifteen buses to the city of Detroit, Department of Street Railways, during the period from Dec. 15 to 31, inclusive.

United Railways of St. Louis, Mo., is equipping all of its 1,800 cars with automatic window wipers as a safety measure. The wipers will assure the motorman a clear vision in all kinds of weather. They work on the same principle as the more familiar automobile windshield wiper, but cover a much larger area of the glass. Fifty cars on the Park Avenue division and several on the various suburban lines have already been equipped with the cleaners.

Track and Line

Cincinnati, Hamilton & Dayton Railway, Dayton, Ohio, has commenced the reconstruction of its line between Dayton and Cincinnati, it was announced this week by J. H. McClure, vice-president and general manager. The work will cost approximately $200,000.

Athol & Orange Transportation Area, Orange, Mass., shows much activity in the way of improvement in the past year. The tracks and bridge between Athol and Brookside Park, about half way to Orange, have been reconstructed; 1,000 ft. of 60-ft. rail has been laid in South Main Street, Athol, and 4,000 new ties have been placed. In addition more than 2,000 ft. of overhead was installed with new span wires and poles. The largest expenditure was for power, which cost $12,908.

Trade Notes

Raymond H. Liefeld, formerly a salesman for the Packard Motor Car Company, has joined the forces of the Bridgeport Brass Company of Bridgeport, Conn.

Mather Garland has been appointed acting general manager of the Hegeman-Castle Corporation of Chicago, replacing W. E. Kelly, resigned. The Hegeman-Castle Corporation is owned and controlled by the National Railway Appliance Company of New York.

American Brown Boveri Electric Corporation, Camden, N. J., announces that Harold D. Gregory has just joined the patent department. Mr. Gregory is a graduate of the George Washington University law school and also a Stevens Institute graduate in engineering. For several years he was patent examiner of the Eastern Railroad Association at Washington, D. C., and for the past few years has been with Bottom, Hudnall, Lecher & McNamara of Milwaukee, Wis. With the former, he conducted infringement and validity investigations for the railroads, as assistant to General Counsel Robert J. Fischer. With the latter company Mr. Gregory was solicitor of patents in the patent department.

Edwin Besuden has joined the sales organization of the National Railway Appliance Company in the capacity of special representative, with headquarters at the main office of the company, 452 Lexington Avenue, New York City. Mr. Besuden was for many years sales manager of the Jewett Car Company, and later served as manager of the railway department Chicago Varnish Company in the Eastern district. Due to a typographical error in the JOURNAL of Jan. 29, Mr. Besuden's name was printed "Desuden."

Manganese Steel Forge Company, Philadelphia, Pa., has appointed Harry Howe engineer of railway equipment in connection with the development of the use of Rol-Man Steel in steam and electric railway passenger and freight equipment. Mr. Howe has resigned as special engineer for the Pressed Steel Car Company, after 21 years service with that concern. He is entirely familiar with all types of steam, electric and freight car details of equipment and design.

Rome Wire Company, Rome, N. Y., has opened a new warehouse for the purpose of serving its Detroit territory. The warehouse is located at 199 Minnie Street, Detroit. It is under Herman C. Joos, the district manager of the company at Detroit, who has always been in charge of this territory.

International Steel Tie Company announces the appointment of Frederic A. Tayler, Richmond, Va., as its southeastern representative, to handle all business in Virginia, North and South Carolina, Georgia, Florida and a part of Tennessee and Alabama. Mr. Tayler was born in Philadelphia on April 7, 1898. He was educated in the public schools there, but removed to Spokane, Wash., in 1912. There he continued his education, entering the Lewis and Clark High School. He left this school in 1915, his senior year, to accept a special apprenticeship with the Baldwin Locomotive Works at the Philadelphia plant. When he had completed this course Mr. Tayler was transferred to the Eddystone plant as track foreman of engines. Later he was promoted to assistant advertising manager in Philadelphia. On Sept. 12, 1921, he was transferred to the domestic sales department, going to the Richmond, Va., office as sales representative. He filled this position until Jan. 1, 1927, when he engaged in the railway supply business.

Ames Shovel & Tool Company, Boston, Mass., announces the appointment of N. E. Brooks as representative in the railway sales division of the Oliver Ames & Sons Corporation. Mr. Brooks is a graduate engineer of Massachusetts Institute of Technology, and comes to the Ames Shovel & Tool Company with fifteen years' experience in railway sales work. His headquarters will be at 41 Park Row, New York City.

New Advertising Literature

Ohmer Fare Register Company, Dayton, Ohio, has just issued a new circular describing its ticket printing register, type 79. The machine is designed for use on buses as well as street cars.

W. S. Godwin Company, Inc., Baltimore, Md., is distributing a new booklet describing steel paving guards. "Booklet 27" contains comprehensive photographs and cross sections showing the application of this product to road edging, street railway paving platforms and steps, sewer inlets and columns.

American Brown Boveri Electric Corporation, Camden, N. J., is mailing out a handsome booklet dealing with the merits of its steam turbo-generators. Splendid illustrations, charts and diagrams are features of the new mailing piece.

Hyatt Roller Bearing Company, Newark, N. J., has announced that the recently named headquarters for the central sales division are now located at 806 Fulton Building, that city. They were formerly at 1352 Union Trust Building. The new location provides amply for the increased sales and engineering forces of the central division, functioning under the direction of B. H. Lytle. H. R. London, a new member of the Pittsburgh force, is now operating in the industrial field of W. L. Iliff.

General Electric Company, Schenectady, N. Y., has just issued a new loose-leaf circular describing arc-welding, equipment. In the main, the circular details recent developments in helmets for operators of arc-welding apparatus.

Dunn Painting Machine Company, San Francisco, Cal., has issued a pamphlet describing the Dunn patent painting machine and the Dunn patent cleaning process. The Dunn equipment and process feature the complete breaking up and atomization of the paint in the machine itself and not at the nozzle. The paint is carried in suspension in the atomized form through a single line of hose for any reasonable distance. The Dunn company believes that this insures a more uniform application of paint than when the atomization is accomplished at the nozzle.

Ohio Brass Company, Mansfield, Ohio, is distributing a descriptive mailing piece which presents new O-B bonds, designated as Hebi-bede Titon and AW-12. The first bond is especially designed for use on heavily beaded and Weber type joints where it is impracticable to install the ordinary type of rail bond. It embodies all the features of the Titon bond, including steel terminals and copper sleeves. The AW-12 bond can be wedged firmly to the rail base by the tap of a hammer before welding is started.

Kentucky Rock Asphalt Company, Louisville, Ky., has just issued "The Story of Kyrock," a booklet describing its natural asphaltic paving material which is mined in Edmonson County, Kentucky. Halftone illustrations give a very clear idea of its application to paving projects of every description, including its use in connection with street railway construction.

Equipment Men's Conferences Worthy of Active Support

COMPARATIVELY new is a phase of sectional association activity represented by the rapid development during the last few years of territorial conferences among groups of maintenance men. Two groups worthy of mention are the Electric Railway Association of Equipment Men, Southern Properties, and the Central Electric Railway Master Mechanics' Association. A report of the recent Toledo meeting of the C.E.R.A. men is published elsewhere in this issue. The meeting of the Southern equipment men in Memphis was reported in the Feb. 5 issue of the JOURNAL.

Both of these bodies have become actual working conferences of maintenance executives rather than merely sectional association meetings. That the men who take part mean business is apparent to any one who has attended their meetings. Better acquaintance, good fellowship and sectional spirit are desirable and laudable objectives of sectional association activity. But these maintenance men go much further than that. They make a critical comparison of their practices and methods and express their ideas as frankly as in a staff conference on their own properties. Their purpose is to find their own shortcomings, and that is the road to progress. General executives of the properties located in the territories covered by these maintenance groups may well afford to lend full measure of their support and backing.

Greater Interest Is Warranted in Economies of Treated Timber

OPPORTUNITIES to make substantial savings by preservative treatment for ties and timber that are used by electric railways have been much neglected. During the past three or four years there has been a slight increase in the interest shown in this important subject by electric railway mangements, but it has lagged far behind that shown by the steam railroads. General adoption of a policy of obtaining the maximum life of all timber used undoubtedly would save the industry a large sum every year.

Desire to keep the initial expenditure to a minimum is probably the principal reason why electric railways have continued to use large quantities of untreated timber. This is a penny-wise and pound-foolish policy, as in many cases the untreated wood deteriorates rapidly. The criterion of economy is the annual cost rather than the initial. In this connection, the experience of the Boston Elevated Railway, as given in an article elsewhere in this issue, is a convincing argument in favor of preservative treatment. On that system the cost per treated tie per year is only 8.7 cents as compared with 13.3 cents for untreated. Thus treatment has reduced tie cost approximately 35 per cent.

Another important factor not always appraised at its full value is the possibility of using a cheap grade of timber when preservative treatment is applied. In Boston, standard or merchantable grade is now employed for many purposes where previously it was considered necessary to use only hard timber of first quality. Judging by the experience of this company, it appears that the economy claimed for the policy of using untreated timber because of its lower initial cost is largely fictitious, and that real economy in the long run will result from greater use of the preservative treatment process. Moreover, in view of the dwindling supply of timber in this country its conservation by every means has become a moral obligation which should be heeded before increasing costs due to scarcity makes it a financial one.

A Damaged Commutator Invariably Means Expensive Rewinding of the Armature

SO MUCH depends on the perfect operation of a railway motor armature that it is important to keep it in as good operating condition as possible. Even though the armature may appear rugged, the component electrical parts must be insulated from the metal core. This necessarily makes some of these parts relatively delicate. It is a rather simple operation to insulate and support the armature conductors in the core, but to insulate the commutator bars from each other and then insulate the entire assembly from the core and from the shaft makes the problem more difficult.

Nearly every commutator failure that occurs today means a new set of armature coils and a labor charge to strip and rewind the armature, while a coil failure usually does not affect the commutator. Therefore, when purchasing a set of assembled segments to refill a commutator, they should measure up with the highest material and workmanship standards. These requirements are the result of costly investigation over a period of years by both manufacturers and operators.

It is also essential that the commutator be assembled correctly. A certain railway purchased a set of assembled segments to refill a commutator. These met all the requirements of a good specification and the commutator was placed on the armature and the motor returned to service. During the morning rush period of the first day the motor was in operation the motor failed. The trip was completed in order not to tie up traffic, but the commutator bars were strewn along the track. When the car returned to the carhouse and an inspection of the motor was made it was found that the

This is the issue in February that is devoted essentially to maintenance and construction subjects

commutator structure had loosened and all of the bars were missing. The armature and field coils were damaged beyond repair. The brush-holders had broken from their supports and lay in the bottom of the motor case.

Due to the damaged condition of the motor it was impossible to determine the cause of the failure. It seemed most probable that there had been improper assembling of the commutator on its spider. Evidently the holding nuts had loosened to such an extent that the bars had come out of the V rings. Proper methods had not been used to tighten the assembly and to insure that the whole structure had been heated sufficiently to secure a permanently tight fit. Probably it had not been inspected cold to be certain that the bars were tight.

Had the commutator been assembled according to the specifications laid down by the original manufacturer, with the use of tools which insure high-grade workmanship, the accident would not have happened. The series of articles on commutators by Jesse M. Zimmerman which has been running in the maintenance issues of ELECTRIC RAILWAY JOURNAL gives in detail the practices of one manufacturer. While the practice of leading railway motor manufacturers may differ slightly in minor details, their general manufacturing principles and standards are comparable. By adopting for maintenance operations the methods set forth in this series of articles the number of armature failures should be reduced materially.

What Is a Pull-In?

PULL-IN records are of great value in determining the condition in which a property's equipment is maintained. But a large part of this value is lost unless such records for one property are comparable with those of another. Discussions of this subject have appeared before in the JOURNAL. There is still, however, a wide variation in the definition of a pull-in as applied by various properties. Because of this, comparisons which should serve as a stimulus toward better maintenance practice are frequently very misleading.

There are several classes of pull-ins. Some are chargeable to the mechanical department, others to the transportation department and still others to causes beyond the control of the company. In this latter class come cars disabled by certain types of accidents. A pull-in record, to be of real value, should include a report of every car that is withdrawn from service before completing its scheduled run. With such a broad interpretation as a beginning, the basis for classification may be fixed by definition, so that pull-ins chargeable to the mechanical department for defects in equipment, and to the transportation department for improper operation, may be determined.

After all, the broad purpose of pull-in records is to stimulate avoidable interruptions to passenger service. Only when the records of various properties are on a comparable basis do they serve to stimulate that effort toward improvement from which progress grows. The mechanical man who makes an honest effort to find out how his performance compares with that of other properties would, of course, welcome any step toward uniformity of definition which would increase the value to him of comparative records. The Association of Equipment Men, Southern Properties, has established a set of rules for determining pull-ins, as was outlined in a letter by A. D. McWhorter, its president, in the Jan. 15 issue of the JOURNAL, page 128. This work should be extended. It appears to be a subject which warrants study by the American Electric Railway Engineering and Traffic & Transportation Associations. Once the proper definitions are laid down and followed by member properties, pull-in records will become of much more value than they are under present conditions.

Opposition to One-Man Cars Is Based on Lack of Knowledge

FROM several quarters attacks have been launched recently against the use of the one-man car. Among these Buffalo, Toronto and Montreal are perhaps the most prominent. In practically all cases, in these and other cities as well, the objections raised have been mainly of a political nature. Organized labor has been a factor, although the national officers of the Amalgamated Association are on record in favor of the one-man car as a progressive step and one which will redound to the advantage of the men themselves.

Those who argue against the one-man car do so without knowledge of the facts. Far from being an experiment, it is one of the most striking successes in the transportation business. There is not a state in the Union nor a province in the Dominion of Canada where one-man cars are not used. They have been found successful on the smallest properties and the largest. In the Borough of Manhattan, New York City, one-man cars are giving satisfactory performance at certain times of the day, as well as all day on Sundays. Across the Hudson River the Public Service Railway of New Jersey uses one-man cars exclusively, operating some 1,200 in regular service, many of them through the heart of Newark, one of the largest American cities.

A stock argument against the one-man car is that it increases the accident hazard. That this is incorrect is shown by the record of practically every property that is a user of this type of equipment. The results obtained by a group of properties under a well-known utility management firm is typical. This group of properties covers a wide territorial range, so that local conditions do not enter to any great extent. In the four years 1922-1925, during which the proportion of one-man car-miles increased from 48.7 per cent of the total to 84.6, the passengers carried per person killed or injured went up from 52,000 in the earlier year to 64,000 in the later. The average cost of the accidents has remained practically stationary, going from \$23.63 to \$23.86. What increase there was came from greater seriousness of accidents with two-man cars, as the cost for these went up from an average of \$23.78 to \$28.08, while the cost per accident with one-man cars went down from \$23.78 to \$23.07 in the same period.

As to schedule speed, now that operators are thoroughly familiar with the method, there is little or no difference between one-man and two-man service. In fact, some companies obtain higher schedule speeds with the one-man car, particularly if small numbers of passengers board at one stop, or if the fare system makes it possible to collect all fares outside the congested district. The advantages of lower operating cost and possibilities of more frequent service are so well known that it is not necessary to reiterate them here.

No one thinks of requiring two men to operate the ordinary type of bus. Yet the driver has to do everything the operator of the one-man street car must do, and in addition he has to steer his vehicle in and out of a maze of traffic.

When action is contemplated inimical to the one-man car, it is well that the legislative or regulatory body become familiar with the facts. They are public property, and it is the duty of the public official not only to acquaint himself with them, but to see that he does nothing that will injure or perhaps stifle one of the public's most essential utilities.

Engineering Supervision Over Maintenance Is a Step in Right Direction

SUCH momentum has been gained by the modernization idea of improving the appearance and comfort of cars that it has now covered the entire country. In most instances the approval of the public is evidenced by the increased revenues. This favorable public attitude can only be perpetuated by maintaining reliable and uninterrupted service. Without such continuity of service all the comfort and all the fine appearance will at once lose their appeal. Reliable service cannot be rendered and road failures decreased unless the shop practices are systematized so that the equipment receives thorough inspections and overhauling on a definite basis, which is given at such intervals that failures are anticipated rather than checked up after they have occurred on the road. Appreciating the importance of this situation, the management of the New Orleans Public Service, Inc., reorganized that company's shop organization and placed the most important work under the direct supervision of a field engineer. The results obtained have been most encouraging. The company's 1926 report shows the remarkable average of 261,084 miles per car pull-in due to equipment failures, and a maintenance cost of $20.39 per 1,000 car-miles. A. J. Naquin, this company's engineer of rolling stock and shops, in a paper presented before the Electric Railway Association of Equipment Men, Southern Properties, which was abstracted in the JOURNAL for Feb. 5, explained the manner adopted for overhauling cars on a 40,000-mile basis. The careful attention given the car equipment accounts in large measure for the results obtained. The plan is well worthy of study. The change in shop organization and standardization of practices along engineering lines is a definite step in the right direction.

Good Maintenance Requires Intelligent Supervision

TAKING too much for granted is a disease easily contracted by those who supervise maintenance work. Many companies make an appropriation for maintenance work either as a definite sum or a per cent of gross revenue and it devolves upon those in charge to spend the appropriation. Some mortgages even specify the per cent of gross revenue that must be spent, leaving the quality of the work performed or its effectiveness undefined.

Obviously expenditures poorly supervised or inefficiently made are economically unsound. Moreover, wasteful methods of maintenance may become evident even to the public. Recently a gang of eight track men were observed slowly walking along one of the tracks of an electric railroad in full view of a morning crowd of commuters. Each man except the foreman was armed with a spiking maul, and as the gang proceeded the spikes that had loosened were driven home again. It does not require a technical education to appreciate the fact that time and money were being wasted by this gang employed in the work generally assigned to one, or two men at the most.

Appearing on the same day in the morning papers was one of a series of articles telling of the progress of a rate case by this same company for an application to increase fares. One of the points brought out at the hearing was that the cost of operation had not declined during the post-war years to the same extent as on other roads. This fact was to some extent substantiated in the minds of those commuters who read and think.

Such an incident, although insignificent and perhaps explainable on good grounds, nevertheless leaves an unfortunate impression that may not be as easily eradicated. Public relations depend on performance, and maintenance is a factor in the establishment of good relations fully as important as any function of the service. The quality of the work will affect the upkeep of the property, but the methods used, especially when exposed to public view, are also important in their psychological effect on the patrons served.

Stop-Loss Bus Operation Merely Begs the Paving Question

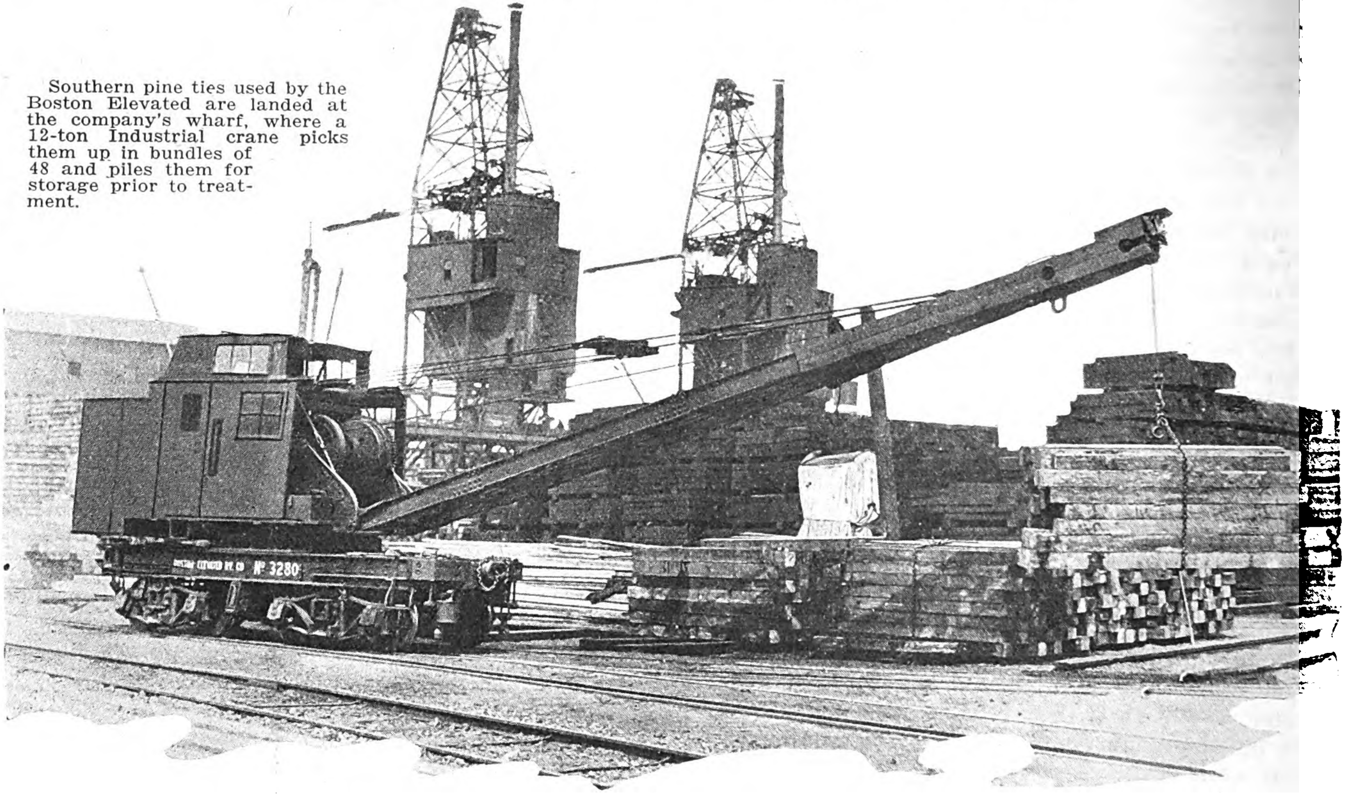
JOY is being expressed by many motorists because the Morris County Traction Company is considering the removal of its tracks from the Newark-Morristown highway and the substitution of bus operation to replace the present car service between Newark and Lake Hopatcong. As soon as the tracks have been taken up it is proposed that the various municipalities through which the line runs replace the worn-out pavement in the track area by smooth new concrete paving.

No doubt such a change would be very agreeable to the motorists, as the present paving is in deplorable condition in many places and the railway is too poor to pay for its replacement. If the municipalities are willing to pay for new concrete paving, as they will have to do if this proposal is carried out, it could be laid just as well with the tracks in place. Last year, however, there was great outcry when the state Senator from Morris County introduced a bill to relieve street railways from their paving obligations. The bill was defeated and the Morris County Traction Company, already in receivership, has had to continue patching pavement worn down by hordes of automobiles and trucks never dreamed of when the obligation was imposed.

A larger question is involved, however, than the mere shifting of the paving burden. Whether or not the bus can provide better transportation than the car on this route appears to have received very little attention. Besides the trackage in paved street, there is considerable mileage on private right-of-way, particularly west of Morristown. In summer the Newark-Morristown-Lake Hopatcong highway carries extremely heavy automobile traffic. Buses certainly could not make as good time under these conditions as do the cars on private way. Before embarking on such a substitution, both the railway and the municipalities would do well to consider experience elsewhere, which has shown clearly that the operation of buses as street cars on rubber tires may serve temporarily as a stop-loss measure, but does not always result in the upbuilding of a satisfactory and prosperous transportation system.

Timber Preservation Saves Money on Boston Elevated System

More than 500,000 Ties Installed Since 1916 on Surface, Subway and Elevated Lines Have Been Treated—Cost Per Tie Per Year Is Estimated to Be 35 Per Cent Less than that of Untreated Ties —Timber for Bridges, Stations, Etc., Also Receives Treatment



Southern pine ties used by the Boston Elevated are landed at the company's wharf, where a 12-ton Industrial crane picks them up in bundles of 48 and piles them for storage prior to treatment.

SINCE 1916 all wood ties used on the surface and rapid transit lines of the Boston Elevated Railway have received preservative treatment before installation. Experience of this company indicates that such treatment practically doubles their useful life. After making allowance for the cost of the treatment, it is estimated that the saving per tie per year is about 35 per cent. Moreover, preservative treatment reduces the original cost of construction by permitting the use of a less expensive grade of timber. Economies have been effected also in the paving account due to less frequent tie renewals. Similar treatment of nearly all other timber used by this company in outdoor construction work has been influential in prolonging its life and reducing maintenance cost.

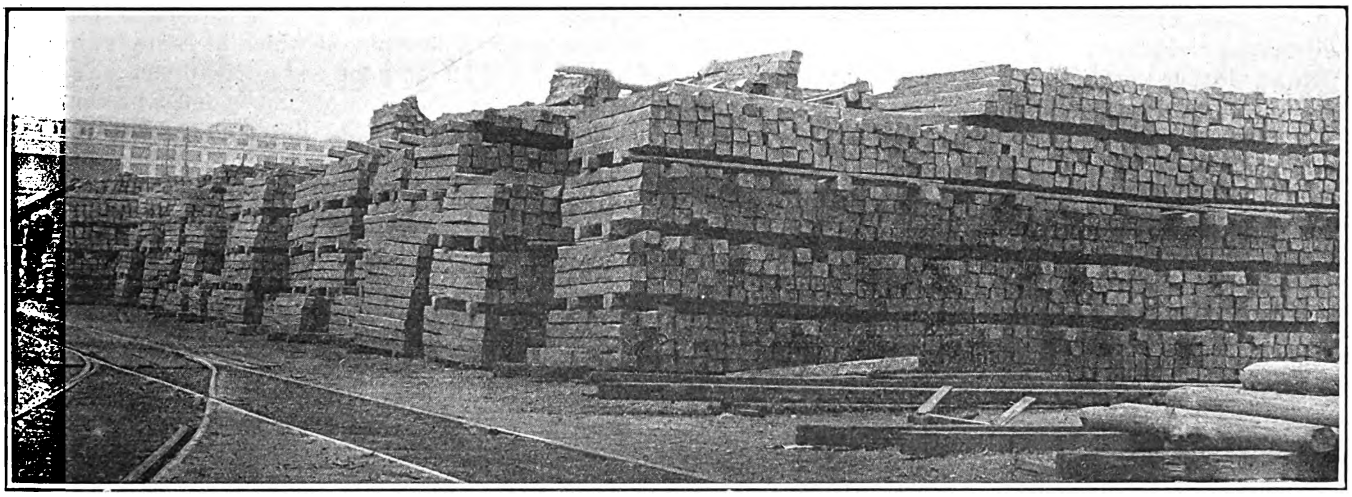
Experience with treated ties on the Boston Elevated began some 25 or 30 years ago. At that time a preparation called "Woodiline" was used in an open tank. Later a preservative known as "Avenarius Carbolineum" was used. While the results achieved by this method and these products were not perfect, they did impress the management with the value of preservative treatment. In November, 1912, the company commenced the use of creosote pressure-treated ties. These were treated by the Bethel full cell process by a commercial creosoting firm. In the early part of August, 1916, operation of the railway's own plant at South Boston was begun. This is equipped to treat timber by the Rueping empty cell, Bethel full cell or open tank processes.

Treated ties are now used in all track, whether paved or in open construction, and also in subways, tunnels and on the elevated structures. No untreated ties have been used since 1916. An average of about 50,000 ties per year have been installed on the surface lines and about 5,000 per year on the rapid transit lines. Altogether more than 500,000 treated ties have been installed, including those laid in 1926, concerning which exact data are not yet available. Figures by years are given in the following table:

TIES INSTALLED ON BOSTON ELEVATED SYSTEM

	Surface Lines	Rapid Transit Lines		Surface Lines	Rapid Transit Lines
1917	54,000	2,878	1923	55,900	4,158
1918	22,500	793	1924	37,284	6,777
1919	81,418	5,079	1925	31,916	7,210
1920	35,324	5,550			
1921	67,782	6,210		449,264	44,557
1922	63,140	5,902	Average	49,918	4,951

Oak and chestnut ties were used on the surface *lines* in 1912 and their use continued until the *opening of* the company's treating plant in 1916. Since then South-



An Average of 50,000 Ties Per Year Used by the Boston Elevated Railway Insures Rapid Movement Through the Timber Treating Plant and Prevents Deterioration Due to Long Storage

ern pine ties have been used except for a brief period during the war when native oak and chestnut were used. Ties on the rapid transit lines have always been hard pine since the opening in 1901. The timber comes from Georgia and Florida by water. Prime grade is used for certain curves on the rapid transit lines, merchantable grade on the remainder of the rapid transit lines and standard on the surface lines.

Hewn ties, 6 in. x 8 in. x 7 ft. 9 in., are used on surface lines except under special trackwork. Sawn ties, 6 in. x 8 in. and 8 ft. to 17 ft. long, are used under special work. On tangent track on the elevated structure ties are sawn 6 in. x 8 in. x 8 ft. 6 in. On the elevated and in the subway under special work ties 7 in. x 8 in., 8 in. x 8 in., 8 in. x 9 in., 8 in. x 10 in., 8 in. x 11 in. and 8 in. x 12 in., ranging from 9 ft. to 17 ft. in length, are used. Bevel ties are used on curves on elevated structures. They vary in size from 6 in. x 8 in. to 7½ in. x 8 in. at the small end and 7⅞ in. x 8 in. to 13¾ in. x 8 in. on the large end. In length they range from 8 ft. 6 in. to 9 ft. 6 in.

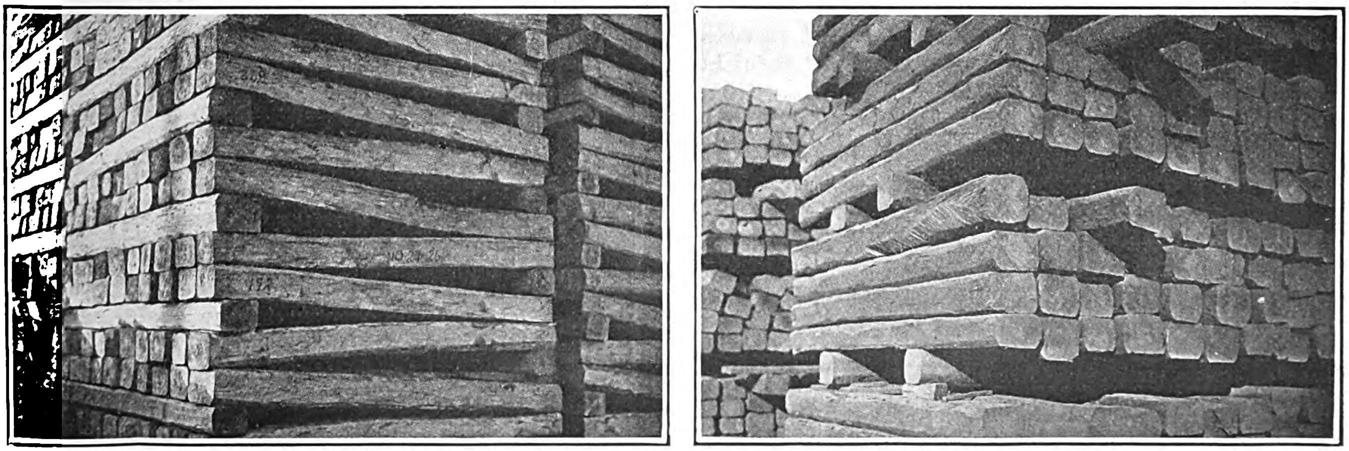
Ties and timber are shipped from the South by steamer. After arrival in Boston harbor they are lightered to the railway wharf, where they are landed f.o.b. They are inspected at the wharf and are piled into sling loads. In the case of 7-ft. 9-in. or 8-ft. ties this means 48 ties are picked up by the crane in one lift and landed at the point of piling. With an Industrial 12-ton crane no difficulty is experienced in handling timber of any dimension.

Grade No. 1 A.E.R.E.A. creosote oil is used for treatment. The oil is delivered in tank cars at a nearby siding. These cars are shifted by the elevated to the storage tanks, where the necessary connections are made. A sample from each tank car is submitted to the railway's chemist for analysis before the car is unloaded. His O.K. must be received before the oil is accepted. Storage for 55,000 gal. of preservative material is provided.

The treating cylinder is of 7 ft. 6 in. diameter and 51 ft. long. Up to Dec. 31, 1925, a total of 454,269 ties and 8,027,554 ft. board measure of lumber had been treated. The entire plant represents an investment of approximately $60,000. Upkeep amounts to about $650 a month.

Operating personnel consists of one supervisor, two engineers, one clerk, one foreman and from ten to 25 laborers as required. Of the two engineers, one is the regular plant operator and the other acts as assistant to the supervisor, but is available for plant operation if a double shift is required or when the regular operating engineer is absent.

In addition to inspecting and directing the treatment of all lumber received at the South Boston plant, the supervisor is charged also with the inspection of all lumber received at other locations on the railway. Reports are furnished to other departments so that they can approve invoices. Lumber from razed buildings on the railway's property is sent to the treating plant for inspection, grading and storage. This is used again



Method of Piling Timber for Storage at South Boston Creosoting Plant. Untreated Ties Are Shown at Left and Treated Ties at Right for purposes to which it is suited, thereby effecting substantial economies.

Hewn ties for the surface lines are adzed before treatment. For this purpose a Greenlee adzing machine has been mounted on an old car which can be moved from point to point. This arrangement has been found to be much more convenient than having the machine in a fixed position. A friction feed on the receiving side allows the ties to be carried to the knives and then dropped to a skid on the leaving side, thence to the treating trucks, with a minimum amount of hand labor. Timber and ties used on the elevated structure are framed at the sawmill after treatment. Certain framing has to be done on the job to fit rivet heads, buckle plates, etc., but in all cases framing done after treatment is protected by a brush coat of creosote. The same precaution is taken after boring holes for bolts, lag screws, etc.

UNIT PILING SYSTEM USED

Before treatment ties are piled according to the one by ten plan, with 224 ties in each bay. Four bays with 896 ties comprise one pile. Four more ties are stored on top to make an even 900 in each pile. The piles are 30 in. apart, allowing proper air seasoning. Illustrations on the preceding page show clearly the methods of piling used for untreated and treated ties.

Treated ties are stored in the open, each lift being two by 40 with five lifts in each bay. The length of the bay depends on the storage area available. As the treated ties move rapidly out of storage, no difficulty is experienced in keeping them in first-class condition. Another advantage of this method of storage is that it follows the principle of unit piling for accounting purposes. When loading ties with a locomotive crane it is easy for the crane helper to force a bar between the bays and drop a chain through, making it possible to pick up 40 ties at one hoist. It has been found necessary to provide employees at the treating plant with cheap canvas gloves to protect their hands. Tie tongs were tried, but did not prove satisfactory. Employees installing freshly treated ties are also provided with gloves.

A gang paving block cutter was installed at the South Boston treating plant in October, 1917. The railway now manufactures its own paving blocks of hard pine, 3 in. x 8 in. and 4 in. x 8 in. This machine makes seven blocks at each cut. The only hand work necessary is to feed timber into the machine. Cut blocks drop into a chute and then go to the treating cages. Sawdust is diverted into a separate chute and lands in a bin where it can be reclaimed.

Dating nails are installed in all ties sent direct to the job from the treating plant. Nails are furnished to division offices which supply ties from other storage points. Ties are shipped to the job in steel dump cars holding 300. For small jobs motor dump trucks holding 60 to 70 ties are used.

As the result of its experience the company estimates the life of untreated ties in pavement without concrete base to be about twelve years and in open track from eight to ten years. It is estimated that treated ties laid in pavement will last at least twenty years and in open track at least fifteen years, although often the useful life of the tie is far in excess of these figures.

Cost of ties varies with the market. Sawn ties cost approximately 26 cents more than hewn ties. At the present time, considering wages, cost of material, etc., the total cost of treating a 6-in. x 8-in. x 8-ft. tie amounts to about 50 cents, of which 21 cents is the cost of handling and 29 cents the cost of treatment. The cost of treatment per cubic foot of timber under present conditions amounts to 11 cents. Based on the first cost per tie of $1.75 and a life of twenty years the cost per treated tie per year would be 8.7 cents. For untreated ties at $1.25 each the cost per year is 13.3 cents. Thus preservative treatment reduces tie cost approximately 35 per cent.

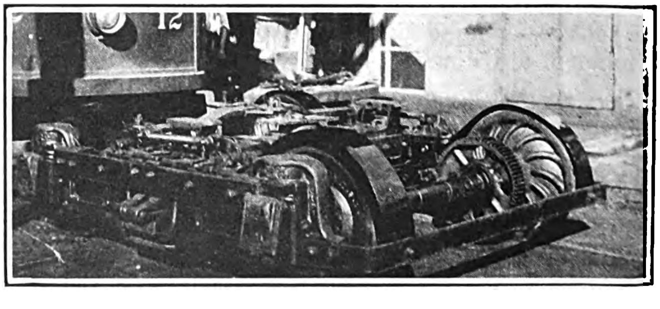
A cheaper grade of timber is now being used by the Boston Elevated for ties and on the elevated structure. Previously it was considered necessary to use only hard timber of first quality. Today standard or merchantable grade timber is used. For surface line tracks in pavement or in the open, the same quality is used. A grade cheaper than merchantable of hard wood, such as beech, birch or maple, may be used if obtainable. Actually the company has found it practically impossible to obtain any hard woods of this description.

No offsetting disadvantages connected with the use of treated ties have been experienced by the Boston Elevated. No difficulties have been experienced with the spikes nor has there been any serious cutting of the ties at the base of the rail. In fact, it is thought that this has been less than with untreated ties.

It has been found that the use of preservative treatment of timber for purposes other than ties on the rapid transit lines increases its life due to a reduction in mechanical wear such as checking or splitting. All timber used for bridge stringers, guard rails, footwalks, cable boxes and miscellaneous purposes on the elevated structures, crossarms, fence posts, pickets, station floor stringers, wharf repairs, piling, block paving, etc., is now being treated before installation. The company is thoroughly convinced that this practice extends its life and lowers maintenance cost.

Wheel Fenders Protect Trucks

FOR the purposes of protecting the electrical equipment and keeping its new cars as clean as possible, the Porto Rico Railway, Light & Power Company, San Juan, P. R., is installing fenders on all trucks for its six new cars now being assembled. The frames for these fenders are made up of ⅛-in. x 1-in. angles bent in semi-circular form and securely bolted to the truck frame. Sheet iron is riveted to the angles, and this has sufficient stiffness to support itself so that no angle is necessary on the inner side of the car wheels.



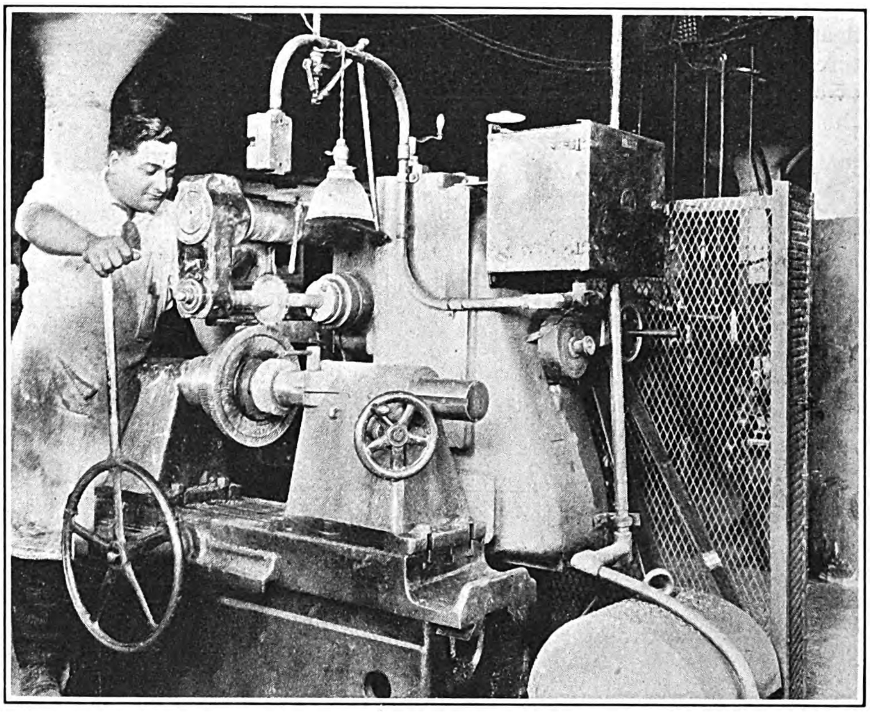
Sheet Iron Fenders Placed Over the Car Wheels Keep Mud and Dirt Off Equipment in San Juan, P. R.

The illustration shows these fenders mounted on one of the trucks. Their use keeps mud and dirt off the equipment and so assists in maintenance of the cars.

Soldering of Railway Motor Commutators*

Satisfactory Methods for Removing the Leads from the Necks of Commutators Preparatory to Rewinding Are Given and Soldering Operations Are Described—Pot Dipping Best When a Large Number of Armatures Are to Be Soldered

By Jesse M. Zimmerman
Renewal Parts Engineering, Westinghouse Electric & Manufacturing Company



Slotting a Westinghouse Type 12-A Commutator Neck

BOTTOM leads of practically all armatures wound with wire coils, and a large proportion of these with single-loop strap coils, may come straight to the commutator necks. With this arrangement it is not necessary to use a filler between the top and bottom leads. However, in order to make a double-loop coil of ribbon wire or insulated strap, which can be wound without forming the bottom leads during the winding operation, it is necessary to bring the leads to the commutator neck at an angle of approximately 45 deg. with respect to the top lead, as shown in an accompanying diagram. A triangular filler must then be placed between the top and bottom leads to take up the space. This filler is kept from sliding back in the slot by bending its front end, *D*, to one side. After the leads are soldered the end of the filler is machined off.

All drifting should be done on the filler in the top of the commutator slot and not directly on the leads. This avoids the nicking of the copper. Swedging of the leads also should be avoided. The bottom lead should lie in the bottom of the slot in the front of the neck only; at the rear of the neck a clearance of ⅛ in. should be left. This is accomplished by making the rear of the slot at least ⅛ in. deeper than necessary to contain the armature leads. The rear mica V-ring should be built up with treated cloth tape 3/16 in. above the bottom of the slot. When the leads are placed in the slot the tape will compress sufficiently to provide a good solid pad for the leads to rest on, thus decreasing the vibration and eliminating the possibility of nicking the bottom lead. Some operators have found it desirable to make a ring of wood to place over the rear V-ring back of the commutator neck to support the leads instead of using treated cloth tape.

In figuring the depth of a commutator slot, two rules are used, one being for the front slot depth and the other for the rear slot depth. The front slot is made the depth of the conductors plus the front depth of the triangular filler between top and bottom leads, if one is used, plus the filler in the top of the slot. The rear slot depth is the depth of the conductors plus the rear depth of the triangular filler between top and bottom leads, plus the filler in the top of the slot, plus ⅛ in. between the bottom of the slot and the bottom lead.

On some types of armatures it has been found necessary to strengthen the leads where they leave the commutator slot, by placing a phosphor bronze sleeve over them. This sleeve supports the leads back of the commutator, eliminating broken leads. The use of these sleeves is confined to ribbon and small strap coils. The thickness of the phosphor bronze sleeve must be added to the depth of the conductors when figuring the slot depth.

It is best to place a filler in the top of the commutator slot. All drifting should be done on this filler and in the front part of the slot, and not directly on the leads. It can be made from the cut-off ends of the conductor. However, in figuring the slot depth ⅛ in. should be the maximum amount to be allowed for the top filler.

Sufficient clearance should be left between the conductor and the side of the slot that the leads may be driven home without crowding and to permit ample room for the solder. In figuring the slot width 0.005 in. is usually added to the width of the conductor for wire coils, and from 0.010 in. to 0.015 in. is added to the width of strap conductors. Whenever a phosphor bronze sleeve is used over the armature lead the allowance should be added to the width of the sleeve and not to the lead.

---

*This is the sixth of a series of articles on commutators appearing in ELECTRIC RAILWAY JOURNAL. The others were "Choosing Materials for Railway Motor Commutator," published Aug. 2, 1926; "Important Considerations in Replacing Commutator Bars," published Oct. 23; "Accurate Machining of the V's of Assembled Commutators Is Essential," published Nov. 20; "Mica V-Rings and Bushings Have Important Functions in Commutators," published Dec. 18, and "Methods and Equipment for Efficient Assembling of Commutators," published Jan. 15, 1927.

Removing Leads from Commutator Neck

Removing the leads from the soldered commutator neck can be accomplished in four ways, namely, drifting the leads out cold; drifting after softening the solder; breaking the solder with a splitting tool, and remilling the slot. Some repairmen drift the leads from the slot with a gouge without heating the solder. This apparently works out very satisfactorily, though care must be taken so as not to break the side of the neck.

To soften the solder the commutator neck should be heated, preferably with a hot soldering iron. With a torch the commutator neck should not be heated too long at one spot as it will tend to anneal the copper. When the solder has softened the leads can be removed from the slot with a gouge. After the conductors have been removed the soft solder which remains in the slot should be blown out with compressed air. This method can be used to good advantage where the conductors are very small.

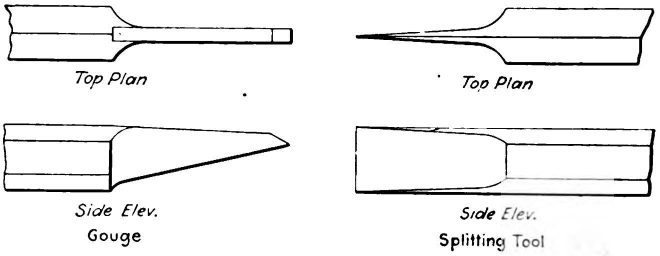
Triangular Filler

Commutator Slotted for Special Triangular Filler

The splitting tool used for removing conductors is a chisel which has a wide thin blade. This is driven between the conductor and the side of the slot to break the solder holding it. It must be driven on each side of the conductor, which then can be lifted by the gouge. After the conductors are removed from the first slot the necks will bend over slightly, giving sufficient room to make the operation easy. This method does not work as well as the previous ones in removing small wire. After the leads have been removed the sides of the slot should be cleaned with a thick hacksaw blade or a thin flat file.

If equipment is available to reslot the commutator bars it is convenient to cut off the armature leads behind the neck in a lathe or with a hacksaw and reslot the commutator. This leaves a clean slot in which it is easier to solder the leads. After the commutator neck has been remilled the slots should be coated with a flux of 1½ lb. of resin mixed with a quart of denatured alcohol. This prevents the copper from corroding.

Before discussing the soldering of armature leads it is well to analyze the different types of solder which are available. There are three important phases to consider, namely, cost, ease of working, and ability to hold the metals being soldered. The two first are closely related. The soldering material may be low in first cost, yet if it does not work easily the excess labor which is required will make the total cost of the soldering very high. Cheap solder always contains a large proportion of lead and is difficult to work. In selecting a solder it is necessary to consider the maximum operating temperature of the commutator, as it must withstand this temperature without softening. An accompanying graph shows the melting points of different mixtures of tin and lead solder.

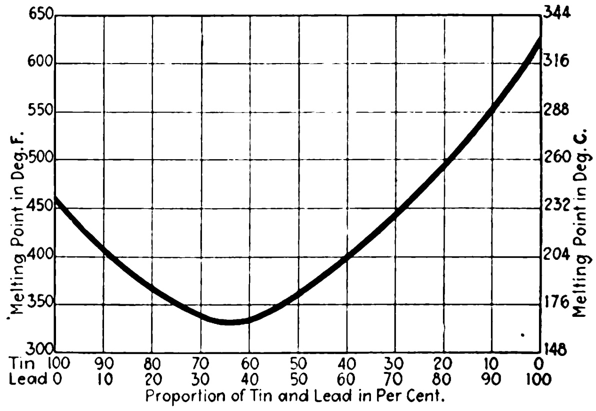


Tools for Removing Armature Leads from Commutator Slots

Solder made from half lead and half tin has a melting point of 181 deg. C. It flows readily and holds the metal firmly as long as the commutator temperature does not become excessive. Besides, it is reasonable in price. Its application is limited mostly to wire-wound armatures.

Pure lead solder has a melting point of 325 deg. C. Although cheaper than half and half solder and having a higher melting point than pure tin it cannot be worked easily. Any solder which has a large proportion of lead is so hard to handle that it is difficult to obtain a good job. Therefore it should not be used.

Where the operating temperatures of the commutator are high pure tin solder should be used. It has a high melting point, 230 deg. C., and when molten it flows easily and rapidly. It tends to spread beyond the surface being soldered, so a skilled workman is needed to handle it properly. The use of pure tin solder is confined to strap and ribbon coils because the clearances between the conductors and the slot are so small that it is necessary to use a very fluid solder. Armatures wound with wire conductors which are worked at high temperatures should be soldered with 85 per cent tin and 15 per cent lead. Extreme care should be taken



Temperature Curve Showing Melting Point of Tin-Lead Solder when using pure tin solder on commutators wound with wire coils in order to prevent it from running through the slot, forming a short circuit back of the commutator.

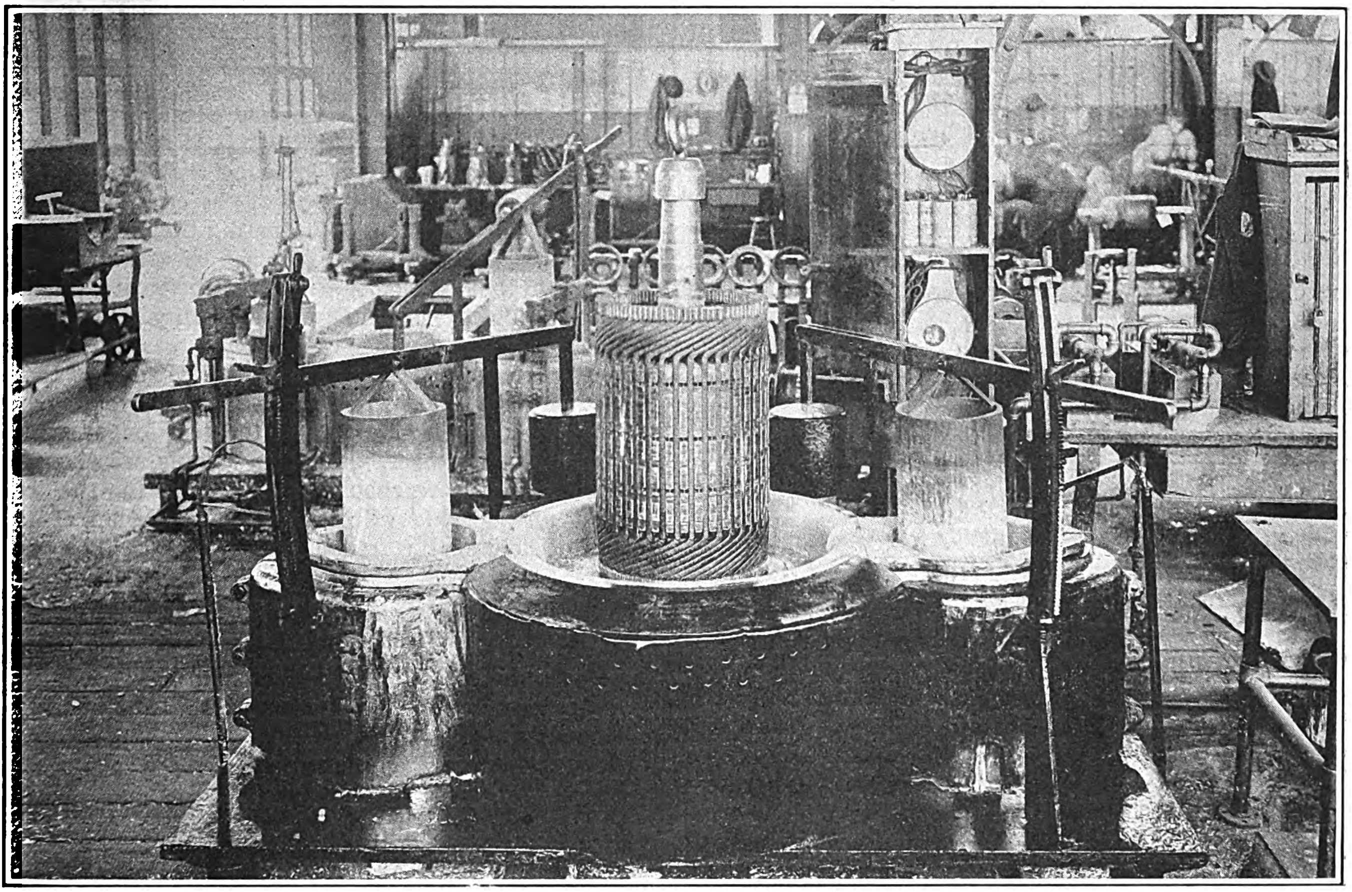
When the commutator is overheated for too long a time while soldering the pure tin will eat its way into the copper parts. It is therefore necessary to watch the temperature and length of time required for the soldering operation when using pure tin.

As soon as the solder begins to soften and throw when the armature is in operation the trouble is usually laid to high commutator temperature. The softening is due to a high temperature of the commutator neck, but not always to high commutator temperature. It is the tendency in some repair shops to take a heavy cut off the front of the commutator neck after the leads have been soldered. This makes the neck narrower, thus cutting down the contact surface. Since in a railway motor each soldered connection in the neck must carry half of the armature current it can readily be seen that if the contact surface is decreased materially the necks will overheat. After the leads have been soldered the machining should remove only the extended leads and as little of the commutator neck as possible.

Flux is a compound which is used to make the solder take hold of the metal. It prevents the formation on the metal surfaces of thin coatings of oxide which hinder the solder from covering the entire surface of the two parts being soldered. It is important to make sure that the flux does not contain acid, as it will destroy the insulation on the armature coil, thus causing a short. An inexpensive flux which will not affect the insulating material can be made by mixing 1½ lb. of resin in a quart of denatured alcohol. It is easier to apply flux in a liquid form.

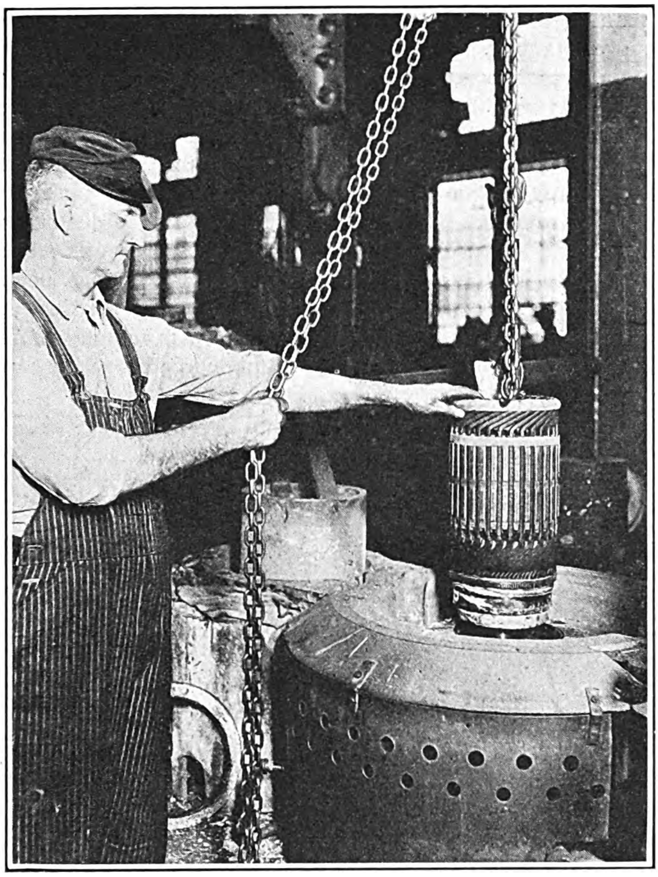
It is not necessary to tin the slots before soldering an armature, if the slots are painted properly with a liquid flux immediately after slotting and the armature leads are tinned well. If the commutator slots are dirty, they can be cleaned with either a heavy hacksaw or a thin file. A few repairmen feel that it is desirable to tin the slots of commutators using strap coils. An investigation has shown that no real benefit has been obtained if the slots are clean and leads properly tinned.

Soldering in the average repair shop is usually done by hand. However, if a large number of armatures are to be soldered, a soldering pot is the most efficient method. Before undertaking to solder the commutator the leads should be tinned well, the slots should be perfectly clean and a coat of flux applied.



Complete Soldering Pot Showing Thermostatic Control

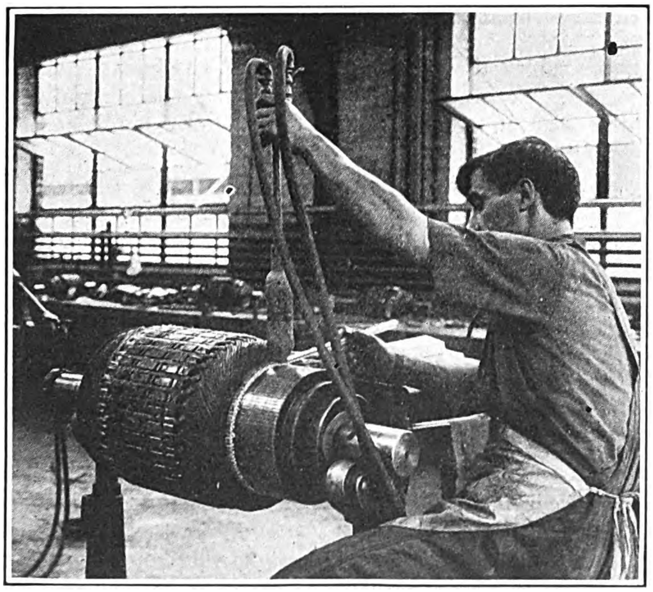
In the illustration, an armature is shown in a soldering pot. The center compartment has an opening large enough to fit the largest commutator. For smaller commutators, rings are used which will fit over the face. The opening between the commutator face and the hole in the ring is closed by wrapping the commutator face with several turns of asbestos rope. This prevents the solder from flowing out of the compartment along the commutator face. The two side pots contain molten solder which is forced into the center pot around the neck of the commutator by lowering the plungers. This solders all the leads at one time, thereby eliminating the danger of overheating the commutator neck. The level of the solder is brought up to the same height as the rear of the commutator neck. With this method the solder cannot work back of the commutator neck



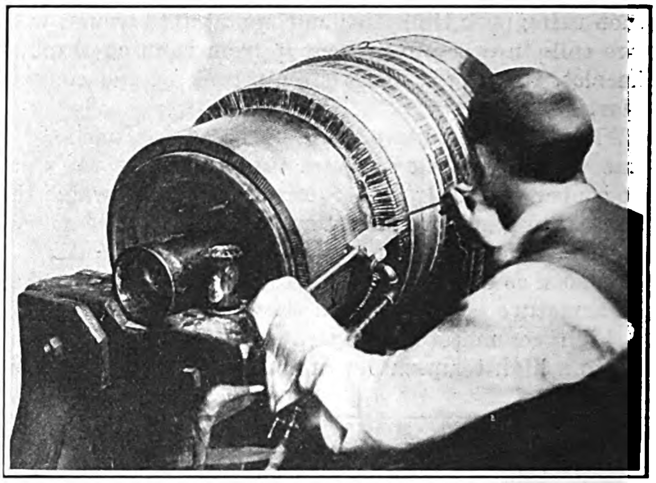
Dipping Armature to Solder Leads

and thus cause a short circuit. After the commutator neck has been immersed for a short time the solder is drained from the center compartment by lifting the plunger. The use of a pot simplifies soldering wire-wound armatures with the 85 per cent tin and 15 per cent lead solder.

In order to prevent short circuits back of the commutator neck, it is necessary to raise the pinion end of the armature high enough that the rear of the slot will be slightly above the front of the slot. This will cause the excess solder to flow to the front of the slot. The soldering can be done either at the top of the commutator or at the side. It is found that by soldering on the side, short circuits back of the commutator are not so likely to occur. By eliminating the possibility of these shorts the repairman will not be afraid to heat the neck so that the solder will cover the entire surface.



Soldering an Armature at the Top with a Self-Heated Iron



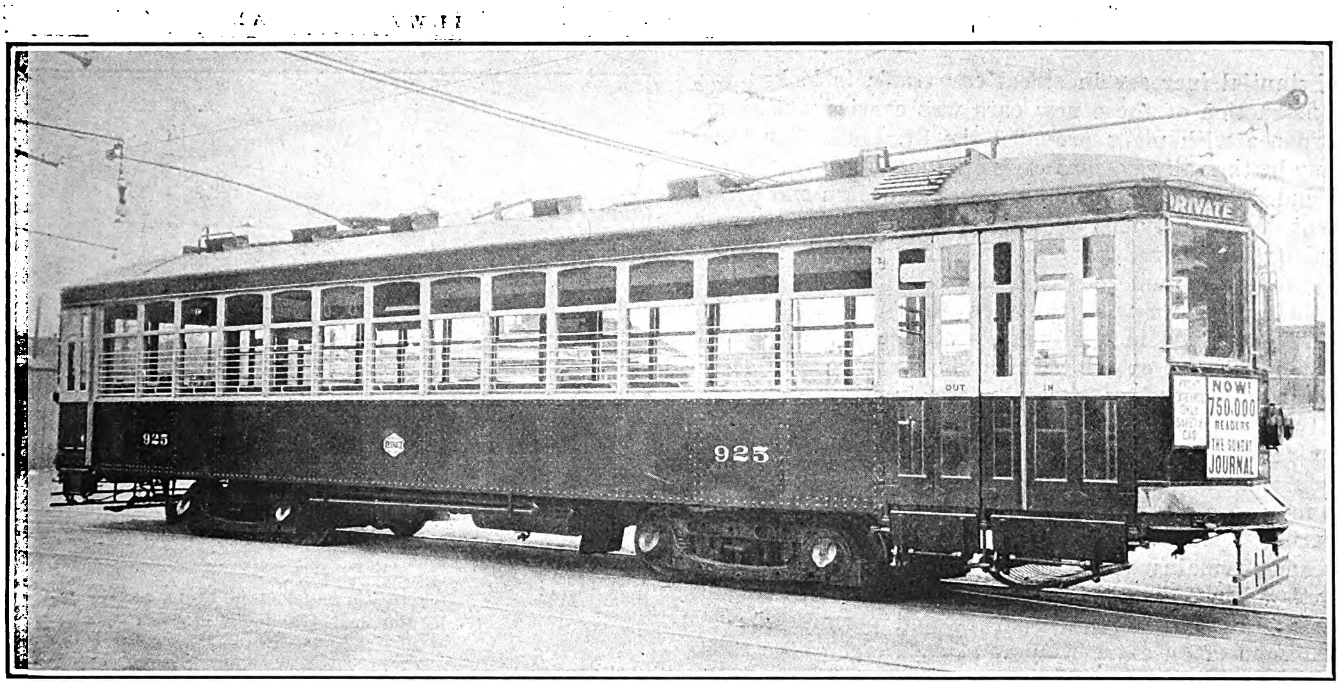
Soldering a Commutator at the Side. The Soldering Iron Is Supported by a Special Rest

Hand soldering is usually done with a copper tool heated in a gas flame. Self-heating gas or electric "irons" are often used but are not as popular as those heated in a gas flame. The irons usually weigh from 2 to 3 lb. Heavy irons will hold the heat longer, which is desirable. However, when heavy irons are used for side soldering there should be a support for the iron to rest upon. This will relieve the workman of the strain of holding the iron during the soldering operation.

Tinning of the iron is very important. When soldering is done on the top of the commutator the whole point of the iron should be well tinned. If the soldering is to be done on the side of the armature with pure tin solder the part of the iron which strikes the copper bar should be clean and tinned perfectly. The lower side of the iron should not be tinned because the molten solder will flow along the bottom of the iron and drop off instead of flowing into the slot.

When soldering large commutators it has been found convenient to apply a gas flame on the iron during the soldering because the leads and core of the large armature will radiate heat from the iron very rapidly. The commutator face should be wrapped with asbestos cloth. The nozzle of the torch is pointed to the front of the commutator and adjusted so that the flame will strike the flat side of the iron.

Before hand soldering, large commutators should be preheated. This is done most conveniently by heating the whole armature in an oven. If an oven is not available the commutator can be heated by rotating the armature while exposing the commutator face to the gas flame. Some armature winders when soldering commutators have a small gas flame strike the commutator face in front of the commutator neck just ahead of the soldering iron. This is bad practice because it is very difficult to adjust the flame so that it will not overheat the commutator face in spots, annealing the copper and causing the commutator face to wear unevenly. The same result can be obtained by making a small electric pad or heater which can be placed against the commutator face to preheat the bars before they are soldered.



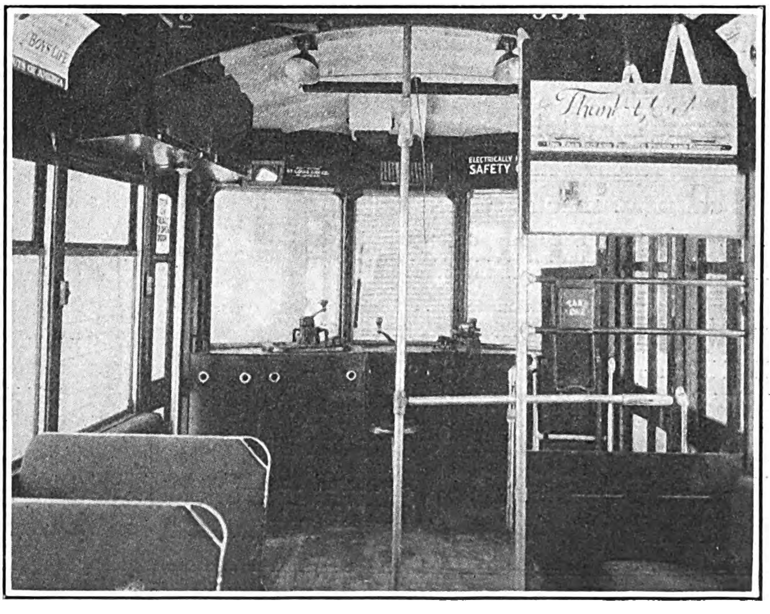
One of 40 New One-Man Cars Built for the Milwaukee Electric Railway & Light Company in the Short Time of 3½ Months. Reduced Width of the Rear Door Gives the Car an Appearance of Added Length

New Cars Selected in Preference to Rebuilding

The Milwaukee Electric Railway & Light Company Has Just Bought 40 New One-Man Cars, Believing that the Operating Economies Possible Will Pay Better than the Rehabilitation of Old Equipment that Later Would Have to Be Discarded

NOTEWORTHY in street railway annals is the recent purchase, building, delivery and assignment to duty on the lines of the Milwaukee Electric Railway & Light Company of 40 one-man cars. This was completed eleven months prior to the date set by the Railroad Commission in an order directing the company to install additional equipment. It is also an illustration of successful co-operation on the part of the car builder in an emergency so that improved city service could be rendered within the shortest possible time. Although the cars were ordered only on Sept. 4, all were in operation by Dec. 30. This is said to set a record in providing street cars in quantity lots.

The first cars arrived on Nov. 22, eight days ahead of the promised delivery date, and the remainder arrived from a few days to more than a week ahead of time. While the building of such a large number of cars requires under ordinary circumstances from six to eight months, in this case the company demanded quick action so that the patrons could have immediate use of the new equipment. The company hopes to effect economies in operation by furnishing the new equipment now instead of providing temporarily rehabilitated equipment that later would have to be discarded in favor of new cars.



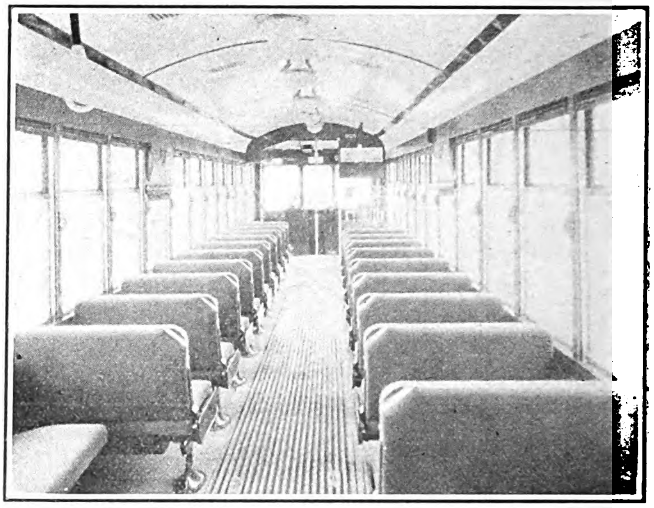
A Feature of the Cars Is the Inclosure of the Piping and Wiring

In general appearance and construction the 900 type car, as the new series is known, is much the same as its predecessor, the 800 type one-man car, which was originally designed by the company's engineers. No effort has been spared to enhance the interior and exterior appearance. With a headway that is at least 20 per cent more frequent than the previous one, a substantial increase in street car traffic is looked for. Construction of these new cars was carried out in accordance with plans provided the St. Louis Car Company by the railway company's engineering staff. These included several important changes in design and equipment from previous types. Interior improvements which have a parallel application in automobile construction are more numerous than the exterior changes. This is in accordance with the view that the rider is far more interested in the inside accommodations than in a finely finished exterior which may have been provided at the expense of an attractive and inviting interior.

Unlike the preceding model the new cars are arranged for front entrance only. Elimination of the doors at each end for operation by a conductor has a tendency to make the car appear longer as well as to add to the seating capacity. Only a small exit door, operated by a treadle, remains at the rear, and it has been moved farther back. The change in platform design provides seats for four more passengers and permits the installation of an extra window at each end where there formerly was a door. The new cars have a seating capacity of 55.

A pleasing feature of the new car which attracts the eye of the rider immediately on boarding is the clean-cut appearance. This is largely the result of the introduction of a new control cabinet arrangement. The entire control equipment is incased in brown enameled sheet metal, concealing the compressed air pipes and other devices ordinarily visible on the platform. Besides improving the appearance, this arrangement allows the platform to be cleaned thoroughly, which was impossible with many exposed pipes. Now only two pipes and the foot valve are exposed. This is done to make a recess or opening in the center of the cabinet so that the operator can bend his knees when in a sitting position.

An improvement in the control which was developed as an added precaution against accidents provides an automatic interlocking of the air brakes with the treadle door so that should a passenger stand on the treadle ready to alight and the operator release the air, the brakes would still remain set until the passenger alighted, after which the treadle would unlock the valve.



The Interior Is Attractively Finished in Light Cherry Trim, Set Off by Polished Aluminum Fittings

Another important interior improvement which has attracted much favorable comment is a radical change in the lighting equipment. Instead of the old type 23-watt lamps mounted in sockets on a molding above the seats, six large attractive center fixtures of the semi-direct type are equipped with two 61-watt non-glare lamps each. These units are hung from the center of the ceiling, throwing a much brighter light, but without discomfort to the eyes. This arrangement also increases the clean-cut appearance of the interior. The lighting fixtures were developed by the Milwaukee company. Consequently all overhead lighting equipment was shipped to the builder for installation. Other changes in lighting include the use of two lamps on each platform instead of the customary three. Increased platform illumination is provided, however, by using 61-watt lamps instead of 23-watt.

Aluminum is used for grab handles on the seats and for vertical stanchions, taking the place of brass or white enameled metal. The seat covering is Kemi-suede placed over rattan. Like other interior parts of the car the dark gray seat coverings can be cleaned with soap and water. When worn out they can be replaced quickly with new covering.

A new type signal button has been installed. This is an improvement over the old type because of less difficulty experienced in locating trouble with contacts installed inside the posts. With the entire button mechanism outside the posts little difficulty is had in examining and repairing them.

An electric heater is placed below each seat. The temperature is automatically regulated by a thermostat. Curtains are the National Lock Washer type covered with double-faced Pantasote. Two rear-view mirrors are on each platform, one directly above the operator's head and the other in the front left-hand corner. During daylight hours the operator can watch the treadle door

GENERAL SPECIFICATIONS OF MILWAUKEE ONE-MAN CARS

Weight, total	33,200 lb.
Bolster centers, length	20 ft. 9 in.
Length over all	45 ft. 0 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 7⅝ in.
Height, rail to trolley base	11 ft. 4 in.
Body	Steel, wood roof
Interior trim	Cherry
Headlining	Agasote
Roof	Arch
Air brakes	Safety Car Devices Co.
Armature bearings	Plain
Axles	Heat treated carbon steel
Bumpers	Channel
Car signal system	High voltage
Car trimmings	Bronze
Center and side bearings	Oil lubricated center, plain side
Compressors	DH16
Conduits and junction boxes	Steel
Control	K-35 JJ
Curtain fixtures	National Lock Washers, spring plug
Curtain material	Double faced Pantasote
Destination signs	St. Louis
Door-operating mechanism	National Pneumatic treadle rear exit and T. M., E. R. & L. Co. standard
Energy saving device	Economy meter
Fare boxes	T. M. E. R. & L. Co.
Wheelguards	T. M. E. R. & L. Co. standard
Gears and pinions	Grade M, 30 sets Grade B non-resonant, 10 sets
Heater equipment	Railway Utility
Headlights	O. B. Golden Ray Reflector
Journal bearings	Plain
Journal boxes	St. Louis
Lightning arresters	M-D
Motors	Four GE-264-A, inside hung
Paint	Glidden railway enamel, 20 cars; R. F. Johnston railway enamel, 20 cars
Safety devices	Safety Car Devices Co.
Sanders	St. Louis air operated
Sash fixtures	Edwards wedge lock
Seats	St. Louis
Seating material	Kemi-suede over rattan
Slack adjuster	Non-automatic turnbuckle
Springs	Elliptic bolster and coil for equalizers
Step treads	Kass
Trolley catchers	Ideal
Trolley base	U. S. 13-E
Trolley wheels	6-in. diameter
Trucks	St. Louis E1, B64
Ventilators	Peerless
Wheels	Steel, 26-in.

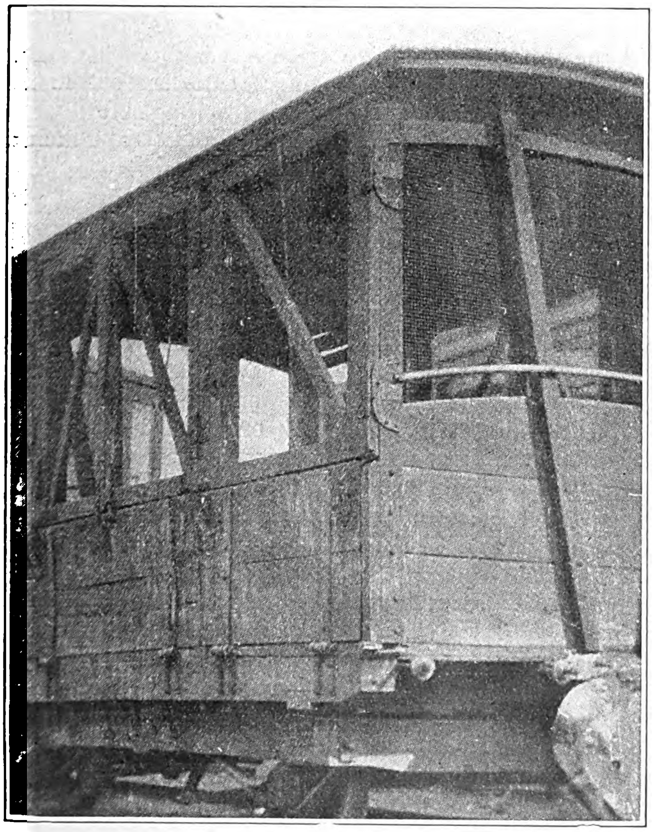
with either mirror. At night when the back curtain is brought into use the center mirror is obscured and observation of the rear is accomplished by means of the extra side mirror. All switches are centralized and inclosed in two cabinets, one on each platform. These are finished in a light cherry stain which lends attractiveness to the interior.

A new type of truck has been introduced which possesses better spring suspension and easier riding qualities. For propulsion four GE-264-A motors are used, together with St. Louis E-1 B-64 cast steel trucks with equalizing springs and auxiliary light-load bolster springs.

The Milwaukee company painted these cars in a special color scheme so that they can be distinguished readily from others on the system by waiting passengers. With the entrance at the front this is quite desirable. The new cars are finished in deep orange on the side panels up to the belt rail and on the letterboard. Sash rests and window posts are ivory and the bands of color are carried across the doors and around the ends of the car to give a streamline effect. The interior is also pleasingly bright, being cheerfully finished with light cherry wood trim that is set off by the polished aluminum fittings.

Screened Refuse Car

CONSIDERABLE trouble having been experienced by the York Railways, York, Pa., from the blowing about of light refuse material during its transportation from the shop to its disposal point, E. L. Greene, master mechanic, designed and constructed a refuse car to obviate this objectionable feature. This car is a single-truck trailer, with heavy yellow-pine underframing, braced and reinforced by cross and vertical oak timbers, all being securely bolted together. It is of semi-closed construction, the closed portion extending above the floor about 3 ft. and the remainder being screened by a wire screen having about ½ in. mesh.



Refuse Car Has Hinged Section of Solid and Screened Parts

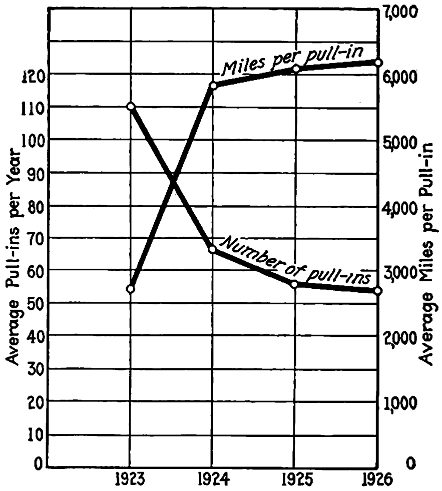
The solid and screened portions of the sides of the car are divided into sections and heavily hinged to permit the opening of the entire side, thus facilitating loading and unloading. Heretofore refuse material was deposited in an open bin in the vicinity of the shop, then loaded and transported on open cars or trucks to the refuse dump. With a reasonably strong wind blowing or the car running at a fair rate of speed considerable of the light refuse was blown to the street.

Now all refuse is deposited directly in the car, thus saving double handling and eliminating the disagreeable feature of light particles being blown to the surrounding highways during transportation.

Maintenance Cost Reduced at Harrisburg

Introduction of Rigid Inspection System, Making Minor Repairs on the Road, Not Filling Vacated Positions Has Improved Operation and Effected a Substantial Saving

EARLY in 1924 the management of the Harrisburg Railways, Harrisburg, Pa., initiated an intensive analytical study of the methods and practices followed in the maintenance of the company's car equipments for the purpose of determining wherein maintenance costs and car defects could be decreased. All departments and sections of departments were investigated carefully as regards the work being performed, the method of accomplishment and speed of production. This resulted in several changes being made in the centralization of production and shop practices and which had an extremely beneficial effect in the reduction of maintenance costs. The four outstanding changes consisted of:



Graphs Showing Decrease in Pull-ins and Increase in Mileage per Pull-in of the Harrisburg Railways. (The Last Three Months of 1926 Are Estimated)

1. Introduction of a more rigid inspection system and means of placing responsibility.
2. Making all minor equipment failure repairs at Market Square.
3. Discarding oil rear lamps and substitution of electric.
4. Leaving labor vacancies unfilled where possible.

It had been the practice for the inspection organization to make inspections and repairs and return the

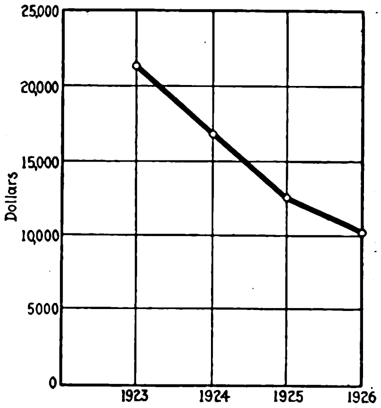
Adoption of this Inspection Tag by Harrisburg Railways Has Resulted in a Better Analysis of Maintenance Costs

car to service without completely recording the findings of the inspection or the nature of the repairs. As a result when a road failure of the equipment developed it was very difficult to obtain sufficient history of the defective piece of apparatus to place the responsibility accurately. To obviate this condition an inspection tag was designed covering all inspection operations which is attached to the car upon its arrival in the shop for inspection. The inspectors are required to note on this card the condition of the various parts of the equipment together with the nature of the repairs made. This tag, bearing the signature of the inspector is filed in the master mechanic's office and provides a permanent record of the inspection, repairs and responsibility for every car going through the inspection process. This tag has been the means of creating a feeling of responsibility among the inspectors and has resulted in more efficient and satisfactory work being performed, with a marked reduction in road failures.

The physical layout of the system with regard to the main traffic arteries is such that if the transportation crews were required to return defective cars to the carhouses serious service interruptions would occur. It had therefore been the practice to utilize two carhouse men for the replacement of a defective car with a good operating one. This replacement generally took place at Market Square, which is the terminal for all lines. As a result of this method the services of these two men for shop production purposes were lost during the greater part of the working day.



Electrical Maintenance Costs Have Decreased Each Year Since the Adoption of the New Method. (The Last Three Months of 1926 Are Estimated)

A careful check of the road failures showed that 95 per cent of them were of a very minor nature and could have been repaired on the road, saving the shifting expense. Therefore a capable man was placed in Market Square, whose duties were to make all repairs possible without interrupting service, and the services of the shifting crew were dispensed with. This change has been the means of reducing greatly the pull-ins and labor expense for maintenance, as well as obtaining appreciation from the operating men and the public.

SUMMARY OF AVERAGE PULL-INS PER YEAR, AVERAGE MILEAGE PER PULL-IN AND ELECTRICAL MAINTENANCE LABOR COST ,HARRISBURG RAILWAYS

1923...............	110	2,700	$21,322.62
1924...............	66	5,773	16,805.86
1925...............	56	6,044	12,518.18
1926...............	54	6,220	11,204.48

(Nine months actual)
(Three months estimated)

Basic schedule........................... 50 cars
Peak schedule........................... 90 cars

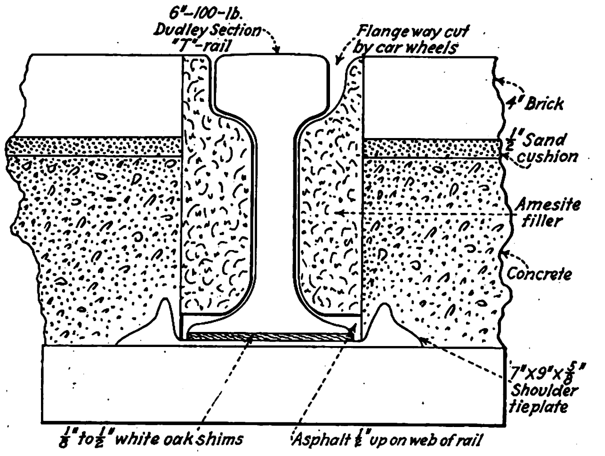
Rear end protection by means of oil lamps was found to be very expensive from a maintenance point of view, since it required the continuous services of two men to gather, distribute and trim these lamps. A careful balance of the cost of a new electric rear end lamp installation and its maintenance against that of the oil light system showed that the cost of the new installation could soon be paid for by the saving effected in maintenance. As a result all cars were equipped with electric rear lamps. As the work progressed the oil lamp maintenance gang was decreased until the maximum of saving in maintenance was procured.

Where possible, vacancies caused by dismissal or resignation have not been filled. A part of the wages saved is utilized in salary increases for the remaining men and the balance is credited against maintenance saving. These increases have been received by the men with great appreciation and have acted as a stimulus for greater effort. As a result the production has not been reduced due to the loss of man power.

Adoption of numerous changes in methods and procedure throughout the shop, especially those enumerated above, has been a means of reducing the electrical maintenance labor costs 47 per cent and increasing the average mileage per pull-in 230 per cent.

Correcting Rail Alignment and Repaving

EARLY in 1913 new rails were laid by the Erie Railways, Erie, Pa., on State Street between Sixth and Fourteenth Streets. A standard 6-in. steel rail weighing 100 lb. was laid on wood ties with steel shoulder tie plates and screw spikes, all being imbedded in solid concrete. This rigid construction, together with the heavy traffic, finally caused rail joint flexion which radiated the entire length of the rail. This resulted in wear on spikes and tie plates and a general loosening of the rails.



6"-100-lb. Dudley Section "T"-rail
Flangeway cut by car wheels
4" Brick
½" Sand cushion
Amesite filler
Concrete
7"x9"x⅝" Shoulder tieplate
⅛" to ½" white oak shims
Asphalt ½" up on web of rail

Sketch Showing Method for Shimming Rails, Installing Paving and Applying Filler

This condition was discovered in the spring of 1926. It was found that the rails were very loose in some places and would require immediate attention. A careful examination and calibration of the rail and the pavement away from the rail showed both to be in such good condition that a new construction job was not warranted. Various schemes were considered for the realignment and tightening of these rails. A method was finally adopted which after eight months service has been found satisfactory.

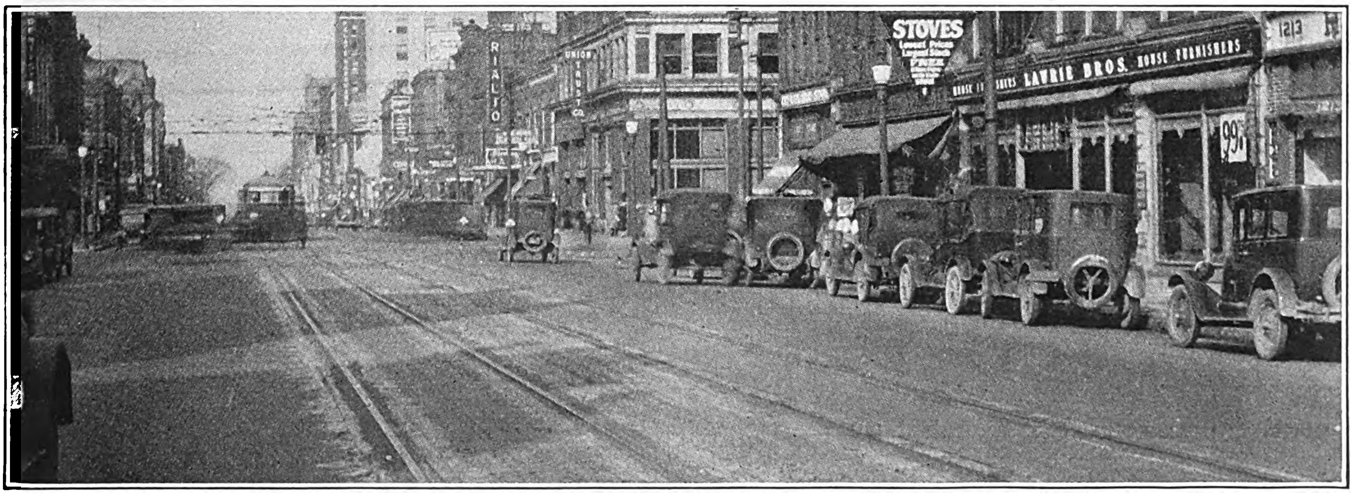
The pavement was opened adjacent to the rails and excavation made to the top of the tie. After the rail was brought up to grade the gap between rail and shoulder plate was filled with white oak shims, varying in thickness from ⅛ in. to ½ in., and the rails spiked. A wooden form was set up on the edge of the rail base of such a height as to permit laying 4-in. brick to grade on a ½-in. sand cushion and this form was filled with concrete. Removal of the form left the base of the rail exposed. When the concrete was set thoroughly, hot asphalt was poured around the base of the rail and up ½ in. on the web. On top of the concrete 4-in. brick on a ½-in. sand cushion was laid 3 in. back from the rail on the gage side and 2 in. back from the rail on the outside. The space between was tamped tightly with Amesite flush with the top of the rail, the flangeway being cut by the car wheels. The surface was then rolled and hot pitch asphalt poured over the entire surface to fill any existing voids. At the expiration of about a week or ten days, an examination was made. Where settlement had occurred hot asphalt was again poured into the depressions and on top of this was tamped and rolled a Tarvia mixture with considerable small aggregate and sand content.

While this method of realignment of rails and adjacent paving is purely experimental great hopes are expressed that it will prove a success, and if so it will be of material assistance to the maintenance man where rails are too good to scrap and the pavement has several more years of life.

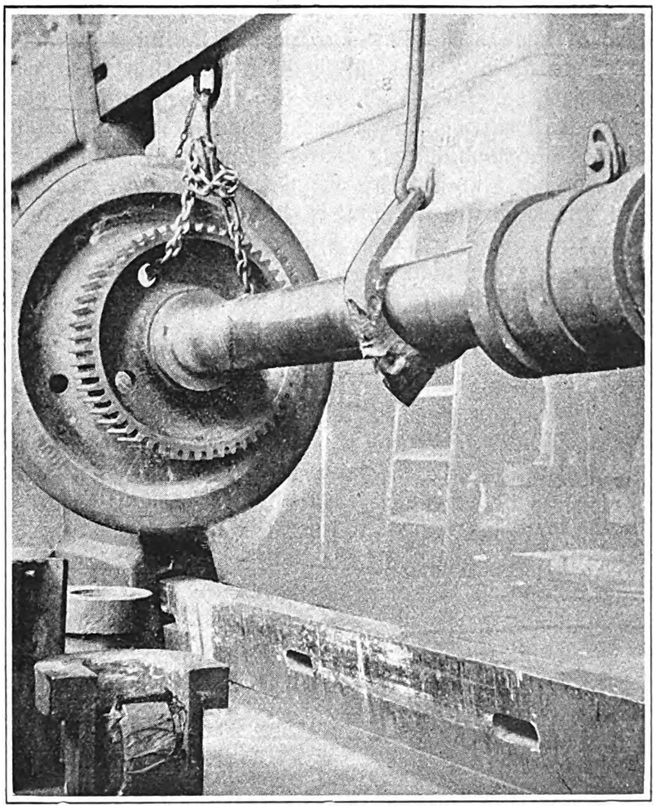
Wheels Removed and Pressed On Economically

PRESSING on and removing of wheels, together with the keeping of accurate wheel and axle records, is being given very careful attention in the shop of the Wilkes-Barre & Hazleton Railway, Hazleton, Pa. Where it is necessary to remove a worn-out wheel it has been found good practice to burn the wheel radially to within ¼ in. of the axle by means of an acetylene torch. By driving a wedge into the slot at the tread or by applying a slight pressure the seal is broken and the wheel is removed easily. This method has been found very economical due to the rapidity with which it can be carried out.

In pressing on wheels the danger of shaft distortion, so generally encountered by the usual pressing methods, has been overcome by the use of a specially designed thrust cylinder and mandrel. The cylinder is made of steel about 13½ in. long and 9½ in. outside diameter bored to fit snugly over the wheel fit, with the end pressing



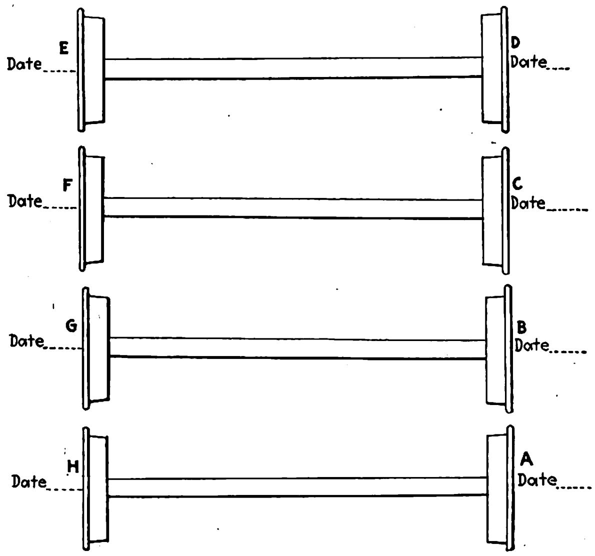
General Appearance of Rails and Pavement on State Street, Erie, Pa., Where Experimental Paving Method Has Been Installed



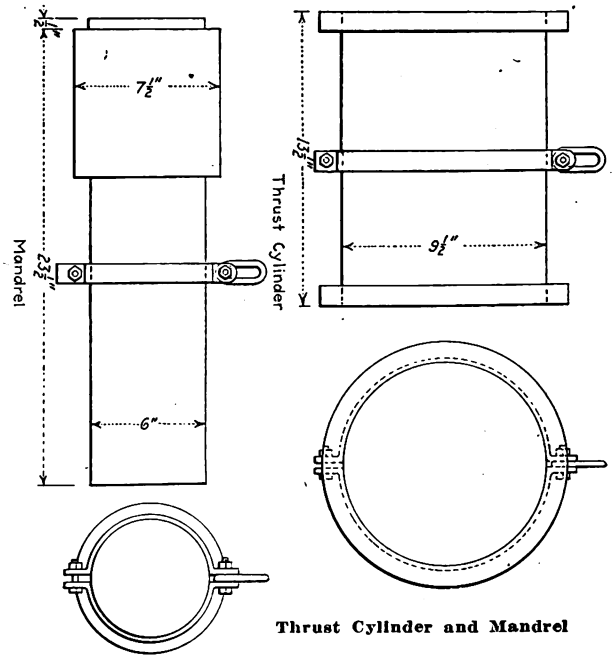
Wheel Being Pressed on with Thrust Cylinder and Mandrel

perfectly against the wheel seat. The mandrel is of steel about 24 in. long, 6 in. diameter at the small end and 7½ in. diameter at the large end. A ½-in. x 6-in. projection extends from the large end fitting the bore of the cylinder. This projection does not touch the end of the axle.

To press on a wheel the thrust cylinder is placed on the wheel fit with its face pressing against the wheel seat. The mandrel is next put on with the projection entered in the cylinder bore and the other end against the press ram. With this equipment the entire pressure is exerted against the wheel seat, thus eliminating the danger of shaft distortion due to shaft end pressure. This apparatus has proved very satisfactory and since its adoption not a single case of a distorted shaft has occurred.



Wheel and Axle Record Stamping



Thrust Cylinder and Mandrel

The press used is of 400 tons capacity with a 25-ton release. All 36-in. wheels are bored 7 in. and are pressed on at a pressure of 75 tons. The pressure used for each wheel is kept on a recording gage chart and filed systematically for ready reference.

Each wheel of a car, together with the end of each axle, is lettered consecutively from A to H, along with the date it was pressed on. This record is suitably filed so that complete information on any wheel or axle is obtainable when desired.

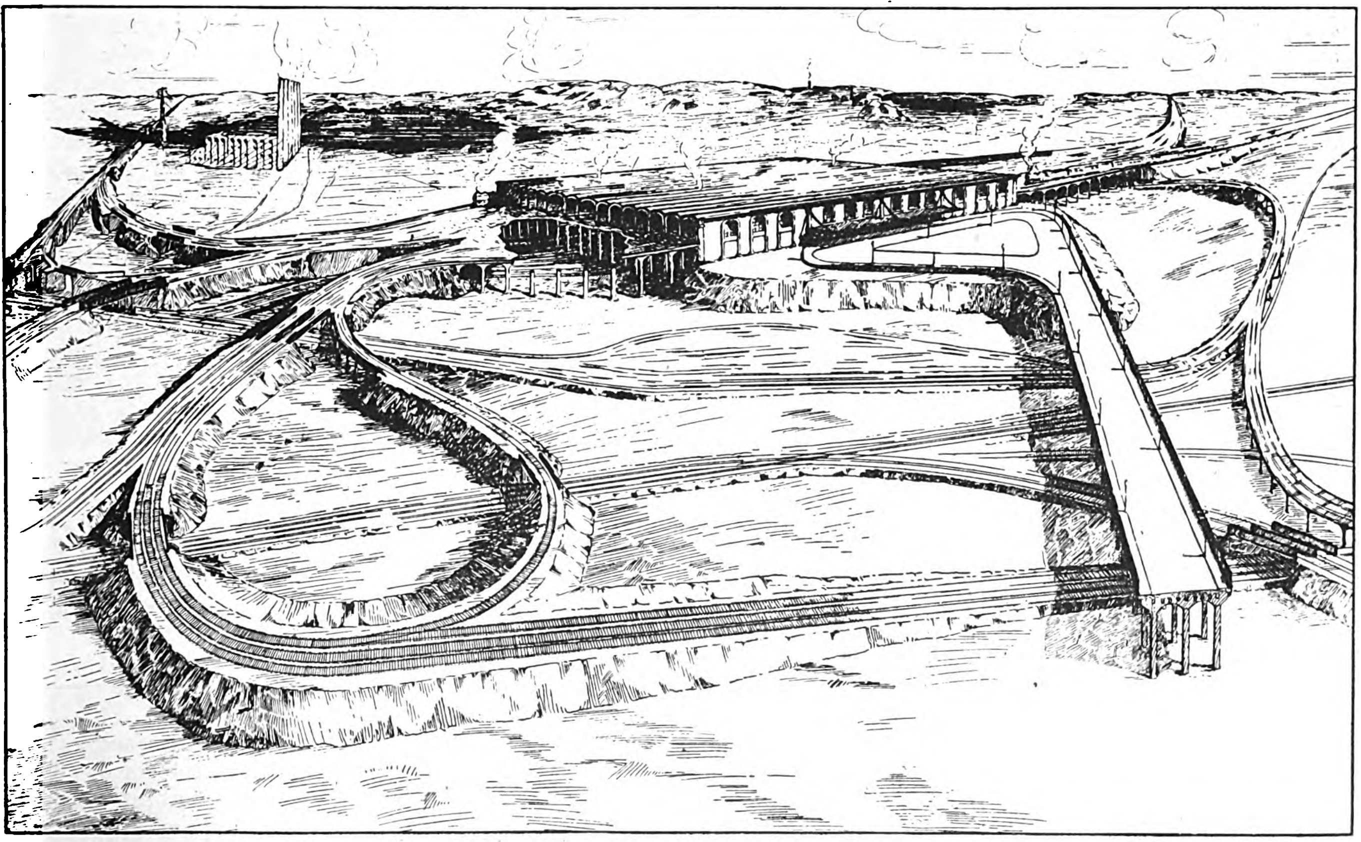
Studies Made by North Jersey Transit Commission Embrace a Loop Line Between Manhattan Borough, New York, and the Steam Railroads Serving New Jersey Communities—Alternate Plans Provide for Various Contingencies—Many Differences from Proposals of Former Commission



Perspective of Proposed Meadows Transfer Station Near the Present Croxton Yard of the Erie Railroad

MARKED efforts toward elimination of former physical objections and definite recommendations for the speedy realization of the interstate rapid transit loop are features of the new report of the North Jersey Rapid Transit Commission, which was presented to Governor A. Harry Moore on Feb. 14. This report, prepared under the direction of Chairman Daniel A. Garber, follows an earlier report presented in 1926, and which gave somewhat similar recommendations although not in such complete form.

In order to obtain definiteness and clarity the report is presented in three major sections: Status of the physical plan, prepared by Glenn C. Reeves, assistant chief engineer, and Daniel L. Turner, consulting engineer; studies in means of financing, prepared by Philip H. Cornick, specialist in taxes and assessments, and opinion of counsel relative to district organization, prepared by Spaulding Frazer, counsel.

While the basic plan is the same as that reviewed in ELECTRIC RAILWAY JOURNAL for Feb. 6, 1926, page 239,[*] the commission, during the five months at its disposal, has by exhaustive studies broadened the entire scope of the project and developed several new features of outstanding importance. In addition, it has apparently established an *entente cordiale* not only with the managements of the steam roads entering New York but with the transit officials of New York City.

Briefly the new features are: (1) A transfer station at Journal Square, Jersey City. (2) Physical connections with the New York City Board of Transportation's Eighth Avenue subway and various changes in the 1926 plans for physical connections with the downtown subways. (3) A transfer station at New Durham, N. J. (4) Definite plans for extending the B.-M.T. Fourteenth Street-Eastern subway to Meadows Transfer Station. (5) Definite plans for extending the Interborough Rapid Transit 41st Street subway to connect with the New Durham Transfer Station. (6) An

independent subway through Manhattan in conjunction with the authorities of Westchester County, New York.

These new plans are predicated on a detailed study of passenger traffic into New York City on the various routes from New Jersey points. The accompanying table summarizes the information which was secured from an elaborate traffic count.

Basic Plan of 1926

1. Construction of a new North Jersey rapid transit system.

2. Hudson & Manhattan Railroad extensions in New Jersey.

3. Interborough extensions of its Manhattan lines to New Jersey.

4. Brooklyn-Manhattan Transit system extensions from Manhattan to New Jersey.

5. Extension of North Jersey rapid transit system, listed as part one of this program, to serve a larger area.

6. Electrification of existing steam railroads.

The North Jersey rapid transit system, part one of the program, would consist of the following five lines:

1. Interstate loop line, running north and south between the Hackensack River and Bergen Hill in New Jersey, passing under the Hudson River via a tunnel at the Battery, up through Manhattan to 57th Street and back through another tunnel to New Durham. Its length would be 17.3 miles. A so-called Meadows Transfer station would be located near the intersection of the Erie and Delaware, Lackawanna & Western Railroads.

2. A line from Paterson through Montclair and Newark, following the Interstate loop route through Manhattan to New Durham and thence to Rutherford and Hackensack. The length of this route would be 41.9 miles.

3. A line from Ridgewood via Paterson, Passaic, Rutherford, New Durham, the Interstate loop route in New York City, to Newark and Elizabeth. Route mileage would be 39.8.

4. An intrastate route from Elizabeth through Newark and Rutherford to Hackensack, 18.8 miles in length.

5. Another intrastate line from New Durham to Newark, 13 miles in length.

Of the nine steam railroads involved, four, the Central Railroad of New Jersey; the Delaware, Lackawanna & Western; the Erie, and the West Shore, now handling 83 per cent of the commuting population, will need to make a complete reorganization of their terminal operations, and three will have to move from their waterfront terminals to the other side of Palisades Hill.

The commission has laid the situation before the managements of the roads affected and has obtained the co-operation of practically all of them. The West Shore is recommending a rearrangement of its terminal facilities in accordance with the commission's plans; the Erie, whose traffic load is 33 per cent of the total and exceeds by 46.8 per cent that of any other system, has made helpful suggestions and still has the plan under advisement. In this stand the Erie has been joined by the Lackawanna and the Central Railroad of New Jersey, whose traffic loads are 23 and 19 per cent respectively. The Hudson & Manhattan (which receives 31 per cent of its total passengers from steam railroads) has agreed to the extension of its lines to the proposed Meadows Transfer Station. The Pennsylvania Railroad, which enters New York directly and hence is not particularly concerned in the steam commuter problem, has raised no particular objection to the plan. The Lehigh Valley is noncommittal.

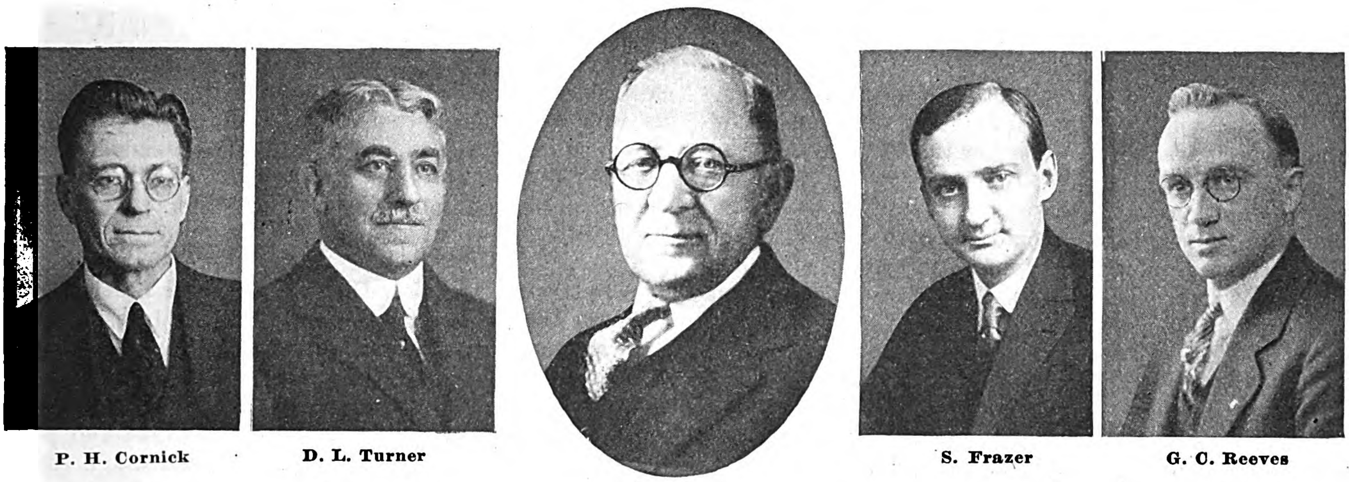
On the basis of a request from the engineering staff of the Port of New York Authority, the advisability was considered of revising plans for the proposed 178th Street and Fort Lee Bridge so as to permit of at least four rapid transit lines passing over this structure.

Journal Square Station

Returning to the outstanding modifications of and additions to the 1926 plan, the Journal Square Station, Jersey City, has been given considerable study because it is the locus of most of the bus and trolley passenger traffic on the west bank of the Hudson River. On a typical day the buses alone deliver 52,000 one-way passengers, most of whom use the Hudson & Manhattan tubes to New York City, so that any plan for traffic relief at this location affects both the Pennsylvania and H. & M. Railroads. "This plan," the report states, "proposes a rapid transit station to be located on the rock ledge which now forms the northeasterly side of the railroad cut in which the present H. & M. Journal Square Station is located. The station is to extend between the Hudson County Boulevard Bridge and a point some 250 ft. beyond the Summit Avenue Bridge. The rapid transit electric station platforms below are reached by ramps and stairs from a mezzanine over the electric tracks, which in turn is reached from the street level by additional ramps, one connecting with the Boulevard Bridge, another from Bascot and Magnolia Avenue, and another connection with the Public Service trolley plaza and the Hudson & Manhattan platforms. Entrances are also provided from Summit Avenue to this mezzanine. . . . Other studies for various routing through the Journal Square section which would not make use of the right-of-way of the Pennsylvania Railroad through the northern arch of the Boulevard Bridge also have been made."

Taking into account the colossal problem of financing the Interstate loop as a single unit and based upon suggestions of John H. Delaney, chairman of the Board of Transportation of New York City, the commission made nine different studies to determine the most advantageous routing for the North Jersey transit subway in order to make connections not only to the east side and west side Interborough lines but also to the independent system of the Board of Transportation. These plans include a Manhattan terminal building such as the present Hudson Terminal, utilization of the empty reverse movement capacity now existing on the local subway tracks during the morning and evening rush hours, and a general scheme that will not only collect the greatest number of commuters conveniently, but at the same time form a part of the final loop.

Of the nine studies, three of the most desirable are illustrated in this article. These are referred to as Schemes *F*, *G* and *I*. In all of these the North Jersey Transit Commission's subway line would enter Manhattan at the Battery. In Scheme *F* the line would bifurcate to make connections with local lines of the east side and west side Interborough subways, the former connection being south of Brooklyn Bridge with deep level stations under the east side line. This contemplates provisions for development of the Board of Transportation's subway plans.



P. H. Cornick **D. L. Turner** **D. A. Garber** **S. Frazer** **G. C. Reeves**

Men Responsible for 1927 North Jersey Transit Plans

Scheme *G*, on the other hand, proposes connections to both Interborough subways and also with the Board of Transportation's independent line in Church Street. The plan of the connection is shown in the map. Scheme *I* also proposes a connection to each of these three subways, but would include a cross-connecting track at Barclay Street. It also contemplates running the new line under Washington Street for the southern portion of the route, making connection with the east side subway at a point north of Worth Street.

According to the report, "all of the studies for one entrance into Manhattan have been made with the thought in mind that at some future time it would be necessary to have an independent commuter subway through Manhattan to connect with New Jersey. These schemes, *F, G* and *I*, are to be considered as a first step measure, and when the time does arrive for the independent commuter subway this first step construction would be used as a part of that independent line."

At New Durham, N. J., on the meadows opposite 57th Street, New York, the commission proposes a rapid transit station whereby the steam railroad passengers from the West Shore Railroad, the New York, Susquehanna & Western and the Northern Railroad of New Jersey will have opportunity to transfer to rapid transit electric trains for distribution in New York City or other parts of New Jersey when the comprehensive plan is accomplished. Four studies have been made for this station, any one of which would mean the removal of steam railroad passengers and local ferry passengers from the waterfront terminals. "This very important step," continues the report, "is one that should be made, and the West Shore Railroad is in sympathy with such a move."

Of the four plans presented, Scheme *D* provides for a complete separation of the Erie and West Shore Railroad tracks and platforms by a passageway or driveway leading to the ticket offices and other facilities. Directly over this passageway and parallel to the axis of the steam station platform are the electric tracks and platforms. To reach these platforms passenger bridges leading to a distributing concourse over the

Route Planned for New Jersey-Westchester County (New York) Subway. One of the First Relief Measures Suggested by the Commission driveway and directly under the electric platforms are provided over the steam tracks.

In order that this transfer station might be of service to the commuters, the minimum rapid transit construction required would be either the 57th Street trunk of the Interstate loop or the 41st Street extension of the Interborough subway. At this point recommendation is made that should the 57th Street tunnels be constructed before the Interstate loop, they should be made of sufficient size to accommodate standard railroad equipment.

B.-M.T. FOURTEENTH STREET EXTENSION

In regard to this extension the commission now makes these definite proposals as a means not only of effecting the most direct connection with the B.-M.T. subway for traffic of the Lackawanna and Erie, but of serving passengers from Hoboken and the heights section of Jersey City. The most advantageous route extends from Fourteenth Street and Sixth Avenue westward under the Hudson, emerging to the surface about Clinton Street, Hoboken, to pass into the side of Palisades Hill at Congress Street, where the route turns southward in subway into Palisade Avenue. Continuing under Palisade Avenue, the line turns into Franklin Street and thence into Manhattan Avenue, where, after the Hudson County Boulevard has been reached, it emerges in the western slope of the Palisades to continue on trestle to Meadows Transfer Station. This line will be stub-ended and the rapid transit electric trains will be returned over the same rails to New York City.

Scheme "I"—Which Proposes Physical Connections with the West Side and East Side Interborough Subways and Also with the Independent Subway of the Board of Transportation

"This is a very logical extension," the report states, "and should be made at the earliest opportunity. Conference has revealed that such an extension would be acceptable to the New York Rapid Transit Corporation." In addition it is pointed out that it might prove desirable to extend this line to New Durham Transfer as well and then return to New York via the 57th Street tunnels to connect with the stub-ended tracks of the B.-M.T. at 59th Street and Seventh Avenue, thus forming the upper trunk of the Interstate loop.

INTERBOROUGH 41ST STREET EXTENSION

All plans for the New Durham Transfer Station provide for the extension of the 41st Street Interborough subway line as part of the rapid transit system almost in a direct line under the river through Palisades hill to the New Durham transfer station, with a subway station on Franklin Street between Boulevard and Bergenline Avenues, Union City, N. J., which would serve a large portion of those local ferry commuters now depending upon the Weehawken ferries for transportation to New York City.

WESTCHESTER-NEW JERSEY COMMUTER SUBWAY

On this project the commission makes some very definite observations based upon the uncertainty of the present subway policy of New York City, which it believes might prevent the construction of connections to the subways. In such an event the commission urges a co-ordination of effort with the authorities of Westchester County, New York, for the construction of an independent subway from some point in that county through the entire length of Mahattan, under the Hudson River to the Central Railroad of New Jersey terminal at Communipaw. Thence one section would continue along the Newark branch of that road to its present Broad Street station in Newark, while the other section would extend to Meadows Transfer through the Journal Square section of Jersey City. On this point the report continues:

> This would furnish Newark with a rapid transit service in addition to that rendered by the Pennsylvania Railroad (Hudson & Manhattan) and at the same time would afford the suburban passengers of the Erie and the Lackawanna Meadows Transfer access to a rapid transit line for distribution in New York City. Such a line would be economical of operation in that the loaded trains from Westchester County would distribute their passenger load through Manhattan; then these same trains would continue to Newark and Meadows Transfer and return with another load of Manhattan-bound passengers. This is a slight modification of a part of the comprehensive plan as presented in the 1926 report. The main points of difference, however, are only temporary in that the southern trunk of the proposed North Jersey Transit System would terminate at Newark until the comprehensive plan can be fully developed instead of continuing to Paterson or Elizabeth, and the Manhattan trunk would be continued to Westchester County until the 57th Street line or northern trunk of the Interstate loop could be constructed.
>
> In the event that the complete Interstate loop commuter subway cannot be developed and financed as a unit, then the first section of that loop constructed should be an express and local service line from and including Meadows Transfer station to a physical connection with the downtown Manhattan subways.
>
> Should the subway policy of New York prevent this physical connection to downtown Manhattan subways, then the first step of construction should be (in conjunction with the Westchester County of New York State) the Westchester-Meadows Transfer-Newark commuter subway.

PLAN OF FINANCE

The section of the report dealing with finance, comprising some eight chapters, is a powerful argument as to the fallacy of financing such a project by a private corporation. Admitting that there are probably one or two railroad companies in the North Jersey transit district which have reserves adequate for the establishment of their own commuter terminals in New York City, the report dismisses these as local and, continuing, comments:

"So far as any comprehensive plan for rapid transit is concerned, however, no public body and no conceivable combination of private agencies is in position to provide accumulated capital sufficient for its consummation."

The commission also frowns on anticipated revenues as a means of financing the project and makes it clear that the only revenues that could be made available for construction costs would be those derived from taxes as special assessments. The report continues:

> The only remaining alternative is that of basing the financial plan, in part at least, in anticipating future revenues—in other words, the issuance of bonds to be supported out of operating revenues, taxes, special assessments, or a combination of all three. If the bonds are to be supported solely by fares and additional revenues from advertising, your engineers have estimated that the cost for total expenses would require a fare of 16.56 cents per passenger on a basis of 125,000,000 passengers per annum and 11.28 cents on a basis of 250,000,000.
>
> The nearest comparable service rendered in the district is that supplied by the Hudson & Manhattan lines whose fare is 5 cents for intrastate passengers and 6 or 10 cents for interstate passengers, depending on their destination in New York. It is open to question, therefore, whether it would be feasible, wise or desirable to rely solely on anticipated future operating revenues as a means of supporting construction costs. If that be granted, revenues derived through the taxing power would be needed at least to supplement operating revenues.
>
> A concrete example will serve to illustrate the relative advantages and disadvantages from the standpoint of the taxpayer of using this supplementary source as a basis for a bond issue, or of making a direct levy for construction funds as they are needed. The preliminary estimates made by the engineers of the cost of constructing the interstate loop (exclusive of land costs) totaled $154,000,000. Assuming a seven-year construction period and equal yearly expenditures throughout that term the annual requirements would amount to $22,000,000.
>
> In order to provide this from current tax revenues a levy amounting to $5.44 on every $1,000 in the net valuation taxable for 1926 in the North Jersey Transit district would be necessary. The weighted average tax rate imposed on the same base in 1926 for all purposes was $39.63 per $1,000. Assuming that all other governmental expenditures were to remain constant and that there were to be no change in assessed valuations, this additional burden would require an aggregate average tax rate of $45.07 per $1,000 for the seven-year period.
>
> If, on the other hand, seven successive bond issues for $22,000,000 each were to be made during the construction period, each issue running for 35 years and bearing interest at 4½ per cent per annum, and if sinking funds were assumed to earn at the rate of 3½ per cent yearly, then the increase in tax rate would amount to only 31 cents per $1,000 of assessed values of the first year. It would increase 31 cents per year during the remaining six years of the construction period and would then remain constant at $2.19 per year for 28 years.
>
> If current revenues from special assessments were to be relied on, the increased burden would, of course, remain the same, but the base against which it was levied would be considerably narrower. It is evident, therefore, that no plan for financing construction costs direct from current revenues, and without resort to bond issue, can be carried out for a work of the magnitude of the proposed Interstate loop without bringing about an unduly severe increase in the current burdens which already fall on taxable or assessable property.

Following the foregoing analysis, the commission makes the following conclusions relative to choice of means of financing that would seem to be warranted:

> 1. *That the proposed North Jersey Transit System be publicly financed and publicly owned.* It is true that the only rapid transit system now operating in the North Jersey transit district was provided by private capital. It is probable, furthermore, that certain of the railway companies which handle large numbers of commuters in this district have the capital and credit necessary to provide rapid transit connections with New York City for their passengers. Nevertheless, all such operations, desirable though they may be, can provide only local and temporary relief; and there is slight probability that any one company, or any group of companies, can provide the necessary capital for a transit system of the type which the North Jersey Transit Commission believes to be essential to the continued and symmetrical growth of the territory comprised within the district.
>
> 2. *That the bonds to be issued for construction costs be supported by supplementary pledges of full faith and credit based on the taxing power.* Regardless of the types of revenues which are to be pledged to the support and retirement of bonds, the supplementary pledge of full faith and credit is essential to obtaining the lowest interest rates.
>
> 3. *That the maximum term of all bonds issued for transit developments, regardless of the specific part of the work for which they are to be issued, be fixed at 35 years.* The completion of a rapid transit system in this region will inevitably bring new population, and an attendant increase in problems, for whose solution further bond issues will be needed. The imposition of long-deferred burdens which will fall on future generations, who will have abundant current burdens of their own, is therefore to be avoided.

Scheme "D"—Proposed Transfer Station at New Durham, N. J., for Commuters on Several Branch Lines of the Erie Railroad and for the West Shore Railroad. This Plan Has Been Indorsed by the Latter Road

SPECIAL TAXING POWERS ASKED

In the main the legal section of the report is a plea that the commission be empowered with authority to levy taxes within the territory affected:

> A study of the portion of this report dealing with the physical and financial aspects of the transit situation shows that no type of agency now in existence, except that of state authority financed by general state tax or by state bond issue, similar to the existing Highway Commission, can bring to the problem powers adequate for its solution.
>
> And yet the problem, despite its magnitude and the large territory involved, is essentially a district problem, in which other portions of the state have naturally either no interest at all, or, if we bear in mind the rapidly growing Camden metropolitan section at best so slight an interest as to make the proposal of state-wide authority supported by the contribution of the whole state, whether in the form of direct tax or of bonds, one which must seem obnoxious to the voters of those parts and therefore, quite naturally and properly, one which, except under unusual conditions, would scarcely receive the support of the senators and assemblymen from those counties. . . . Many commissions have been granted assessing powers, and this has been upheld not only in state courts but in the broadcast terms by the federal Supreme Court as in no way violating the due process and equal protection clauses of the federal Constitution.

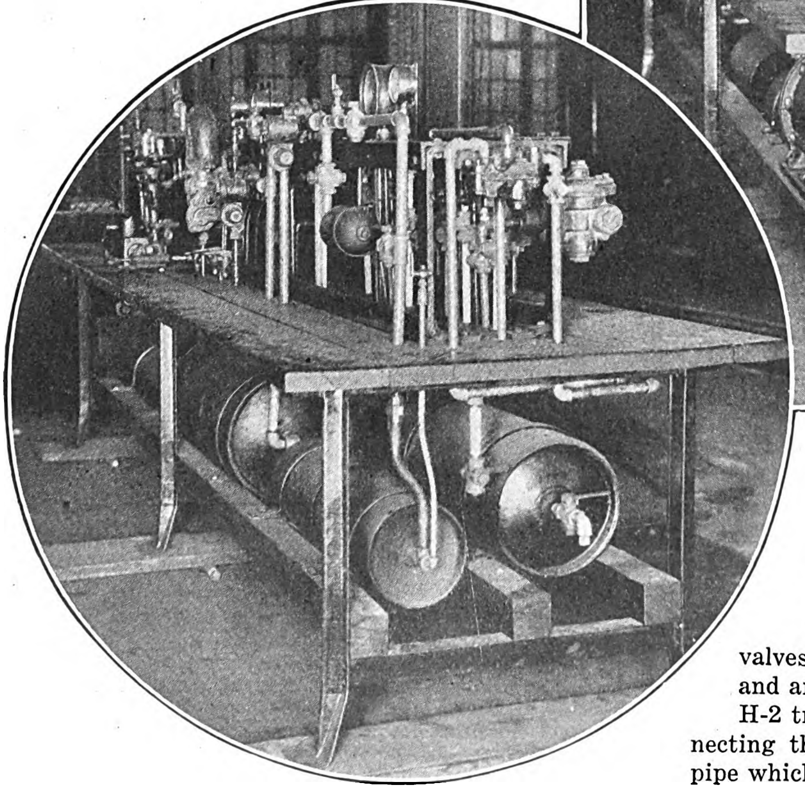
Air Equipment Tested in Place on Cars

Thorough Testing of Triple Valves, Motorman's Valves, Brake Cylinders, Feed Valves and Other Parts by Means of a New Test Rack Has Eliminated Many Troubles on the Cars of the Indiana Service Corporation

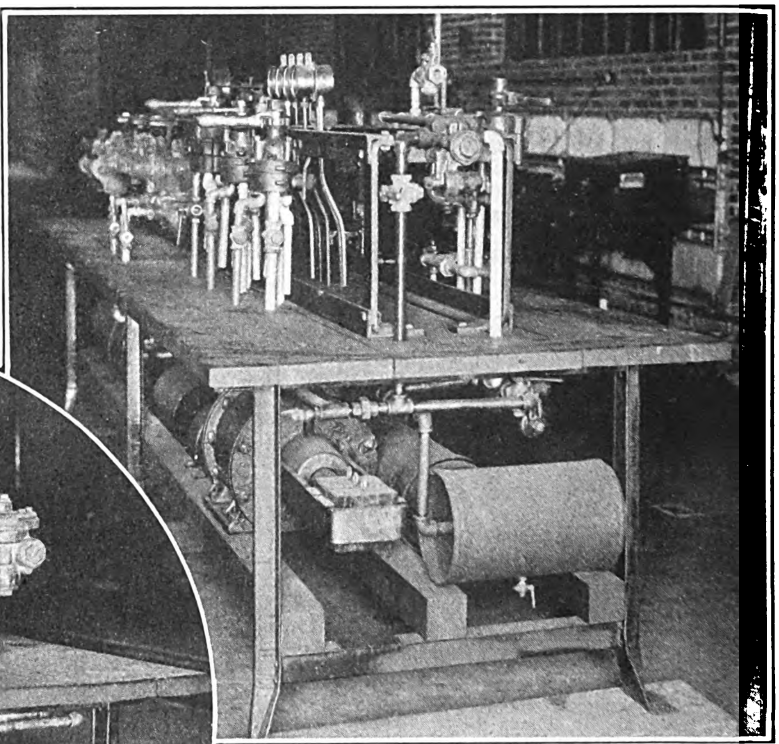
By Arthur W. Reddersen
Superintendent of Motive Power Indiana Service Corporation, Fort Wayne, Ind.

Each piece of air apparatus used on either city or interurban cars of the Indiana Service Corporation is given a thorough test by means of an air brake test rack, recently completed and installed as a part of the equipment of the Spy Run shops at Fort Wayne. The air supply for operating the rack is furnished by a 225-ft. shop compressor, located in the basement. Air lines from this run to the rack and also to the various shop pits for careful testing of the equipment in place on the cars. Where desirable, equipment may also be removed and taken to the rack for testing.

The top of the bench on which the various pieces of air brake test equipment is installed is 14 ft. long, 46 in. wide and 36 in. above the floor. In the center is a framework built up of 2¼-in. x ⅜-in. angles. It is 11 ft. 4 in. long, 18 in. high and 14 in. wide. This is bolted to the top of the bench and braced at each end so as to leave 16 in. of bench space all the way around, providing a convenient place for tools when testing and making adjustments. All pipe brackets are mounted on the framework, with the necessary cut-out cocks located in the pipe lines between the brackets and top of the bench.



Space on Top of the Bench Around the Test Rack Provides a Convenient Place for Tools When Making Adjustments



The Brake Cylinder Installed Underneath the Bench Is Provided with Blocks so that Different Length Piston Travel Can Be Obtained.

A brake-pipe line is run in the basement of the shop to the tracks where box cars and all non-compressor car repair work is done, so that after the brake rigging has been overhauled and the triple valves and brake cylinders cleaned and lubricated a test is given for piston travel before the car is again returned to service.

A brake cylinder located under the bench is operated when any triple or brake valve is being tested, unless this cylinder is cut out by closing the double cut-out cock above the bench. A yoke is attached to the non-pressure head of the brake cylinder so that by dropping in blocks of various thicknesses any given piston travel may be obtained and the result indicated on the brake cylinder gage.

Automatic engineer valves and triple valves are tested on one side of the rack. Feed valves, governors, safety valves, gong ringers, door engines, low-pressure city brake valves and emergency valves are connected in with the straight air brakes and are tested on the opposite side of the rack. An H-2 triple valve application test is provided by connecting the brake pipe to atmosphere through a ⅜-in. pipe which runs above the bench with a cut-out cock on the end. The cut-out cock is plugged at one opening. The plug is drilled with a hole of the proper size so that the brake pipe pressure is reduced from 70 lb. to 50 lb. in ten seconds when the cut-out cock is open. Two duplex and six single-pointer test gages are used on the rack, each mounted so as to be in the operator's direct range of vision while tests are made.

Following are some of the troubles that have been overcome through the building of the rack:

Previous to the installation and use of the present careful testing methods frequently a triple valve would be removed from a car on account of a defective slide valve. Either the inspector would fail to mark the cause of removal or the tag would become destroyed before the triple valve arrived at the repairman's bench. The repairman, not being able to detect the defective slide valve, would clean the valve and mark it O.K. An inspector would again put the triple valve on a car, only to find that the slide valve was defective. This often necessitated going to the shop for another triple valve and caused delay to the train as well as unnecessary expense in getting proper equipment to make the car pass the test.

Since the installation of the test rack, triple valves are given a test after cleaning. Those found to have defective slide valves are sent to the factory for a general overhauling. After being cleaned all feed valves are given a rack test and a code test, as recommended by the Westinghouse Air Brake Company. If they do not pass this test, they are also sent to the factory for general overhauling.

The rack has been arranged so that it can be used for instruction, as well as for testing purposes. Motormen being instructed on car equipment can thus be shown what actually happens in addition to obtaining explanations of the various operations. These include particularly the time required to charge the auxiliary reservoirs after a train has been made up and the importance of waiting until all auxiliary reservoirs are charged before attempting to make a terminal brake test. Motormen are also shown that when making a brake application it is useless to reduce the brake pipe pressure below the point of equalization. The importance of stopping the brake pipe reduction when the point of equalization has been reached is explained. This instruction has proved very beneficial.

The Readers' Forum

Extensive Rehabilitation Programme Planned by South Carolina Power Company

CHARLESTON, S. C., Jan. 22, 1927.

To the Editor:

An extensive program of improvement and modernization has been mapped out for the railway department of the South Carolina Power Company. This includes track renewals, the substitution of improved rolling stock for worn-out or obsolete equipment, and an advertising campaign to "sell rides" in connection with the improvements.

It has been recommended that all cars in regular service be equipped with comfortable, upholstered seats, and with floor covering. All cars will be painted in our new standard color, a bright orange, and instead of being lettered will carry a distinctive insignia emblematic of the company.

It is our opinion that by furnishing the public economical, safe and dependable service, and keeping that picture prominently before their eyes, we can increase our gross revenue to such an extent that with the attendant economies in operation, we can finally pull a mighty sick patient out of the hospital.

H. BIGELOW,
Superintendent of Railway.

Careful Inspection Program Gives Good Results

PHILADELPHIA RAPID TRANSIT COMPANY
PHILADELPHIA, PA., Jan. 20, 1927.

To the Editor:

Before the present one-man, two-man, front-entrance, center-exit cars were adopted as standard on the Philadelphia Rapid Transit Company lines a very thorough study was made of the operating requirements in this city. The variety of transportation requirements led us to believe that a car of the maximum flexibility was necessary for our purpose, and we feel that our present type is the best which has yet been developed to fulfill our needs. Our fare collection system was also developed from a standpoint of giving the maximum of adaptability to all our service requirements. It is possible to operate one of our standard cars over any of our surface lines and in the surface car subway on Market Street. We will probably continue to standardize on this car design until some later development appears which will prove even more desirable for use in our co-ordinated transportation system.

It is true that we have not placed a great deal of emphasis upon interior fittings which approximate the luxurious. Deep spring seats with leather upholstery have doubtless proved very satisfactory in many applications, but we have thus far found it expedient to retain the wooden seats, both lengthwise and crosswise. Great care is manifested at all times, however, to keep the cars thoroughly clean and attractive, both inside and out. We have adopted a very positive schedule for car cleaning and inspection, and as a result we have succeeded in reducing our electrical and mechanical failures from a total of 15,035 in 1921 to 2,102 in 1926.

To obtain this gratifying result the following schedule for car cleaning and inspection has been adopted:

Daily—The interiors of the cars are washed thoroughly with a solution consisting of one part disinfectant to fifteen parts of water.

Weekly—The interiors of the cars are cleaned thoroughly and the exteriors are given a complete washing.

500 Car-Miles—At the end of this period, the so-called "A" inspection is given to the cars. This consists of a careful mechanical inspection of fundamental brake equipment, control equipment and current collection equipment.

2,500 Car-Miles—After this interval the car is given both an "A" and "B" inspection. The "A" inspection was described above. The "B" inspection consists in giving the cars a thorough lubrication of the controls, motors, compressors, etc.

7,500 Car-Miles—At this time the cars receive a complete electrical and mechanical inspection which covers all operating parts of the cars.

60,000 Car-Miles—When this limit is reached every car is completely overhauled and sent through the paint shop.

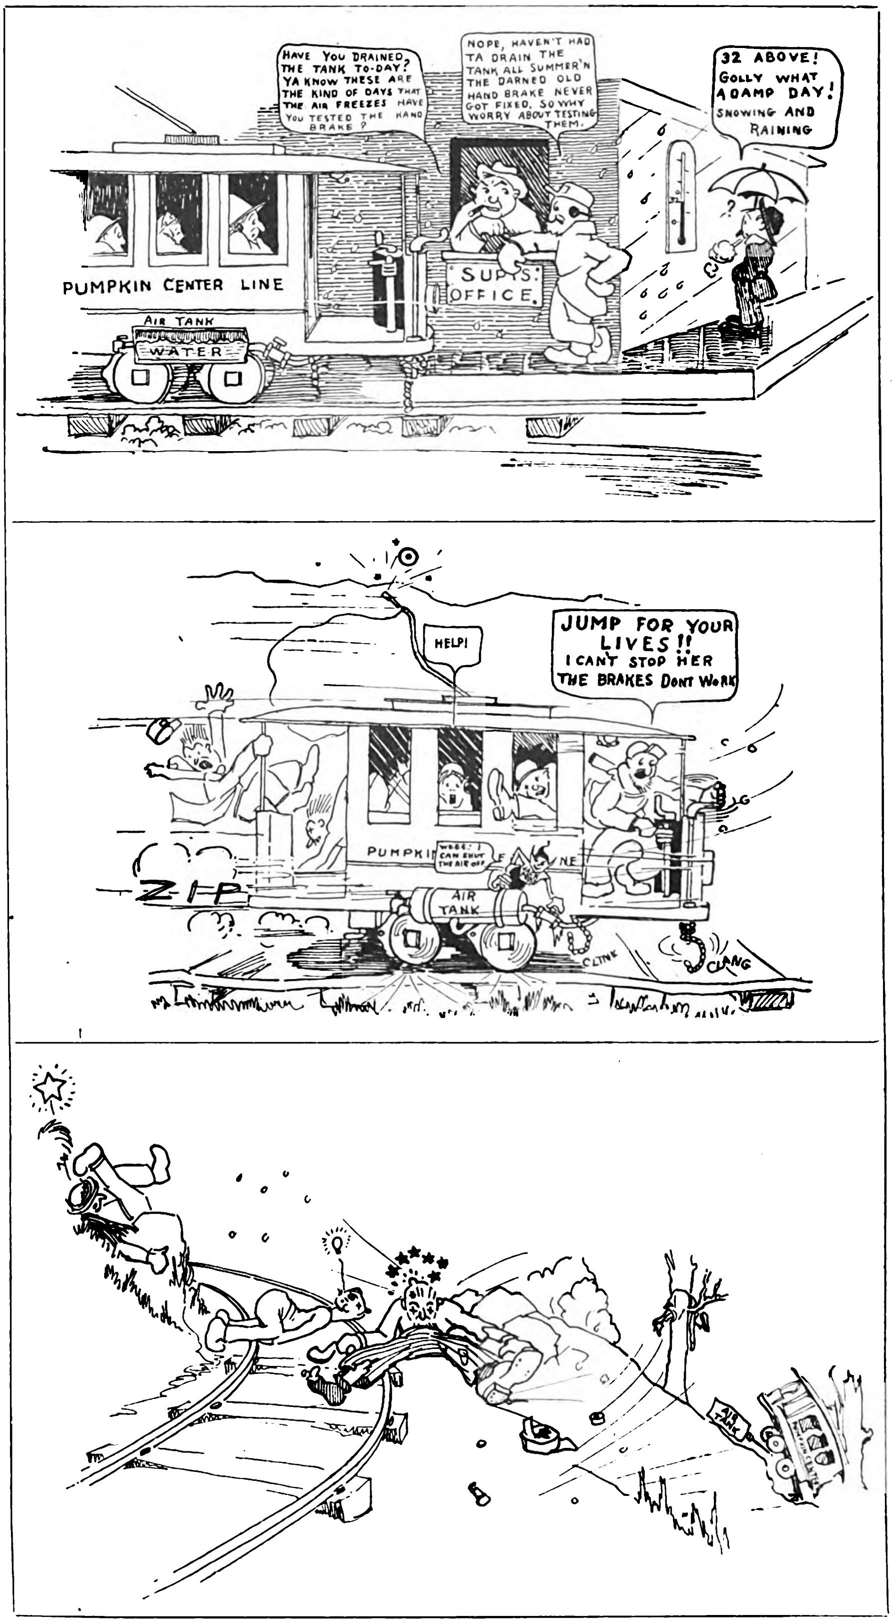
Not only has this system succeeded in reducing the street failures to a remarkable extent but it has also had a very favorable reaction from the public. Frequent comments are heard on the cleanliness and well-painted appearance of the surface cars, and we find that our conductors and motormen react very favorably to public appreciation shown for presentable rolling stock. The cost of cleaning and painting cars is after all but a small price to pay for the gratifying returns in public good will and in improved morale which is bound to follow, and this does not take account of the material savings in maintenance expenditures which result from reduced street failures.

G. H. STIER,
Superintendent Rolling Stock and Buildings.

Adventures of

Old Man Trouble on the Hicksville Railway

The Electric Car Is Not an Aquatic Animal



HAVE YOU DRAINED, THE TANK TO-DAY? YA KNOW THESE ARE THE KIND OF DAYS THAT THE AIR FREEZES HAVE YOU TESTED THE HAND BRAKE ?
NOPE, HAVEN'T HAD TA DRAIN THE TANK ALL SUMMER'N THE DARNED OLD HAND BRAKE NEVER GOT FIXED. SO WHY WORRY ABOUT TESTING THEM.

M. ZIMMERMAN and E. L. PROCTOR

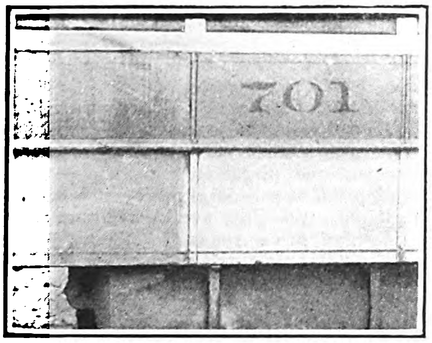
Maintenance Notes

Weekly Washing Keeps Cars Attractive

By A. F. Rexroth
Master Mechanic Harrisburg Railways, Harrisburg, Pa.

Believing that clean cars are one of the greatest inducements to ride, the Harrisburg Railways, Harrisburg, Pa., devotes particular attention to car washing. Cars are scrubbed and washed with soap every seven to ten days and a more general and thorough scouring and cleaning are given once a year. In the general cleaning Wyandotte detergent is used.

This is a scouring preparation somewhat like pumice. From 8 lb. to 10 lb. of this preparation is used to about 8 gal. of hot water. This quantity will clean and scour a 48-ft. car inside and out. An accompanying illustration shows a car as it is being scoured by this process. A marked contrast is shown in the car portion which has been washed and that which has not as yet received the treatment.



The Light Part of the Panel has Just Been Cleaned. The Remaining Part of the Car Is in Its Original Condition

The keeping of cars clean and attractive has been facilitated somewhat by the use of the enamel system of car painting that was adopted some time ago to replace the paint and varnish system. Cars now receive two coats of enamel, which is the equivalent of a three-color paint job.

Be Wise, Systematize,
Open your eyes, Modernize
And thus Economize.

"Join the K.K.K.'s"
"Keep Kars Klean"

This enamel is placed over the old paint and a good job is obtained. After a car has been newly enameled a record is placed immediately under the water table showing the date and kind of job done. Thus the designation "E-1-15-27" would show that an enamel job was done on the car on Jan. 15, 1927.

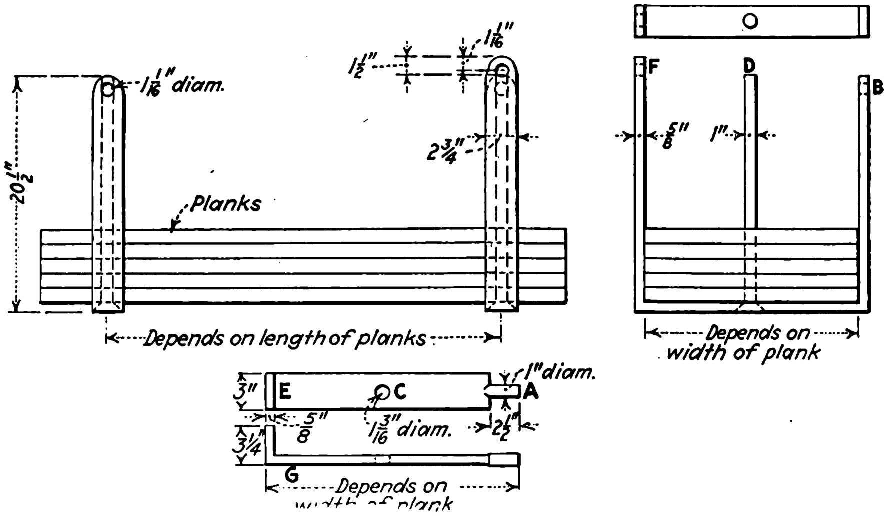
The second time that a car is brought in for refinishing by the enamel system it is given but one coat of enamel and is then restriped and relettered. By this method cars are kept in attractive condition without great expense.

Receptacle for Scaffold Plank Storage

It is a common occurrence for the paint shop organizations to be annoyed and their work retarded when men of other departments remove scaffolding planks from the paint shop and utilize them for other purposes. This was particularly true in the shop of the Washington, Baltimore & Annapolis Electric Railroad, Academy Junction, Md. To overcome this objectionable condition and assure the painters that the planks would always be at hand when required, George Watts, foreman painter, designed and built a receptacle for the storage of the scaffolding planks which has not only permitted uniform and neat storage but provided a means for locking them securely to prevent removal.

There are two ⅝-in. x 2¾-in. bar-steel U-shaped frames, each with a piece of 1-in. round bar riveted at the center of the bottom. A ⅝-in. x 3-in. flat steel strap slips in suitable holes in the uprights and provides a means of padlocking. Each plank has a 1⅛-in. hole bored in the center about 12 in. from either end. The planks are impaled in the upright posts. After the clamp is placed in position and locked it is impossible to remove any of these planks unless the padlock or other parts are destroyed. Planks not in use during the day are kept locked and the key is retained by the foreman of the paint shop. At the close of the day all planks are returned to their receptacles and locked.

This method has resulted in eliminating paint shop delays. The planks are always at hand when required. Accidents caused by breakage have been reduced since the planks are not being used for purposes for which they were not designed.

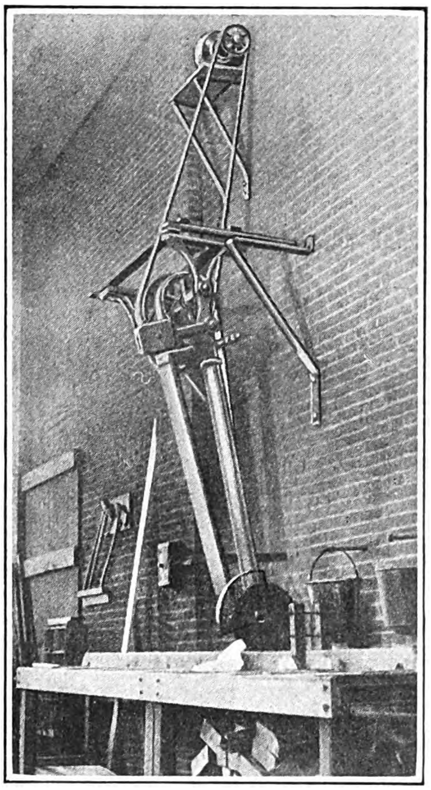


Appearance of Scaffold Storage Used in the W., B. & A. Shop

Rod *A* slips into hole *B*, rod *D* passes through hole *C*. Surface *G* rests on top plank. Holes *E* and *F* are in line and are fastened with a padlock.

Saw Belt Driven by Air Compressor Motor

INDIVIDUAL electric drive for a circular swing saw has been provided in the shop of the Lackawanna & Wyoming Valley Railroad, Scranton, Pa., through the utilization of an air compressor motor. This motor is suspended from the side wall directly above the saw by means of strong, rigid brackets and is belted through a countershaft. All of the shop requirements for this class of work are easily handled by this unit.



Circular Swing Saw Belt Driven by an Air Compressor

Utilize the PEP in the uPkEeP of your equipment.

Pull-in Classifications Corrected

IN THE table published on page 250 of the issue of Feb. 5 giving a comparative statement of car pull-ins for the year 1926 as reported by the Electric Railway Association of Equipment Men, Southern Properties, the headings "Not chargeable to carhouse" and "Chargeable to carhouse" were reversed. The lower table should have carried the first heading and the upper table the second heading.

Dick Prescott Considers Shop Policy

And Reaches a Conclusion

DICK PRESCOTT, assistant shop superintendent of the Consolidated Railway & Light Company, spent considerable time studying the design of the springs used by the company for replacements on various types of trucks. Following his investigation of the use of wood blocks to compensate for sagged springs he found that the practice of ordering replacement springs by sample had led to considerable variation in the materials obtained, with consequent unsatisfactory performance in service.

Study of the subject led him to a careful check of the operating loads on various types of equipment in service, and finally to the preparation of a series of drawings and specifications covering the types of springs needed for replacement purposes on each series of equipment.

"Here," concluded Dick, "is the kind of work that should be done by the engineering forces in a maintenance organization."

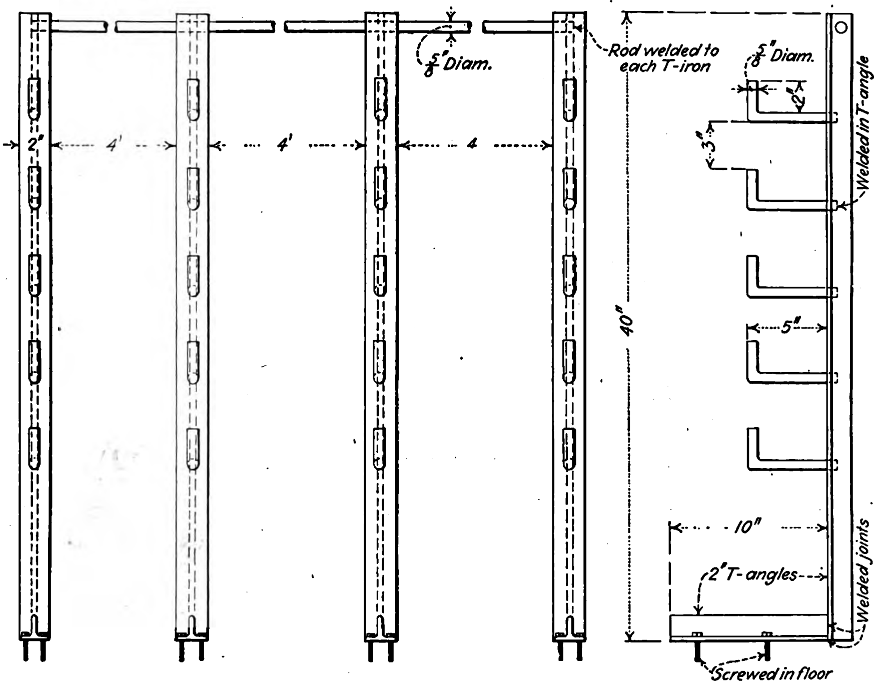
This particular subject was one to which Dick Prescott had devoted considerable thought. He had found in the Consolidated shop a general tendency to manufacture many parts, which he believed could better be obtained from regular manufacturers. True, there were machines and men available, and the manufacture of parts tended to give the shop a better load factor. So there had always existed a question as to just what constituted a sound shop policy in regard to the manufacture of parts. With the development of an engineering offce in the shop there was an even greater tendency than formerly toward manufacturing activity.

Dick had established a clearly defined policy in his own mind. "The question of delivery is one of the important factors in drawing the line between manufacture and purchase," he concluded. "Here again the stores and purchasing departments are important elements. We have a tendency to order replacements in ridiculously small quantities, and unquestionably this habit affects both the matter of delivery and cost. Careful checking of inventories and renewal parts consumption per year; closer co-operation between the shop, storeroom and purchasing department, and adoption of a general policy of buying all parts possible, even when there is a slight price shade in favor of home manufacture, would improve our situation."

His study also led to the conviction that it was hard to obtain the actual cost of manufactured parts and that the factors of quality and uniformity were sometimes stretched in favor of the shop's own output. But despite all this, he felt that there was an even more important reason for avoiding home-made manufacture as much as possible. "A railway shop," he concluded, "is primarily a maintenance organization. Its resources should be devoted to the improvement of maintenance practices and not to the manufacture of items that can be purchased from reliable manufacturers. An organization which devotes itself to the manufacture of a wide variety of parts does not give the attention which is needed to improving maintenance procedure and methods. This affects particularly the men in supervisory or technical positions. When the shop becomes a manufacturing organization, it attracts the major attention of the men in key positions, from the head of the department down. For that reason, attention which should be devoted to the primary problems of maintenance is diverted elsewhere, and the principal function of the mechanical department is left very much to drift, while the problems of manufacture absorb attention."

Dick was so impressed with the soundness of these views that he undertook the preparation of a report on this subject to the company's operating staff for Tom Mullaney's signature.

Rack for Storage of Light Bar Steel



Rack Installed in Norfolk Machine Shop of the Virginia Electric & Power Company for Storage of Light Bar Steel

BELIEVING that the appearance of a machine shop floor reflected the character of the work being performed, Master Mechanic T. W. Madison of the Virginia Electric & Power Company, Norfolk, Va., designed and erected a compact rack in the machine shop for the storage of assorted light bar steel. Prior to the erection of this rack, this material was scattered around the floor of the machine shop, creating a very untidy appearance.

This rack is constructed of four L-shaped T sections spaced 4 ft. 2 in. centers and bolted to the floor. These T's are reinforced at the top by a ⅝-in. round steel bar 12 ft. 9 in. long passing through and welded to the web, about 1½ in. from the top. A piece of T-bar 10 in. long welded to the end of another 40 in. long forms the L-shaped support. Five L-shaped ⅝-in. diameter rods, 5¾ in. long, spaced 5⅝ in. centers, form the members for the support of the stored material. These supports are inserted in holes drilled in the web of the T's and welded.

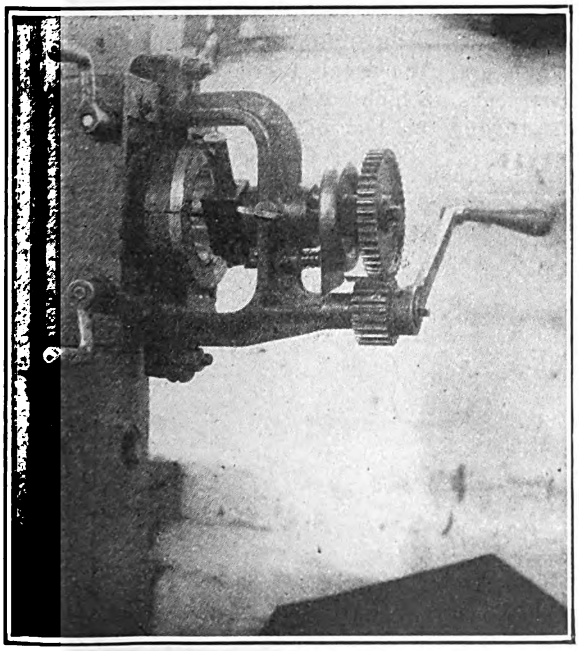
This rack occupies very little floor space. It has been found very effective for the storage of this material and has assisted in maintaining a better shop floor appearance.

Axle-Bearing Flange Fitted to Truck

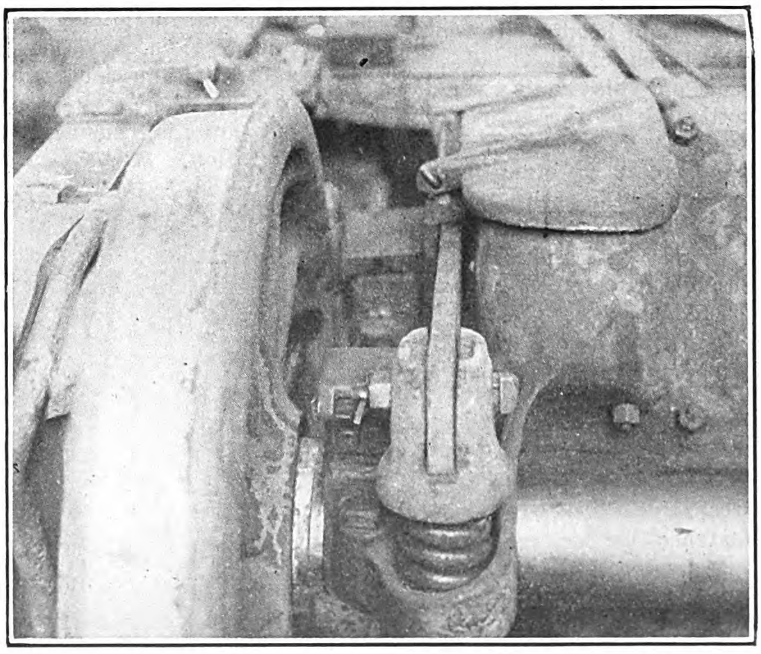
BECAUSE narrow-gage trucks are used on the Los Angeles Railway cars, there is no axle collar against which the axle bearing can be fitted. As a result it is necessary to fit the axle bearing flange to the gear on one side and wheel on the other, allowing the proper clearance.

In the truck shop, the motor is swung into its place, the pinion aligned with the gear, and then the gear end axle-bearing flange is trimmed to allow approximately $\frac{1}{32}$-in. clearance between it and the gear. The other axle-bearing flange is trimmed to allow $\frac{1}{32}$-in. clearance between it and the wheel at the commutator end of the motor. The size of each bearing flange is determined by calipering the space between the motor shell and the wheel or gear, as the case may be.

A machine to cut the flange of the bearing has been constructed and



A Machine Mounted on a Post in Los Angeles Railway Truck Shop Trims Off the Flange Face of Axle Bearing to Give It the Proper Clearance in the Narrow-Gage Truck



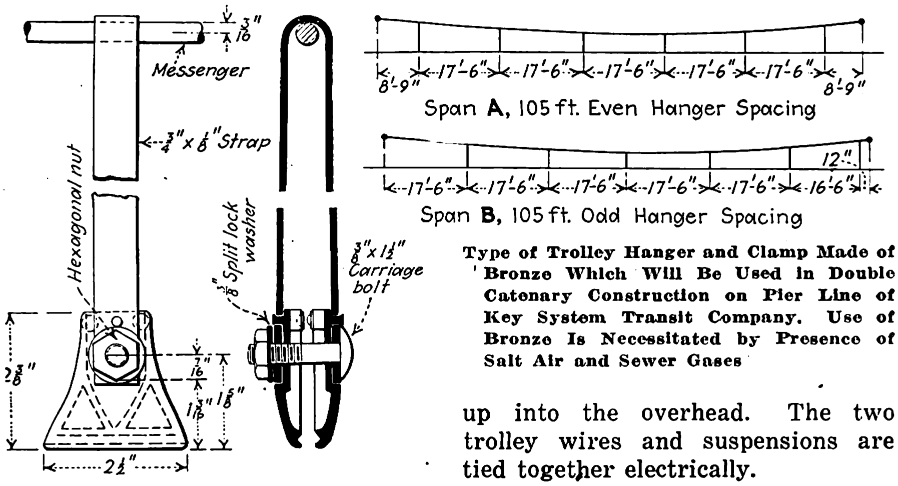
Close Quarters in Narrow-Gage Trucks Eliminates the Possibility of an Axle Collar. The Axle-Bearing Flange Fits Against the Gear at the Gear End of the Motor and Against the Wheel at the Commutator End. A Clearance of Approximately $\frac{1}{32}$ In. Is Allowed is mounted on a workbench in the truck shop. It consists of a clamping device for holding the two halves of the bearing and a U-shaped frame which has a spindle carrying the cutting tool at the end of an arm. The spindle is turned by hand through a single reduction spur gearing. One of the illustrations shows the construction of this machine. The cross feed is automatic, the tool arm being moved out of the spindle head by a feed screw, actuated by a five-pointed star pick-up, which on each revolution of the spindle strikes a lug, advancing it one point. A bin below the machine catches the waste metal, which is later reclaimed and put back into the babbitt pouring pot.

Double Catenary Insures Service

DOUBLE catenary suspension with a double trolley arranged as independent supply for pantograph operation is being installed by the Key System Transit Company, Oakland, Cal., on the 3½-mile double-track pier route between the mole, where the ferryboats connect with the cars, and the mainland at Oakland. This installation is entirely of copper and bronze. It replaces several types of overhead suspension used on this route, which is the bottleneck of the entire Key Route System. Failure of the overhead on this section of right-of-way means paralyzing the entire system. Therefore, it was decided to make the overhead construction of the best possible type and in duplicate so that mechanical failure of one line would not interfere with service.

The new trolley suspension is of the catenary type with a ⅜-in. composition bronze messenger supporting by bronze straps a No. 0000 Phono-electric trolley wire. The straps are of ¾ x ⅛-in. special bronze, fastened by bronze carriage bolts, lock washer and hexagonal nut to a trolley clamp which is designed for either wheel or pantograph operation. The two trolley wires of this construction are spaced approximately 6 in. apart, with the hanger spacing staggered to give odd and even spacing in the same span. The roller of the pantograph makes contact with both trolley wires, and as a result the mechanical failure of one does not permit the roller to fly up into the overhead. The two trolley wires and suspensions are tied together electrically.

This type of construction, using bronze, is made necessary by the climatic conditions. Salt air and the sewer gas encountered, particularly on the flats, cause excessive corrosion of any metal other than bronze or copper. The old overhead line, with galvanized messenger and hangers, has only seen service for a few years, but now is considered unsafe for operation.



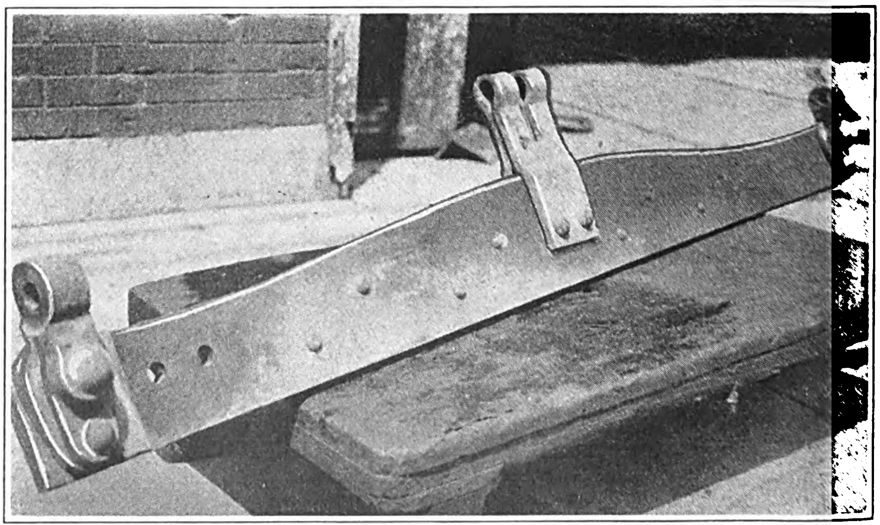
Type of Trolley Hanger and Clamp Made of Bronze Which Will Be Used in Double Catenary Construction on Pier Line of Key System Transit Company. Use of Bronze Is Necessitated by Presence of Salt Air and Sewer Gases

Brake Beams that Are Worn Where the Pull Rods Are Attached Are Built Up by Oxyacetylene Gas Welding

Welding Brake Beams to Make Good as New

BRAKE beams on all types of cars become worn at points where the pull rods are attached. The practice of the Grand Rapids Railway, Grand Rapids, Mich., is to build up the worn surfaces, fill in the holes and when redrilled the beams are as good as new.

Some of these are found to be worn to a depth of ⅜ in. The welding work is done with an oxyacetylene outfit and a welder can build up and fill in the holes of a brake beam in half an hour. Accompanying illustrations show where the wear takes place and a beam which has been repaired. This method of repair has proved effective in reducing noise.



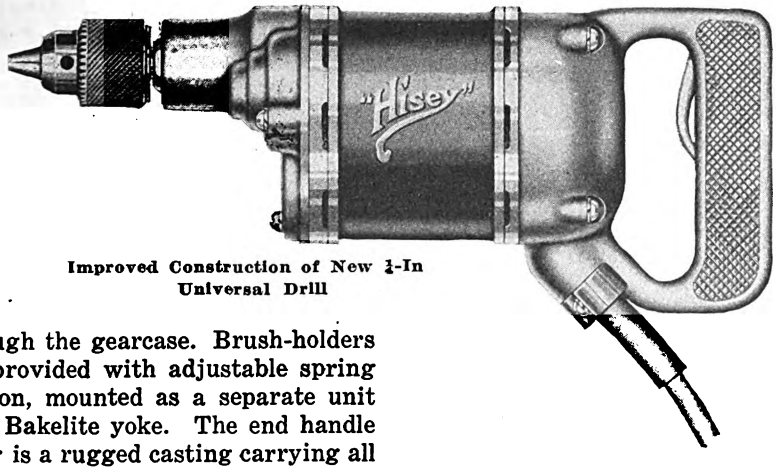
Brake Beam Repaired by Welding Ready for Installation on Car

New Equipment Available

Small Size Electric Drill

BALL bearings and a removable gear on the armature shaft are features of an electric drill of ¼-in. capacity placed on the market by the Hisey-Wolf Machine Company, Cincinnati, Ohio. The gearing is made of high grade steel, electrically heat treated. The compound gear shaft is supported with bearings at each end.

The chuck spindle is hardened and ground and automatically lubricated through the gearcase. Brush-holders are provided with adjustable spring tension, mounted as a separate unit on a Bakelite yoke. The end handle cover is a rugged casting carrying all pressure applied and is independent of the motor and its bearings. This arrangement relieves them of all strain and also affords convenient access to the carbon brushes for adjustment or renewal.



Improved Construction of New ¼-In Universal Drill

Repairs made in time save pull-ins from the line.

Improved Unit Switch Construction

BY THE application of the type 480 mechanism to the 272 switch unit, which was made possible by the development of new arc chutes, operators are given the advantages of more modern construction in unit switches manufactured by the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

The design of the type 480 mechanism is such that the contacts close with a rolling motion which eliminates wiping action. This mechanism uses a contact spring worked at a low fiber stress. The switch arm gives the mechanism better protection from arc gases and cast copper arc horns with a large cross-section of metal provide better dissipation of the heat of the arc. The use of the type 480 mechanism results in less frictional wear on the contacts, less burning of the contacts, arc horns and arc chutes and the practical elimination of finger spring breakage.

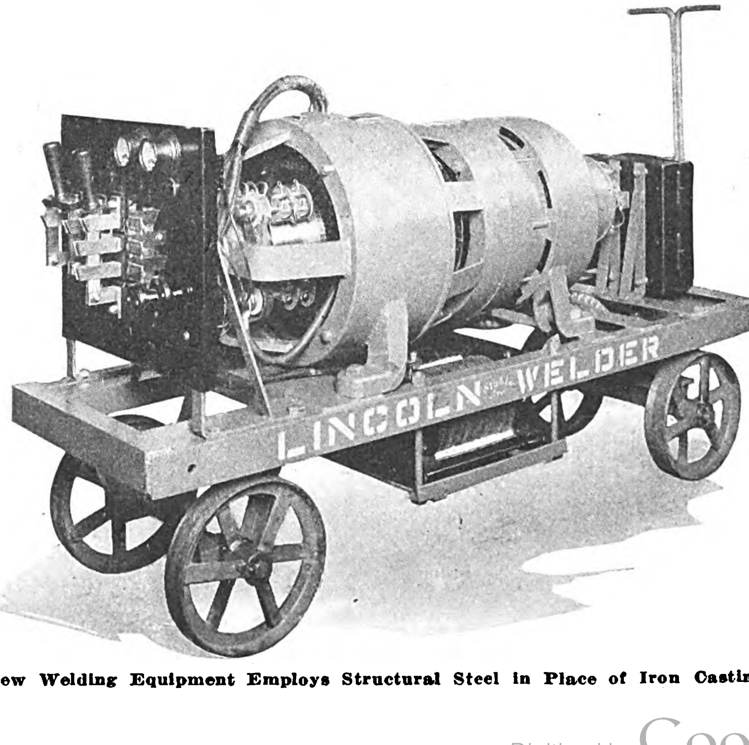
The new arc chutes are built up of asbestos lumber with sides and blocks made from a special arc-resisting molded material. The arc blocks are shaped so that they reduce the possibility of arc gases entering the switch mechanism. The complete arc chute is fastened in the switch box by one wing bolt, which permits removal with minimum effort.

In replacing old switch units, it is recommended that those in an entire group be replaced at the same time, preferably when the equipment is overhauled. Old switch units should be dismantled and serviceable parts placed in stock to be used to maintain the type 272 switch units which have not been modernized. As the stock of the old parts becomes low, additional equipment should be changed over. This permits modernization with the least confusion and lowest cost to the operator.

Welded Steel Shapes Used in Welding Framework

SUBSTITUTION of welded structural steel to replace gray iron castings for the 300-amp. "Stable-Arc" welder has just been announced by the Lincoln Electric Company, Cleveland, Ohio. The motor and generator end rings, brackets and connecting rings are all made of structural angles rolled up into the proper shapes and welded together. The feet of the motor-generator set are made of drop forgings. The truck wheels are of T-sections rolled on a special machine. The hub of the wheel is made of steel tubing. Control panels are usually made of slate or special non-metallic compounds, but the panel of the new machine is made of sheet steel welded together and welded to the supports.

The underlying idea in the adoption of this construction for the new welder is to meet the severe conditions which portable welding equipment must withstand. It is claimed that use of the steel construction, which will bend rather than break, reduces the liability of failure.



New Welding Equipment Employs Structural Steel in Place of Iron Castings

Association News & Discussions

Central Master Mechanics Meet in Toledo

Busy One-Day Session Devoted to Discussion of Brakes, Perfection of Standard Freight Car Specifications and Other Matters Which Would Facilitate Interchange of Equipment

PROGRESS in the work of bringing about greater uniformity of practice among interurban roads in the C.E.R.A. territory was made at a meeting of the Central Electric Railway Master Mechanics' Association held in Toledo, Ohio, on Feb. 2, immediately preceding the meeting of the parent association. Various phases of the work being done by this body to facilitate the interchange of freight equipment among the interurban lines in the central association territory were taken up for progress reports, discussion and further development. Car builders' representatives were present to discuss with the entire group questions in connection with the design and construction of the standard interurban box car, which was one of the early important accomplishments resulting from the work carried on since the organization of this association.

Crowded into the short space of a single day's session was a combination program consisting of papers by manufacturers' experts on subjects of direct interest to the equipment men, a conference and discussion on the work of standing committees and the customary inspection trip through the shops of the home company, in this case the Community Traction Company of Toledo. Air brake design and maintenance practices were covered in a paper on this subject by W. C. Horner of the Westinghouse Air Brake Company. This formed the basis for considerable discussion of brake inspection and maintenance methods. At the request of the association, this paper will be printed in complete form in an early issue of ELECTRIC RAILWAY JOURNAL so that it may be made available to all mechanical men interested in the subject.

AIR-MAGNETIC BRAKES DISCUSSED

Another subject which aroused a great deal of interest and discussion was that of air-magnetic brakes, which was presented by C. V. Ives of the General Electric Company. He covered particularly the form of brake developed co-operatively by the Buffalo & Erie Railway, the General Electric Company and the Cincinnati Car Company. In this design the magnetic brake is energized directly from the trolley instead of by regeneration of the motors. Magnetic brake equipments heretofore used, he explained, fall into three classes: (1) The solenoid brake, in which the armature of a solenoid transmits pressure to brake shoes on the wheels; (2) the disk brake, in which a disk keyed to the axle is retarded by a stationary disk, magnetically attracted to it; (3) the track brake, in which an electro-magnetically actuated shoe acts on the rail and is at the same time mechanically connected to wheel shoes through a system of levers.

In practically all former installations, both in this country and abroad, current for energizing the magnets has been taken from the car motors acting as generators. This method of deriving the power, according to Mr. Ives, afforded the outstanding advantage of the magnetic brake; i.e., the retarding force is automatically decreased as the speed of the car is reduced, thereby compensating for the increase in the coefficient of friction as the car speed declines. This characteristic tends toward uniform retardation without requiring any special skill on the part of the operator. On the other hand, the speaker held that the additional apparatus required and the additional size of motor needed represented inherent disadvantages of most former designs. Resistance banks were needed to limit the current to the brakes during the braking controller operations. Furthermore, when the car reached a stop and the motor armatures stopped rotating it was necessary to utilize the hand brakes to keep the car from moving.

COMING MEETINGS
OF
Electric Railway and Allied Associations

March 4—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

March 8-10—Oklahoma Utilities Association, ninth annual convention, Huckins Hotel, Oklahoma City, Okla.

March 17-18—Illinois Electric Railways Association, seventh annual joint convention, Hotel Abraham Lincoln, Springfield, Ill.

April 26-29—Southwestern Public Service Association, convention, New Orleans, La.

May 31—June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.

With any form of wheel brakes, the rate of retardation is limited by the adhesion between the wheels and the rail. For that reason, Mr. Ives explained, the combination air-magnetic design is a development of value in making possible much quicker and shorter stops in emergency than are possible with air brakes alone. He cited the results of tests made on the Buffalo & Erie property and published in ELECTRIC RAILWAY JOURNAL for July 17, 1926, page 96, and Aug. 21, 1926, page 290.

USES TROLLEY CURRENT

Due to the use of direct trolley current instead of regeneration from the motors, the control of the air-magnetic design has been worked out in a very simple manner. The design is such that the magnetic track brake is automatically brought into play whenever an emergency application of the air brake is made. It may also be used for service stops (at the will of the operator) in case of a slippery rail, provided he has first made either a partial or full application of the air brake. The automatic feature is obtained by connecting a relay valve to the automatic sanding line of the standard safety car devices. This is used as a means of actuating the relay valve, which in turn admits air from the main reservoir to small vertical cylinders that push the magnet shoes down on the rail. At the same time reservoir air is admitted to a pneumatic contactor which connects the coils of the magnet shoes, through a fixed resistance, to the line. The service application feature is obtained by connecting the manual sanding pipe from the M-28 brake valve to the relay valve through a cut-off valve, the latter being open only when the straight air application pipe is under pressure. In the pipe between the brake valve and the cut-off valve a timing element, consisting of a small reservoir and vent plug, is installed so that the magnetic brake is held on for a predetermined time and is then released independently of the air brake. In any condition of operation, the magnetic brake is released with the release of the air brake.

Mr. Ives also spoke of the continued satisfactory performance of the brakes of this type which have been installed on the Buffalo & Erie property and also on the cars of the Kentucky Traction & Terminal Company. Reports on these properties indicate that maintenance costs up to date have been quite low. He said also that operators of cars equipped with the new brakes are given a sense of security in knowing that a quick stop can be made in an emergency, and that they can accurately judge service stops even under bad rail conditions.

Most of the proceedings during the business session consisted of reports of standing committees and discussions regarding their recommendations. Questions raised by car builders in connection with the specifications for the C.E.R.A. standard box cars were the subject of careful analysis. Other recommendations of the standards committee, of which T. H. Nicholl is chairman, occupied a considerable period of consideration and discussion. Recommendations were made by this committee regarding standards which it felt should become American Electric Railway Association Standards to be included in the Engineering Manual of that association. The committee also presented for discussion the design of a master inspector's gage and recommended that arrangements be made so that a number sufficient to provide at least one gage for each member property could be ordered from a reputable tool manufacturer in order that all rejections of cars passing over foreign lines would be in accordance with a standard gage. This was felt to be more than worth while as a means of avoiding controversy because of differences in the gages made up individually by the various properties.

New officers elected for the ensuing year were as follows: President, G. R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway; vice-president, F. J. Foote, superintendent of motive power and equipment Indiana, Columbus & Eastern Traction Company. Charles Sigler, master mechanic Winona Service Company, was elected a new member of the executive committee. An invitation of the Westinghouse Air Brake Company to hold the next meeting of the association in Pittsburgh, so as to permit an inspection of the air brake plant at Wilmerding to be made, was accepted, and it was decided to make this a two-day meeting, the exact date to be set later.

The business session adjourned in the afternoon for an inspection of the shops of the Community Traction Company. During the noon-day recess all of the visiting master mechanics were entertained at luncheon by the local company. General Manager J. F. Johnson, Commercial Manager J. A. Greig and Master Mechanic W. A. Smith acted as hosts.

Higher Standards of Maintenance Will Improve Performance and Reduce Costs*

Modern Shop Machinery, Higher Grade Workmanship and Closer Tolerances Are Needed—Better and More Reliable Performance and Lower Ultimate Costs Will Result

By H. S. Williams
Assistant Superintendent of Equipment
Department of Street Railways, Detroit

Electric railway operations at present show the most alert and progressive spirit that has been manifest in a decade. The mechanical departments are feeling this and are devoting renewed study to maintenance problems. But actual improvement takes more than a decision by the equipment department to adopt higher standards; it requires that the idea be sold to the management and it is the underlying thought in the preparation of this paper to assist in this latter very necessary detail. The question that first arises before the manager is cost, and following that is its corollary—will the results justify the cost. If these two questions can be answered properly the result will or should be the acceptance of the plan. Higher maintenance standards mean slightly higher initial cost, but if intelligently applied will result in ultimate economies that will wipe out the first cost, produce continued savings and help give a more salable service to the public.

Let us examine for a moment the functions of maintenance. The first requirement is to provide for cleaning and sanitation, lubrication and adjustment of wearing parts. The second function is concerned with the detection of defective parts and their renewal before they cause difficulty, which aims at keeping the equipment in as nearly 100 per cent physical condition as is feasible. This requires foresight and regular inspection designed to anticipate possible trouble. In other words, let us call this preventive maintenance. Third, and of almost equal importance, is the study of the equipment and methods with a view to making improvements that will be economically beneficial and that will also increase the sales value of the ride.

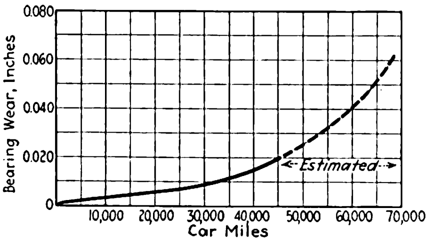


Fig. 1—Progressive Bearing Wear. Average of Tests of Sixteen Railway Motor Axle Bearings

It is not my purpose to dwell long upon the first element, though it may not be amiss to call attention to the unquestioned sales value of clean cars. People will not ride in dirty cars if there is any other means of transportation available. It is regrettable that it cannot be shown how many riders will be attracted to a car on account of its cleanliness or how many will be driven away because of its untidy condition. In a time like the present not only our own interest but the good of the communities which we serve demands that we win over the private automobile driver. But how is that possible if the seat, say of rattan, is bordered with a brownish discoloration and is only presentable where the passengers' clothing has cleaned off a part of the car seat; if the floor is littered with papers, transfer stubs, coin wrappers and dust drifts in every corner and out-of-the-way place; if the windows are streaked and dirty? It just cannot be done and the sooner we stop trying to cut the expense of car cleaning to the bone, the sooner we will help overcome the falling riding habit.

Preventive Maintenance Reduces Pull-Ins

As to preventive maintenance, we must lay especial stress on this item. Probably no one questions the economy of the principle. What is needed is more extensive use of means now within reach. A systematic, thorough, periodic overhaul program is or should be the goal of every equipment man. Failing in this, the next alternative seems to be the application of a periodic testing of car wiring, motors and all electrical equipment with high voltage in order that weak spots may be broken down at a chosen and opportune time. This results in lowered maintenance cost and improved service through reduced pull-ins. As a specific example of the effect of this practice upon pull-ins is cited the case of a road which adopted this practice in 1924 after an intensive campaign to reduce pull-ins. In this case the reductions are almost entirely attributable to the detection and repair of potential electrical failures before they caused road failures. The results are shown in the following tabulation:

COMPARISON OF PULL-INS FROM POWER CIRCUIT FAILURES AND BREAKDOWNS ON HIGH-TENSION TEST

Year	Pull-Ins per Thousand Car-Miles Due to Power Circuit Failures	Cost of Account 33 per Car-Mile	Cars Broken Down by High-Tension Test
1923	0.0647	0.0059	....
1924	0.0478	0.0044	216
1925	0.0257	0.0043	514
1926	0.0312	0.0042	1,101

It is to be noted in this tabulation that there is a slight increase in pull-ins in 1926, which is explained by an abnormal storm and flood. The increasing number of cars broken down by the high-tension test is explained by added facilities for making these tests and a more strict following out of the procedure. It will be seen, however, that the added breakdowns shown in the last column did not produce a corresponding increase in the cost of maintenance of electrical equipment.

Bearing Abuse Increases Cost

Perhaps one of the most abused elements of a street car is the motor axle bearing and there is no one item to which higher maintenance standards can be applied to better advantage. This is true because the condition of this bearing controls not only its own life but that of the motor gears. This being a sleeve type bearing, it is apparent that if it be maintained at a close fit, the only wear to which it will be subjected is frictional. So if the housing is properly designed to exclude dirt and if sufficient lubrication is provided, maximum life of the bearing will be obtained. However, if the original fit be loose enough to allow radial movement, if ever so slight, the bearing is then subjected to impact blows which are far more destructive than the frictional wear and consequently the rate of wear instead of progressing in even stages will increase at an accelerated rate. To illustrate, it is only necessary to compare this hammering action to the main or connecting rod bearings of the automobile engine. Every one is familiar with the action of these bearings and the fact that when well-fitted their life is relatively long. But let them become worn to the stage where hammer is apparent and you know how rapidly the wear accelerates to the destruction point. In order to make a definite application of this principle to the axle bearing and show exactly what happens in actual service on electric cars a series of tests has been run and accurate measurements have been made showing progressive bearing wear.

---

*Abstract of paper presented before Central Electric Railway Association at Toledo, Ohio, Feb. 4, 1927.

Sixteen bearings of the solid bronze type were used in the test. The analysis of this bearing metal is: Copper, 79; tin, 8; lead, 8; zinc, 5. The bearings were new and were carefully fitted in their housings. All of them were tightly clamped in position and three sets of measurements of inside diameters were taken by inside micrometers. These measurements were made at either end and the center, so that liability to error was reduced as far as possible. To secure a range of motor sizes, the bearings were divided among 35, 50, and 70-hp. motors. At intervals, the motors were removed from the cars, the bearings clamped back in position and the inside diameters measured. This test has been under way for fifteen months, and while it has not been finished, sufficient data are available to show the tendency of wear and to predict its future trend with reasonable assurance. So far as could be determined, this is the first study that has been made of progressive bearing wear of motor bearings. A detailed record of all the data obtained to date would needlessly confuse this discussion, so the averages have been computed and are shown graphically in an accompanying illustration. Attention is called to the fact that the results from the various test bearings are remarkably consistent. This gives confidence that the results shown in the graph reproduced on the preceding page can be depended on.

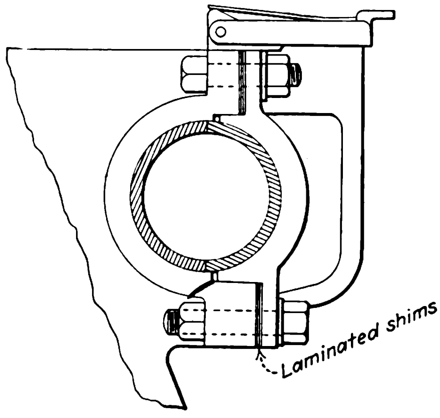

Fig. 2—Type of Railway Motor Bearing Tested

The important deduction from this test is the value of bearing mileage during the time that the bearing clearances are small, or, stated in another and more specific way, a bearing wear of 0.001 in. in the early stages of bearing life will give approximately ten times as much mileage as 0.001 in. of wear near the end of its life. This furnishes proof that loose bearings are not economical and that to secure maximum life the original bearing fit must be as tight as practicable.

Assuming agreement with the principle that loose bearings are not economical, what shall be done to maintenance standards to bring about greater life and economy? First, the outside surface of the bearing should be given more attention. The bearing should receive careful machining, to the end that when clamped in position the strains of the axle cap shall be uniformly distributed and that there shall be no distortion. Also the clamping should produce the strong vise-like action that will hold the bearing tightly in the shell and will eliminate dependence upon keys or dowels to keep the bearing from turning. Dowels were originally designed as locating means only, although the practice has gradually grown into existence of expecting them to hold the bearing from turning. In fitting of axle bearings the practice should closely approximate the fitting of connecting rod bearings of an automobile engine. The cap should have a clearance at its bolting lugs and this space should be filled with laminated shims. The intent of this may be understood better by reference to the accompanying illustration which shows the recommended method of fitting.

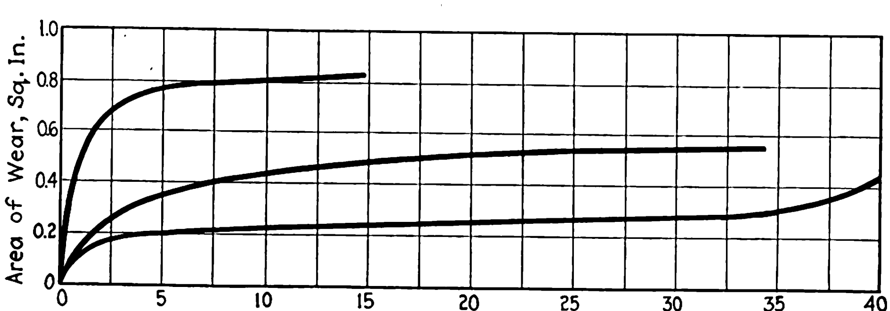

Fig. 3—Characteristic Gear Tooth Wear

SMALLER CLEARANCES DESIRABLE

As to the wearing surface of the bearing, it is believed that clearances may be made smaller with profit. To do this the bearings must not only be individually fitted to the axles, but it is contended that the finish fit must be a line-reaming operation. If you will check the alignment of surfaces of newly prepared bearings when clamped in position but without the axle in place the necessity of this will be readily apparent in most cases. A line-reaming operation is not necessarily a difficult nor complicated thing if properly approached. It is estimated that it will add not more than $1.75 to the cost of one motor overhaul while the value of added life should run to many times this cost.

Present standards call for an axle-bearing clearance of 0.015 in. to 0.017 in. Every thousandth that can be saved in original fitting means approximately 5,000 miles added to its life. With careful machining the clearances may be reduced to 0.010, or 0.007 in. less than present practice. This, it is predicted, will add 35,000 miles to the bearing life, which will certainly justify the added cost of higher standards of machining previously mentioned. The next step that logically follows is to apply the line-reaming operation to armature bearings, though the results from this will not show results proportionate to those obtained from axle bearings.

BEARING WEAR AFFECTS GEAR LIFE

As stated previously, bearing wear has an important effect upon the life of gearing. Loose bearings will superimpose the element of hammer blow upon the normal frictional wear in exactly the same manner as pointed out in the case of axle bearings. A third element of wear is injected into the case when bearing wear is such as to permit a spreading of gear centers, although this is the least important factor. This is contrary to the commonly accepted view, but it is a fact that if the tooth form is correct and the mounting of the gearing is solid, that is, that the bearings are not worn, the effect of spread centers has little effect on the efficiency of the involute gear. Of course if the teeth are badly worn, another set of conditions is introduced and the normal wear will be excessive.

Spreading centers of correct gears changes the pressure angle. This results in increased tooth and bearing pressures and concentration of wear over a smaller area of the tooth. To show the exact effect of this, the change of pressure has been calculated for the spur gearing of a modern 35-hp. motor with a 20-deg. pressure angle. If the bearings on this motor allow the gear centers to spread ⅛ in. this changes the pressure angle but 2.2 per cent. This means that tooth pressure and bearing pressure due to gears is increased only 2.2 per cent. This naturally results in increased wear, but the increase is not sufficient to cause alarm if bearings are tight. Such, however, is not the case in practice because the thing that causes spread centers is worn bearings. As in the case of the bearings themselves, this looseness allows vibration and consequent hammer blow on the gear teeth with a resultant wear far in excess of normal frictional wear. The exact loss of life due to the hammer blow is difficult of determination. It could be evaluated only after a long series of practical tests. However, it is predicted that the probable wear characteristic will resemble the form of curve shown in Fig. 1.

Now let us examine the other side of the picture and see what would happen to the gear life if the bearings are kept tight. Recently an exhaustive investigation of gear life was made by the University of Illinois. This included careful records of progressive wear. From the data secured in these tests computations have been made to show the characteristic wear of gears. Of course the tests referred to were not made upon railway gears, but the tooth form was the same and pressure angles used were 14½ deg. and 20 deg. Fig. 3 shows the results for several combinations. From this it will be seen that wear occurs rapidly at first but slowly toward the end of its life. Just previous to the finish of the test, the wear curve shows an abrupt rise. The value of these data is to show the tendency of gear tooth wear under good conditions or what the characteristic wear will be if bearings are kept tight. If bearings are loose then the wear curve will not flatten off as indicated in the accompanying diagram, but will continue its abrupt rise and probably following the characteristic of the curve shown in the illustration.

TIGHT BEARINGS MEAN LESS NOISE

Having shown that it is highly economical to keep bearings tight, let us look at another view of the question. We are all endeavoring to reduce noise in car operation. Loose bearings and worn gears are one of the greatest sources of noise, so high maintenance standards in these cases will do more to eliminate noise than any other single line of action. It may be argued that as long as we have to depend upon spur gearing or a low angle helical gear we will have noise. If present methods of gear cutting were the only ones in sight, this might be admitted, but fortunately such is not the case. Gearing is inherently quiet. It is inaccuracy of cutting that makes noise. It is predicted that within two or three years we shall be able to secure gears whose inaccuracy will be measured in ten thousandths of an inch instead of thousandths. With the advent of such gearing, we shall be able to obtain results in quietness hitherto deemed impossible. So it behooves us to bring up our standards of bearing maintenance to such an extent as to take full advantage of this perfected gearing when it arrives.

It is manifestly impossible to take up all of the details of car maintenance to which higher standards may be profitably applied. However, the line of reasoning developed in the cases which have been discussed applies to practically all wearing parts. It must not be thought that the advantages to be gained by the introduction of higher standards of maintenance can be obtained without cost. Far from it. First, it will undoubtedly call for an investment in machinery. If present machines are not in first-class condition and capable of doing accurate work they will have to be replaced. Special tools will have to be provided. Second, and more difficult, the mechanics will have to be trained to accommodate themselves to the new requirements. The ultimate savings which are bound to accrue will not be apparent until considerable time has elapsed. In other words, if a car is now overhauled on a basis of eighteen months and by improved methods this period can be extended to 24 months the savings will not be manifest until the eighteenth month. Consequently the adoption of such a plan requires foresight, confidence and courage. It is unthinkable that we should be content with present practices, because that would be to assume that perfection has been reached.

Modern Production Methods May Be Applied to Maintenance Work*

Introduction of Labor-Saving Machines and Time-Saving Methods Are Possible in Many Maintenance Operations—Workman Morale Must Be Built Up to Secure Results

By W. T. ROSSELL
General Manager Pittsburgh Railways

TRUE economy is what we are seeking. Better maintenance or less cost, or both, means cash, which can be used in any way we see fit. There is a close analogy between all forms of work. Whether we are maintaining cars or track or overhead lines, the underlying principles are the same.

If we look back ten years, improvement in methods is obvious. The same will be true ten years hence. We can hasten this change, but first we must admit honestly to ourselves that our present methods are not the best. We pride ourselves on the accumulation of knowledge the value of which sometimes passes as we acquire it. Experience may become an actual burden as it is always based on the past, whereas we must live and work in the future. It is not desired to belittle knowledge and experience, but to keep them to their proper functions. They are tools, nothing more. A machine or unit of equipment, crystallizing knowledge and experience as it does, becomes a liability as soon as further improvements are developed. So it is with the mind if we fail to seek new ways.

Some one has said that mental attitude is more important than mental capacity. Courage to act according to our convictions and courage to asume full responsibility for our actions is needed. Much of our progress is necessarily through trial and error. Analyze the maintenance problem—there are five definite parts: Supervisory force, workmen, machinery, materials, design. In addition there is a flexible force which pervades the whole. It is method or organization and it determines and controls.

MANAGEMENT FIXES THE VIEWPOINT

The supervisory force includes all who do not do the actual work. It is obvious that the mental capacity of these men from top to bottom is but average and is beyond control. Their mental attitude, however, can be controlled. Justice, opportunity, security, ambition, interest, vanity, all play their parts. Each man has but to recollect his past to understand. Here is the part of management. The subject is too wide to attempt a complete exposition. Favoritism, nepotism and harshness must go. Each must feel that he is judged solely on merit. We must "know no difference of race or creed." There must be a similarity of opportunity in different departments and groups. This is obtained through the plant of organization and the method of promotion. Wherever we find a position without opportunity, there we find a discontented man. See to it that the curve or per cent of opportunity is favorable to all. The individual must feel that if he performs well his position is secure. Due consideration must be given to the humanities, the ambition, the interest, the vanity of the individual. In a word the morale must be high. Here again is the part of management. Now, with a high morale, we must somehow keep all of these men discontented. One of the masters has called it divine discontent.

Through discontent comes progress. They must be discontented with methods and results. They must feel that each process can and must be improved, that each improvement is but a step toward a distant goal. This feeling must reach each one and the utmost freedom of thought and discussion must prevail. Any man's ideas are worthy of respect.

Each man in the supervisory force must be given a definite part and his title should so state. There should be no "assistants." An assistant is usually either a messenger boy or a member of the department office who does all the work, depending on the nature of his chief. Initiative and courage and self-assurance should be developed by judging results and not separate acts. Fear of criticism by superiors is a creeping paralysis which stifles all progress. Petty interference will do the same. We must recognize and overcome the tendency, which all have, to become satisfied, to get in a rut, to cease struggling, to let well enough alone.

In the case of workmen we may

---

*Abstract of paper presented before Central Electric Railway Association, Toledo, Ohio, Feb. 4, 1927.

expect only the average. But the morale may be raised to the heights. All that has been said of the supervisory force is equally true of the workman. See that he understands what is being done and why. Encourage and praise him if he is doing well and talk frankly to him if he is not. Above all, see that he has a proper amount of work to do and that his work is geared to that of others. This gearing of one man's work to that of others brings a proper pride and feeling of responsibility that will cure much indifference and idling. If work slows down, it is quickly shown who is at fault and how.

LABOR-SAVING MACHINERY ELIMINATES DRUDGERY

Upon the introduction of labor-saving machinery depends much of our hope. The elimination of drudgery and the raising of the productivity of the individual will come about more through the use of machinery than in any other way. Both selfish interest and common interest call for the use of more and more machinery.

For proper maintenance results, materials should be of proper quality of course, and the utmost care should be taken to assure this. Even more important, however, the flow of materials to the work should be regular and ample. For mass production this is essential. An investigation of the methods of leaders in manufacturing will convince any one of this. A shortage even of unimportant items may prove very costly.

In general, we inherit design and must make the best of it. It is usually very faulty as it is of the past. We may cure minor and glaring faults slowly, but in general we cannot greatly change the equipment on our hands. However, we can and should call the attention of manufacturers to faults. In general, it is the duty of manufacturers and not that of operators to improve design.

ORGANIZATION INCREASES PRODUCTION

It is through method or organization that we may attain what is known as mass production. Its application to maintenance differs from its application to manufacture only because the former is partially repetitive and the latter is entirely repetitive. This gap is bridged by three steps: First, the unit to which the repairs are made is separated from the whole and then dealt with as a complete unit; second, pools of assembled units, partially assembled units and separate parts are maintained and located between each work step and the next; third, the repair is made rather complete, that is, parts are replaced which still have some life.

This last rule covers both small and large units and may be called the overhaul method. All of these processes, however, still lack some of the efficiency which may be attained in manufacturing where exactly the same thing is done over and over.

Now, we have many examples of what to do. A spy tells me that the Ford plant is well worth investigating.

Broadly, we are endeavoring to obtain satisfactory results with as little work as possible. The mechanical equation of work is — force × distance = work. It is obvious that the only way to decrease work is to decrease force or distance or both. Consideration will show us that cost of force varies greatly and that the equation may be restated. Cost of unit of force over unit of distance × force × distance = cost of work.

The cost of a unit of force over a unit of distance at once suggests cranes, tractors, grinders, and other machinery of all sorts. It also introduces the economic problems which go with the use of machinery, such as its utmost use, depreciation, etc. It is usually cheaper to apply a greater force once than to apply a lesser force many times. So we get mass handling of material. Specialization is also suggested as different grades of labor differ in cost. There are ways of reducing the amount of force through more efficient machines and better lubrication. Improved methods of using levers, wrenches and other tools by workmen will also reduce this factor.

The reduction of distance leads the way to centralization, specialization and routing of work, materials and tools. When a workman lifts or sets up a tool, performs one operation and then goes to something else, the lost motion becomes obvious. Examples are all about us, and if we have builded our organization well and will keep its aims high, we cannot fail in our purpose of applying modern production methods to maintain work.

Illinois Association to Meet March 17-18

ILLINOIS Electric Railway men will meet jointly with the state gas and electric associations at the eighteenth annual convention to be held on March 17 and 18, at the Hotel Abraham Lincoln, Springfield, Ill. According to an announcement by Secretary E. V. Prather, the Central and Western Passenger Associations have granted reduced fares—1½ fare for the round trip —over all steam roads in the state, and this same reduction has been made by the Illinois Traction System. He also suggests that hotel reservations be made direct with the hotel.

Papers to be presented before the electric railway association are as follows:

"Traffic Regulation and Relation to Street Car Operation," by E. J. McIlraith, staff engineer Chicago Surface Lines.

"Track Maintenance," by Jonathan Wolfe, assistant supervisor of track and roadways Chicago Surface Lines.

"Handling L.C.L. Freight by Truck vs. Railroads."

"Advantages to the Public of One-Man Car Operation in City Service," by R. F. Palmblade, manager Peoria Railway.

"Car Construction," by M. J. Oswald, sales representative St. Louis Car Company.

"Bus Maintenance," by H. P. MacDonald, superintendent of automotive equipment East St. Louis & Suburban Railway.

There will also be two morning joint sessions on public relations, finance, terminable permits and public utility information.

Automotive Engineers Discuss the Bus

THE place of the motor bus in urban transportation was the subject of a meeting held by the Metropolitan Section, Society of Automotive Engineers, in New York on the evening of Feb. 17.

Speaking with a background of more than five years experience in bus operation, R. N. Graham, manager of railways Pennsylvania-Ohio Edison Company, presented a carefully prepared analysis of the part the motor bus may be expected to play in the transportation scheme of the country. Mr. Graham spoke not as a railway man, but as a transportation man interested in finding the place of each form of vehicle which is available for transportation purposes. An abstract of his talk will be published in next week's issue of the JOURNAL.

Both automotive and electric railway men took part in the discussion. Adrian Hughes, Jr., manager Baltimore Coach Company, said that progressive transportation men today have no prejudice against the automotive vehicle. If there was such prejudice when the bus first made its appearance, the speaker explained, it was the natural result of the unfair conditions under which a great many original competitive bus lines were started. He held to the view that the application of buses as a part of the transportation systems of modern cities should be dictated by the economics of each situation. He said that the study of the matter of how best to use the motor bus, and the analysis of the factors which determine the proper vehicle to use under each given set of conditions, is considered by progressive transportation men to be one of the major problems of the industry.

Gas-electric drive for buses, effect of power brakes on tire wear and one-man operation of double-deck vehicles were phases of the subject discussed by other speakers.

American Association News

T. & T. Executive

PROGRESS reports of committee chairmen occupied the greater portion of the time at the meeting of the executive committee of the T. & T. Association held in Toledo, Ohio, on Feb. 4. R. N. Graham, chairman of the committee on bus operation, indicated substantial progress of the work which has been undertaken. S. E. Emmons reported on the work of the service betterment committee, in which much new work is being undertaken. In the absence of Chairman C. H. Evenson, Samuel Riddle reported on the work of the traffic and safety committee, which is being conducted jointly with the claims association. This committee recently reviewed the conditions of the Anthony N. Brady Award and agreed with Chairman Thomas Fitzgerald of the American Association committee on a revised set of conditions to be offered to the American Association and the American Museum of Safety. A subcommittee was appointed to co-operate with the electric railway section of the National Safety Council in preparing a revised classification of accidents.

President Sullivan appointed two new committees. The one on convention program consists of W. H. Boyce, chairman; Paul Wilson and A. R. Myers. In addition to preparing the program for the T. & T. Association, this committee was also instructed to get in touch with President Proctor of the Claims Association regarding arrangements for a joint session for the presentation of the report of the joint committee on traffic and safety.

A committee on subjects for next year's work was also appointed, consisting of Edward Dana, chairman; Samuel Riddle and G. B. Anderson. This committee is to consider the results of this year's work and make recommendations for the work of the committees for next year, also taking into consideration whether committees on entirely new subjects should be appointed and some of the present subjects dropped.

It is planned to have the next meeting early in July after the reports of the standing committees have been presented. The date and location will be announced later.

President Sullivan appointed a committee on resolutions on the death of E. M. Walker, late president of the Schenectady Railway. This committee, consisting of Paul Wilson, Edward Dana and Samuel Riddle, was instructed to draft suitable resolutions and submit them for presentation at the convention and inclusion in the Proceedings. A letter of appreciation from Mrs. Walker for the floral tribute sent by members of the committee was read.

Those present were President J. V. Sullivan, Edward Dana, W. H. Boyce, Samuel Riddle, A. R. Myers of the executive committee; Committee Chairmen S. E. Emmons, R. N. Graham, and J. W. Welsh and G. C. Hecker.

Depreciation

POSTPONEMENT of the Interstate Commerce Commission hearing scheduled for Feb. 28 on depreciation, Docket No. 19157, until May 23, 1927, was obtained by Lucius S. Storrs, managing director of the American Electric Railway Association. This change was announced to the sub-committee on depreciation of the national relations committee at a meeting held in New York, Feb. 17, 1927.

Electric railways which report to the Interstate Commerce Commission will be interested in the course events are taking with respect to the impending order of the Interstate Commerce Commission in the matter of entering an order prescribing a system of depreciation accounting for electric railways substantially the same as that entered recently with respect to depreciation charges of steam railroads. Before considering the proposed order it was the idea of the commission to hold a hearing on Feb. 28 at Washington, D. C., before Examiner Bunton, at which those concerned were to have an opportunity to testify.

It was decided that the committee would present the case of the electric railways showing that the situation of the industry was essentially different from either the steam railroads or the telephone systems. Only a few of the electric interurbans and still fewer city systems come under the Interstate Commerce Commission jurisdiction. The assumption is, however, that many state commissions may follow the example of the Interstate Commerce Commission if the national commission should promulgate this change in the depreciation system. The committee recognized the isolated character of electric railways. This and the widely different conditions of finance, earnings, and competition with automobiles was considered of such importance that no standard rule of depreciation could be made effective with justice to all.

The committee outlined a program to collect data and prepare a comprehensive study of the industry. Obtainment of outside counsel to help present the case scheduled for May 23 was agreed upon.

Those of the committee present were: J. H. Hanna, chairman; Thomas Conway, Jr., F. W. Doolittle, W. F. Ham and C. R. Mahan representing C. E. Thompson. In addition Charles L. Henry, Lucius S. Storrs, J. W. Welsh and other members of the association staff attended.

Education

IMPORTANT plans were approved for further development of foreman training and study of the training of platform men at a meeting of the American Association committee on education, held at Toledo immediately after the annual convention of the C.E.R.A. This meeting followed correspondence among the committee members as to the best procedure for the current season and it proved successful in bringing out constructive suggestions.

In attendance at the meeting were these committee members: Edward Dana, chairman; H. H. Adams, W. H. Boyce, F. H. Miller, H. H. Norris and A. J. Sarré. M. B. Lambert was represented by A. B. Gibson and J. A. Dewhurst by Charles Gordon. Guests present by invitation included J. W. Colton, Prof. D. D. Ewing, E. P. Waller and Adolph Schlesinger, all of whom have shown keen interest in the work of the committee.

Discussion on the foreman-conference movement showed a lively interest on the part of railway managers and the need for some definite plan for training foreman-conference leaders. The series of conferences preceding the demonstration at Cleveland was believed to be a step in this direction. The subject is so large, however, that it was referred to a sub-committee, as follows: Mr. Dewhurst, chairman, and Messrs. Lambert, Boyce and Sarré. This committee will consider all possible methods of training, including the holding of a series of training conferences at the Cleveland convention this year. If such a series is planned it is understood that the sessions will occupy only a half day each.

The training of transportation employees was taken up in some detail, with the result that a sub-committee on this subject was appointed also. Dr. Rowland will be chairman, and Messrs. McCants, Adams and Hyatt will complete the committee. This committee will report on the general situation in this field with the possibilities of effective work in the field by the committee.

A third sub-committee was appointed to bring about greater publicity for the educational work of electric railways. The committee comprises Mr. Norris, chairman, and Messrs. Boyce, Dewhurst and Burke.

It was deemed necessary this year to send out a questionnaire to gather facts on educational activities in the industry, but this will be so worded as to call for a minimum of time in the compilation of the replies. The committee will also bring up to date the bibliography on educational work which formed an appendix to the report for last year.

In the interest of conservation of time and energy at the disposal of the committee it was decided to omit the educational exhibit at the 1927 convention and to concentrate upon the phases of the work assigned to the sub-committees named. As a guide to future activities a chart will be prepared showing the ramifications of educational and training work on an electric railway property. Thus the committee this year and later will have a guide by which to prepare its plans, taking up at one time only those lines of work that are timely and promising.

Bus Operation

GENERAL discussion of various phases of operation was participated in by the members of the committee on bus operation of the T. & T. Association at its meeting held in Toledo, Ohio, on Feb. 3. A check-up was made of the replies to the questionnaire which was sent to 51 companies. It was found that nineteen companies had been heard from. It was decided that the chairman would follow up the members responsible and attempt to get the data all in within the next two weeks.

Progress was reported by the sub-committee chairmen on the four subjects which are being studied. Much of the work is awaiting the tabulation of material from the questionnaires.

It was decided to hold the third meeting of the committee in Chicago, Ill., on April 8 at 9 a.m. Central Standard time, the meeting place to be arranged for by B. W. Arnold.

Those present at the meeting were Sponsors Paul E. Wilson and A. R. Myers, Chairman R. N. Graham, D. L. Fennell, S. W. Greenland, M. L. Harry, Adrian Hughes, Jr., D. S. Mackay, Thomas Noonan and D. A. Scanlon, members, and G. C. Hecker, R. E. Plimpton, W. W. Holden, C. D. Smith and R. F. Palmblade, guests.

The News of the Industry

$750,000 for Rehabilitation in Phoenix

The City Commission of Phoenix, Ariz., has unanimously approved an ordinance calling for a special municipal election on March 12, at which the public will be asked to approve an issue of bonds totaling $750,000 for the purchase of new cars, rails, ties and other necessities for bringing the present municipal railway up to date. The ordinance calls for the rehabilitation of the entire system, including the Washington Street, the Brill, the Indian school, the Grand Avenue, the Kenilworth and the Hollywood lines.

The ordinance adopted by the commission asks approval of the issuing of 750 bonds of a denomination of $1,000 each. The bonds are to bear interest at a rate not exceeding 5 per cent per annum, payable semi-annually, maturing at the rate of $30,000 annually, over a period of 25 years beginning in 1932. Under this plan the system will be operated for a period of five years before the sinking fund begins to operate.

Parking Regulations in Philadelphia Opposed

Hardly had the enforcement of the new parking regulations in Philadelphia been in effect when a demand was forwarded to the Mayor and Director Elliott for their modification. In a set of resolutions the Market Street merchants asked for half-hour parking, claiming that the restrictions are driving trade away. So far has the protest gone that an ultimatum was delivered to the city administration on Feb. 11 by the Market Street Merchants' Association stating that unless the parking ban on Market Street was modified the association would file an injunction demanding enforcement.

In response Director Elliott has told the Market Street Merchants' Association that he would fight all attempts to modify the anti-parking ordinance until it has had a fair trial. His attitude met the approval of several traffic organizations and officials, including the traffic committee of the Chamber of Commerce and Kane S. Green, president of the Automobile Club of Philadelphia. Director Elliott told the representatives of the association that he would make no change in the regulations until all the "no parking" signs had been erected and the ordinance had received a reasonable test. Then he and Superintendent Mills would report to the City Council.

When the parking bill was signed the warning signs were still in preparation. Under the ruling of the court these signs are a necessary preliminary to the enforcement of the rule. The recent parking regulations have been referred to before in the ELECTRIC RAILWAY JOURNAL.

The latest move on the part of the Market Street Merchants' Association was the drafting of a parking bill on Feb. 15, the third ordinance since the anti-parking dispute. Two of the ordinances providing for restricted parking in the central city district were introduced in the Council on Feb. 17. Director Elliott refused to comment other than to say that enforcement of the parking ban was uppermost in his mind.

One-Man Car Right Sustained

Toronto Transportation Commission Wins Point Over City's Complaint—Review of the Situation in Canadian City—Amalgamated President Defends New Equipment

BY JUDGMENT of the Ontario Railway Board, the application brought by the city of Toronto to restrain the Toronto Transportation Commission from using one-man cars has been dismissed with costs. The decision was based upon an investigation conducted by its officers which resulted in the finding that accidents occurring with one-man cars could not have been prevented by the two-man type. Vice-Chairman Ingram said:

> If the people of Toronto are dissatisfied with the one-man car it is their duty to present their feelings to the Transportation Commission. It has not been shown that there have been accidents due to this type of car, and that is the only phase in which we are interested.

During the hearing of the application it was contended by Controller MacGregor that the opinion of the City Hall was unanimously in favor of the removal of the one-man cars. This statement, however, was sharply challenged by I. S. Fairty, K.C., counsel for the Transportation Commission, who stated that Controller MacGregor did not represent the unanimous opinion of the City Council, and could not get such a motion through if he wanted to. Mr. Fairty objected to statements made by Controller MacGregor during his election campaign, characterizing these as "reckless and wild."

Mr. Fairty declared that it would have been much more sporting for the city to have gone to the Toronto Transportation Commission and asked it to abandon the one-man cars than to apply to the board. He regretted that much election propaganda had been spread on the question. The commission, he said, had spent thousands of dollars in remodeling cars with the approval of the Board of Control.

CONTROVERSY IN MONTREAL

Agitation in Canada against the use of the one-man car was not confined to Toronto. The Montreal Trades and Labor Council's objection to the one-man cars was expressed in a resolution passed on Nov. 4. A copy of the resolution was sent to the Montreal Tramways management, accompanied by a letter which said in part:

> We hope you will give the resolution deserved consideration, as this is a vital question in the interest of the Montreal public, and, as a public body, we would like to have an opportunity to discuss this question with your company.

Julian C. Smith, president of the Montreal Tramways, replied in part:

> We believe that further study of the situation will convince you of the material benefits which the community gains through the operation of the one-man cars. We will be very happy to discuss the situation with you, and if you will advise me when it will be convenient to meet yourself and any other representatives of the Montreal Trades and Labor Council at the tramway offices, I will be glad to arrange to have with me some of our people who can discuss intelligently the features of the one-man cars that you refer to.

The Trades and Labor Council also sent its resolution to the Montreal Tramways Commission, and it received a letter from the commission about the same time as it received Mr. Smith's. The Trade and Labor Council considered these communications, and one-man car operation generally, at a meeting late in Nov., 1926, and reports indicated that the discussions were, in the main, far from harmonious. It was decided that no delegation should be sent to consult with the tramway management, on the ground that the company is not a controlling body, and that action to be taken on the commission's communication should be left to the Council.

The Trades and Labor Council's president, Mr. Foster, was very critical of the tramway union. It was a strange thing, he said, for the tramway union to denounce one-man cars and ask the T. and L. Council to do the same and then send a delegation on a tour to determine if its criticisms were correct. He felt that the union might have made sure that one-man cars are undesirable before asking the T. and L. Council to go on record against them.

Julian Smith, a few days later, stated that the protests against one-man car operation had been made before the equipment had been given a fair trial. He said that the fears held by labor that one-man car operation would reduce employment were groundless and pointed out that the fact of one-man cars constituting 30 per cent of the street cars operating in North America would indicate that they had merit.

He said the company had no desire to force on the public something it does not care to engage in any controversies.

not want, and that the one-man cars were introduced solely in keeping with the company's policy to give the public the best service possible.

G. Gagnon, president of the Montreal Tramways Employees' Union, was unable to accompany the delegation appointed to inquire into one-man operation in other cities and was replaced by R. Trepanier. Messrs. Trepanier, Champagne and Manion visited Detroit, Toledo, Cleveland, Pittsburgh, Trenton, Youngstown, Elizabeth, Scranton, Newark, New York, Bridgeport, Philadelphia, Albany and Troy in the latter part of November and their report was considered at a union meeting on Dec. 1.

It stated that one-man car operation was practically universal in all the cities visited, and of even greater importance, it indicated that informed people everywhere, inside the electric railway and outside of it, are convinced of the desirability of one-man cars and of their safety and economic value.

In Detroit the delegates met W. D. Mahon, president, and W. B. Fitzgerald, vice-president of the Amalgamated Association of Street and Electric Railway Employees of America, who impressed upon them their view that the one-man car is a modern development and a natural outgrowth of the march of progress; that its coming was inevitable, and that controversy in regard to its use has been settled by the courts in its favor, and, finally, that one-man car operation has not been injurious to the employees' interests.

The delegates suggested to Mr. Mahon that possibly the Montreal Tramways was violating the contract with its employees in placing one-man cars in operation, but their attention was called to a clause in that contract stipulating that one-man car operators are to be paid 5 cents an hour extra, implying that when the contract, all the conditions of which the men accepted, was entered into, operation of one-man cars had been in view.

The union's chief executives acquainted the delegates with the fierce competition electric railways have had to face, and with the fact that one-man cars constitute one of the best weapons the electric railway management have to meet that competition and hold their traffic. It is probable that at the end of the interview the delegates had come to a realization of the fact that the one-man car is just as beneficial to the electric railway employees, as a class, as to any one else.

Japanese Railway Representative Visits America

Gitaro Ishida, assistant to director of the Japanese Government Railways, Kobe region, is making a tour of the United States to study transportation methods more particularly in the electric railway and bus fields. Arriving in California on Nov. 14 he spent a week making observations in San Francisco and a month in Los Angeles and its vicinity. He is now in New York and will remain there until Feb. 20, when he will depart for a visit to various Western cities. He plans to see Philadelphia, Cincinnati, St. Louis, St. Paul, Minneapolis, Chicago, Detroit and Cleveland.

Hearing in Oakland Postponed

Pending the completion of an inventory and valuation of the company's properties, the hearing on the application of the Key System Transit Company for adjustment of rates was postponed on Feb. 1 by the California Railroad Commission until May 10. It is expected that the valuation survey will be completed by April 15, thus giving the experts time in which to check over their figures.

This valuation is of Dec. 31, 1926. It is based on unit prices over a three-year period ended June 30, 1926. In addition to a reproduction cost at new and at present values and a reproduction cost new less depreciation, a historical reproduction cost value will be made.

At the Feb. 1 hearing in Oakland, Herman Phleger, counsel for the Key System, filed a report which showed that despite a temporary increase in revenue granted by the authority of the Railroad Commission on Dec. 31, 1925, the additional revenue has fallen short of expectations.

When the 7-cent railway fare and the 21-cent ferry fare were officially authorized it was estimated by experts of the Railroad Commission that the company would require $800,000 additional revenue in 1926 to obtain the finances necessary to make improvements and to cover the $400,000 wage increases.

Mr. Phleger, in his report, pointed out that the revenue of the company in 1926 exceeded that of 1925 by $277,000 and that bond interest paid in 1926 exceeded that paid in 1925 by $125,857. During 1926 the company spent $4,549,196, made up as follows: Cars, $940,646; automotive equipment, $198,901; boats, $1,794,977; service equipment, $99,436; way and structures, $1,515,235.

The money for these improvements was obtained through the issue of the following securities: First mortgage 5½ per cent bonds, $2,500,000, an annual charge of $137,500; first mortgage 6 per cent bonds, $1,500,000, an annual charge of $90,000, and equipment trust 6 per cent bonds, an annual charge of $93,500.

The company is proceeding with the formulation of plans for changes in its pier, the report declares, and its officers are conferring with the city of Oakland regarding the making of a solid fill, but in view of increased operating costs in 1926 and the insufficient increase in revenue it has not been possible to do any work on the pier "and it will not be prudent to attempt to do so until the finances of the company are in better condition."

The two new ferryboats now in course of construction at an Oakland shipyard will be ready for service early in March.

Pennsylvania Railroad Talks of a Future Power Plant

An announcement made at Philadelphia by the Pennsylvania Railroad on Feb. 10 said that conferences had been held between the officials of the Pennsylvania Railroad, Philadelphia Electric Company, Philadelphia Rapid Transit Company, Public Service Corporation of New Jersey, Philadelphia Suburban Gas & Electric Company and Counties Gas & Electric Company (the latter two being subsidiaries of the United Gas Improvement Company) looking toward the construction of a power plant of sufficient capacity to provide for the rapidly increasing needs of these properties, especially for 25-cycle energy. In printing this announcement the newspapers said that the site of the plant would probably be on the Delaware River near Trenton, N. J.; that it would cost about $10,000,000, and that the power generated would be applied in extending the electrification of the Pennsylvania Railroad. Contradictory reports concerning the conferences, however, at once followed, the Philadelphia Electric Company and the Philadelphia Rapid Transit Company denying that they had taken part in such negotiations. A five-year contract between the Philadelphia Electric and the Philadelphia Rapid Transit for the supply of power to the latter will expire in the spring.

Status of Winnipeg Franchise

There have been no new developments in the Winnipeg electric railway franchise situation. The City Council had the right under the original contract made 35 years ago to take over the system in 1927 at its physical value by giving the company six months notice of its intention to do so. Such notice would have had to be given not later than Aug. 8, 1926. The City Council failed to give this notice and consequently the franchise is automatically extended for five years dating from Feb. 8, 1927. The right of the city to take over the system recurs every five years from now on.

New Ticket Rates in Tacoma

Tickets good for six rides, with transfer privileges, on all lines of the Tacoma Railway & Power Company, Tacoma, Wash., will be sold on street cars, effective Feb. 8, 1927, for 50 cents. This new fare does not replace either the token or the 10-cent cash fare offering similar riding privileges. The 5-cent inner zone fare will likewise remain.

Decision to institute the new fare was reached after conferences between city officials and members of the City Council. The new fare is simply another experiment designed to provide still further evidence of what is desired by the riding public, and how the necessary amount of revenue can best be obtained. Offer of the new fare came from Richard T. Sullivan, manager of the railway. It will give a fare of 8⅓ cents for riders who do not care to invest $1 in tokens, or who do not find it convenient to go to one of the regular token-selling places. The wide difference between cash fares at 10 cents and the token at 6⅔ cents has led many people who would otherwise not bother with tokens to purchase them, Mr. Sullivan states. The new ticket fare will practically restore the former 8-cent cash fare.

Report of the railway for December, with about ten days under the zone system included, showed an increase in gross earnings but a decrease in earnings per mile.

New York City's Transit Bills Introduced

Bills embodying the New York City administration transit program were introduced in the Senate and Assembly on Feb. 17 by Minority Leaders Bernard Downing and Maurice Bloch.

One bill amends Sections 32, 39, Chapter 4, laws of 1891 (New York City rapid transit act) by authorizing acquisition of any railway by eminent domain in the event that terms and conditions may not be agreed upon between the board or commission representing city and owners or operators of the railway.

A second measure amends Section 11, city home rule law, by empowering local legislative body of city to enact laws for ownership, establishing, construction, acquisition and operation of municipal bus and trackless trolley lines.

A third measure adds new Section 134-a to the Chapter 480, laws of 1910, public service commission law, giving the Board of Transportation such additional powers and duties as may be conferred by local legislative body of city under the city home rule law.

A fourth bill amends Section 134, public service commission law, by stripping the Transit Commission of all powers except that relating to the rapid transit readjustment plan and conferring such powers on the transportation board.

The fifth bill adds new subdivision 12, Section 49, public service commission law, by authorizing any municipality to cancel a contract, franchise or certificate for privilege of transporting passengers or property if lessee, operator or grantee thereunder shall petition, or accept the benefit of the exercise of, the powers by the commission in altering, changing or modifying the rate of fare fixed in contract.

Another Finding in Superior

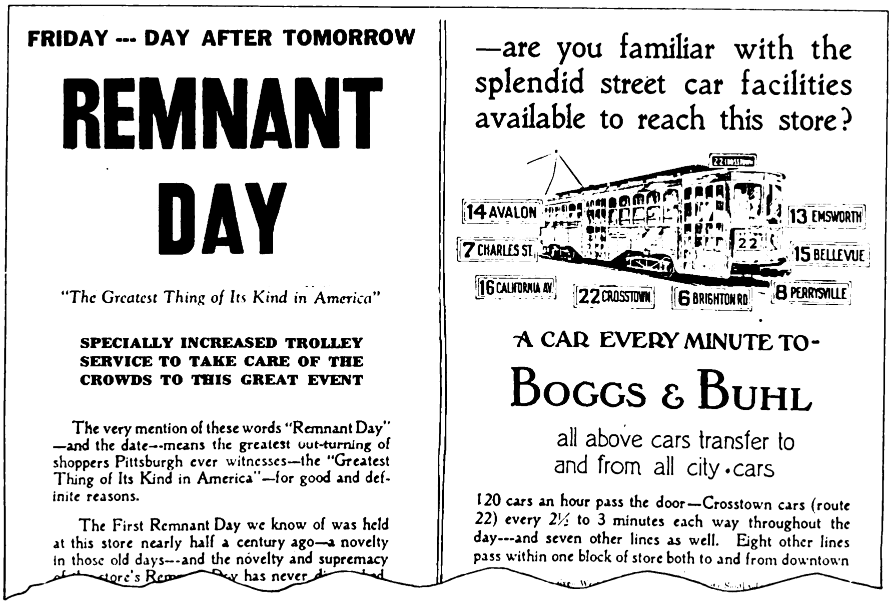
A coroner's jury exonerated the one-man street car operator, grade crossing switchman and train engineer of all blame for the street car-passenger train crash at Superior, Wis., on Jan. 6. The Duluth Street Railway was censured because of the use of one-man cars at this dangerous point, negligence was charged on the part of the Railroad Commission because it refused a previous petition for extension of a viaduct over the tracks where the accident occurred, neglect was intimated in the case of the Great Northern Railroad for allowing its trains to operate at an excessive rate of speed over the crossing, and negligence was charged on the part of the Northern Pacific Railroad because the gates at the crossing had not functioned properly at the time of the accident.

Department Store's Full-Page Ad Features Pittsburgh Service

One of the most remarkable examples of the co-operation between the Pittsburgh Railways, Pittsburgh, Pa., and other interests of the community is the full-page advertisement which Boggs & Buhl ran in the Pittsburgh newspapers on Jan. 19 to feature their annual "Remnant Day." The announcement was repeated the next day, but in smaller space.

The Boggs & Buhl department store is on the so-called Allegheny side of the city and therefore not in the general metropolitan shopping area of Greater Pittsburgh. On that account many Pittsburgh prospects must figure on using transfers.

To offset the disadvantages of location, Boggs & Buhl have worked in closest harmony with the commercial department of the Pittsburgh Railways to assure ample service for their patrons. Their annual "Remnant Day" is a really big feature in Pittsburgh's retail merchandising and the Pittsburgh Railways made every effort to see that ample service would be provided. In turn, Boggs & Buhl showed their appreciation by featuring the electric railway more than the sale itself. The motto seems to have been: "Get 'em on the cars first and the sale will take care of itself." The full-page advertisement was concluded with the slogan: "The Weekly Pass Is a Wise Investment."



FRIDAY — DAY AFTER TOMORROW

REMNANT DAY

"The Greatest Thing of Its Kind in America"

SPECIALLY INCREASED TROLLEY SERVICE TO TAKE CARE OF THE CROWDS TO THIS GREAT EVENT

The very mention of these words "Remnant Day" —and the date—means the greatest out-turning of shoppers Pittsburgh ever witnesses—the "Greatest Thing of Its Kind in America"—for good and definite reasons.

The First Remnant Day we know of was held at this store nearly half a century ago—a novelty in those old days—and the novelty and supremacy store's Rem Day has never

—are you familiar with the splendid street car facilities available to reach this store?

A CAR EVERY MINUTE TO—

BOGGS & BUHL

all above cars transfer to and from all city cars

120 cars an hour pass the door—Crosstown cars (route 22) every 2½ to 3 minutes each way throughout the day—and seven other lines as well. Eight other lines pass within one block of store both to and from downtown

Upper Half of Pittsburgh Ad—Lower Half Listed Routes

New Name for Inland Empire Under Great Northern Control

After announcing that the properties of the "Inland" and allied interests, recently purchased by the Great Northern Railroad, would be known hereafter as the Spokane, Cœur d'Alene & Palouse Railway, officials at Spokane canceled this new name and have made plans to have the name changed legally to the Spokane & Idaho Northern Railway. Approval of the transfer of the properties to the Great Northern is now pending before the Interstate Commerce Commission.

Commercial organizations in towns of the Idaho panhandle requested the Spokane & Idaho Northern title based on grounds that the name Spokane has always been used in the several titles which these roads have borne, and because the name of the state of Idaho has not been properly recognized and used by business interests. The second change in names was made largely in deference to the wish to foster a spirit of good will.

The properties to be purchased by the Great Northern consist of electric interurban lines out of Spokane, most recently known as the Spokane & Inland Empire Railroad, to Moscow, Idaho, and the Spokane & Inland Empire, operating to Cœur d'Alene, Idaho.

Suburb Agrees to Cleveland Railway Plan

According to the Cleveland *Plain Dealer* the second long step in carrying out the metropolitan traction program for the Cleveland Railway system has been taken by the Cleveland Heights Council. The program was submitted in June, 1925. The Cleveland Council approved it in April, 1926. Now the Heights acts more than eighteen months after the commission finished its work. East Cleveland and Lakewood have yet to act.

The new franchise shows the fruits of negotiation. The company wins the one concession which the metropolitan commission considered essential to the plan; that is, the suburb agrees to pay a fare 1 cent above what city passengers pay. In return for this the company agrees to build extensions on Mayfield and Cedar Roads and to establish a bus line on Fairmount Boulevard. These terms must have the approval of the Cleveland Council, but no difficulty on that point is anticipated. The community now awaits action by Lakewood and East Cleveland.

"No Accident" Reward Plan in Trenton

The Trenton & Mercer County Traction Corporation, Trenton, N. J., has put into effect a "No Accident Bonus Plan," whereby a bonus of $1 a week will be credited to each operator with a clear accident record during that week. Payments of bonus will be made in a lump sum covering four weeks. To be eligible to receive the weekly credit the operator must work at least five days of the week, a regular man must total at least 40 hours and an extra man at least 35 hours.

Notes from Knoxville on Fares and Threatened Bus Competition

C. H. Harvey, president of the Knoxville Power & Light Company, Knoxville, Tenn., says that the new fare arrangement put into effect on Jan. 3, consisting of the sale of weekly passes at $1.25 per week, five tokens for 30 cents and single cash fare of 10 cents, has met with very general public approval, and that the company has had many letters of commendation and oral comments on the convenience of the pass, the purchasers finding so many different ways that the pass can be used to advantage. He feels, however, that the question of whether or not this new system is going to be satisfactory to both the public and to the company can be determined only upon further trial.

In this connection it is of interest to note that the application made some time ago by the Knoxville Rapid Transit Corporation for a franchise has been revived and that early action by the Council has been requested. The position of the Knoxville Power & Light Company with respect to this matter is that the granting of this general franchise for bus operation is undesirable because there is no necessity for the general installation of bus routes in the city and because this kind of competition is ruinous and against the public interest. The Knoxville Power & Light Company has been willing, and is willing, to install and operate buses where and when this service is necessary and bears promise of resulting in a reasonable profit. The position of the company is that it would undoubtedly be in the interests of Knoxville to have any buses installed operated by the utility in conjunction with its street railway system, but it feels this should not be required of the company until the public convenience and necessity is sufficiently great as to justify it.

"Ride in the Street Cars" in Seattle

Plans to make the week of Feb. 21-28 in Seattle, Wash., a "Ride in the Street Cars" week, during which every one will be urged to use the street cars and help put the system on a paying basis, have been adopted by a newly organized "Ride in the Street Cars" Club, in which is represented service clubs, commercial clubs and improvement clubs. All other clubs in the city will be asked to get behind the movement and line up the people in their localities, so that the receipts of the week will help materially in getting the railway back on a cash basis. A speakers' bureau is being organized to cover club meetings for the next three weeks. Automobile owners will be asked to favor the cars for one week, refrain from picking up passengers and give the cars all possible patronage. Clifford Wiley, chairman of the club, states that the movement is in nowise directed against the automobile. He asserts that the fact that practically every club member owns a car does not relieve him of the responsibility of supporting the municipal railway as much as possible.

News Notes

Would Grant Right of Eminent Domain to Interurbans.—The North Carolina Senate has passed and sent to the House a bill to allow interurban railways to do business in the state and to give them the right of eminent domain.

New Franchise in Leavenworth.—Officials of the Kansas City, Leavenworth & Western Railway and the City Commission of Leavenworth, Kan., have agreed upon the terms of a new twenty-year franchise for the railway to operate over city streets.

Fare Increase Proposed in Williamsport.—Little more than a week after the Public Service Commission approved the merger of four railway companies in Williamsport, Pa., the consolidated concerns known as the Williamsport Railways filed a new tariff, increasing the present rates. Under the new schedule, announced by the commission, the present fare of 5 cents would be raised to 8 cents with two tokens for 15 cents. The increase becomes effective March 1.

Fourteen Men Have Perfect Record.—Throughout the year ended Dec. 31, 1926, fourteen employees of the Tide Water Power Company, Wilmington, N. C., held a perfect safety record. During this time they operated cars over the system without a single accident being charged against them. The total car mileage operated during the year was 738,000 miles.

Must Preserve Safety Rules.—Orders have been issued by the Board of Public Utility Commissioners of New Jersey for the Ocean City Electric Railroad, Ocean City, N. J., to improve service over its lines. After investigation the board stipulated that all one-man cars should have properly controlled doors and folding steps, rear doors for emergencies, automatic signals to notify operators when the rear doors are opened and a signal system to enable passengers to notify the operator to stop the car.

All One-Man Cars in Rockford.—The Rockford Public Service Company, Rockford, Ill., which recently acquired the Rockford traction interests, introduced one-man cars on all its lines on Feb. 15. Inclusion of the one-man car clause in the franchise to the new company was considered one of the outstanding features of that grant.

Fine Accident Record in Kansas City.—The 1926 accident record of the Kansas City Public Service Company, Kansas City, Mo., is one of the most impressive the trainmen of the company have ever made. During the year 681 trainmen operated day in and day out without having an accident of any kind for which they were responsible. Motorman J. D. Shepard of Ninth and Brighton headed the list.

Will Look Into One-Man Operation.—City officials of Portland, Ore., recently started an investigation to determine whether the one-man street cars on Broadway Avenue, operated by the Portland Railway & Light Company, at night interfere with traffic. If they do the company will be "invited" to discontinue that sort of operation. The question has also been raised as to the one-man operation of cars on other heavily traveled lines, and the whole question may be considered by the Council at an early hearing. City officials are resentful, it is stated, over the fact that the change in operation had been made without consulting the City Council or traffic department.

Safety Course in Session. — The Beaver County Section of the Western Pennsylvania Safety Council announced the third annual safety lecture course from Jan. 6 to Feb. 24, 1927. The sessions are held every Thursday evening from 8 to 9.30 in the auditorium of the Carnegie Library. This is a course for foremen, superintendents, employers, employees and others interested in the prevention of accidents in the home, the streets, the factory, the mine and mill. In connection with the course H. O. Allison of the Beaver Valley Traction Company invited the trainmen and coach drivers of his company to be present at the lecture on Feb. 3.

Tokens in Seattle Stores.—Tokens for use on the Seattle Municipal Railway, Seattle, Wash., will be sold at all downtown stores beginning Feb. 8. This is part of the plan to speed up cars and reduce operation costs, relieve traffic congestion by quicker loading, and provide a service to the rider. All downtown stores have agreed to co-operate with the railway officials and have offered to make special displays of the tokens, including window displays, to attract customers' attention. Cards have been printed and will be displayed on the cars urging patrons to buy their tokens before getting on the cars. One of the slogans is: "A token in the hand saves time."

Fire Insurance on Railway Property.—The Detroit Street Railway Commission at its meeting on Jan. 25 voted to take out $5,000,000 in blanket fire insurance on municipal railway property and to distribute the insurance equally among six agencies and companies. Sixty-eight bidders were reported, the successful ones selected by the commission being Johnson & Higgins, Willett & Hughes, Michigan Insurance Agency, John A. Parks Company, Edward T. Fitzgerald and Gorman & Thomas.

Commission's Order to Stand.—Under a stipulation filed, the Public Service Commission on Feb. 11 discontinued the proceedings instituted by the Mayor of Elmira, N. Y., against the Elmira Water, Light & Railroad Company over rates charged by it for gas and electricity and street railroad transportation, and permitted the withdrawal of the complaints and cross-complaints. The order provided that nothing therein contained shall affect or impair the order of the commission on May 7, 1925, authorizing a maximum street car fare of 7 cents in Elmira, and the tariff filed under this order is to remain in full force and effect. Commissioner Van Namee said that an increase in rates would be necessary if the company were to obtain anything like a fair return on the value of its property.

Recent Bus Developments

Bus Substitution Considered on New Jersey Interurban

Because of the bad condition of paving on a number of streets over which the Morris County Traction Company operates in Essex and Morris Counties in New Jersey proposals have been made that car service be discontinued and bus service started in its place. The main line of this railway is between Lake Hopatcong and Maplewood, where connection is made with tracks of the Public Service Railway, permitting through operation to the center of Newark. In all, nearly 50 miles of track is operated, about half of which is on private right-of-way.

For a number of years the company has been in financial difficulties. In July, 1923, a receivership was ordered by the court because of the refusal of a minority interest to agree to a refinancing plan. Prior to that, in 1918, the earnings being insufficient to meet the full interest charge on the bonds, the bondholders agreed for a period of five years to exchange the 5 per cent coupons on their bonds for new coupons at 2 per cent and income trust certificates to cover the difference. Under the trust agreement the 3 per cent coupons attached to the income trust certificate were automatically canceled each year when the earnings were insufficient to permit payment. During the following five years the 2 per cent coupons were regularly met and the income trust certificates were canceled.

Before the expiration of this proposal, in 1923, a refinancing plan was submitted to the bondholders. According to this plan they were to accept new bonds at 6 per cent for half of their holdings and non-cumulative preferred stock for the other half. Execution of this plan required the consent of all bondholders. Unfortunately, three individuals out of a total of 286, representing only 3.13 per cent of the bonds, refused to deposit their holdings for exchange and the refinancing plan could not be undertaken.

When the original paving agreements were made macadam paving was in general use throughout the territory in which the company operates, and it was stipulated that the paving work done by the railway should be of this type. In recent years, however, heavier pavements have come into use and an attempt has been made to have the railway install these more expensive kinds. To this the company has objected. As a solution of this difficult problem a bill was introduced in the New Jersey Legislature a year ago to relieve electric railways in part of their paving obligations. Although passed by the Senate and General Assembly, this bill was vetoed by the Governor and the question reverted to its original status. A similar bill has recently been presented to the Legislature, but no action has yet been taken.

Meanwhile O. G. Schultz, general manager of the railway, has proposed to remove the tracks and operate buses from Maplewood to Lake Hopatcong. Formal application for the necessary permits has not yet been made, but it is said that the company is hopeful of making the change by April 15. The municipalities would then do the repaving. Much favorable comment has been made concerning the pavement improvement feature of the plan.

Bus Service for Wisconsin Cities

Service on the lines of the Wisconsin Public Service Corporation in Two Rivers and on the interurban line between Two Rivers and Manitowoc will be abandoned if the Wisconsin Railroad Commission and the cities affected approve the discontinuance. Both the city service in Two Rivers and the interurban service are being run at a loss. In addition the city of Two Rivers has started an extensive paving program on streets occupied by the city lines and the interurban which would entail a burden heavier than the railway feels the traffic can bear.

C. R. Phenicie, vice-president of the company, who appeared before the City Councils of Two Rivers and Manitowoc recently, stated that ever since the corporation purchased the Manitowoc & Northern Traction Company the road has been operated at a loss. It is his idea to discontinue railway service and establish service by bus in Two Rivers and between the two cities. Several months ago railway service was abandoned in Manitowoc due to lack of patronage and the street cars there were replaced by a bus system.

Injunction Sustained at Louisville

A motion to dissolve a temporary injunction restraining the People's Transit Company, Louisville, Ky., from operating buses on Broadway was overruled by the Court of Appeals at Frankford on Feb. 12. The court, in overruling the motion, ordered the case heard on its merits.

The temporary injunction was granted the Louisville Railway by Judge William H. Field recently and carried to the Court of Appeals by the bus company.

The question to be decided, Judge Thomas said, was whether the operators were required to hold a franchise when they have already been granted licenses and permits by the city.

The court said that the question is "a far-reaching one since it would not only affect the various municipalities in the commonwealth, but it might also affect a county if it should attempt to grant such privileges over its public highways." In view of this it ordered the case tried on its merits.

The transit company in its appeal against the injunction said it was operating under a permit and license issued it by the city, while the railroad contended that "privileged" users of highways must have a franchise.

Auto Stages to Replace Interurban Trains in Washington

In the face of considerable opposition, the Department of Public Works at Olympia, Wash., recently granted the application of the Pacific Northwest Traction Company, which operates an interurban-stage line between Seattle and Bellingham, to substitute stages for certain interurban trains between Bellingham and Mount Vernon. The department was urged by the City Council, Chamber of Commerce and practically every civic club in Bellingham to grant the permit, declaring that Bellingham and Whatcom County are being discriminated against because they had no stage connections to Skagit County and Seattle and that the service would be a convenience and necessity.

The department granted the permit after the company testified that the gross operating revenues of the interurban had decreased steadily during the past few years; that it was necessary to increase the revenues between Mount Vernon and Bellingham and to curtail the operating expenses of the electric interurban line, which would require a reduction in the amount of service rendered; that increased patronage might be expected by reason of the coordinated service, and the fact that the bus is able to render more service to intermediate points along the highway than is now furnished by the electric railway.

The permit was opposed by a group of residents of Skagit County in Mount Vernon and Anacortes, who now threaten to carry their fight to the courts. Attorneys for the objectors declared that there was sufficient ground for appeal because of the basis upon which the department rested its decision, which they declared amounted to a subsidy for the railway by the department because the company had not been making sufficient money. The department declared that the objections of the Skagit County residents were not germane to the issues involved and were without the jurisdiction of the department. They include a charge of increased danger to the general public by reason of increased traffic, excessive speed and insufficiency of present tax methods to cover adequately the use of public highways by motor vehicles.

Tax on Interstate Buses Upheld

Much attention has been attracted by the decision of the United States District Court in Connecticut confirming the right of the state to levy a mileage tax on buses engaged in interstate commerce. It appears that a law was passed in Connecticut in 1925 imposing a tax of 1 cent a mile on interstate buses traveling on State highways. The Interstate Buses Corporation contested the act as unconstitutional under Section 8, Article I, which gives to the Congress the regulation of commerce among the several states. The law did not undertake to make interstate commerce subject to the jurisdiction of the utilities commission as the intrastate carrier is in Connecticut.

The opinion was written by Judge

Martin T. Manton of Brooklyn. Another Brooklyn Judge, Marcus B. Campbell, also sat in the court, and the third judge was Edwin S. Thomas of Norwalk, Conn. Judge Manton wrote that there could not now be a serious doubt that where the state had at its own expense furnished special facilities such as highways for the use of those engaged in commerce, interstate as well as domestic, it could exact compensation therefor. The theory of the excise tax, he said, was consistent with the rulings of the United States Supreme Court in cases concerning the use of special privileges and facilities. All that was required was that the tax should be reasonable in relation to the privilege. He wrote:

> As long as the discretion exercised by the State goes to the point of exerting its taxing powers in proportion to and adjusting the scheme, basis and amount of the tax to the possible extent and result of the use of the roads it is not an interference against interstate commerce. The state, however, may not enact a statute which requires an interstate carrier of passengers by motor bus to secure a certificate to establish the public convenience and necessity of operating the buses.
>
> Interstate business must pay its way and the expenses to others incident to the use of it.

Steam Bus Tested in New York

The Fifth Avenue Coach Company, New York, is testing a standard bus chassis driven by a new type of automotive boiler. Used with a steam engine of conventional type, the vehicle is said to combine flexibility and economy. The tests are under the supervision of L. H. Palmer, vice-president of the Fifth Avenue Company, and William McClellan of the engineering firm of McClellan & Junkersfeld, Inc. Ten tons of railway car axles are used on the test chassis to approximate the weight of a fully loaded bus. The vehicle is being driven about the city, particularly in the hilly districts of Washington Heights. Both Mr. Palmer and Mr. McClellan said the tests were not far enough advanced to determine definitely how it would operate under actual working conditions. The device is also being studied by one large city electric railway as a substitute for the expensive underground conduit system.

Buses Supplant Cars. — Implying abandonment of its interurban line between Raymond and South Bend, Wash., the Willapa Electric Company has been granted permission to provide service by bus between the two cities.

Applies for Permission to Run Buses.—The St. Louis Bus Company, affiliated with the United Railways, St. Louis, Mo., has applied to the St. Louis Board of Public Service for permission to operate buses on Olive Street when that street is widened from 60 ft. to 100 ft. between Twelfth Boulevard and Channing Avenue. The bus line would cooperate with the cars of the railway.

Buses Replace Cars.—The Worcester Consolidated Street Railway has discontinued railway service on its line between Clinton and Worcester, Mass., and substituted bus service. The change became effective on Feb. 7. C. V. Wood, president, has announced that it is probable other suburban lines operating out of Worcester will be converted to bus operation.

Financial and Corporate

Boston "L" Reorganization

Chairman of the Metropolitan Board Outlines Plan Now Up for Extension of Public Control.

Henry I. Harriman, chairman of the Division of Metropolitan Planning, which has reported to the Legislature of Massachusetts the proposition for reconstruction of the financial structure of the Boston Elevated Railway with a 50-year extension of the term of public control, has submitted to the committee on metropolitan affairs and the committee on street railways of the Legislature a statement of reasons and recommendations.

NEW RAPID TRANSIT COMMISSION PROPOSED

He says that a reorganization of the Elevated would be accomplished through the sale of its assets to a new rapid transit corporation for approximately $24,000,000 of common stock upon which 5 per cent was guaranteed and $26,000,000 of preferred stock upon which 4½ per cent was guaranteed, the new transit company, of course, assuming the obligations of the Elevated. Public control would be extended to the new transit company for a period sufficiently long to permit the preferred stock to be retired through the operations of a sinking fund by the end of the new period of public control. He said in part:

> In my explanation of the bill I referred specifically to a dividend saving of approximately $800,000 and referred in a general way to additional savings which would be made in tax payments, both under the plan suggested and under a modification of the same which would substitute 4½ per cent debentures for the 4½ per cent preferred stock, it, of course, being understood that the debentures, like the preferred stock, would be tax free in Massachusetts and would be paid off during the period of public control. Since the hearing the details of the tax savings have been worked out and are most interesting and important.
>
> The federal corporation tax is 13½ per cent on the net earnings (which in the case of the Elevated are its dividend payments), and a saving of $800,000 in dividend payments, therefore, means an additional saving in federal taxes of a little more than $100,000, bringing the actual saving under the plan suggested by us to $900,000.

DEBENTURES FOR PREFERRED STOCK

> If debentures are substituted for preferred stock, such substitution will change a dividend payment into an interest payment upon which there is no federal corporation tax. This interest payment will be a trifle under $1,200,000 a year, upon which the federal corporation tax saving will be about $160,000 annually. This saving should be added to the previous saving of $900,000, making the total saving about $1,060,000. The substitution of debentures for preferred stock will also effect a saving to the Elevated road of between $310,000 and $340,000 in its present Massachusetts franchise tax, so that the total immediate saving to the Elevated road resulting from the adoption of our plan of reorganization, modified, however, by substituting debentures for preferred stock, would be approximately $1,400,000, to which should be added a further saving of at least $200,000 in bond interest as old issues mature and new issues at lower rates are put out. This larger saving will make it feasible to set up a somewhat larger reserve for the retirement of the debentures and thus make possible a shorter term of public control, say to 30 years, if it is deemed desirable.

As either the preferred stock or the debentures will be callable for the retirement fund at par it is safe to assume that the retirement fund will be compound at 4½ per cent per annum. Accordingly, the $26,000,000 of debentures or preferred stock of the new company can be retired by an annual payment of $420,000 if the term be reduced to 30 years, or $235,000 per annum if it be reduced to 40 years.

An annual payment of $470,000 would retire both the preferred and common stocks at the end of a 40-year term. With any of the above payments the balance of the savings effected by the reorganization of the Elevated, and available for the payment of the indebtedness to the city and for new subway rentals, would be from $900,000 to $1,200,000. Because of the large savings effected Mr. Harriman recommends the substitution of the tax-free debentures for preferred stock in the reorganization plan.

This substitution of debentures for preferred stock might be objected to by the present bondholders on the theory that it unbalances the present ratio of stock to indebedness. As the debentures would be all guaranteed by the state and would all be retired within the period of public control, it would be perfectly safe to make these debentures junior to the outstanding bonds. It would also be necessary to make the debentures tax exempt in Massachusetts in order to make them a form of security acceptable to the present preferred stockholders.

Gary Employees Subscribe 100 Per Cent for Railway Stock

Employees of the Gary Railways, Gary, Ind., brought to a successful close on Feb. 14 the company's preferred stock sales campaign by subscribing 100 per cent to their allotment. Every one of the 310 employees of the railway subscribed for one or more shares, thus topping the mark established during a similar campaign in the fall of 1925, when 92.6 per cent of the employees purchased stock. The average holding is less than 1½ shares per employee.

The present issue of $200,000 par value of 7.2 per cent class A preferred stock was offered for sale under the customer-ownership plan beginning on Feb. 1 by the Utility Securities Company. Employees of the Gary Railways were the only persons participating in the public sale. Because of the limited number of shares available, orders from employees were given first consideration during the first five days of the sale. Subscriptions from patrons and other investors in communities served by the company were unusually heavy and the issue was oversubscribed within ten days.

The stock was offered at $98 a share, either on cash or deferred payment terms, at which price it yields about 7¼ per cent in annual dividends.

Redemption Plan Suggested

Seattle Bondholders Co-operate with Mayor in Alleviating Railway's Burdens—Herberg Suit Continues

A plan for the reduction of bond redemption payments on the Seattle Municipal Railway, Seattle, Wash., from $833,000 a year to $500,000 a year by extending the bond redemption period over an additional eight years has been placed before Mayor Bertha K. Landes by A. W. Leonard, president of the Puget Sound Power & Light Company, as the reply of the railway bondholders to the request of the Mayor for co-operation in lightening the railway's financial burdens. Mr. Leonard recently returned from Boston, where he conferred with the board of trustees of the Stone & Webster interests.

As a condition the bondholders insist that the present contract provisions giving priority to the bonds over all other obligations of the railway be fully protected by necessary legislation. The present holders of the purchase bonds ask the city to use good faith in endeavoring to obtain an extension of other outstanding bonds, amounting to approximately $1,650,000, which would mature prior to the Stone & Webster bonds if the latter were extended. If this could not be readily arranged, the purchase bondholders will waive priority as to these bonds, with the understanding that no other bonds junior to them would be issued.

The bondholders, in their plan, also suggest that if they are willing to assist the utility $1,000 a day in deferring annual bond payments, it is only fair to the thousands of railway patrons that the city accelerate the steps it has taken to increase earnings and still further reduce operating expenses.

In this connection it has been estimated that a reduction in power costs would save the railway $200,000 a year. The sale of power to the railway constitutes approximately 9 per cent of the light department's business. Mayor Landes and several of the Councilmen favor the plan as a simple way out of the difficulties of the line.

While the Mayor and the City Council are considering the plan suggested by the Puget Sound Power & Light Company to reduce bond redemption payments on the Seattle Municipal Street Railway, litigation involving the railway in the federal and Superior courts is moving forward. Judge Calvin S. Hall of the Superior Court has ruled that the company will be a defendant in the suit started by J. G. Von Herberg to compel the city to apply all receipts of the railway first to wages of its trainmen before any provision for bond redemption or other obligation be made. Immediately after this ruling, Mr. Von Herberg filed a motion in federal court asking that a complaint the company filed there be dismissed so far as he was made defendant.

The city filed a similar motion in the federal court, asking permission to be withdrawn as a defendant in a suit the company filed on Jan. 13. The power company, in its suit, named both the city and J. G. Von Herberg as defendants, asking that the city officials be restrained from withholding payment of the bond redemption and interest on the railway purchase contract until operating expenses of the line have been paid. The city's motion asks that the company's bill of complaint be dismissed in so far as it refers to the city as a defendant.

Action by Mr. Von Herberg and the city indicates that both want to see the railway litigation settled in the state courts rather than in the United States courts. In his suit in the state courts Mr. Von Herberg sought to have the city enjoined from putting money into the railway purchase bond fund until operating expenses had been paid. The city filed a bill of interpleader asking that the power company be made a defendant.

Good Showing in Milwaukee

Net Income in 1926 Increased by $1,186,867—Financial Structure Improved During Year.

Operating revenues of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., from transportation of passengers, freight and express were $10,937,411 for the year ended Dec. 31, 1926, an increase of 3.03 per cent compared with the year 1925. Operating revenues of the electric and heating departments were $15,282,343, an increase of 14.24 per cent over the previous year. Net income available for dividends was $4,025,699, compared with $2,838,831 in 1925. Net capital expenditures for additions to property and for betterments during the year were $7,409,146, after deducting replacements and property that was withdrawn from service. These facts were disclosed in the annual report to the stockholders.

Expenditures in the railway utility include principally the construction of the new rapid transit line, consisting of new double track on private right-of-way; extension of double track on Center Street in the city of Milwaukee to 60th Street; double tracking Downer Avenue; extension of track on First Avenue; extension of double track on Forest Home Avenue; rebuilding and double tracking Twenty-seventh Street, and double tracking Howell Avenue. Approximately 10½ miles of new track was constructed and added to the system during the year.

INCOME ACCOUNT OF THE MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY

		1926		1925
Operating revenues		$26,219,754		$23,992,653
Operating expenses:				
Ordinary operating expenses	$15,369,656		$14,415,619	
Depreciation	2,043,191		1,847,077	
Taxes	2,283,191		2,160,755	
Total operating expenses		$19,696,038		$18,423,451
Net operating revenues		$6,523,716		$5,569,202
Non-operating revenues		335,348		357,675
Gross income		$6,859,064		$5,926,877
Interest charges:				
Interest on funded debt	$2,266,754		$2,574,457	
Interest on depreciation reserve balance	521,979		471,814	
Interest on other reserves	44,630		41,772	
Total interest charges		$2,833,363		$3,088,043
Net income		$4,025,698		$2,838,831

STATISTICS OF RAILWAY OPERATION AT MILWAUKEE

	1926	1925
Miles of track owned	429.74	419.28
Miles of track leased	1.90	1.90
Miles of revenue track operated	399.00	391.49
Revenue passengers carried	154,908,620	150,591,216
Transfer passengers carried	54,648,880	53,635,554
Per cent transfer to revenue passenger	35.28	35.61
Receipts per revenue passenger	$0.0677	$0.0677
Number of passenger and express cars owned	912	861
Number of passenger motor buses owned	141	124
Kilowatt system demand	182,868	174,604

Forty new one-man safety passenger cars were purchased and placed in service during the month of December. Twenty new buses were purchased during the year. Four new snow sweepers and other necessary transportation utility equipment were purchased or constructed in the company's shops.

The financial structure of the company was considerably altered and improved during the year. The ratio of funded debt to the total capitalization was 64.6 per cent on Dec. 31, 1925, and was reduced to 54.6 per cent on Dec. 31, 1926. This decrease was accomplished by the sale of additional common and preferred stocks to provide funds for retiring $6,500,000 consolidated first mortgage bonds which matured and were paid on Feb. 1, 1926. The proceeds of the sale of common and preferred stock were also used in part to finance new construction during the year. The total par amount of securities retired was $19,576,500 and the total par amount of securities issued was $22,435,900.

S. B. Way, president, states that the transportation revenues of the company showed some improvement over previous years; the operation of an increased number of one-man safety cars during the non-rush hours and improvements to passenger equipment and rapid transit service should improve the future earnings of the transportation department.

The relations between the employees and the company continue to be satisfactory. The Employees' Mutual Benefit Association has now 6,110 members. The Employees' Mutual Savings Building & Loan Association continues to be a very important factor in establishing homes for employees and their families. Upward of $10,801,960 has been provided members for this purpose since the inception of the association in April, 1914.

Balance in Columbus $1,383,483

According to the report of the secretary and auditor of the Columbus Railway, Power & Light Company, Columbus, Ohio, the net balance of the company in 1926 was $1,383,483, against $672,600 for 1925. These facts were contained in the thirteenth annual report of the board of directors to the stockholders. Cyrus S. Eaton, president, states that the continued healthy growth of the company's business is reflected in the reports submitted.

During the year the company issued $1,857,100 of its first preferred 6 per cent stock. Of this amount $1,500,000 went to the public through its bankers and $357,100 to employees and customers. All stock was sold to the public, employees and customers at par in a customer-ownership campaign conducted by the employees of the company and supplemented by schedules of educational advertising in the Columbus daily newspapers.

INCOME ACCOUNT OF THE COLUMBUS RAILWAY, POWER & LIGHT COMPANY

	1926	1925
Railway operating revenues...	$3,409,499	$3,383,966
Power, light & heat operating revenues.................	5,887,572	5,316,787
Non-operating revenues......	33,187	10,236
Total gross revenues.......	$9,330,259	$8,710,989
Operating expenses..........	$5,086,958	$4,914,303
Taxes......................	953,239	912,275

Common stock............	....	450,408
Balance (credit to profit and loss account)...............	$1,383,483	$672,600

The company's policy of carrying out an extensive improvement program was continued. This is evidenced by the fact that total expenses chargeable to property account were $3,670,608. Of this amount $541,550 was used for track and roadway projects and $93,331 for cars and equipment. Railway improvements included new track, reconstructed track, track removal and special work. Rolling stock improvements included the overhauling of 166 cars and the painting of 115 cars. In addition six gas-electric buses were purchased during the latter part of the year and put in crosstown service. During the year 1.84 per cent of the gross receipts was used for claims cost.

Springfield Property Passes to New Haven

Control of the Springfield Street Railway, Springfield, Mass., passed to the New York, New Haven & Hartford Railroad at a stockholders' meeting on Feb. 14. Directors were increased from seven to nine. They include E. J. Pearson, E. G. Buckland and A. P. Russell, New Haven; W. E. McGregor, Boston; George Dwight Pratt, Charles W. Bosworth, Clark V. Wood, George B. Bulkley and Henry A. Field, Springfield. The last three were re-elected. President Pearson of the New Haven was made chairman of the board, which immediately ratified the $1,500,000 improvement program. The executive staff of the Springfield Street Railway is unchanged. Clark V. Wood remains as active head. At a reorganization of the Springfield Railways E. J. Pearson was made president. New trustees with him are Messrs Buckland and Russell. C. M. Rogerson and Leverett Candee were re-elected vice-president and treasurer respectively of the Springfield Railways. William Crowe continues as secretary of both the Springfield Street Railway and the Springfield Railways and Bentley W. Warren as general counsel.

Approval Sought for Sale of Coral Gables Road

Approval of the sale of the Coral Gables Rapid Transit Company, Coral Gables, Fla., and all equipment is to be requested before the State Railroad Commission. Petition for the approval is to be filed within the next few days by John M. Murrell, Miami, attorney for the company. The monetary consideration involved was not given. It will be recalled that some time ago a proposal was advanced for the sale of the road to the city, but the information at present at hand about this latest move by the company does not make it plain whether or not the application now made is in furtherance of that plan.

Will Discontinue Line.—The Coast Cities Railway, Asbury Park, N. J., will discontinue its inside belt railway on March 1. The company claims that there is no further public demand for the belt line. The poles and tracks will be removed.

Capital Traction Would Buy Leased Line.—The Capital Traction Company, Washington, D. C., has opened negotiations for the purchase of the Washington & Maryland Railway, which runs from Fourteenth and Kennedy Streets, Washington, to Takoma Park, Md., according to reports received by the Public Utilities Commission. The company has been operating the line for the last ten years under a lease which expires on Feb. 19.

Increase in Capitalization Approved.—At the recent annual meeting of the Wisconsin Public Service Corporation, Green Bay, Wis., approval was voted of the plan recently projected to increase the authorized capital stock of the corporation from $8,500,000 to $20,000,000. Consequently the number of preferred shares will be increased from 55,000 to 125,000 valued at $12,500,000, and common from 30,000 shares to 750,000 shares valued at $7,500,000. The value of common stock at par is reduced from $100 to $10. It is not likely that any considerable amount of the stock will be issued in the near future.

$2,500,000 North Shore Notes Issued.—Halsey, Stuart & Company and the National City Company, New York, are offering for subscription at 99½ and interest, yielding more than 5.65 per cent, $2,500,000 of Chicago, North Shore & Milwaukee three-years 5½ per cent gold notes. The notes are dated Feb. 1, 1927, and interest is payable on Feb. 1 and Aug. 1. They are in the denomination of $1,000, $500 and $100.

Financing of New Rockford Companies Approved.—The Illinois Commerce Commission has authorized the Rockford Public Service Company, Rockford, Ill., to issue bonds to the extent of $1,000,000 against the company's holdings and stock to the amount of $500,000. The Rockford-Belvidere Railroad, recently acquired by the Ellis interests, has been authorized to operate the electric railway between Rockford and Belvidere and to issue $150,000 of stock. The formal approval of these plans completes all details of the financing of the successor companies at Rockford.

New British Columbia Director.—W. G. Murrin has been elected a director of the British Columbia Electric Railway, Vancouver, B. C., Canada. Mr. Murrin is vice-president of the railway.

Valuation of Discontinued Properties Computed.—Electric railway systems of the aggregate value of $591,225, located in Salem and Eugene, Ore., have discontinued operations owing to the failure of the public to support them adequately. The Public Service Commission has also authorized the Willamette Valley Southern Railway to discontinue the operation of 12 miles of railway in the Salem district. The books of the State Tax Commissioner show that the apportioned valuation placed on all these discontinued rail systems is $377,021. This source of state revenue will, necessarily, cease with the dismantling of the carrier lines in question. The Willamette Valley Southern is owned and operated by the Portland Electric Power Company, while the Salem and Eugene systems have been operated by the Southern Pacific Company.

Personal Items

G. R. Green Heads Master Mechanics

Superintendent of South Bend Road Heads Central Equipment Men's Organization

George R. Green, general superintendent of the Chicago, South Bend & Northern Indiana Railway, Michigan City, Ind., and its affiliated lines, the Southern Michigan Railway and the Railway Transit Company, a bus operating organization, has been elected president of the Central Electric Railway Master Mechanics' Association. Few men in mechanical circles in the Central Electric Railway Association's territory are better known than is Mr. Green; few men have had a career more spectacular than he and few have risen through the ranks to greater responsibility.

G. R. Green

Twenty-six years ago Mr. Green started to work at the age of fourteen as an armature winder's helper with the Detroit United Railway. He was not content merely to assist in winding armatures and then to wind them himself. He studied the whys and the wherefores. It did not militate one iota against his upward progress that he remained with the Detroit United property for eighteen years, except for three years between 1909 and 1912, during which time he was master mechanic of the Saginaw & Flint Railway.

At first promotions came slowly and advancement was by small steps, but initiative, persistence and hard work, combined with an interest in the problems of his company outside of his immediate duties, won for him deserved recognition. He finally rose to the position of general foreman of interurban equipment with the Detroit United Railway, but when he did attain that position, few other men in the country were better qualified by experience and training than was he.

In July, 1920, Mr. Green went to South Bend as superintendent of equipment. So thoroughly impressed was the management with the man's ability that when it appeared that railway service might be supplemented with buses, he was selected to study bus operation in other cities. When the new service was decided upon, he was placed in charge of starting the buses and operating them. Next followed his appointment to be general superintendent of the rail lines and buses. He was appointed to this post in March, 1925.

Retirements and Changes in Rockford

A. P. Lewis of Wichita, Kan., has been appointed general superintendent of the Rockford Public Service Company, recently acquired by T. M. Ellis. Mr. Lewis succeeds Archie Andrew, who retires from the post as superintendent of transportation of the old Rockford City Traction Company after 25 years service. Five veteran department heads in executive positions are retired under the new ownership. Besides Mr. Andrew they are Edwin Main, maintenance of way engineer; Shell R. Smith, claim agent; H. D. Hollenbeck, purchasing agent, and Otis R. Hill, superintendent of equipment.

J. D. Whittemore Resigns from Wheeling Company

Joseph Damon Whittemore has resigned as vice-president and general manager of the Monongahela West Penn Public Service Company, Wheeling, W. Va. He became connected with the Wheeling property in July, 1924. Three years prior to that he was associated with W. S. Barstow & Company, New York, as supervising executive of several utility properties in the East. During his residence in Wheeling he had charge of the operations of properties in Wheeling and Morgantown.

Mr. Whittemore is a New Englander by birth. In the time that he was at Wheeling the Monongahela West Penn Public Service Company expanded widely and practically all of the independent properties in northern West Virginia were purchased and amalgamated with the Monongahela West Penn Public Service Company.

Howard R. Whitney has been named operating vice-president of the Worcester Consolidated Street Railway, Worcester, Mass., as the personal representative of President Clark V. Wood to supervise and carry through the program of rehabilitation sponsored by the New York, New Haven & Hartford Railroad. Mr. Whitney is also vice-president of the Springfield Street Railway, but his office there will not be filled for the present. Mr. Whitney is being assisted in his work in Worcester by Henry C. Page, general manager of the Consolidated.

E. F. Kelley Assigned Additional Duties at Louisville

Edward F. Kelley, secretary to President James P. Barnes, Louisville Railway, Louisville, Ky., was recently appointed purchasing agent in addition to his secretarial duties. He succeeds in that capacity C. Edward Earley, to whom less arduous duties have been assigned.

Mr. Kelley is well known in the railway field, not only because of his work assisting Mr. Barnes but also as editor of the *News Service Bulletin*, a bimonthly publication of the Committee on Public Utility Information of the Kentucky Association of Public Utilities. It was his keen knowledge of electric railway affairs of the state and country and his realization of the difficulties confronting the utility companies and their relation to the public which brought him the editorship of the bulletin. In that work he has been constantly improving the understanding between the public and the company. He is also editor of *Trolley Topics*, the house organ distributed by the Louisville Railway among its employees.

E. F. Kelley

Mr. Kelley became associated with Mr. Barnes in 1905. Prior to that he was with the New York Central and thereafter with Mr. Barnes at Syracuse, Utica, Rome, Little Falls, Oneida, Rochester and Schenectady, N. Y. In 1920 he became secretary to Mr. Barnes at Louisville.

In his new work he will have complete charge of the purchase of supplies and materials for all departments of the Louisville Railway, the Louisville & Interurban Railroad and the Kentucky Carriers, Inc., as well as being superintendent of the office building in charge of maintenance of that building.

Besides the offices already mentioned Mr. Kelley is secretary of the Kentucky Association of Public Utilities and secretary and director of the Kentucky Committee on Public Utility Information. He is also secretary of the Louisville Kiwanis Club, which position he has held for the past seven years, and for a while was district secretary of the Kentucky-Tennessee District Kiwanis Clubs.

W. W. Foster Heads New York Interurban

Former Secretary, Treasurer and Manager of Rochester-Buffalo Road Is Made President—Other Changes

William W. Foster, for many years secretary, treasurer and general manager of the Rochester, Lockport & Buffalo Railroad Corporation, Rochester, N. Y., was elected president of the company to succeed E. R. Wood, Toronto, who retired, at a meeting of directors and stockholders in Rochester on Feb. 8.

Joseph D. Nailor was advanced from superintendent of transportation and equipment to general manager and treasurer. Mr. Nailor began his railway career eighteen years ago as a motorman.

Jerry D. Foster becomes secretary of the corporation, but retains his present position as auditor.

Allen S. Muirheid, Toronto, was reelected vice-president. Herman L. Lang, trainmaster, was promoted to superintendent of transportation and Donald Dewitt was advanced from special agent to general traffic agent. L. D. Harner, general shop foreman, becomes master mechanic.

W. W. Foster

It was stated at the headquarters of the company in Rochester that Mr. Wood retired to devote his attention to other interests nearer his home in Canada, and that there would be no change in policy or operation as a result of the changes in personnel.

Mr. Foster, the new president, is very well known in New York State, not only for his association with electric railway activities but also for his banking and business affiliations. At the age of sixteen he entered the employ of the First National Bank of Syracuse as a clerk. Two years later he entered the service of Holden & Sons, wholesale coal dealers, as an accountant and cashier. In 1905 he became identified with electric railway interests when he went with the Beebe Syndicate as general auditor and assistant treasurer. This syndicate operated five interurban electric railways, including the Buffalo, Lockport & Rochester Railway, which was taken over in 1911.

In the railway field Mr. Foster seemed to have found his chief interest. In June, 1915, the Buffalo, Lockport & Rochester Railway was segregated from the Beebe Syndicate and at that time he became auditor, secretary and treasurer, moving his offices to Rochester, N. Y. A little more than two years later he was appointed general manager of the company, but still retained the position of secretary-treasurer. In April, 1919, the company was reorganized and the name changed to the Rochester, Lockport & Buffalo Railroad Corporation. Then it was that he was elected a director and appointed to the positions of secretary-treasurer and general manager. In June, 1926, he was elected president of the New York Electric Railway Association. He was born in Syracuse on Jan. 1, 1873.

The road he heads operates 67.9 miles of interurban railway across western New York connecting the important cities of Buffalo and Rochester, through transfer at Lockport, its western terminus. The line in general follows the route of the Barge Canal, serving the communities in the prosperous Lake Ontario fruit belt.

President Ready in New Office

The directors of the Key System Transit Company, Oakland, Cal., at their monthly meeting, held on Dec. 16, formally elected Lester S. Ready to the presidency. He assumed his new duties on Jan. 3, taking complete charge of the entire system. The new president has been chief engineer of the California Railroad Commission. His career has been reviewed before in the ELECTRIC RAILWAY JOURNAL.

Mr. Ready has accepted the presidency of the Key System Transit Company believing that with his thirteen years experience in the observation of public utility operation and in the active work of the regulation of these utilities he can be of material assistance both to the company and the people of the East Bay.

As he sees it, the development of a great metropolitan area such as the East Bay district is dependent upon utility transportation. A large part of the public must rely upon the facilities of the Key System for its means of travel. At the present time the Key System Transit Company is responsible for the safe, convenient and rapid transportation of at least 50 per cent of the traveling public of the East Bay district. Experience of other cities indicates that as the population grows a greater and greater percentage of the public must depend upon street car and bus transportation. Mr. Ready realizes that it is important that the problems of traffic and public transportation be solved correctly.

He has said that the aim and duty of the Key System Transit Company are to render to the rapidly growing East Bay district a good utility transportation service. As an evidence of the company's disposition to do this Mr. Ready recalled that during the last two years and ten months approximately $6,500,000 has been spent to enlarge and improve the facilities of the company that a better service may be rendered. Further improvements will be made as rapidly as it is financially possible.

Convinced that the best service can only be rendered to the community through the whole-hearted co-operation between the company and the public, Mr. Ready has stated for the company that it is ready and willing to co-operate with the public as far as it can and that he will appreciate suggestions from the public. Thus he enters upon his new duties convinced that, in view of the importance of adequate transportation to the development of a community, the problem can be worked out so as to be profitable both to the company and to the public it serves.

C. G. Adsit a West Towns Official

Charles G. Adsit, nationally known as an engineer, has been elected a director of the Chicago & West Towns Railway, Oak Park, Ill. He has long been interested in the affairs of the Georgia Railway & Power Company and is vice-president and executive engineer of that company. Previous to his affiliation with the company at Atlanta he had extensive engineering experience in the western part of the United States, in South America and in Mexico. His association with the Georgia company actually dates back to 1911, when he became resident engineer on the Tallulah Falls hydroelectric development. Later he was made consulting engineer and chief engineer, and had charge of the development of Mathis dam and reservoir and Burton dam and reservoir and the Tugalo development. On April 1, 1922, he was made executive engineer with authority and jurisdiction over engineering work of all departments. In May of the same year he was made a vice-president of the company.

C. G. Adsit

Ezra Brainerd, Jr., Nominated for I.C.C.

Ezra Brainerd, Jr., Muskogee, Okla., was nominated to be a member of the Interstate Commerce Commission on Feb. 16 by President Coolidge, succeeding Frederick I. Cox of New Jersey, whose reappointment was rejected. This action eliminates Pennsylvania from the contest for the post for which Cyrus E. Woods, backed by Senator Reed of Pennsylvania, was first nominated by President Coolidge. Mr. Brainerd is a lawyer and vice-president of the oldest bank in Oklahoma. He was graduated from Colgate University and the University of Michigan Law School. He is a Republican and was recommended by Senator Harreld.

New Commercial Department Functioning at Youngstown

With the appointment of D. J. Graham as assistant manager of railways of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, at the opening of the year the ride-selling activities of the Penn-Ohio System have been concentrated in a well-organized commercial department.

In this department will be centered all matters that have to do with checking and developing the service of the various transportation lines and making them have a stronger and stronger appeal to the traveler and to the people of the communities served. Here also will center the development of freight traffic, a branch that has been of steadily increasing value.

Associated with Mr. Graham as his aids in carrying on this work will be:

Charles J. Collins, general freight agent, in charge of the freight service of the system.

Donald S. James, general passenger agent, directly engaged in the duty of developing passenger business.

H. H. Best, supervisor of schedules, in charge of analysis and preparation of schedules of service.

Perry Weller, statistician, who will develop and keep records and checks of service.

The purpose of the commercial department will be to sell more rides through the application of good salesmanship in every department of the service—to build up and develop both freight and passenger business.

Victor Emanuel to Return to Utility Field

Victor Emanuel, former chairman of the National Electric Power Company, is planning to return to the utility field. He resigned as chairman last year, but continued as a director after the company was acquired by Samuel Insull. The National Electric Power Company was founded by Albert Emanuel, father of Victor Emanuel. It was learned recently that Mr. Emanuel had formed in New York State last October the United States Electric Power Corporation, which through a subsidiary, has acquired small utility properties in the State of Washington. The United States Electric Power Corporation has applied for permission to increase its capital from 100,000 shares of no par or nominal value to 800,000 shares.

C. E. Earley, who has been purchasing agent of the Louisville Railway, Louisville, Ky., for the last eight years, has at his own request been transferred to duties less arduous. Mr. Earley has been connected with the company for 35 years. He entered the service when he was only 15 years of age as a trolley boy and worked his way up to the position of purchasing agent.

Obituary

O. C. Macy

O. C. Macy, vice-president of the Chicago, Harvard & Geneva Lake Railway, Walworth, Wis., died recently. Early in his career Mr. Macy had been superintendent of the electric railway lines in Cairo, Ill. In 1908 he became affiliated with the East St. Louis & Suburban Railway in charge of the Alton division. In this work he continued until 1915, when he took charge of the East St. Louis, Columbia & Waterloo Railway. After severing his connection with the latter property he was employed in the automobile sales business for a while and then went to Chicago, where he served as vice-president of the Chicago, Harvard & Geneva Lake Railway. This property connects Harvard and Big Foot, Ill., and Walworth and Fontana, Wis. Late last year Mr. Macy came East on a business trip and became suddenly ill. He was taken to the Mountainside Hospital at Montclair, N. J., where he died of pneumonia.

Albert Bath

Albert Bath, one of the executives of the Detroit Department of Street Railways, died on Jan. 30. At the time of his death and for about two years previous he was division superintendent of the Trumbull-Northwestern belt line of the Municipal system.

Late in 1907 he became night foreman at the Trumbull Avenue carhouse of the Detroit United Railway. He was transferred soon after to the Jefferson carhouse and in May, 1909, was made day foreman of the Fourteenth Street carhouse. His promotion to assistant division superintendent of the Fourteenth and Crosstown lines followed in October, 1909. He was made division superintendent of the Harper-Sherman-Baker lines of the Detroit United Railway in July, 1915, and was transferred to the Trumbull Northwestern belt lines in January, 1925. Mr. Bath was born in Rochester, N. Y., in 1880.

Russell Robb

Russell Robb, senior vice-president and treasurer of Stone & Webster, Inc., died at Phillips House, Boston, on Feb. 15. Mr. Robb was one of the pioneer associates and earlier members of the firm of Stone & Webster and was known throughout the public utility industry as a sagacious leader of its inner councils. Modest and kindly in disposition, he was much beloved by those who came in contact with him.

The development of Stone & Webster's organization from its small beginnings nearly 40 years ago to its present magnitude and influence is, of course, due to no single individual, but as the first partner in this enterprise to enter the firm after Messrs. Stone and Webster, Mr. Robb's share in its upbuilding and his sound influence upon the utility industry cannot be reduced to measurement.

He was born at Dubuque, Iowa, Dec. 6, 1864; was graduated from the Massachusetts Institute of Technology in 1888, being a classmate of Charles A. Stone and Edwin S. Webster, and after two years of engineering service with the Thomson Electric Welding Company at Lynn, Mass., joined the engineering organization of Stone & Webster at Boston in 1891. In 1905 he was made a member of the firm and in 1920 was made senior vice-president and treasurer of the company which succeeded the former organization.

Mr. Robb was an officer and director in a long list of public utilities in the traction, light and power field. In 1896 he was the author of a book on "Electric Wiring," and in 1909-11 he lectured at Harvard University on public utility topics, his "Lectures on Organization" being privately printed in 1909. He was prominent in civic life in his home town of Concord, Mass., and was a member of the American Institute of Electrical Engineers and many other organizations and clubs.

John W. Smith, director of the Indianapolis Street Railway, Indianapolis, Ind., and also of the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., died recently. He was 67 years old.

Jeston N. Chamberlin, secretary of the Beckwith-Chandler Company, Newark, N. J., died on Feb. 6 at Jefferson Hospital, Philadelphia, Pa., following an operation. Mr. Chamberlin had been connected with the Beckwith-Chandler Company fourteen years as secretary in charge of railroad sales. He was 46 years old.

Louis Lewis, formerly of Richmond, who assisted in building the first electric railway in Richmond, died recently in Philadelphia. At the time of his death he was president of the Central Automatic Sprinkler Company, Philadelphia. Following his work in the railway field, Mr. Lewis designed and built the electric power equipment in many large mills and institutions in the country. He was 78 years old.

Robert W. Seebaum, assistant claim agent for the Cincinnati Street Railway, Cincinnati, Ohio, died at his home in that city on Jan. 11 following a long illness. Mr. Seebaum, had been connected with the claim department of the railway for 23 years. He was graduated from Columbia University and attended the Cincinnati Law School.

Lynn Shaddeau, purchasing agent of the Saginaw Transit Company, Saginaw, Mich., died suddenly on Jan. 18. Mr. Shaddeau had been connected with the Saginaw Transit Company and the Saginaw-Bay City Railway, its predecessor, for twenty years. His death marks the first break in the new organization since its inception three years ago. Mr. Shaddeau was born in Saginaw in 1886.

John S. Moore, general passenger and freight agent of the Chicago, South Bend & Northern Indiana Railway and the Southern Michigan Railway, both of South Bend, Ind., died recently. Mr. Moore had been connected with these companies since 1918. Previous to that time he had been in the freight department of the South Shore Railway and had been employed by the Wabash Railroad in the capacity of station agent at different points on its line.

Manufactures and the Markets

$724,372 Net Profit for Brill

Car Builder Reports Approximately $7,250,000 of Work on Hand Jan. 1, 1927

For the year 1926 the combined output of the J. G. Brill Company's four plants amounted in sales value to $10,416,381.

The combined output for each of the past seven years follows:

1920	$17,537,293
1921	7,647,898
1922	10,177,582
1923	18,167,486
1924	8,721,726
1925	9,101,909
1926	10,416,381

After deducting from earnings all cost of operations, in which are included maintenance and repairs and depreciation for the year amounting to $507,602 and after setting aside out of earnings reserve for federal income taxes, not yet due, of $109,178 the result of the operations of all the plants of the company shows a net profit for the year of $724,372.

The amount of work on hand on Jan. 1, 1927, was approximately $7,250,000, compared with $3,850,000 at the same time last year.

CONSOLIDATED PROFIT AND LOSS AND EARNED SURPLUS ACCOUNTS OF THE J. G. BRILL COMPANY AND SUBSIDIARIES FOR YEAR 1926.

Total net sales billed		$10,416,381
Cost of sales, including operating, selling, administration and general expenses and depreciation for the year, less miscellaneous income		9,582,831
Operating profit		$833,550
Less estimated federal income and state taxes for 1926		109,178
Net profit to earned surplus		$724,372
Earned surplus at Dec. 31, 1925		$4,916,668
Surplus adjustments		....
		$4,916,668
Add profit as above		724,372
		$5,641,000
Less dividends paid—		
Preferred	$320,600	
Common	200,425	521,025
Earned surplus at Dec. 31, 1926		$5,120,015

Milwaukee Company Has $5,000,000 Railway Budget

Nearly $5,000,000 will be spent for railway and bus improvements by the Milwaukee Electric Railway & Light Company and five other North American subsidiary companies, according to a recent statement issued by S. B. Way, president of the Milwaukee utility. The entire addition and betterment program will cost approximately $11,449,000. Of this amount $4,492,184 for improvements and additions to the electric railway and bus transportation service in the Milwaukee area. In the territory served by the Wisconsin Gas & Electric Company, operating in Racine, Kenosha, Waukesha, Watertown, Burlington and a score of smaller communities in southeastern Wisconsin, $105,334 will be expended for railway and bus improvements. While in the Appleton district, the Wisconsin Traction, Light, Heat & Power Company is slated to spend $152,314 in improving its railway and bus service.

Montreal Tramways Has $1,000,000 Rolling Stock Program

Fifty new street cars and ten new auto buses to cost approximately $1,000,000 shortly will be added to the equipment of the Montreal Tramways. Although plans for the cars have not been completed, it is understood the order will include 25 double-truck cars of a different design from those now in use on the St. Denis route. Each car will cost $17,000 and delivery is expected in the early fall. Approximately $130,000 is being spent by the company for new auto buses, each bus to cost approximately $15,000. They are being manufactured by the Yellow Truck & Coach Manufacturing Company. Delivery on this order of ten buses has already commenced, five of them having reached Montreal from Chicago last week. The buses have a seating capacity of 34 passengers each as compared with the 29-passenger type now in service. Contract for the cars will be awarded shortly.

De Luxe Car Service for Washington & Baltimore Soon

Ten articulated cars recently ordered by the Washington, Baltimore & Annapolis Railroad are to be placed in service very shortly, according to a recent announcement made public by President J. J. Doyle. It is understood that five of the cars will be in operation by the end of February.

The new rolling stock, for which contracts were awarded the J. G. Brill Company and the Westinghouse Electric & Manufacturing Company, represent an outlay of $500,000. They will be the first of their type chosen for operation by any high-speed interurban line in America. As detailed in the JOURNAL for Jan. 22, page 165, the cars are connected or articulated by a center truck.

The decision to provide a new and exceptionally luxurious type of car for the patrons of the Washington, Baltimore & Annapolis line was made by officials of the company when it was realized that the advent of the beautifully finished and smooth riding buses attracted thousands of electric car riders to the auto coaches. It was then decided to furnish equal riding luxury on the electric cars, which, with traffic over a carefully guarded right-of-way and with rigidly maintained schedules capable of meeting any transportation demands, day or night, would afford the riding public the greatest degree of safety.

Rockford & Interurban to Order Seven New Interurban Cars

From official circles it is learned that the Rockford & Interurban Railway, Rockford, Ill., shortly will place contracts for seven new one-man interurban cars and that it will immediately convert two of its present interurban cars to the one-man type. Plans also call for rebuilding a third car along these lines in the near future. Delivery of the new rolling stock is set for May 1. Thus the information was incorrect which appeared in an article in the JOURNAL for Feb. 5, page 270, in which it was stated that ten cars had already been ordered by the company at a cost of $100,000. Recent advices raise this figure to $160,000 for the seven new cars.

Omaha Company Allots $80,000 for Trackwork

According to the annual forecast of the Omaha & Council Bluffs Street Railway several important improvements are contemplated for the coming year. Among them is the widening of the Q Street viaduct in South Omaha, which has just been ordered by the City Council. The cost of this project is estimated at $200,000, of which the company's proportion, including trackwork, will be about $36,000. Another item is the widening of Twentieth Street between Dodge and Harney Streets. This work is expected to cost in the neighborhood of $25,000 and will involve the realignment of tracks. Another improvement includes the expenditure of $30,700 for the repaving of Sixteenth Street between Farnam and Leavenworth Streets. Paving of Vinton Street between 24th and 25th in Omaha and the resurfacing of Broadway in Council Bluffs between First Street and Franklin Street are other contemplated improvements, for which the company estimates it will spend $15,000.

Giant Electric Engine Goes West for Great Northern

Great Northern Railway, St. Paul, Minn., will soon put into service in the Pacific Northwest a giant two-unit motor-generator electric locomotive recently completed jointly by the Baldwin Locomotive Works and the Westinghouse Electric & Manufacturing Company of East Pittsburgh. The locomotive is now being piloted through the Northwest states by T. E. McGettigan and E. R. Randolph, making stops at the principal cities, perhaps going as far as Vancouver, B. C., for exhibition purposes. The locomotive weighs 715,000 lb. and is 94 ft. 4 in. long over all between faces of buffers.

The motive-power will operate on the Great Northern line between Skykomish and the summit of the Cascades on the Everett-Wenatchee division, and later, when the new Cascade tunnel is ready, will haul trains through the 7¾-mile bore.

Orders for Electrical Goods Increase

New orders booked during the fourth quarter of 1926, as reported to the Department of Commerce by 72 manufacturers of electrical goods, were $246,711,426 as compared with $229,423,540 for the third quarter of 1926 and $234,871,751 for the fourth quarter of 1925. The total bookings for 1926 for these concerns were $963,852,642, as compared with $900,985,980 in 1925.

Rolling Stock

Springfield Street Railway, Springfield, Mass., and Worcester Consolidated Street Railway, Worcester, Mass., have completed specifications and will shortly call for bids on approximately 100 new cars of the one-man, two-man type.

Fitchburg & Leominster Street Railway, Fitchburg, Mass., has recently ordered four double-truck safety cars from J. G. Brill Company. The specifications include Brill 117-E trucks.

J. G. Brill Company, Philadelphia, Pa., has received an order for five 50-ft. 6-in. passenger and smoking car motor bodies from the Philadelphia & Western Railway, Philadelphia, Pa. The bodies will be mounted on Brill 27 M.C.B. trucks.

Portland Electric Power Company, Portland, Ore., has received a new six-cylinder Mack bus with street car body for use on the bus line to Marquam Hill.

Phoenix Municipal Railway, Phoenix, Ariz., will purchase a number of new cars if the voters on March 12 approve a program calling for the expenditure of $175,000 in rehabilitating the property.

Fageol Company, Kent, Ohio, reports the delivery of eleven coaches, type DD to the Department of Street Railways, City of Detroit, Mich. All the coaches are equipped with Westinghouse air brakes.

Track and Line

Tidewater Power Company, Wilmington, N. C., owned by the Fitkin interests, will reconstruct its line between Wilmington and Wrightsville Beach, North Carolina, at a cost of approximately $50,000. The project will include the relaying of 32,000 ft. of new and heavier rail. Charles Brooks, general manager railways for the company, has charge of the work, which is scheduled to begin about March 1. Wrightsville Beach is North Carolina's leading ocean resort and the new line will double the service capacity.

Trenton & Mercer County Traction Corporation, Trenton, N. J., will commence shortly the construction of a loop in the Wilbur section of the city, the work having been approved by the Board of Public Utility Commissioners.

Wisconsin Public Service Corporation, Green Bay, Wis., has completed its budget for 1927, which calls for the expenditure of $1,680,000 for improvements and additions to its properties in Wisconsin. To improve its electric railway and bus properties, approximately $625,000 will be spent during 1927.

Tri-City Railway, Davenport, Ia., is installing a new trolley wire on Harrison Street. The wire is being strung from Second Street north to Eighth Street for use of the Vander Veer Park and Gaines Street line. The improvement will cost about $1,000.

Seattle Municipal Street Railway, Seattle, Wash., through its superintendent, D. W. Henderson, is urging the immediate reconstruction of Westlake Avenue car tracks, and has asked the Council utilities committee to make $55,000 available for the work at once. Rails and other materials worth more than $30,000 were purchased three years ago, but the railway fund has never been able to finance the installation. The project extends from Roy to Fulton Street. Mr. Henderson suggests that the $55,000 be appropriated as a loan from the depreciation reserve.

Shops and Buildings

Cincinnati, Hamilton & Dayton Railway, Dayton, Ohio, will erect eight new automatic stations between Dayton and Cincinnati at a total cost of $200,000. This is part of a $1,500,000 rehabilitation program which has just been launched.

Hartford & Springfield Coach Company is removing all steam and electrical equipment from the old power plant at Warehouse Point, Conn., and is installing automatic machinery for rebuilding and repairing buses for its own and other lines. Among the concerns to be served are the Interstate Buses Corporation, Long Island Coach Company and Colonial Coach Company of Newport, R. I. Carl Derr is superintendent of the maintenance operations.

Trade Notes

Rome Wire Company, Rome, N. Y., announces the opening of a new warehouse to serve the Detroit territory. Herman C. Jobs will be in charge of the new service station.

Universal Car Parts Corporation has just been organized in Baltimore, Md., for the purpose of manufacturing and installing car parts and accessories and having as its special product the "Universal joint coupler," of which Joseph M. Saurez is the inventor. The corporation will concentrate its energies and resources on introducing Mr. Saurez's invention, a two-ball coupler designed to take the shortest curves and most abrupt change of grades and lateral inclinations. Offices of the corporation will be at 6 East Mulberry Street, Baltimore, Md.

Tide Water Oil Sales Corporation has secured a yearly contract for gasoline from the Fifth Avenue Coach Company, the Yellow Taxi Cab Corporation, and the Hertz Driv-Ur-Self Sales Corporation. The probable amount of gasoline which will be used by these corporations for the year is between 16,000,000 and 20,000,000 gal.

ELECTRIC RAILWAY MATERIAL PRICES—Feb. 15, 1927

Metals—New York

Copper, electrolytic, cents per lb	12.435
Lead, cents per lb	7.425
Nickel, cents per lb	35.00
Zinc, cents per lb	7.00
Tin, Straits, cents per lb	68.625
Aluminum, 98 or 99 per cent, cents per lb	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.825
Somerset mine run, Boston	2.125
Pittsburgh mine run, Pittsburgh	1.85
Franklin, Ill., screenings, Chicago	2.05
Central, Ill., screenings, Chicago	1.875
Kansas screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, 9/16 in. and larger, cents per lb	2.90
Tie plates (flat type), cents per lb	2.35
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	4.20
Steel bars, cents per lb	1.90
Ties, white oak, Chicago, 6 in.x8 in.x8 ft	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.40
Sheet iron (24 gage), cents per lb	2.80
Sheet iron, galvanized (24 gage), cents per lb.	3.70
Galvanized barbed wire, cents per lb	3.25
Galvanized wire, ordinary, cents per lb	2.40

Waste—New York

Waste, wool, cents per lb	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–17.50
Colored	10–14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.80
White lead in oil (100 lb. keg), cents per lb	14.50
Turpentine (bbl. lots), per gal	$0.76
Putty, 100 lb. tins, cents per lb	5.25–5.50

Wire—New York

Copper wire, cents per lb	14.50
Rubber-covered wire, No. 14, per 1,000 ft	$5.50
Weatherproof wire base, cents per lb	16.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$142.40
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.94
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y	1.75
Sand, cu.yd., f.o.b. N. Y	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	10.50
Light copper, cents per lb	9.25
Heavy brass, cents per lb	6.75
Zinc, old scrap, cents per lb	4.00
Lead, cents per lb. (heavy)	6.00
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	15.25
Rails (short), Chicago, gross ton	16.75
Rails, (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

The Legislative Reformer Is Hard at Work

LEGISLATURES are in session in 41 states. Thousands of bills of all descriptions are pouring into the hoppers. Many of them will never see the light of day. It is just as well. Of all the sins to which humanity—particularly humanity in the United States—is heir, the sin of legislation is one of the worst. It is an ever-recurring but strange sight this, but there seems nothing to do but grin and bear it. That, however, is not so easy to do in some cases. There is no need to go into the details, but the efforts being made in some states to legislate against one-man cars, to return to home rule and to attempt to cure this or that supposed ill by legislation would be funny if they were not quite so serious in their possible consequences.

This does not mean that one should not give serious heed to the recommendations in the Governors' messages abstracted elsewhere in this issue. Some of the things sought to be accomplished are laudable in their purpose. It is to be hoped that the bills intended to put these recommendations into effect may be enacted into law. To assume a negative attitude on the whole matter of legislation will not do just because many of the bills are ill-conceived. It is advisable to work assiduously against bills that are likely to impose hardship on the industry, but while doing so it is also well to try to preserve a philosophical attitude toward the measures of the zealot imbued with the insane idea of reformation at one fell swoop. Nothing helps the reformer more than to underestimate him or to hold him too cheaply. The zealot, enamored of his own estimation of his own importance and charmed by the sound of his own voice, is not dangerous so long as he is content, Narcissus-like, to be satisfied with his own reflection and his own echo, but no one knows how long he will remain thus content. It is when he attempts to translate his zeal into action that he becomes a menace to society. Evidence of the bitter consequences of such endeavor beset the world at every turn. If legislation could make us good, we would be good indeed.

Many Failures in Service Are Due to Carelessness

NOT long ago a certain large department store made a careful investigation to determine the reason for every road breakdown of its motor truck delivery equipment. It was found that about 40 per cent of the breakdowns were due to carelessness, either in operation or maintenance, and that 60 per cent could be properly attributed to causes such as failure of material or general wear and tear. Analyzing further the matter of carelessness, it was found that only 10 per cent of the total breakdowns resulted from faulty maintenance, while 30 per cent were caused by improper operation of the vehicle. These conclusions are particularly significant because the investigation was conducted by a neutral member of the store's executive staff.

To some extent a similar condition exists in connection with electric railway operation of cars and buses. Because of careful inspection methods on most railways incipient failures of material usually are detected before breakdown occurs on the road. For that reason the proportion of breakdowns due to abuse of equipment probably exceeds the 30 per cent found in the cases of the delivery trucks, and the proportion due to material failure is smaller. While the construction of the average railway car is more rugged than that of an automotive delivery vehicle and it will stand more abuse by its operators, the number of road failures resulting from such causes as carelessness and improper operation undoubtedly is large. Careful analysis of this situation would be well worth while on any railway property. Not only would repair bills be reduced but fewer interruptions to service would occur.

Ready-to-Wear vs. Custom Built

MUCH theory has been aired concerning the ultimate rôle which the bus will play in the drama of co-ordinated transportation. There have been some to claim that it might properly be expected to replace the street car, or at least to share honors with it, as an instrument of mass transportation. Enthusiasts all for the bus, the exponents of this theory have shown a singular lack of foresightedness in sensing the real field in which the vehicle might best develop its manifold possibilities. In their eagerness to see its widespread adoption in transportation work they have, in various local instances, come perilously close to convincing the people that the bus is nothing more nor less than a street car on rubber tires.

Much more constructive is the stand taken by an ever-increasing number of transportation executives, that the bus will best serve them as an entering wedge among the class of people who have a decided aversion to rubbing shoulders with the hoi polloi in a crowded car—who prefer the comfort and individuality of their own automobiles, be the attendant evils of traffic congestion and lack of parking facilities what they may. This is no small element in any community of size. It is constituted of people who know what they want and who have the money to pay to secure it. The prosperous business man as a rule does not drive to his office in his own car because he enjoys the task of threading the choked downtown streets and paying an exorbitant parking charge for space in some centrally located garage. But he will do this if he must in order to obtain the privileges which he has been led to believe epitomize social prestige and which certainly guarantee a degree of comfort not obtainable in a mass transportation vehicle.

There is no fundamental reason why buses should not be operated in de luxe suburban service, providing for the better residential districts of a given area a transportation medium quite comparable to the private automobile. Direct express service to the central business and shopping districts; even reserved club car service for the men in a certain residential section who might wish to subscribe to such an institution—these are but suggestions of the possibilities which might be developed by a railway company whose executives have a sense for latent values. Of course the fares charged for these services must of necessity be on a plane to justify the luxurious equipment and attention to individual needs wihch are provided.

Two Pennsylvania systems, the Philadelphia Rapid Transit Company and the Pittsburgh Railways, are among the most recent to embark upon such a program. The former has established a de luxe bus service connecting Doylestown, Willow Grove and the center of Philadelphia. From Willow Grove to Philadelphia no service stops are made. The usual electric car service between the several points on the route has been retained, but a well-planned selling campaign was adopted for the bus service, this being directed at the well-to-do elements of the citizenry of Willow Grove and the other communities along the route. Luxurious 27-passenger gas-electric buses have been provided and the fare charged is considerably higher than the street car fare for the same trip. Similar services offered by the Pittsburgh Railways were explained in detail by T. W. Noonan before the C.E.R.A. at its recent meeting.

These are but examples of the broadening vistas for the bus. It is "custom-built" to fit individual needs of varying groups, while the street car must always be ready on the shelves of the transportation merchant.

Something Different in Fares and Public Relations

UNUSUAL circumstances attended the settlement of the recent fare case in Fort Worth, Tex., an account of which appears elsewhere in this issue. The railway concerned is the Northern Texas Traction Company, 1924 Coffin prize winner. Its approach to the matter differed in detail from the general procedure. In this respect and in respect to the system of rates suggested the case is of interest to the entire industry. The negotiations culminated in the City Council authorizing the rate readjustment by unanimous vote. It was a remarkable demonstration of public good will. The whole proceeding occupied a period of only two months. This in itself is remarkable, but, more remarkable still, not a single letter or protest appeared in any of the newspapers during all this time. At no time in any of the conferences did the company's lawyers participate in the discussion. The company took the position that this was not a legal but a business matter and that it should be handled in a business-like way with technicalities avoided. For taking this attitude the company was complimented by the members of the Council.

So much for the spirit of good will that pervaded the negotiations. Now for the increase and its significance. The new rates contemplate a 10-cent cash fare, three tokens for 25 cents and a pass costing 40 cents a week which entitles the holder to a wholesale rate of 5 cents per ride. This type of pass is somewhat of a departure in charging for railway service. On twelve rides a week the average fare on the ticket is 8⅓ cents, the same as the token rate. All rides that the passholder takes in addition to twelve a week are likely to be in off-peak periods. The company, it is understood, feels that the nickel pass has many advantages over the weekly pass. A supposititious case is that if the company had adopted the weekly pass at $1.25 the passenger would have to use the pass more than fifteen times a week to save any money under the token rate, whereas the feeling of the Fort Worth management is understood to be that the rider is entitled to begin saving as soon as he has exceeded the twelve-ride-per-week mark. Moreover, the buyer of the nickel pass puts up only 40 cents, and if he should be unable to use the ticket for a part of the week, he has less to lose than on the $1.25 or $1.50 weekly pass. The company estimates that 25 to 30 per cent of the passengers will ride on the nickel pass.

As for the actual change in the system, it appears to have been put into effect with unusual celerity. The whole proceeding carries a lesson to the industry, a lesson showing the influence exerted in behalf of a company that has the public good will, and a lesson of the resourcefulness that is constantly seeking to make the electric railways of greater value to the communities they serve while at the same time they strive by wholly legitimate means to turn to their own advantage every resource that may increase earnings.

Two Worth-While Educational Activities

PROVISION for the training of foreman-conference leaders and a study of the methods of training car and trainmen are two aspects of the work of the American Association committee on education on which it has decided to concentrate its attention this year. The decision was reached at the meeting held at Toledo this month in connection with the C.E.R.A. meeting.

Both of these subjects are of vital importance. One relates to the supervisory force, where training in the duties and opportunities of foremanship is both needed and desired; the other is in a field where vast sums of money are spent annually and where a small improvement will net a large return.

The committee on education has through its studies, recommendations and demonstrations awakened a real interest in foreman conferences and other forms of supervisor training. Assent to the need for such training is freely given by all managers who have familiarized themselves with the information now available regarding its possibilities. This assent is based on the conviction, first, that foremen as a class have not realized the full potentiality of their position as intermediary between the men and the management, and, second, that foremen welcome an opportunity to study their jobs as foremen and to appropriate the fruits of modern development in the art of foremanship.

When the problem of the foreman conference is considered, the first question that arises is, Who will lead it? The success of a series of conferences obviously lies largely in the leadership. A high official cannot be leader of a conference of the type that brings out informal and profitable discussion on foremanship. Except in rare cases, men hesitate to disclose their thoughts about their own jobs before an official on whom they wish to make a good impression. The leader must be a man whose position with the company or outside its ranks is such that the standing of the foremen cannot possibly be affected by anything they may say in his presence. And he must have their confidence in his ability to keep to himself what he hears.

Whoever undertakes the leadership of a foreman group will benefit by study of the experience of other leaders. Much material is available through books and pamphlets, particularly those prepared by the Federal Board for Vocational Education. State educational boards, also, stand ready to assist in practical ways. They should be consulted freely. If in addition to these sources of information and leader training the committee on education can directly and indirectly provide further opportunities, countrywide as well as local, for special training of electric railway foreman-conference leaders, the path of the manager who wishes to furnish foreman training on his own property will be made smoother.

The second proposed activity of the committee, training of platform men, is an entirely different matter. There is a real need here also. That present practice is not altogether satisfactory is indicated by the spirit of investigation everywhere apparent. Railways are sending out representatives to study training methods elsewhere so that their own may be improved.

Campaigns such as those for accident reduction, merchandising transportation and energy saving emphasize the qualities needed in the present-day motorman, conductor or operator. The present liberal wage scales warrant high-grade service on the platform. This means training of a new order. The committee on education can help here by formulating, for discussion and adoption by the industry, those fundamental training principles which must be followed in developing the 100 per cent 1927 trainmen.

Courtesy Declares Dividends of Good Will

FROM far off Buenos Aires comes a problem in courtesy some form of which is met with every day by the American motorman and conductor. According to the Buenos Aires *Standard*, a tram guard's problem is difficult in that city. If he invites a passenger to take a seat instead of standing on the platform he is abused for his pains. On the other hand, if he does not invite the passenger to be seated when there is room, he runs the risk of being accused of neglecting his duty. This is the old case of being between the upper and the nether millstones. Undoubtedly there are many people who travel today who have no consideration or discretion, much less courtesy. Dealing with such people presents one of the most important phases of public relations work, in which the platform men should be made to realize that they can be of enormous assistance to the railway companies.

In the last analysis, the motorman or conductor is the company. Upon his ability to analyze human nature rests the success of the company in winning public favor. While it is difficult to keep one's temper when placed between the upper and the nether millstones, it will be a comforting fact if the motorman or conductor is reminded that the only solution of the problem lies in continual courtesy, which, like water washing on a stone, eventually will penetrate surface resistance. The trouble about so-called courtesy is that it is often manufactured politely and is as different from the real article as education is from culture. A real exponent of courtesy is a person upon whom no amount of rudeness can have any effect. Courtesy, the aristocrat of social relations, is found on every step of the social ladder.

We cannot, however, expect the courteous employee to anticipate all of the public relations problems encountered during a ten-hour tour of duty on the platform. Hence it seems the practical thing to assign a specialist to this question with the idea of preparing a skeleton course in platform etiquette. It will be well worth the expense when we bear in mind that a courteous platform man declares daily dividends of good will for his company.

A Reorganization That Saved the Original Investment

FRANK, indeed, in what it told was the paper presented by Robert M. Feustel before the Toledo meeting of the Central Electric Railway Association. The very title of the paper, "Financial Reorganization Saved the Original Investment," was provocative in the disclosures which the title implied. And Mr. Feustel did not disappoint his audience. It is impossible here to recapitulate what Mr. Feustel said. The facts set down by him do not lend themselves to such treatment, but the author was on firm ground when he made the suggestion that some years ago it would have been rank heresy for a utility operator to have admitted that outstanding securities were greater in face value than the actual money invested in physical property. Indeed it would. More's the pity. He was on thoroughly sound ground, too, when he said it had always seemed to him that the utility operators had failed to make the most before utility commissions of the very natural and logical history of the growth of their financial structures. What is most important, he backed up this statement with the reasons for making it.

The problem in the case of Mr. Feustel's property was no different from that presented in many others. Within a period of fifteen years poor guesses as to the choice of territory in some cases and the development of the automobile in all changed what was a perfectly legitimate business enterprise into a task for salvaging. And the salvaging was intelligently done. Money had to be found to better the service and so increase revenues. And that money was found. First mortgage bonds were cut in amount from $9,000,000 to $4,700,000. It wasn't easy to do this. The new securities equaled in face value all of the cash which had been put into the property, including the foregone interest for the three years of default. As things stand now the first mortgage represents only 35 or 40 per cent of the investment, a very different financial set-up from that with which the company started.

Mr. Feustel is over-modest when he says that there is nothing at all remarkable about the plan outlined except that "the new securities did represent all the cash in the properties at face value and were so arranged that future financing would be accomplished, and if earnings would have been low the sheriff was not so near." Particularly was he not condemnatory of the *entrepreneur*. It seemed to him that the original financial structure was a perfectly logical outcome of the highly competitive condition under which the early electric railways were built and that the promoters were well entitled to any profits they could make in gathering so much money into the development of the new and still speculative utility field. With that point of view ELECTRIC RAILWAY JOURNAL is in thorough accord. All in all, Mr. Feustel told a story that the industry needs to have on the records, a story that substantiates the position taken by the committee on finance. On this occasion the need is not to scoff at what was originally attempted, but to proclaim what was eventually accomplished.

Three Classes of Service,

Says T. E. Mitten

Must Be Recognized by Local Transportation Men

Some of us are trying to sell cotton goods in a silk age. The quality of local transportation service has not kept pace with the changing demand of the times. A constantly increasing standard of service at a fair price should be the objective of the industry

AN INTERVIEW BY
Charles Gordon

T. E. Mitten

THERE has been considerable interest—and some skepticism—throughout the transportation world in the steps taken during recent years under the direction of T. E. Mitten to develop all branches of local transportation in and around Philadelphia. Co-ordination to his organization has meant not only cars and buses, but taxicabs as well.

Because of the bold steps which have been taken in putting together various transportation agencies in Philadelphia, I sought an interview with Mr. Mitten to get his ideas regarding the future of the industry. And it didn't take very many minutes to find that taxicabs and buses notwithstanding, Mr. Mitten continues to look on the electric railway car as the backbone of a co-ordinated system of city transport. But more on that subject later.

Mr. Mitten received me in his office in the new Mitten bank—another example of the man's daring ideas. This latest enterprise, like most of his other ventures during recent years, is an outgrowth of his hobby—mutual ownership by employees and management. Whether or not his ideas are generally applicable only experience will tell. But that they are audacious and interesting is apparent beyond question. He did not talk much about the bank and I did not press him on this feature of his plans, as my purpose was to get his views on more direct transportation subjects. However, the bank is a sidelight on the man, and illustrates how far out of the beaten track he has the courage to go in the development of his ideas. Employee-management co-operation had much to do with its inception. One of its features is understood to be a trust department operated at cost, to administer the estates of stockholders and depositors—and of course the employees of the transportation company may be expected to represent a major element in both groups. The average estate of P.R.T. employees amounts to about $3,000. This is a tidy sum. Though Mr. Mitten did not say so himself, I am told that one of the motives that led to the bank was the effort to help in conserving these estates and to protect both employees and their families from the ravages of the shyster lawyer and the fake stock salesman.

I let my imagination run a little as a former street car conductor resplendent in gray uniform and shining hardware ushered me into the bank elevator. When the company needed capital recently it sold preferred stock from car platforms—$10,000,000 worth of it in ten days! Deferred payments are made to the conductors by a transaction little more complicated than the issuance of a transfer. Bankers long ago discovered that people save more if you put a branch bank near at hand. From the making of stock installment payments to the conductor to making savings deposits on car platforms doesn't seem like a long step. No wonder that Philadelphia bankers are watching Mitten with great interest.

Although the bank is beside the real subject, it forms a background for the study of the characteristics of the man interviewed. He is generally considered a radical in the electric railway industry—and he probably is. But since the industry as a whole suffers from over-conservatism, his views on the industry's future and the objectives he has in mind as the goal of his daring moves during the past few years rank him as a distinct optimist on electric railways. Not only is that true, but he is also an optimist on the future of the street car as an agency of public transportation, once it has been developed and applied in combination with other forms of transportation, in a way to take advantage of its inherent service characteristics. Mr. Mitten made all this evident quickly at the beginning of our talk.

Since his acquisition of the Yellow Cab Company of Philadelphia is one of his most recent steps toward complete co-ordination of all facilities, that was a good place to start the questions, to find out just what had led the P.R.T. to acquire the cab company.

"It is the local transportation company's job," he said,

IN DEMOCRATIC America we don't like to admit class difference in anything—but we have it nevertheless. . . . We have three classes of service at three different rates. Once we recognize that condition fully we'll begin to make real progress in development. The bus is the middle class vehicle. It fits between the street car and the individual automobile or taxi. When combined, these three agencies form a complete local transportation system, but we still have considerable to learn about how to utilize each form of vehicle in such a co-ordinated system, and how to build a proper rate structure for the various classes of service given.

"to furnish every form of service required by the public. As we lose the short-haul rider and the strangers in our city with the development of the automobile, why let them go to some other agency that can make a profit from carrying them? The demand for transportation all over this country has been growing rapidly in quantity but changing at the same time in character. Why should we sit by and lose a large proportion of riders who are willing to pay the price of a taxi ride when we can haul them that way at a profit?"

That sounded like good business sense, and so without trying to get further into the taxi matter, another question was ventured in the direction in which I was more particularly interested. "What about the buses, Mr. Mitten, are they going to replace street cars?"

"Not by any means!" was his emphatic reply. And then he asked me a question. "Why do that? What good would it do?

"Substitution of buses for street cars would make no particular improvement in the situation as regards congestion. That would constitute a change without any fundamental advance in transportation facilities, either as to quantity or character. The electrically propelled vehicle has one inherent advantage that we have not talked much about, but which is distinctly in its favor nevertheless. It can be operated under ground and does not produce a gas problem. The great proportion of the people who ride in public vehicles must be taken off the streets in the congested areas and carried in underground streets—for that is all subways really are. In most cities of major size in this country there is no other alternative."

This seemed perfectly sound reasoning, but I did not feel that it covered the whole situation, and so I ventured another question.

SURFACE CARS UNDERGROUND ONLY IN CONGESTED DISTRICTS

"Does that mean, then, that you accept the idea that transportation of the future will be furnished entirely by subways underground along main traffic routes, with buses on the surface to act as feeders, so that street cars will ultimately be no longer necessary?"

Here again Mr. Mitten refused to accept the opinion expressed by others and showed the independence of his thinking.

"I don't think that follows at all," he said, "except in New York, where there are special conditions not comparable with the situation in any other city in the country; any system of subways in other American cities extending beyond the central congested business district would be needlessly extravagant and inconvenient. There is no particular reason why a passenger should have to transfer from rapid transit lines to feeders and vice versa in order to get from his home to his place of work. If you figure time from his door to his office, under such a system it is questionable whether any actual time would be saved in the average city over a system in which the car took him within convenient distance of his home without a transfer after leaving the business district. Certainly there is serious delay in getting through the congested district in most cities. Therefore the thing that is needed is to put the street cars underground when they strike the congestion. On the surface extensions therefrom, they should be operated over routes that would move the greatest possible number of people to their homes with the minimum of inconvenience."

DIFFERENT KINDS OF SERVICE NEEDED

Here Mr. Mitten launched into a very significant part of his discussion.

"One of our troubles in city transportation today is that we are trying to force everybody to use one class of service, whether they want it or not, and that service, from the standpoint of comfort and convenience, is the lowest in grade that the public will bear. In Europe they are just beginning to conceive the real meaning of co-ordination in the sense of tying together various transportation agencies to give the greatest possible variety of service at maximum efficiency. If we don't look to our laurels we'll soon be looking to their leadership. In democratic America we don't like to admit class difference in anything—but we have it nevertheless. On the railroads we have it and it is also an established fact in local transportation, whether we admit it or not. We have three classes of service at three different rates. Once we recognize that condition fully we'll begin to make real progress in development. The bus is the middle class vehicle. It fits between the street car and the individual automobile or taxi. When combined, these three agencies form a complete local transportation system, but we still have considerable to learn about how to utilize each form of vehicle in such a co-ordinated system, and how to build a proper rate structure for the various classes of service given."

At this point Mr. Mitten threw precedent to the winds.

"What do you consider the proper measure of service for the basic or lowest rate agency?" I asked.

"A seat for every passenger is the only acceptable standard," he said. "One of the fallacies in present-day thinking on transportation is that we have started with the assumption that such a standard is impossible. I don't agree with that at all. By providing prepayment facilities in surface car subways under the greater part of the business district in a city like Philadelphia, practically any car when properly equipped with safety devices can be operated with one man. Since platform labor is at least 50 per cent of present operating costs, it is evident that such a saving would enable a much higher service standard than at present can be attained. The increased speeds that would be possible would enormously increase the present capacity of the downtown tracks.

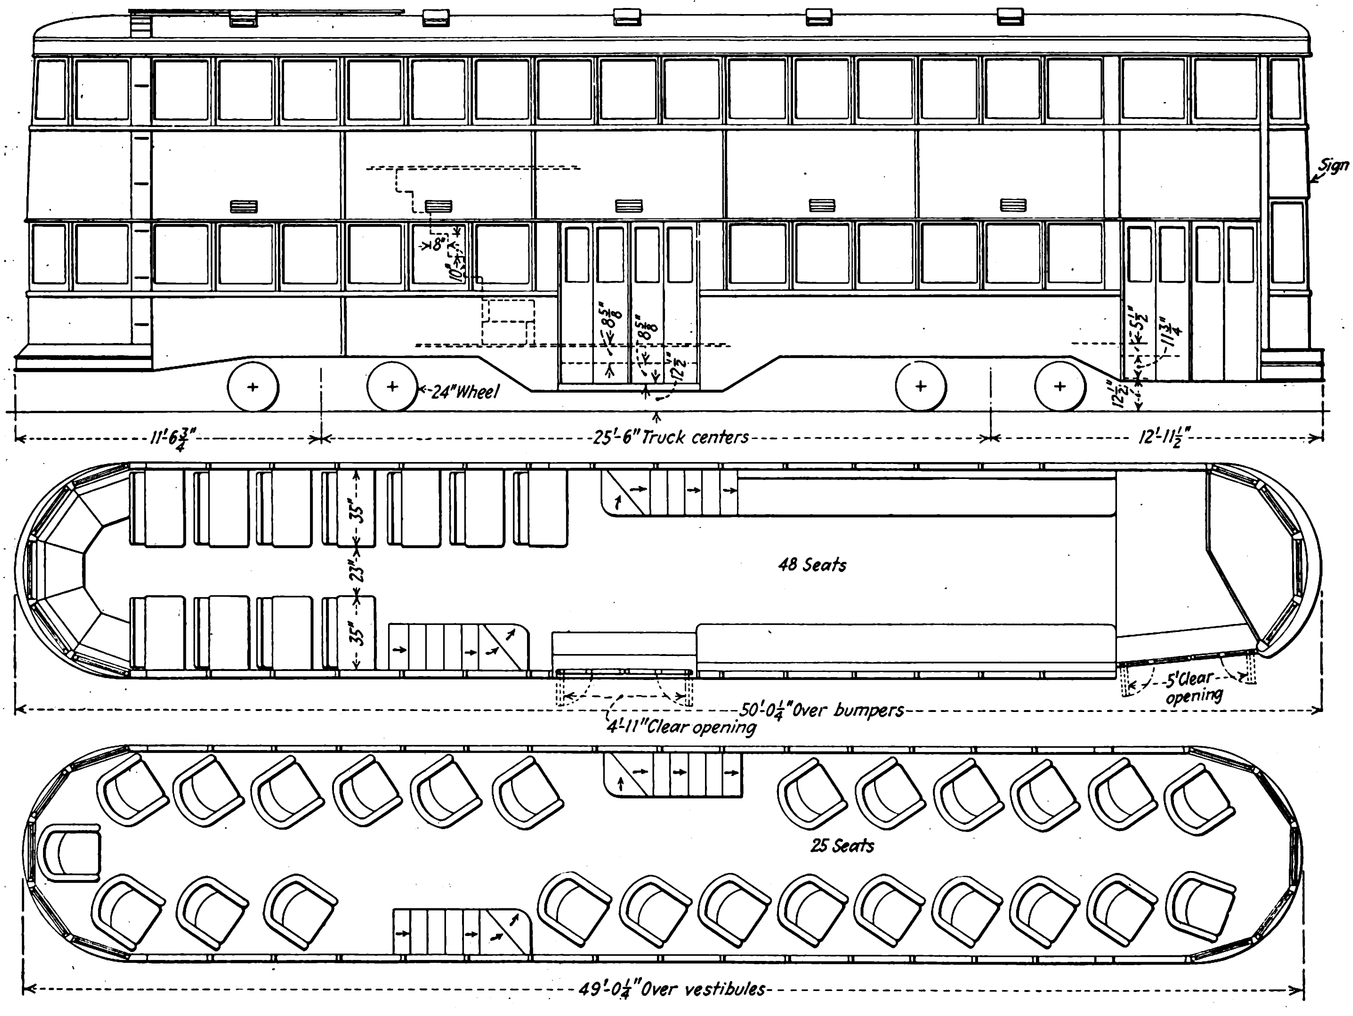
There seems to be no good reason whatever why every passenger cannot be given a seat, and why the rate of fare cannot at the same time be held at a reasonable figure for this popular class of service. Beyond that point the bus plays its part. By putting cars underground and operating buses on the surface, the capacity of the business districts will be increased. At the same time the bus has desirable flexibility for surface operation in the business districts. But its service should be maintained on a distinctly higher level at higher rates. Since it is possible for buses to pass each other going in the same direction on a given street, special express service can be given. This can be developed into a distinctive service at rates of fare which are a proper measure of the value of the service given. And there you have the picture. Beyond that point is the individual vehicle, for those who are willing to pay more for individual service. Each of these agencies, has its own distinct field to serve, and a live transportation company should be in position to furnish any class of service that is wanted. It is a serious mistake to try to bring all transportation to one class, or to permit other agencies to step into a city and take all of those riders who are no longer content to utilize the popular service at minimum cost."

Peter Witt Designs New De Luxe Car

PETER WITT, Cleveland consulting railway expert and car specialist, has just designed a new double-deck de luxe car with which he hopes to increase revenue without a corresponding advance in the cost of operation. To accomplish this Mr. Witt has planned to fit the upper deck with revolving chairs, for which there will be an extra charge. Twenty-five passengers are to be accommodated on the upper level, which is reached by two sets of stairs within the car.

By skillful planning, the main deck is arranged to seat 48 passengers and still leave ample room for standees and for free passage to the upper level. General dimensions of the car are as shown in the accompanying table.

Length over bumpers	50 ft. ¼ in.
Length over vestibules	49 ft. ¼ in.
Height over all	15 ft. 0 in.
Truck centers, two trucks	25 ft. 6 in.
Maximum headroom, upper level	5 ft. 6 in.
Maximum headroom, lower level	6 ft. 6 in.
Side-front entrance, clear opening	5 ft.
Side-center entrance, clear opening	4 ft. 11 in.
Height rail to first step	12½ in.
Height, first step to platform	8⅝ in.
Steps to upper level	8-in. tread, 10-in. risers



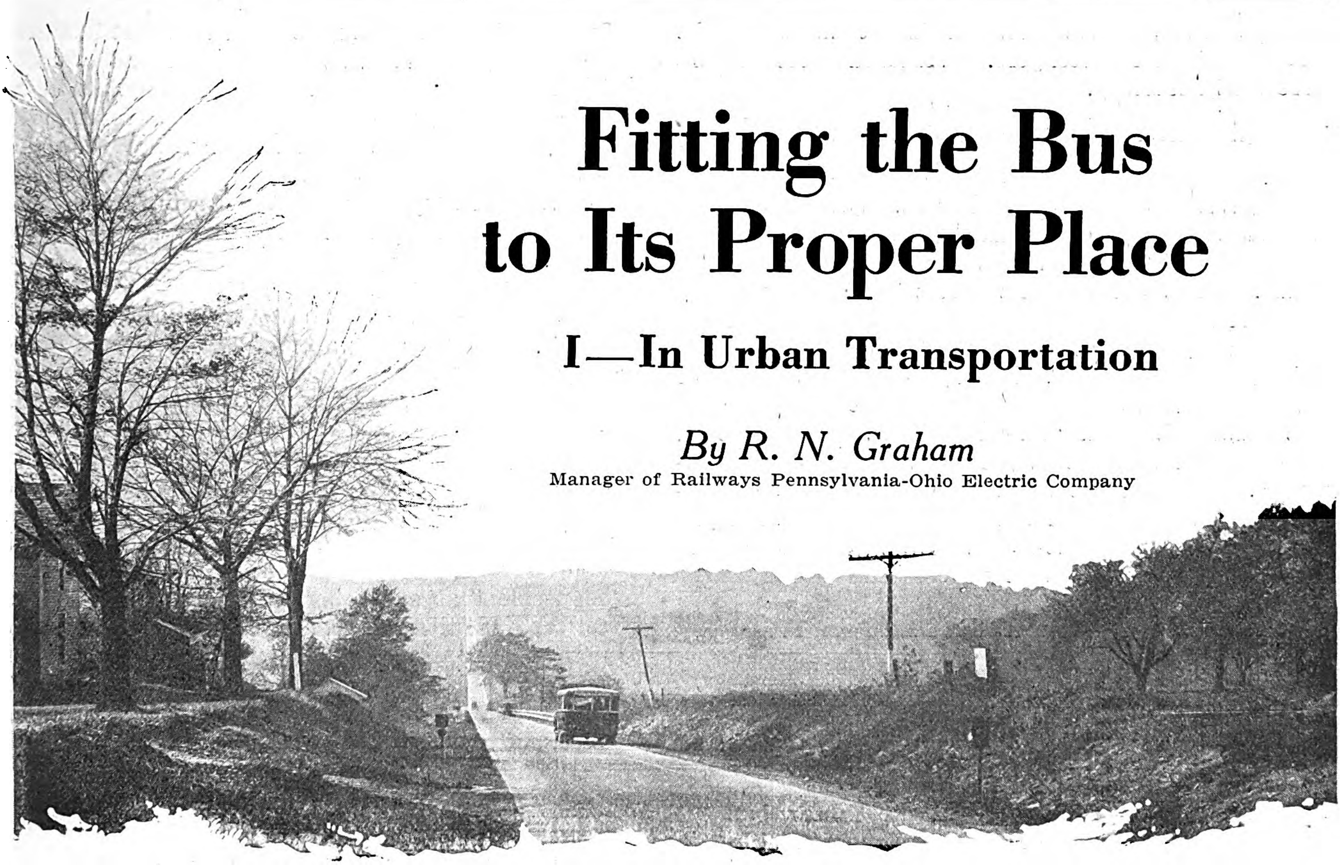
Side View and Seating Arrangement of Proposed Double-Deck Car

Fitting the Bus to Its Proper Place

I—In Urban Transportation

By R. N. Graham

Manager of Railways Pennsylvania-Ohio Electric Company



THE company with which I am connected has been operating motor buses for about five years. We have operated a total of 13,609,365 miles. Of this operation, about one-half has been city bus operation and about one-half suburban and interurban operation. The greater part of our city bus operation is in the city of Youngstown, Ohio, which probably has about 160,000 inhabitants. We have some city bus operation in New Castle, Pa.; Sharon, Pa., and Warren, Ohio, which are towns having from 20,000 to 50,000 inhabitants. We have a number of local suburban coach lines connecting Youngstown with surrounding communities and three real interurban operations, a line connecting Cleveland with Youngstown, a distance of about 70 miles; a line connecting Akron and Youngstown, a distance of about 50 miles, and a line connecting Youngstown with Meadville, Pa., a distance of about 70 miles.

THIS is the first of two articles on the motor bus, which reproduce practically in full an address made by the author before the Metropolitan Section, Society of Automotive Engineers, in New York on Feb. 17. The second article, which will be published next week, deals with interurban operation and certain features of bus design. The present article covers urban operation exclusively. It approaches the controversial bus-car question frankly and is one of the most able discussions of this subject ever published. Mr. Graham considers the bus to be a useful transportation tool and is interested in determining how best to use it. While he explodes some current claims for the bus and strikes directly at the "rubber urge" theory, he foresees for the automotive vehicle a much larger future in urban transportation than that of merely a street car on rubber tires. Every transportation man will be interested in what the author has to say. The JOURNAL will welcome comments by its readers on Mr. Graham's conclusions.

The gross revenue of our entire bus and coach operation for the year 1926 was $1,344,072.40. In the city of Youngstown during that year we operated 2,027,964 bus-miles. Gross revenue was $638,145.11 in buses. The gross revenue of both street railway and bus operation was $2,101,877.56. The number of passengers carried in Youngstown by street railway was 23,269,544, and by bus 10,380,431.

The first use of the bus in urban transportation by the Youngstown Municipal Railway was in September, 1922. An accompanying statement shows the gross revenue, passengers carried and bus-miles operated in the city of Youngstown for that year and each year since then.

You will note that we operate in the city of Youngstown about 80 street cars. This is about the same number that we operated in 1921. We now operate in the city 57 motor buses, but in 1921 we had none.

In our conception of our job in furnishing transportation to our communities, we differentiate in no respect between a street car and a motor bus. We view them both as proved agencies of transportation, as the tools of our trade. We do not intend to operate a street car where a bus can be more effectively used, neither do we intend to operate a bus where the use of a street car produces a more satisfactory result in the service to the public and in financial returns to our company.

Prior to 1916, like every other great industry in this country, the electric railway industry, which with steam shuttle service made up the only customary instrument of mass transportation, was extremely liberal in the use of man power from the fact that wages were low. With the increasing demand for man power and consequent increase of wages, the expenses of this industry increased enormously. Like every other industry, the relief was in an increase in the price of the product, which, in this case, was almost exclusively the carriage of local passengers. Increased rates of fare were thus necessary.

AUTOMOBILE COMPLICATED TRANSPORTATION SITUATION

However, unlike other industries, the price of the product could only be increased through a long siege of legal and political endeavors. In the very nature of human things the ultimate result would undoubtedly have been an increased price for the carriage of the public in the cities of the country proportionate to the increase in the expense, if there had not been another development contemporaneous with that which I have just described, greatly affecting mass transportation. This was the increase in the use of the private automobile. The increase in the use of the private automobile took away from the transportation industry a great part of its market at the very time when the cost of giving service was greatly increased.

THERE is hardly a city in the United States of 150,000 population that could not well support this supplementary service and the demand for vehicles for this service would furnish to the motor bus manufacturing companies a more stable market than the attempt to force into mass transportation at standard rates of fare vehicles wholly impractical to operate from a profitable standpoint.

I am reviewing very hastily this development of the decade from 1916 to 1926, because so many people have in their minds a conviction that electric railways in some manner failed to keep progress with the step of the world and because there is a feeling in many quarters that they are in difficulties because they are a passing or obsolescent activity. This confusion of thought is increased by the fact that during the very period that increasing costs and increasing use of the private automobile has embarrassed the street railway companies, the automobile bus has been under process of development, and the tendency has been to reason that the bus is a radically new type of transportation and that in some manner the difficulties of the railway companies are a natural result of the development of a new type of transportation which they either would not or could not use and which is to succeed the electrically propelled vehicle.

Since the problem of mass transportation as distinguished from a service primarily directed to the comfort of the individual is to provide for the carriage of people in groups from point to point in an urban community, it is evident that the generic problems facing such an industry are the same regardless of the vehicle used. There is little difference between the problems encountered in transporting a given group of people with a bus or with a street car. These are simple compared with the great problems facing either class of vehicle as a result of the constantly increasing use of the private automobile, or, on the other hand, the constant increase in operating costs.

To make this point plain, let us assume that in a given city every individual owns a motor car and every individual uses this motor car for any trips that he has to make in the city; there would be no controversy then about the fact that it made no difference whether a public transportation company engaged in business in such a city used buses or street cars; its fate would be certain no matter what vehicle it used.

THERE IS NO "RUBBER URGE"

However, when buses first became more or less generally used in this country, there was persistent talk of the "rubber urge." The idea back of this slogan was that the bus was so much more attractive a vehicle than the street car that people who were no longer customers of the mass transportation industry would again become customers if the bus were used instead of the street car. If this was not the idea, then there would be no advantage to either the transportation company or the public in simply transporting tomorrow on the motor bus the same people that are being transported today on the street car. In other words, the idea back of the "rubber urge" theory was that people who had ceased to ride street cars would refrain from using their private automobiles and avail themselves of public transportation if the bus and not the street car were offered.

It is impossible to define the use of the motor bus in city transportation without giving the most careful consideration to the question of whether this so-called "rubber urge" exists. If there is an impelling factor that will cause people to ride motor buses in preference to their private automobile when they would not avail themselves of other forms of public city transit, then the motor bus occupies an essentially different position than it does if its use is dictated by such factors as flexibility, convenience, economy, speed, etc. To deny this so-called psychic "rubber urge" does not deny the bus a place in city transportation any more than there is denied a place for subway service, elevated service, trolley cars or street cars of varying types. Proper consideration of the question of the existence of this psychological factor would perhaps in the past few years have saved many heavy expenditures. Too much consideration cannot be given to the problem of whether such an urge exists.

In the first place, inferences have been hastily drawn ascribing to this intangible factor facts to which it never contributed. For instance, let us take the ordinary city of this country in which the streets are laid out in checkerboard fashion, as is common in the Middle West towns. On one of these streets there is a street car line, and six blocks from this street and parallel with it there is another street car line. People living on the street half way between the two car lines are compelled to walk three blocks to either line. If a bus is operated on this street, these people will no longer walk three blocks to the car but will patronize the bus line. Here there is no "rubber urge." It is just a matter of greater convenience. The same fact would follow if a car line were built down the street in question.

PEOPLE WILL USE MOST CONVENIENT TRANSPORTATION

Let us take another street car line on which there is a ten-minute headway. If buses are operated on this same street over the same route as that of the street cars, and splitting the headway of the cars, manifestly if similar service is given and the trip takes an equal length of time, a part of the people will ride on the bus. This is not a result of a "rubber urge" but is merely again a matter of convenience.

There have been instances where street car tracks are worn out, the special work gone, the cars old, noisy and decrepit. When a bus entered into competition, practically no customers rode the decrepit utility. They patronized the utility which, under the individual circumstances, furnished them more convenient service. This again is not the influence of the "rubber urge" but is merely again a seeking by the customer of his own personal comfort and convenience. The same result would have followed if a different street railway company had laid new track down the same street, with new, modern, comfortable, easy-riding street railway equipment.

There are still other conditions existing which might lead to a confusion of thought in regard to the "rubber urge." For instance, a given street car route may cross a number of railroad tracks at grade, where there are many train movements or shifting movements, resulting in constant delays to the street railway service. There may be in the neighborhood some street traversing the same locality on which there is a separation of grade so that buses can be operated without the delays and discomforts attached to the steam railroad crossing. In that event there would be considerably more traffic given to such a bus line than to the street car line which had this disadvantage. If a new street railway line were constructed on the street having the grade separation it would possess the same advantage over the original layout.

Again, the street railway line may have been built to accommodate portions of the city as originally laid out, but there has been such a change due to shifting of population centers that there is a more direct route to where the population lives than is offered by the rail line. In such a case, either a bus or street railway line following the more direct route would naturally attract more travel than the old line.

After eliminating all these confusing factors, let us face the question squarely—is there an attraction in the bus itself, disregarding factors which can influence either bus or street railway traffic, that would cause more customers to use a bus service than a street railway service under similar conditions? Leaving out of consideration for the present the question of expense of operation of the two modes of transportation, the query as to whether such an attraction exists is a very important factor in determining whether buses are a substitute for or a supplement to the electric railway car in mass transportation.

TABLE I—GROWTH OF BUS OPERATIONS IN YOUNGSTOWN, OHIO, BY PENNSYLVANIA-OHIO ELECTRIC COMPANY. IN 1926 THE COMPANY OPERATED 80 STEEL CARS AND 57 BUSES

Year	Gross Revenue	Passengers Carried	Bus-Miles
1922	$28,453.56	510,929	112,901
1923	228,425.53	4,032,882	918,644
1924	444,700.25	7,387,091	1,511,091
1925	511,347.59	8,361,236	1,738,930
1926	638,145.11	10,380,431	2,027,964

YOUNGSTOWN AFFORDS COMPARISON OF BUS AND CAR

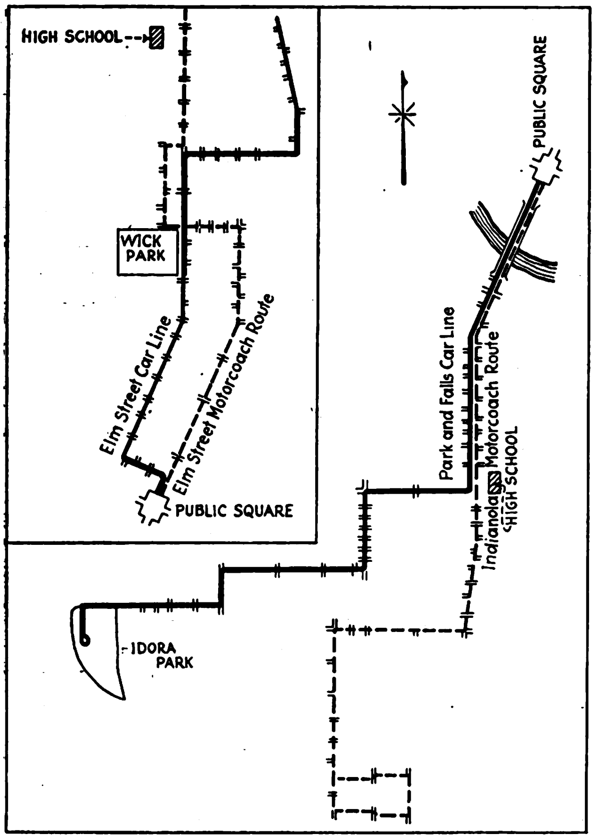
In our operation in Youngstown we have eight bus routes and eleven street railway routes. They are operated with the same rate of fare, the fare being 8 cents cash, tokens seven for 50 cents, and a transfer charge of 1 cent. All bus routes as well as all street railway routes are operated to the center of the city. There are no shuttle lines, either bus or street railway. The bus routes in general are extended into well built-up sections of the city. Duplicate service is not given. In general, the manner of operation for buses and street cars is substantially the same. As a result of five years of operation of bus lines in this manner, I would assert without hesitation that there is little preference shown by the citizens of Youngstown to either bus or street car, but where a choice can be exercised, the choice is generally in favor of the car.

Now I wish to call attention to a specific situation in which the materials for a test of the public's preference are, I think, complete and fair. There are in Youngstown a car line and a bus route which penetrate the same general territory. Both these routes are known as Elm Street. The Elm Street car line is 2.6 miles in length and the Elm Street bus line 2.5 miles in length. For the greater part of their distance they are separated by a distance of three blocks. For less than half a mile they are separated by one block, and for the remainder of the distance by five blocks. This bus route was one of the first of those operated in Youngstown. Service has been continuous on the route for almost five years. An accompanying table shows the service given and patronage on these two lines for the month of October, 1926.

HOWEVER, there is a fourth, and I believe even greater, field than any of those enumerated for the use of this vehicle, and that is as a special, supplementary service at a much higher rate of fare to furnish unusual convenience to customers who do not object to this higher charge. In the city of Pittsburgh there are at present being operated several bus routes from the suburbs to the heart of the city where a 25-cent fare is charged and these routes are being operated with a high degree of success.

The car-miles operated for this month were 22,236. Bus-miles were 21,873. Street cars made 7,846 trips and buses made 8,568. The off-peak headway on both car and bus lines was ten minutes. However, to give this off-peak headway required four street cars and only three buses. Therefore the round trip by cars took 40 minutes and the round trip by buses 30 minutes, so that the service by buses was speedier. This is the fact because a large portion of the car line is single track with passing sidings. On the other hand, only one tripper car was used and three tripper buses were required. The cars operated were the small Birney cars seating 32 people. The buses were modern single-deck equipment seating 25 passengers. The cars had slat seats; buses were equipped with leather upholstered seats. The track of the car line is in as poor condition as any we have in Youngstown, but would be considered fair, average city track.

Thus, with these two lines penetrating practically the same section of the city, operated with absolutely equivalent service at the same rate of fare, the revenue from



Above, Elm Street Car Line and Elm Street Motor Coach Route, as Referred to in Table II. Below, Park and Falls (Idora Park) Car Line and Indianola Motor Coach Route, Referred to in Table III. Car Routes Are Shown in Heavy Lines and Motor Coach Routes in Light Lines

TABLE II—COMPARISON OF OPERATING FIGURES FOR MONTH OF OCTOBER, 1926, ON ELM STREET CAR LINE AND SIMILAR BUS LINE SERVING SAME TERRITORY REFUTES THE EXISTENCE OF A "RUBBER URGE"

	Car	Bus
Length of line	2.65	2.5
Miles operated	22,236.78	21,873.8
Number of trips		
Scheduled	7,746	8,400
Trippers	100	168
Number of cars for base schedule	4	3
Number of cars for trippers	1	3
Maximum number of cars	5	6
Headway—offpeak, minutes	10	10

Hours operated	5,397.37	2,796.54
Revenue per hour	04.065	02.756
Total passengers carried	359,476	121,937
Transfer passengers carried	66,412	17,521
Passengers carried per trip	22.35	14.82
Based on eleven months of 1926:		
Operating cost per mile	0.3102	0.2598
Operating cost per hour	2.8219	2.4219

the cars for the month of October was $7,833.49 and from buses $7,585.08. The total passengers carried on cars amounted to 126,355, while 127,103 were carried on buses; 23,531 transfer passengers rode the cars and 23,933 rode the buses.

Now, I want to call your particular attention to the average number of passengers carried each trip. On the car this was 16.1, and on the bus 14.8. With a 25-passenger bus, an average load per trip, not round trip but one-way trip, of 14.8 is a very high load factor, being 60 per cent of the total seats offered. The car load factor is high, being 50 per cent of the total seats offered, but from this decreased factor of loading it is evident that more people enjoyed seats on the cars than on the buses. With the exception of the stretch of single track on the car line, there are no physical obstacles to the operation of either car or bus on either of these routes. There is a railroad crossing just outside the public square which holds up both bus and cars impartially. Both cars and buses are comparatively new, the cars being seven years old and the buses anywhere from one to four years old. Both buses and cars are clean and the schedules are well maintained. Both cars and buses are operated with one man each. The men wear practically identical uniforms and badges, and are well trained in courtesy and merchandising practices.

I believe that this exhibit indicates, or should indicate, to any unbiased and impartial observer who is interested only in working out intelligently the tools for mass transportation that there is no inherent attraction in the bus that would cause its choice as a vehicle by a prospective passenger in preference to using his own car that would not be equally applied in every respect to the street car.

BUS HAS BOTH ADVANTAGES AND DISADVANTAGES

I do not expect to carry conviction with a single isolated example. However, the example is a perfectly fair one. The result is confirmatory of our entire experience in this class of operation. I can hear immediately some one saying that the bus loads at the curb and the street car in the center of the street. This is true and in this respect is undoubtedly an advantage to the bus in attracting patronage. It is equally true that the standing passenger is more comfortable on the street car than on the bus, which is to the advantage of the street car. It is true that in congested areas the bus can make better time than the surface street car. It is also true that service with a bus is more flexible. There are many advantages offered by the one vehicle not enjoyed by the other, but in the main these are not fundamental. There is, however, one basic, serious and important distinction between the bus and the street car which at the present time sharply limits the use of the bus as an economic substitute for the street car in mass transportation, and that is its size.

It will be necessary for me here to call your attention to two outstanding features of American mass transportation which differentiate it absolutely from mass

transportation in any other country. You are familiar with the fact that in every city of the United States public transportation is conducted on a flat fare, that is, the fare per ride remains the same regardless of the distance carried. This has become so universally the practice and has been the practice for so many years that as a measure of practical expediency it may be said that it is impossible to change or uproot it. You will remember the costly and elaborate experience that was made by the Public Service Company of New Jersey in an attempt to inaugurate a modified form of zone fares in the United States, which attempt was utterly unavailable. There have been numerous attempts, the last one being in the city of Pittsburgh, to create an inner and an outer city zone with varying fares, and these have been generally unsuccessful. Consequently it may be taken as typical of mass transportation in our country that the fare, whatever it shall be, is the same for any ride in the metropolitan zone, whether the ride be for one block or a distance of 9 or 10 miles.

The other distinguishing feature of mass transportation in this country is that with very few exceptions the maximum capacity of the vehicle is used only once on a single trip. With these few exceptions, there is no intermediate riding. In many foreign cities where the country has been for a long time in a high state of development and thickly settled, there are metropolitan areas which are really an aggregation of smaller urban communities. On a single transportation route there are many points on a one-way trip where passengers board and where passengers get off, so that the seating capacity of the vehicle is used over and over on a single trip. In the United States the growth of the cities, in the main, has been like the growth of fresh wood on a tree. The city extends outward in every practical direction from the nucleus first established. As a result of this, whether you go to Cleveland, Chicago, Kansas City, Omaha, Dallas, Houston or Los Angeles, you will find that there is little intermediate traffic. In the morning the workers in store and office ride from their homes to the store and office. In the evening they ride in the reverse direction. During the day there is the single ride from the home to the theater, to the shops and stores and then the ride home. But on any given trip the maximum capacity of the vehicle is in use but once. It is, therefore, a matter of the simplest elementary arithmetic to ascertain the earning capacity of a vehicle for at least 95 per cent of the trips in our cities.

LOAD FACTOR IS LOW

Mass transportation must begin in the early morning, when people commence to move to their work, and ends at night when the last theater, church or public entertainment closes. Consequently the vehicles of any public transportation system must be operated for eighteen hours. During the rush hour in the morning the movement is all from homes to shops, stores and offices. In the evening the movement is in the reverse direction, so that even in peak hours the greatest traffic or movement is only one way. Between the peak hours of the morning and the afternoon and throughout the period when the vehicles are moving at night the traffic is small compared to that offered during the heavy hours. Therefore, in any public transportation utility, we find that there are not as many passengers as the seats offered by all vehicles during the entire period of operation. What we may term the load factor of such a utility is the ratio of passengers carried on all trips to the seats offered on all trips. This load factor for all the cities of the United States will not run above 40 per cent.

It is very plain that if we take the seating capacity of any public transportation vehicle, multiply it by the load factor we may expect and multiply that in turn by the average rate of fare, we will get the earnings of such vehicle on a single trip. If we divide this sum in turn by the number of miles operated on such a trip, we have the earnings per mile. By taking general statistics good for the whole United States, we can reach a general figure of what earnings to expect per mile on any given vehicle.

The average fare per cash passenger in the United States today is 7.6 cents. The average fare per passenger, including transfer and free passengers and school rates, is approximately 7 cents per passenger. Therefore, if we take a 25-passenger bus with an ordinary load factor of 40 per cent, the average rate of fare of 7 cents, we get 70 cents per average trip. If the length of line is 2 miles, we get 35 cents a mile. If the length of line is 4 miles, we get 17.5 cents per mile. If the vehicle accommodates 50 passengers, then we will get per trip $1.40; if a 2-mile trip, 70 cents per mile, or if a 4-mile trip, 35 cents per mile. It is thus immediately apparent that there is a definite limit to the distance which the small vehicle can be operated. In order to reach this conclusion, we do not have to go very seriously into the question of operating costs. With our five years of operating experience as a basis for buses in city transportation, we are convinced that a fair figure for operating cost of a single-deck, 25-passenger bus is 25 cents without reserve for depreciation and 30 cents including all reserves. Our conclusion on this subject has been backed up by all the operating figures to which we have had access.

> **THE history of present day transportation in all American cities shows that while the community as a whole may fight to the last extremity for a low rate of fare, there are certain elements in the community who pay little attention to the cost of transportation as long as such transportation is speedy and comfortable.**

OPERATING RADIUS LIMITED BY FARE

If it costs at the rate of 30 cents per mile or even 25 cents per mile to operate such a bus, it is apparent that using the general figures throughout the United States for load factor, average rate of fare, the operating radius of the single-deck bus seating 25 people is very little more than 2 miles. However, it must be conceded that the smaller the vehicle the higher will be the load factor. Let us assume, for example, that for a given operation a minimum of six or seven passengers are carried on an average trip. This minimum will contribute more to the load factor of a vehicle seating 25 than it will to a vehicle seating 50 passengers. We may therefore assume that in the case of small vehicles the load factor will reach 50 per cent, or, under extremely favorable conditions, 60 per cent. With a load factor of 60 per cent on a 25-passenger vehicle, there will be fifteen passengers on the average for every trip, one way, during the entire period that the vehicle is operated. Applying the average rate of fare, we would have $1.05 for a trip, producing an operating revenue of 35 cents per mile for a 3-mile trip. This is, manifestly, the absolute limit to which a 25-passenger bus can be operated at a profit on the present average rate of fare.

I now wish to again refer to the comparison between the Elm Street bus and street railway lines. An accompanying table shows the operating figures of these two lines. The revenue per car-mile is 35.22 cents and the revenue per bus-mile is 34.67 cents. The operating cost per car-mile is 31 cents and per bus-mile practically 26 cents. In both cases, to make the results comparable, no depreciation or other reserves, or any return on the investment, is included. The street cars used on this line are the small Birney 32-passenger cars, so that the load factor in both the case of the cars and buses is high, there being sixteen passengers carried per car trip and 14.83 per bus trip. With a seating capacity of 25 passengers on the bus, the load factor is nearly 60 per cent. On a line of this length, it is evident that the bus is the better transportation medium from the standpoint of the public utility giving the service. By the use of a larger street car, the car-mile earnings might, perhaps, be increased, but only by decreasing the headway, and a decrease in headway would probably reduce patronage.

Now let us compare this situation with a case where we again have a bus line and car line going into similar territory, but where the lines are much longer. Such an example is offered by the Idora Park car line and the Indianola bus line in Youngstown. In this case, the car line is double-track and modern cars seating 54 passengers are used. The car line is 3.76 miles long and the bus line 3.55 miles. The buses are the same size as are used on the Elm Street line and the loading is the same, being 14.82 passengers per trip, or again, almost a 60 per cent load factor. Here the revenue per car-mile is 42 cents and the revenue per bus-mile is less than 26 cents. The cost of operation per car-mile is 31 cents and per bus-mile 26 cents. Thus it is evident that here we have an operating profit of 11 cents per mile on the street car while we are operating the bus line at an actual operating deficit, and yet, from the standpoint of traffic, the line is as good as the Elm Street line. In fact, with a 60 per cent load factor, it may be said that the buses on the line are saturated to such an extent that it was necessary materially to increase the number of buses in the following month, which, of course, reduced the load factor and reduced the bus-mile earnings.

TABLE IV—VARIATION IN COST OF MOTOR-BUS OPERATION IN YOUNGSTOWN WITH AGE OF EQUIPMENT. FIGURES ARE IN CENTS PER BUS-MILE. MR. GRAHAM ADVOCATES CHARGING HIGHER DEPRECIATION RATE DURING EARLY LIFE OF BUSES

	Sept.-Dec. 1922	1923	1924	1925	Ten Months 1926
Equipment	2.63	3.21	4.76	5.46	6.15
Conducting transportation	11.83	13.47	15.19	15.34	15.48
Traffic	0.00	0.01	0.00	0.00	0.00
General and miscellaneous	2.03	3.42	4.06	3.54	4.18
Total operating expenses	16.49	20.11	24.01	24.34	25.81
Taxes	0.65	0.48	0.97	0.86	0.66
Depreciation at 25 per cent per year	2.31	2.98	4.22	3.93	2.83
Interest	0.77	1.01	1.00	0.96	0.92
Total fixed charges	3.73	4.47	6.19	5.75	4.41
Cost of service	20.22	24.56	30.20	30.09	30.20

Therefore, reasoning from these two examples, we would say that with a bus seating from 25 to 29 passengers on a line practically 2½ miles long the bus is a better transportation medium than the street car, but on a line 3½ miles long it cannot be operated except at a positive loss. On the two lines compared the only difference is in the length of trip.

These two typical cases prove the formula we have just asserted. If, on the line 2½ miles long, with a very high load factor, we get a revenue of 35 cents per mile, we should naturally expect on a line 3½ miles long with the same rate of fare and with the same load factor to have the bus-mile earnings reduced in the exact proportion as the length of line is increased, and this is just exactly what has happened in these typical cases. Therefore, we have assumed, first, that single-deck buses cannot be operated at a profit even under the most favorable conditions of traffic at a city rate of fare for a distance longer than 3 miles. Second, that the only change in the situation that will permit the operation of a single-deck bus for a distance longer than 3 miles for a profit will be a substantial increase in the seating capacity of the bus. This increase must be substantial because it is entirely practicable to operate street cars seating as many as 60 passengers with a single man.

It may be argued that one remedy would be to increase the average rate of fare. The street railway industry has been carrying on a campaign for ten years to increase the average urban rate of fare and has progressed from 5 cents to an average of 7.6 cents, so that there would be very little chance of increasing the average rate of fare sufficient to overcome the penalty of the small seating capacity of the bus.

The next point that arises is the question of increasing the size of the bus. If this increase is brought about by an upper deck, such increase is of no practical value in the average American city. The double-deck bus would require two men and the only hope of transportation at our ordinary city rate of fare is the elimination of the second man on every transportation vehicle. To use a bus with two men in comparison with a street car operated by one man would cause the operating cost of the bus to be greater than the operating cost of the street car.

It may be argued that double-deck buses could be devised and have been devised to operate with one man. Here we enter on another extremely dangerous ground, that of the avoidance of accident cost. Twenty years ago the wheel height of the standard American street car was 34 in. At present the wheel height of the standard street car is 26 in. It has required the combined resources of the business over a period of twenty years to reduce the floor of our cars 4 in. for the purpose of eliminating the accident hazard attached to the carriage of the public in mass transportation. To arbitrarily add 6 ft. to the height which any of the passengers have to negotiate in order to reach their seats without the attention of a second man to regulate the motion of the vehicle would be utterly impracticable to the ordinary operating company.

It is impossible for me to understand how it can be argued that a 25 or 29-passenger bus can be successfully and economically operated on an average city route of more than 3 miles. There can be no question about the fact that our business, taking the country over, is without intermediate hauls. There can be no question about the load factor that can be expected. There can be no question about our average rate of fare. Therefore, to expect such a vehicle to prove profitable in operation on a long trip is an arithmetical impossibility.

BUS FIELD LIMITED FOR MASS TRANSPORTATION

You may therefore ask, where is the field in city transportation for the 16 or 21-passenger bus? My answer to this is that there is no such field in city mass transportation.

Where, then, in our cities can the 25 or 29-passenger bus be used? First, on routes not to exceed 3 miles where the traffic is dense. Second, on routes longer where through unusual or peculiar conditions there is intermediate traffic. For instance, crosstown lines crossing several street railway or other public transportation routes where passengers get on and off at many different transfer points might readily build up the bus-mile earnings to such a point as to render the use of the bus feasible. Third, and this I regard as the most important present use of the bus in urban transportation, to furnish service in territory unserved by street car lines in a city where the financial condition of the street railway company forbids the installation of track but where the rendering of some form of transportation service is necessary in order to round out the function of the utility as a giver of transportation service in such community.

WE KNOW that the American public is vitally opposed to a sweeping increase of fare for every one. On the other hand, there is no reason why any one should object to a higher fare for specialized service, when such specialized service does not interfere with the regular service given at a regular rate of fare.

On our property all our long bus lines are operated for this reason and for no other reason. They are operated at a loss in order to give the public, as a whole, transportation to all parts of the community.

AN UNLIMITED FIELD FOR SPECIAL SERVICE

However, there is a fourth, and I believe even greater, field than any of those enumerated for the use of this vehicle, and that is as a special, supplementary service at a much higher rate of fare to furnish unusual convenience to customers who do not object to this higher charge. In the city of Pittsburgh there are at present being operated several bus routes from the suburbs to the heart of the city where a 25-cent fare is charged, and these routes are being operated with a high degree of success.

You see, it does not make any difference which factor of our equation we change; we can increase the bus-mile earnings through raising the fare, reducing the length of the trip, increasing the size, or increasing the load factor. If we triple the average rate of fare, we can either triple the haul or we can reduce the size of the bus. It is perfectly practical to operate a 21-passenger bus at a 25-cent rate of fare where it would be impossible to operate a 29 or 25-passenger bus at the standard rate of fare.

We know that the American public is vitally opposed to a sweeping increase of fare for every one. On the other hand, there is no reason why any one should object to a higher fare for specialized service, when such specialized service does not interfere with the regular service given at the regular rate of fare. This specialized service cannot be given by street car, as one condition would be a high average rate of speed, and an express street car service could not be run on the same tracks as the regular street car service. The public would not permit the use of tracks to be put down in the street to serve only a selected portion of the community.

The history of present-day transportation in all American cities shows that while the community as a whole may fight to the last extremity for a low rate of fare, there are certain elements in the community that pay little attention to the cost of transportation as long as such transportation is speedy and comfortable. These are the elements that are at present using their private cars to go back and forth to their jobs, paying not only for the depreciation, upkeep and operation of these cars, but a substantial sum to house them in garages when they have reached their destination.

The modern bus with its high average rate of speed, which would be automatically made still higher by confining the number of passengers carried to the seating capacity of the bus and keeping the bus within reasonable limits of size, would exactly follow the needs of this class of citizenship and by the collection of fares approximating 25 cents per person, would be made a profitable transportation medium. There is hardly a city in the United States of 150,000 population that could not well support this supplementary service, and the demand for vehicles for this service would furnish to the motor bus manufacturing companies a more stable market than the attempt to force into mass transportation at standard rates of fare vehicles wholly impractical to operate from a profitable standpoint.

SEES ENLARGED FIELD FOR BUS

There may be a feeling that I am attempting to argue a restriction of the bus in urban transportation. I believe that by intelligently working out the best use of the bus, we enlarge its ultimate use. If the attempt had been made in Youngstown simply to parallel street railway transportation routes with bus routes, the investment in the buses would have been lost. Our company would have been crippled in its ability to buy either street cars or buses. However, as a result of the effort to co-ordinate bus service and street car service, using each class of service where it is best adapted, we are now operating nearly as many buses as we are operating street cars, and as a result, our street railway situation has been improved and our bus operation is self-sustaining. Surely this example is a vindication of the policy of co-ordination and not of substitution.

TABLE V—DETAILED ANALYSIS OF BUS OPERATING RESULTS IN YOUNGSTOWN, EXPRESSED IN CENTS PER BUS-MILE. EFFECT OF AGE OF EQUIPMENT ON OPERATING COST IS REFLECTED IN THE FIGURES

	Sept.-Dec. 1922	1923	1924	1925	Ten Months 1926

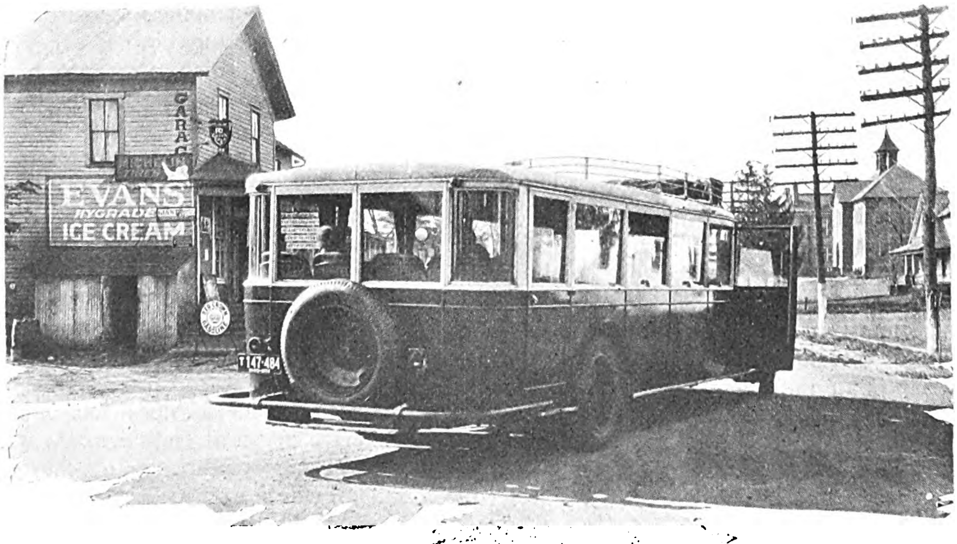
† Included in "Superintendence Conducting Transportation."

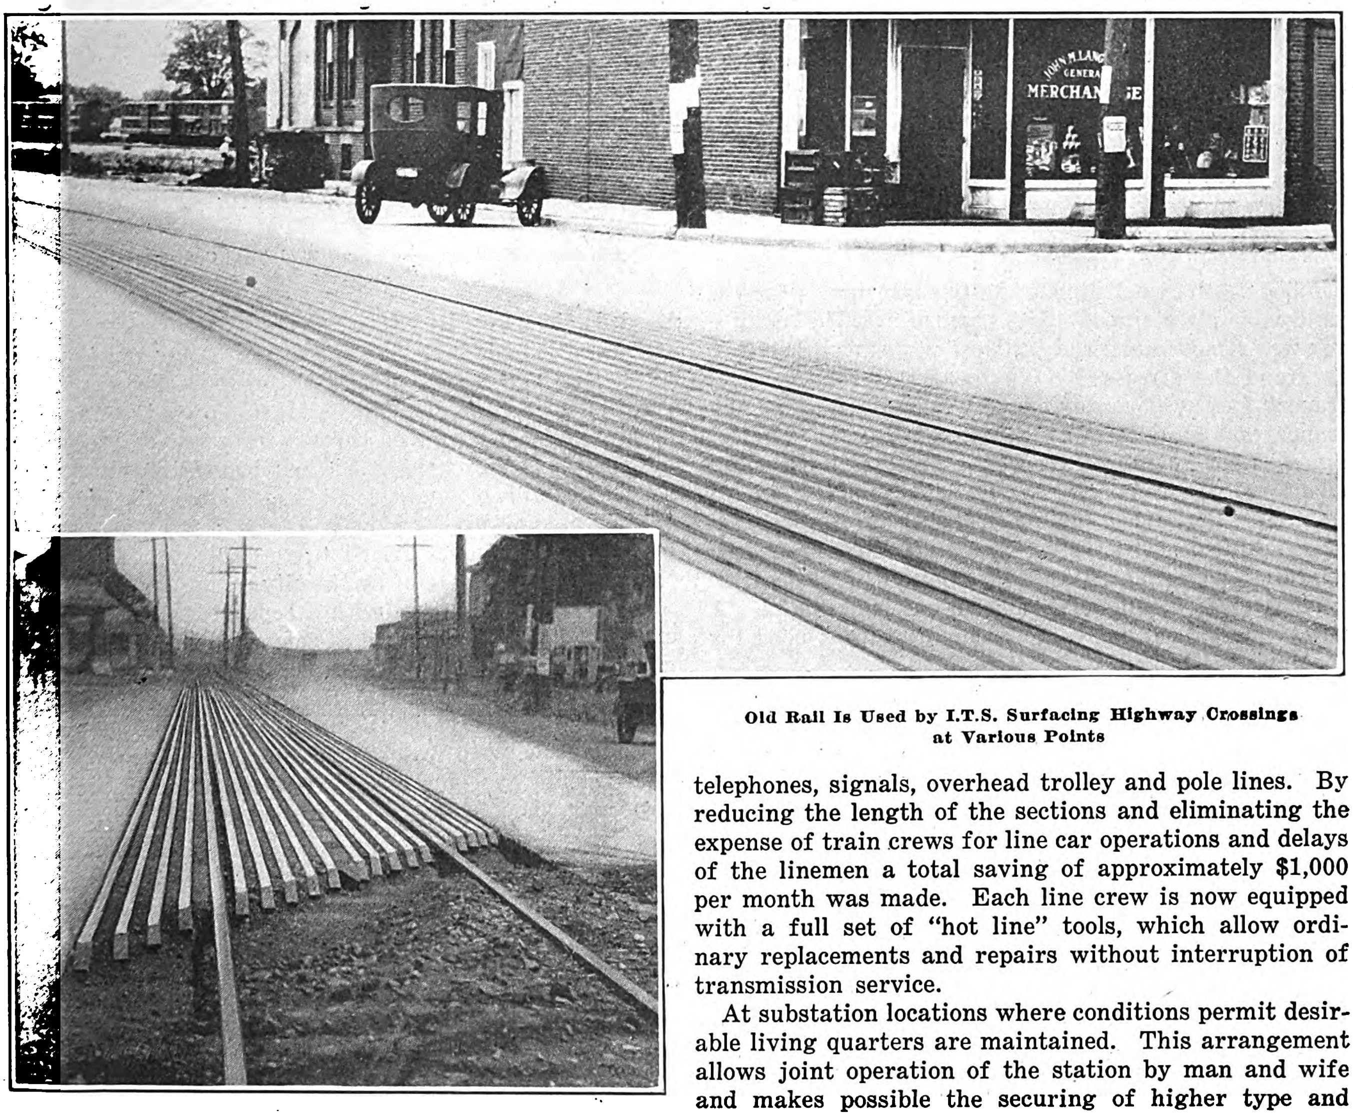
There is scarcely a city in the country where there have been sufficient street railway lines built in recent years to extend service into newer portions of the city. There is scarcely a city in the country where additional short bus routes cannot be operated to sections already served but not sufficiently served with street railway lines, and there is not a city in the country of more than 150,000 inhabitants that does not furnish a field for the specialized, superior bus transportation at a higher rate of fare.



Old Rails Used to Surface Highway Crossings

This and Other Track and Overhead Methods Have Recently Been Developed by the Illinois Traction System

WITH its more than 500 miles of track, the Illinois Traction System has necessarily had to make a study of the best method of track construction at highway crossings. The fact that its lines are crossed many times in Illinois by improved highways, on which there is a large amount of high-speed and slow-speed automobile traffic, has emphasized the need of both a satisfactory and durable form of laying pavement at these points. The methods followed are described in the brief filed by the company in connection with the Coffin Award contest.



Old Rail Is Used by I.T.S. Surfacing Highway Crossings at Various Points

After having tried numerous types and kinds of material for surfacing highway crossings the company decided that old rails would be the most economical foundation for construction of this kind because such paving would require less maintenance and have a longer life than other types. As shown, the old rails are laid parallel to the running rails, with all spaces between rails filled in except for the space required by the wheel flanges. The first crossings built in this way were so satisfactory, both from the standpoint of practicability, economy and satisfaction of the public, that 30 additional crossings of similar construction have been installed.

Some other interesting methods followed by the overhead maintenance department and the maintenance way department follow:

The overhead maintenance department effected an additional economy by increasing the number of maintenance sections from six to nine and equipping the maintenance crew with a gasoline motor car and tower car so they would not have to depend on the regular line cars for their work. The combined crews maintain everything in their territory, such as substations, telephones, signals, overhead trolley and pole lines. By reducing the length of the sections and eliminating the expense of train crews for line car operations and delays of the linemen a total saving of approximately $1,000 per month was made. Each line crew is now equipped with a full set of "hot line" tools, which allow ordinary replacements and repairs without interruption of transmission service.

At substation locations where conditions permit desirable living quarters are maintained. This arrangement allows joint operation of the station by man and wife and makes possible the securing of higher type and more reliable employees. The service obtained and the conditions surrounding stations operating in this manner prove the wisdom of this arrangement.

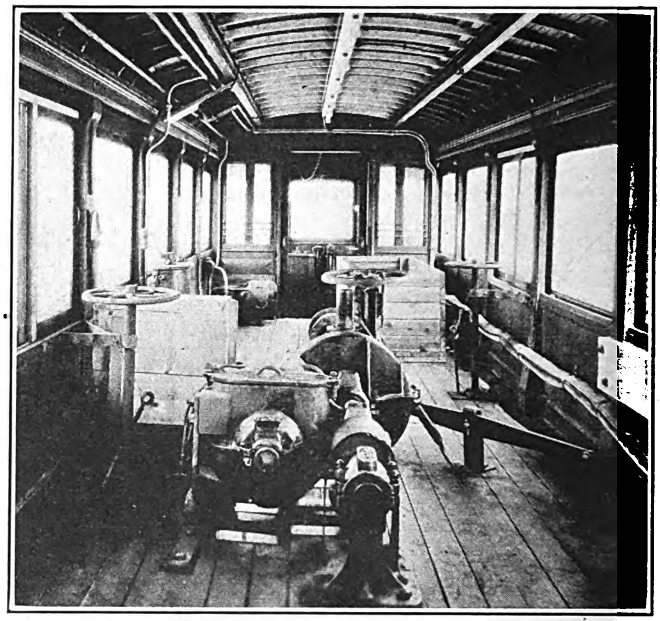
In the maintenance of way department both maintenance and construction methods and practices have been planned and executed with the idea in view of economy and permanence. Since 1909 creosoted ties have been used almost exclusively for main track. During that period 1,081,199 treated ties have been installed. This number corresponds to 90.9 per cent of the total in service. During the same period practically all original ties have been replaced.

The cumulative saving as a result of creosoting is apparent, since had it not been for the use of treated ties it would have been necessary to renew more than 120,000 ties during the past year at a cost of approximately $120,000. The actual cost of ties installed during this period was $45,600 or a saving of $74,400. Treated switch ties also have been used for several years, and during the past year maintenance and installations were less than 10 per cent of the total.

Thermit welding of track joints was tried experimentally two years ago, and this year was adopted as standard for track in paved streets. This applies both to maintenance of old track and the construction of new.

Combined Snow Scraper and Sweeper

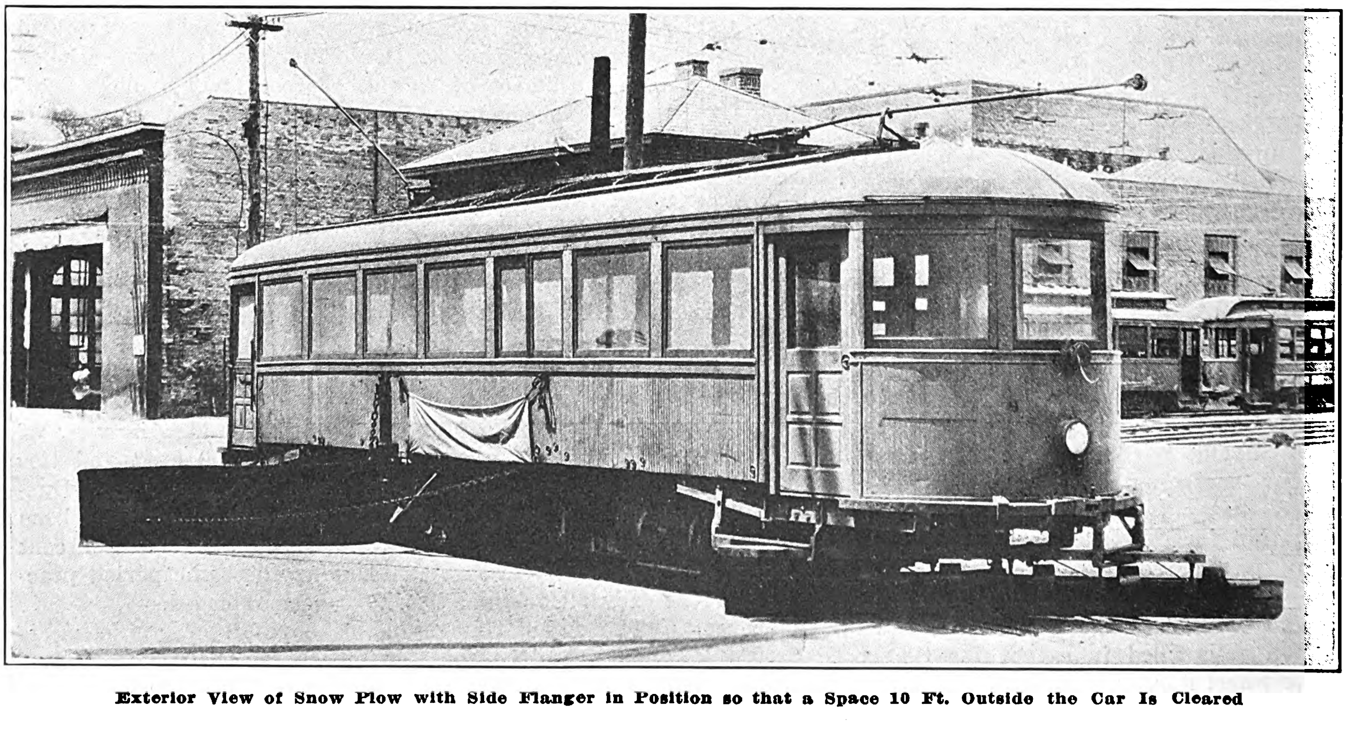
INCLUDED in the equipment destroyed in the Hall Street carhouse fire of the Grand Rapids Railway, Grand Rapids, Mich., in July, 1924, were two sweepers and a snow plow. The company had two passenger cars which, due to extremely heavy weight, small vestibules and bulky proportions, were objectionable for regular service. It was decided to remodel these into combination snow plows and sweepers to replace similar equipment destroyed. These cars, originally built by the Cincinnati Car Company, were 44 ft. over all and 32 ft. over body. In remodeling these the interior of the car was completely stripped of its furnishings, the monitor deck was removed and the car body was strengthened to withstand the stresses set up by the operation of the scrapers and sweeper broom. An adjustable swinging scraper was purchased, together with a broom and frame. Root spring scrapers were placed at the ends and in addition a flanger was installed on each side of the car. This latter can be operated through chains from the inside of the car. The broom and propelling apparatus were placed midway between the trucks, which is quite a unique feature in sweeper design. A railway motor, old but in good condition, was used for propelling the broom.



All Electrical Equipment, such as Resistors, Compressors, etc., Is Installed Inside the Car

The resistance units, air compressor, air reservoirs, etc., which originally were underneath the car, were removed and installed inside the car. Bins were also constructed for sand and salt, so that when out on the line the crew could salt switches or sand the rails where needed. The car is driven by four GE-70 motors and is arranged for double-end operation. An apron is used at the end of the broom to keep the snow down so that it will fall close enough to be taken up by the flanger, as otherwise it would be thrown far away and against windows and automobiles. When tested the plow performed admirably under all conditions. Snow was thrown outside by the plow and broom and was caught by the scraper and carried to the side of the street, there to be taken care of by the city.

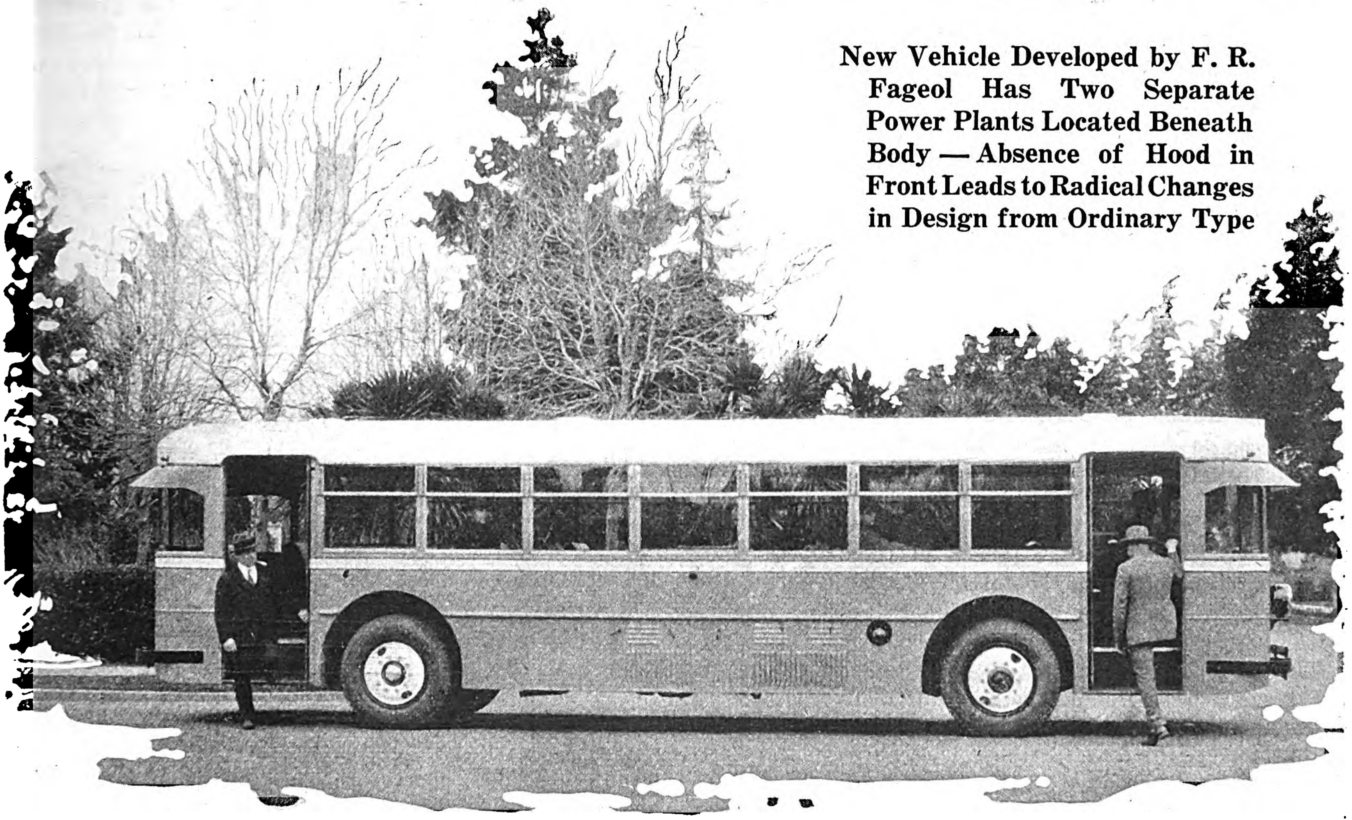
By driving the broom with a separate motor greater efficiency has been obtained as compared with equipment previously used in which the broom was driven by the same motor that propelled the car. The use of this equipment has decreased the number of men in the snow-fighting crew, with resultant lower operating cost. The total amount expended in the reconstruction of this car to provide snow plow and sweeper was $4,337.



Exterior View of Snow Plow with Side Flanger in Position so that a Space 10 Ft. Outside the Car Is Cleared

Twin-Drive Bus Makes Its Appearance

New Vehicle Developed by F. R. Fageol Has Two Separate Power Plants Located Beneath Body — Absence of Hood in Front Leads to Radical Changes in Design from Ordinary Type



DISTINCTLY different from anything that has been placed on the market heretofore is the new Twin Coach designed and built by Frank R. Fageol, Oakland, Cal. The bus, which is illustrated herewith, has two four-cylinder engines, one on each side of the chassis, which drive the two rear wheels through separate worms. According to the builder, the aim is to reduce the passenger-mile cost of transportation.

The new bus, which is built low to the ground, has an over-all height of only 8 ft. 4 in. The over-all length is 31 ft. 6 in. and the width 94 in. The general appearance is somewhat similar to that of the Birney street car, although there has been worked into the design a streamline effect that gives it a long, low, rakish look quite in conformity with present-day automobile tendencies. The wheelbase is 203 in., which gives a turning radius of 34 ft. The gross weight fully equipped is 13,000 lb. It is stated that the vehicle is capable of speeds up to 55 m.p.h.

In its construction the chassis and frame are more closely dependent on each other than in buses of the usual types. The chassis is a frame of light construction, channels running from front bumper to rear bumper being fastened together to form an H-shaped structure. On this is mounted the steel body frame, so built up that the two side structures of the body, together with the chassis channels, form individual trusses tied together by means of the chassis cross members and the sheet steel center panel of the roof. This arrangement allows for the flexing of the chassis along with the body.

On either side, mounted in a recess between the chassis channel and the body side sill, is a four-cylinder engine, with 4-in. bore and 5½-in. stroke. Directly in front of each engine is mounted a radiator with header tank. Each of these power plants is incased in a sheet steel compartment. Power from each engine is carried through an individual clutch, transmission and short propeller shaft to an inverted worm drive mounted adjacent to the brake drum and wheel. There are thus two individual and self-contained driving units. The inverted worm housings are joined by a 3-in. steel tube which acts as a stiffening member. Each worm housing has a spring seat mounted close to the brake drum to minimize the bending action on the tubular tie.

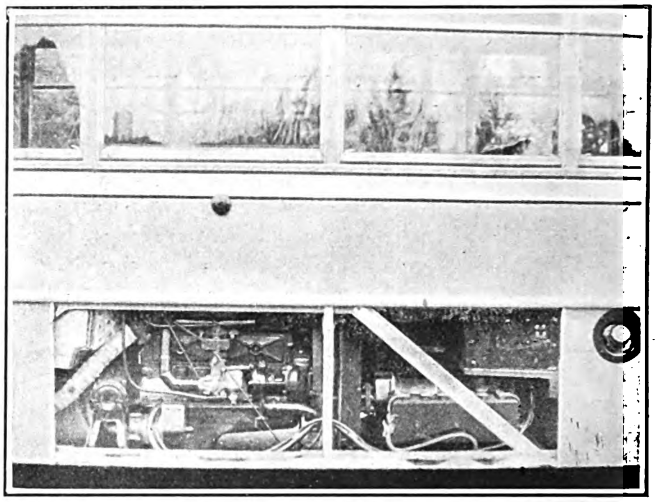
The Interior of the Twin Drive Bus Is Not Unlike That of Other Types, Except Side Seats Are Placed Over the Motors

Because of the side location of the power plants it was found possible to incorporate many innovations in the design. On the forward end of each crankshaft is mounted a 600-watt generator and a 9-cu.ft. capacity air compressor. Together with the 6-volt, 300-amp.-hr. storage battery, these are carried on a shelf in front of the radiator. The 50-gal. gasoline tank is carried between the main frame channel members at the center of the chassis. Feed from the tank to the carburetor is through two Stewart vacuum tanks mounted in the side panels of the body just in front of the radiators. The filling pipe for the gasoline tank is on the left-hand side.

Air is carried through louvers on each side of the body through the radiator, thence it is driven by a fan down past the engine and out under the bus. To make the engine accessible a side plate may be removed as shown in one of the illustrations. The engines are built in pairs, right and left, so that the valve mechanisms and the carburetors are placed on the outside where they are available for easy adjustment and maintenance.

Steering is done in much the same manner as it is on the ordinary type of bus. The steering wheel, however, is mounted ahead of the front wheels, so that the drag link is to the rear rather than to the front. The 203-in. wheelbase and the length of the vehicle place the driver's position approximately 4 ft. ahead of the wheels. This position does not materially affect the "feel" of the driving.

The driver's position is to the left, directly back of the large front window, being similar to that in an electric street car. The control is practically identical with the type used in the ordinary single-motor bus. A single pedal actuates both clutches and a gear-shift lever both transmissions. Two accelerator pedals are mounted side by side. The two form a footrest and are used to synchronize the two engines. By rocking the foot the operator can feed additional fuel to that engine which does not appear to be pulling its share of the load. Two floorboard type starter buttons are located to the left of the driver's seat.



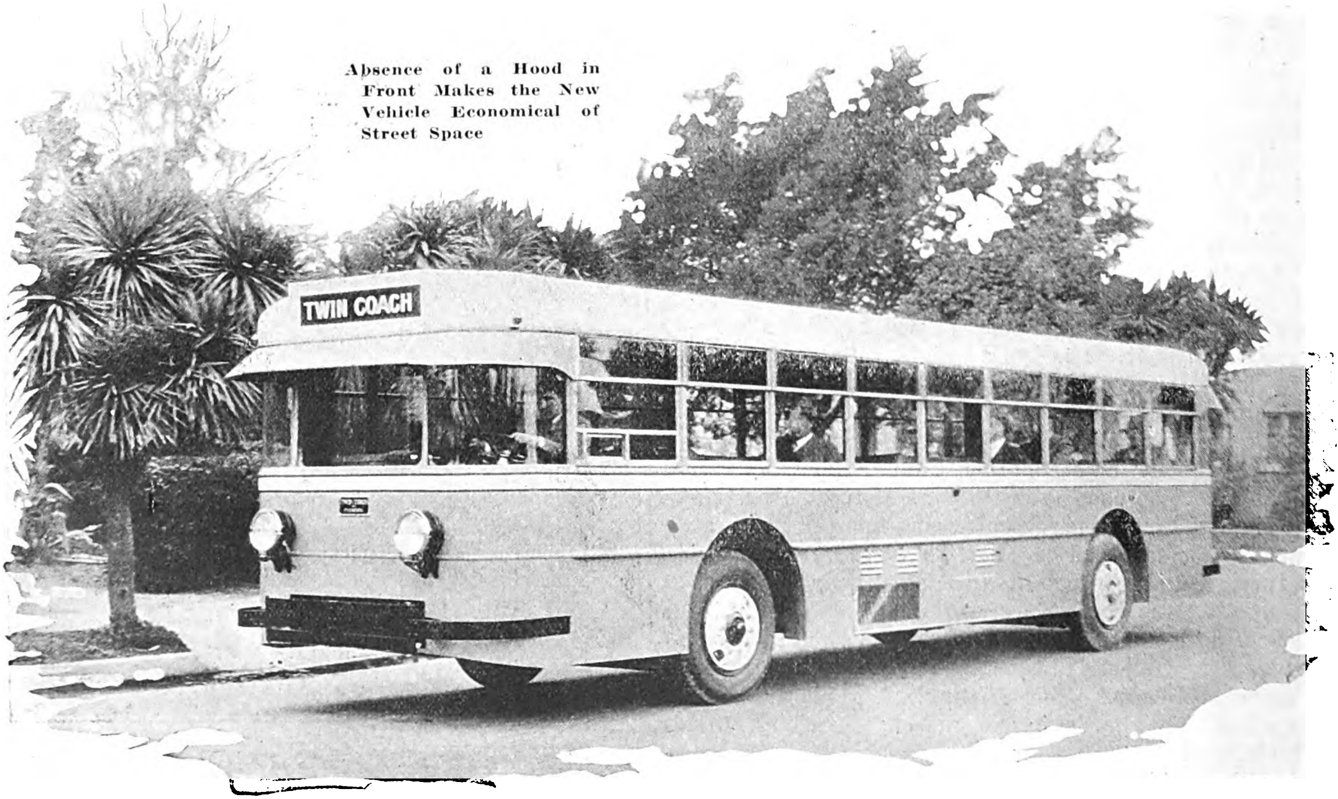
A Removable Panel on Each Side Gives Easy Access to the Driving Mechanism

All four spring mountings are identical, 60-in. x 3½-in. springs being used all around. Tires are single pneumatic on all four wheels. The mounting of the brake mechanism is compact and is built integral with the brake drum mounting.

Interior trim is steel with side paneling of mahogany-finished Haskelite. The floor is exceptionally light in weight, being of ⅜-in. plywood laid in sections so that it can be removed readily for inspection of the driving mechanism. The roof is of the arch type, extended slightly at the front end to form a hood for the illuminated sign. There is a slight break in the middle, increasing the height about 1 in. directly over the aisle.

The lighting is indirect. The ten 21-cp. lamps are placed at the back of a molding located above the windows just below the advertising rack. Reflectors back of the lamps throw the light up against the advertising racks and onto the white enameled ceiling.

Folding doors are located at front and rear. They



Absence of a Hood in Front Makes the New Vehicle Economical of Street Space are air operated. The floor level is 25 in. above the street. One intermediate step is used, 11 in. above the ground, so that the rise from the step to the floor of the bus is 14 in. Windows are framed with brass sash and are arranged to lift.

The corners of the vehicle are rounded and the glass in the corner windows is curved to conform to the body lines. Both ends of the body, which are identical in shape, are fitted with metal visors. The front has two headlights and there is a bumper at each end. Directly behind each bumper is a recess for a spare tire.

Seats are provided for 43 passengers, and there is room for 30 standees. Above each sheet-steel compartment housing for the engines is a side seat accommodating two passengers. Side seats are also placed over the four wheel housings, which cut up the body. Other seats in the body face forward. A lounge-type seat which accommodates six passengers is carried across the rear of the vehicle.

Gross Net Tax Making Progress

AMERICAN ELECTRIC RAILWAY ASSOCIATION

NEW YORK, Feb. 15, 1927.

To the Editor:

I read with great interest your editorial in the ELECTRIC RAILWAY JOURNAL of Feb. 5, 1927, regarding taxation. In this you brought together the views of John J. Merrill of the New York Tax Commission and Prof. Edwin R. A. Seligman of Columbia University. It does not often happen that the theorist and the practical man are in such complete accord, but in this case you have it, and by bringing these views together you have made out a very strong case for tax revision in this state.

I feel sure that much will be accomplished throughout the various states, if the industry realizes that tax reform is no longer a mere theoretical matter but is a subject that can be approached with real hope of success. Within the last few days gross-net tax bills have been presented by the railroads in two of the New England States, and a third bill of the same nature will probably be presented in Wisconsin, as a result of the report of the interim committee on administration and taxation, in which the committee states:

> That there should be a closer approach to uniformity in the taxation of public utilities is acknowledged by everybody, but the hitch comes over whether they should be taxed at the local rate or at the average state rate. To us it seems that there are valid objections to both of these bases. In fact, much is to be said against taxing utilities on their property at all. What is the true market value of a public utility is very difficult to determine and it is still harder to allocate this total value fairly to each of the several taxing districts in which its property is located. Undoubtedly it is simpler to tax utilities upon their earnings and also more equitable. Clearly, however, it will not do to base the tax solely upon net earnings, because this would often result in no tax at all from large companies. The best suggestion made is that public utilities should be taxed upon what is known as "gross-net earnings" basis, such as was proposed by a special legislative committee in New York some years ago. Under this plan both the gross and the net earnings are taken into consideration in determining the tax, and no company escapes entirely and the companies with the largest net earnings also pay the highest rates. That this method of taxing public utilities deserves serious consideration, we are convinced; but we have not been able to work out the details of this plan or to make the necessary calculations to see where it would lead. We, consequently, refrain from recommending any change in the taxation of public utilities.

An editorial such as yours cannot fail to help our industry.

LESLIE VICKERS,
Economist.

Approves Use of "Popular" Transportation

CITY OF DETROIT
Department of Street Railways

Feb. 18, 1927.

To the Editor:

Allow me to compliment you upon the editorial appearing in the Feb. 12 issue of the ELECTRIC RAILWAY JOURNAL commenting upon the term so commonly used to designate that type of transportation which moves the multitudes.

Your suggestion to substitute the word "popular" for "mass" when referring to this type of transportation is indeed very appropriate because the mention of the word "mass" as applied to transportation generally carries with it a picture of a vast throng or jam of human beings, which certainly does not tend to popularize that form of transportation in the minds of the traveling public.

Another misnomer which is quite commonly used, at least in this part of the country, is the term "platform men" used in reference to motormen and conductors. It is the writer's opinion that "trainmen" is a more fitting term to use in designating that type of employment.

D. A. SMITH,
Acting General Manager.

It Hits the Nail on the Head

EAST ST. LOUIS LIGHT & POWER COMPANY

Feb. 15, 1927.

To the Editor:

I notice the suggestion regarding use of the term "popular transportation" instead of "mass transportation" in the leading editorial of the Feb. 12 issue of ELECTRIC RAILWAY JOURNAL, and I think it hits the nail exactly on the head.

I like, too, your thought for the future on "awakening the public to a demand for something better in transportation at an appropriate price."

JOHN H. MITCHELL,
General Manager.

Old Register Cards Used Again

FOR several years the Union Street Railway, New Bedford, Mass., has used a standard mimeograph machine to print letters, circulars, time-tables, notices, etc. Recently, however, this machine has been used extensively for the printing of forms on the backs of discarded register cards, meter cards, etc. The cards are made of heavy manila cardboard and after serving their purpose as accounting cards were formerly sold for old paper or used as note cards. As the backs were usually clean, they made excellent record cards when run through the mimeograph machine and stenciled into form cards. Among the uses found for these cards were inspector's traffic checking forms, tire change forms, mileage reports and several special checking reports. The cost of making these cards is nominal as the cost of the material is practically nil and they can be printed by the office clerks at times when they are not busily engaged with office work.

Maintenance Notes

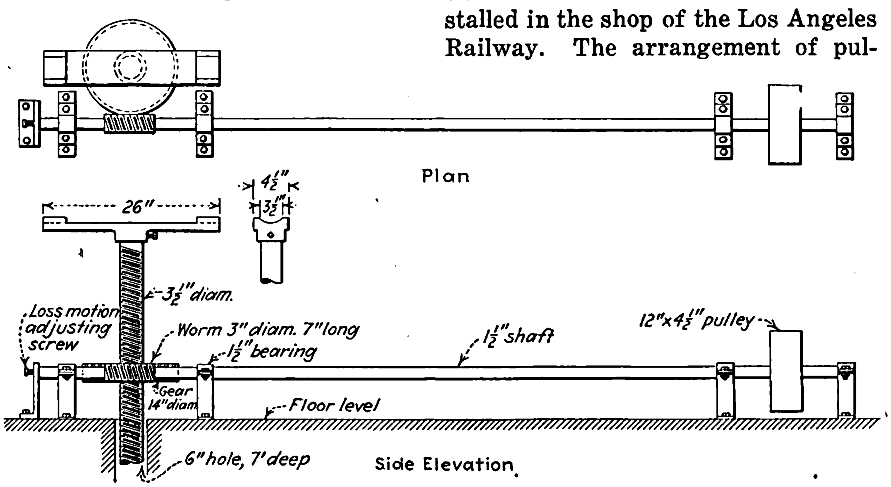
Motor-Operated Wheel Jack

REMOVING a pair of wheels from a truck or installing a pair of wheels in a truck was always considered a slow and tedious process in the shop of the Lynchburg Traction & Light Company, Lynchburg, Va., until Master Mechanic Cochran designed and constructed a motor-operated jack for this work. The principal parts of this equipment are a line shaft, worm, pulley, lifting screw, gear, axle cradle, bearings and adjusting screw.

A 1½-in. diameter steel shaft 10 ft. long is designed with a worm of 3 in. diameter and 7 in. long, located about 12 in. from the end of the shaft.

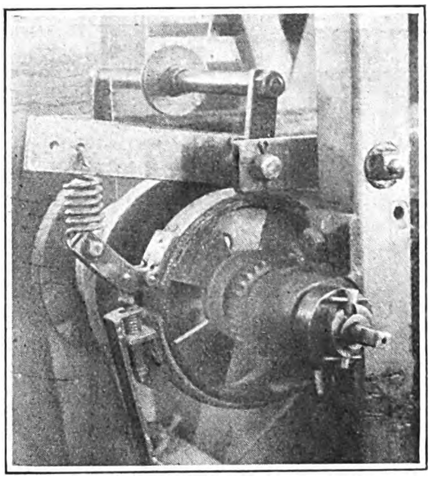
About 10 in. from the end of the shaft opposite the worm is a 12-in. x 4½-in. iron pulley keyed and fastened rigidly to the shaft. The assembled shaft is mounted on four bearings fastened to the floor by lag screws, and sufficient clearance is allowed between the pulley and worm and the floor. A ¾-in. adjusting screw, mounted on the worm end of the shaft, provides a means for taking up lost motion between the worm and gear teeth. A 14-in. worm gear wheel in mesh with the worm drives a 3½-in. diameter lifting screw passing through its center. A 6-in. hole in the pit floor 7 ft. deep allows free and unobstructed upward and downward movement of the lifting screw. A heavy malleable-iron grooved axle cradle mounted on top of the lifting screw provides a means for balancing of the wheels during the handling process. The jack is belt-driven by a General Electric 2-hp., three-phase, 230-volt, 1,800-r.p.m., 60-cycle motor, equipped with a 4-in. paper pulley. The lineshaft, bearings, worm, and in fact all parts of the jack adjacent to the floor, are boxed in with 1-in. oak boards to prevent injury to the workmen.

This motor-operated wheel jack has resulted in increased production and decreased effort due to the rapidity with which it is possible to change wheels.



Motor-Operated Jack for Installation or Removal of Wheels from Trucks

Brake Gives Uniform Band Wire Tension



Close-Up View of the Brake, Which Is of the Automobile External Contracting Type. It Is Held Closed by Weights on the Lever, but Is Operated as the Tension on the Wire Turns on the Pulley Shown Just Above the Brake

PROPER tension is maintained in the banding wire as it is fed to the machine by an apparatus which automatically controls the release of wire from the spool and also holds the tension as the band is laid on the armature. The device is installed in the shop of the Los Angeles Railway. The arrangement of pulleys, levers and brakes is in a wood framework approximately 2 ft. square by 7 ft. in height. It is located about 4 ft. in front of the banding lathe.

From the accompanying drawing it will be seen that the wire leaves the supply spool, which is carried on a shaft at the rear of the framework, to the feed pulley at the front of the apparatus. The path of the wire is such as to engage pulleys which are so mounted as to have an effect on releasing the brake mechanism and allowing the supply spool to revolve.

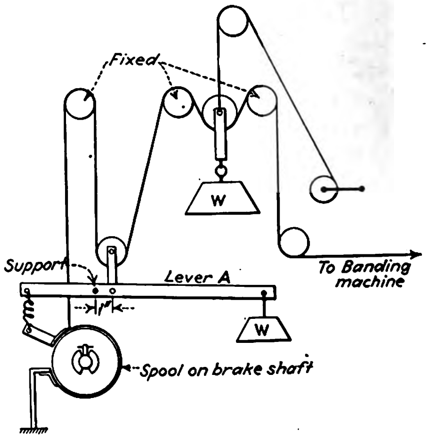


Diagram of Apparatus Which Maintains Proper Tension in Banding Wire and at the Same Time Holds That Tension When the Machine Is Stationary

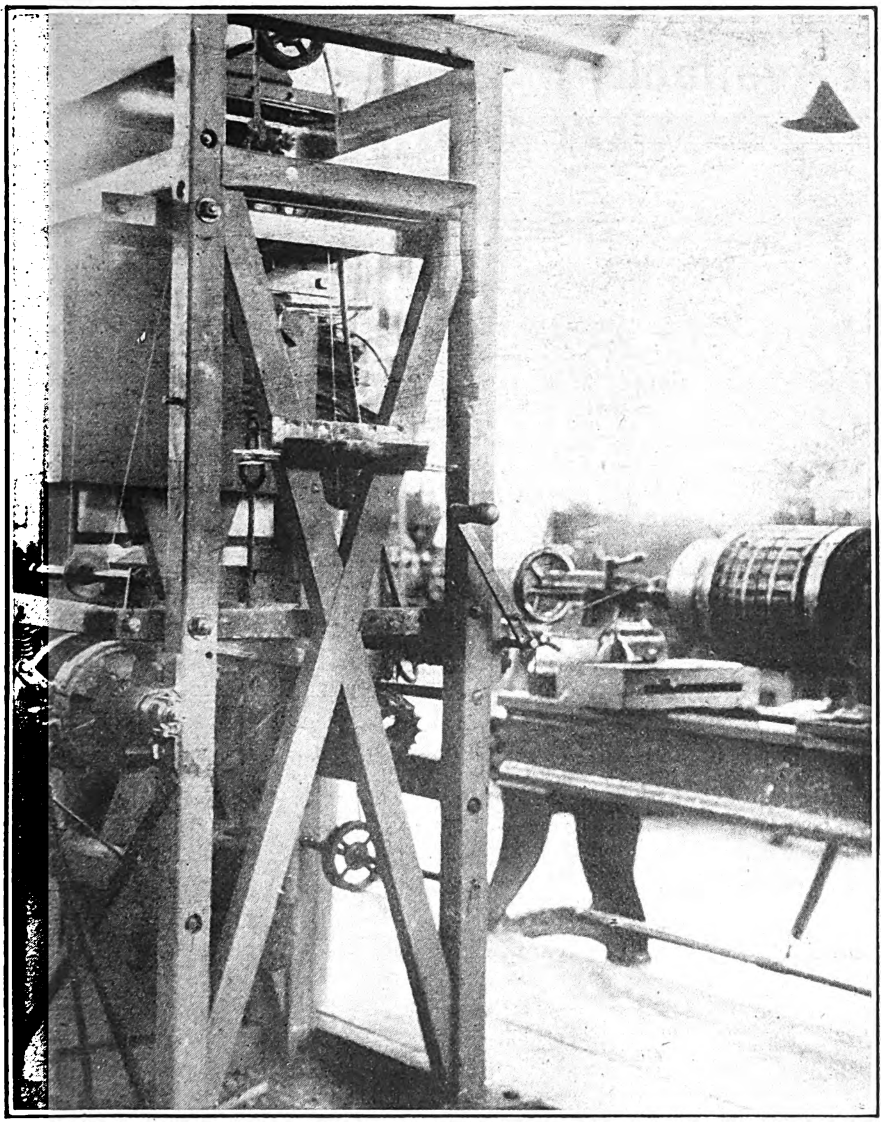
The wire carried upward over a pulley, then down to a pulley mounted on a shaft, which in turn is fastened close to the fulcrum of a lever arm. This same arm extended carries the tension weight at the extreme end and at its other end operates the clamp which closes or opens the band brake on the supply spool. From this pulley the wire is carried to three pulleys at the top of the machine, thence down to the feed pul-



Banding Wire Is Maintained at the Proper Tension in the Los Angeles Railway Shop by an Apparatus Which Includes an Automatically Operated Escapement Brake and a Device for Maintaining the Tension in the Wire When the Armature Is Not Rotating. It Is Placed Approximately 4 Ft. in Front of the Banding Lathe

ley, which is a little below the level of the work in the adjoining banding machine. Of the three pulleys at the top of the machine two are stationary. The center one with weight attached may be lowered by a winch and rope. When lowered, the weight is hung on the wire to maintain the tension which ordinarily is set up by the rotation of the banding machine. Thus, when the machine is stopped for finishing off the banding, the tension is maintained until the wire is fastened. The movable pulley and suspended weight take care of this.

The frame of the apparatus is built up of 2½x2½-in. wooden members securely braced and anchored to the floor. This takes care of the pull of the banding wire, which for No. 16 gage steel wire, as used on the Westinghouse No. 306 armatures, amounts to 400 lb. For the No. 24 wire used on compressor armatures a tension of only 40 lb. is used. This pressure is measured by means of a spring balance connected in the line at the time work is started on an armature. By adjusting the weight applied to lever *A* the tension may be controlled.

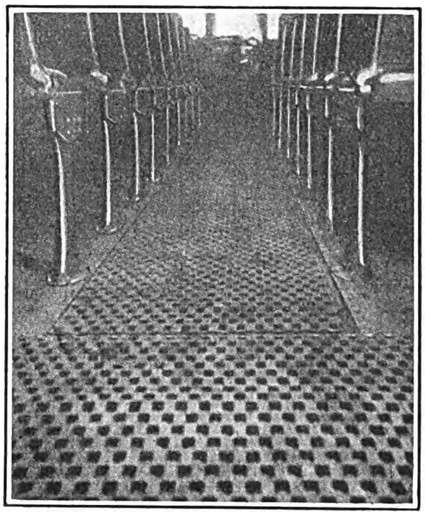
A feature of the apparatus is the ease with which spools of wire may be changed. The flange of the spool has been drilled to take a long set screw which fastens the spool to the shaft. The shaft in turn is fastened by means of a removable pin to the brake drum. By loosening the set screw and disengaging the shaft pin it is possible to slip the shaft out endways and change the supply spool without disturbing the set-up of the machine. By placing a crank handle on the end of the shaft, it is possible to back off—that is, rewind on the supply spool wire which already has been applied to the armature.

The banding lathe used is a rebuilt engine lathe driven by a small electric motor through a worm. A pedal operated cone clutch controls the drive between the motor and the lathe.

Equipment repairs made in time
Will save "pull-ins" from the line.

Linoleum and Flexible Rubber Floor Covering

BELIEVING that a neat, clean and attractive floor covering will have a tendency to attract the public, the Wilkes-Barre Railway, Wilkes-Barre, Pa., has equipped one of its car floors with linoleum and flexible rubber mats. Underneath the cross-seats the floor is covered with a design to represent tile work. The edges of this are bound with a 1-in. brass strip neatly screwed to the floor. Though the center of the car and in front of the longitudinal seats the floor is covered with a flexible hard rubber mat made of ⅝-in. x 2-in. pieces of hard rubber spaced ½ in. apart and bound by steel strips. The linoleum and mat are on the same level. The mats have a clean surface at all times since all dirt falls through to the floor.



Designs of Linoleum and Flexible Rubber Mats Harmonize

This floor covering gives a very impressive appearance, and since the mats can be rolled up easily to permit sweeping this appearance can be maintained.

The linoleum, with its pleasing tile effect, and the brass binding strip create a pleasing interior effect.

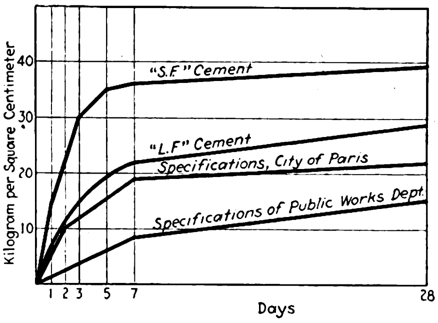
New Equipment Available

Time Saved by Quick-Setting Cement

CEMENT having high crushing strength and quick-setting qualities with a chemical composition which does not differ materially from ordinary cement is being made by the Société Coloniale des Chaux & Cements Portland of Marseilles, France, under the name "Super-Flambeau." It is handled in the same way as ordinary Portland cement. Its quick-setting feature does not hamper the mixing and pouring, which can be done at the same speed as when handling ordinary cement.

Advantages claimed for this cement on account of its strength and quick setting are: (1) Economy in wood plank forms, because the forms can be removed two or three days after the pouring; (2) economy in time, because the reinforced concrete object can be turned over as finished after five or six days; (3) general economy, because the sections of reinforced concrete girders, pillars, blocks, foundations, etc., can be reduced.

As a basis for calculation a strength of 100 kg. per square centimeter (1,420 lb. per square inch) on compression may be assumed. The strengths and setting time characteristics of S. F. cement are shown by accompanying curves.



Tensile Tests of Plastic Mortar Using a 1: 3 Mixture of Super-Flambeau Cement

The chemical analysis of this cement is as follows:

	Per Cent
Soluble silica	22.10
Sand	0.20
Aluminum	6.70
Iron oxide	2.75
Chalk	62.00
Magnesia	1.62
Sulphuric anhydride	0.59
Ashes	3.65
Undetermined elements	0.39
	100.00

S. F. cement shows the following sieve test:

	Per Cent
Retained on 324-mesh sieve	0.0
Retained on 900-mesh sieve	0.1
Retained on 4,900-mesh sieve	0.9
Finest powder	99.0
	100.0

Mixed with 25.5 per cent of its weight of water at 15 deg. C., the cement will begin setting after 2½ hours, and will have set completely after 4½ hours, while exposed to humid air. Immersed in water, the setting will begin after three hours, and will have been completed after six hours.

Tensile and compression strengths of samples of S. F. cement, at various ages, are given in the two accompanying tabulations.

COMPARISON TESTS IN KILOGRAMS PER SQUARE CENTIMETER

Mixture	Number of Days One	Two	Three	Five	Seven	28
Cement—200 kg. Gravel—800 liters. Sand—400 liters. Water—5.7 per cent	66	131	165	204	215	248
	65	127	161	195	201	263
Average	65.5	129	163	200	208	255
Mixture Cement—250 kg. Gravel—800 liters. Sand—400 liters. Water—6.5 per cent.	72	152	190	245	281	325
	72	158	193	251	282	336
Average	72	155	191	248	281	330

Improved Wiring for Switch Groups

IMPROVED design of main wiring for switch groups types 251 and 264 has been announced by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. Use is made of the type 480 main wiring, eliminating many wiring troubles. New design of terminal studs permits assembling the switch units in place independent of the connection straps. Lock washers are used to keep the studs tight. In case any of the connection straps become loose in service the switch units are not affected. The connection straps can be removed without disturbing the switch units.

A cup washer replaces the two upper molded vulcabeston washers of the type 264 main wiring and the molded flat washer and thin cup washer, originally used on the type 480. It also replaces the fishpaper guard on top of the base plate. This new washer provides greater creepage distances and improved insulation. Shrinkage of the new micarta duck washers is much less than that of the vulcabeston. Where the new type of main wiring is used any shrinkage which may occur does not cause the connection on the straps to become loosened. This feature eliminates burning which occurs with the older design due to shrinkage and loosening of the straps.

New bent connection straps are used to replace the flat straps and copper spacing collars used with the old design. This eliminates the spacing collars, thereby reducing the number of contact surfaces and consequently the chance of burning if the straps become loosened.

Association News & Discussions

Co-ordination and Safety Discussed by Kentuckians

WHAT has been generally characterized by members as the most successful and interesting meeting in the records of the Kentucky Public Utilities Association was the two-day convention held at the Brown Hotel, Louisville, on Feb. 18 and 19, it being the tenth annual gathering of the organization. Business sessions were held on Friday afternoon and Saturday morning with the annual banquet on Friday night, in the Crystal Ballroom of the hotel, followed by a dance. The attendance was 278, while 389 persons were seated at the banquet.

From the standpoint of electric railway operators there were two talks of principal interest. One was by W. H. Sawyer, president of the American Electric Railway Association, who spoke on "City and Interurban Transportation." An abstract of Mr. Sawyer's address appears on this page.

Neil W. Funk, director of safety Louisville Railway, in discussing safety work, held that there was a time when the employer's first inquiry, following an accident, regardless of bloodshed and suffering, was "What's it going to cost us?" Everything else was secondary, instead of life and suffering being the first consideration. There were dangerous machines, poor lighting, and criminal negligence, no safeguards. Workers were so many foreigners, or what not. Mr. Funk held that no chances should be taken with the humblest of employees even to the losing of a little finger. The sentimental side of employment was stressed, and the argument made that even though the work did not save the company a cent it increased morale, affection of employees for employer, improved relations between capital and labor, and what was gained was well worth while, as it results in an organization. It results in a sense of loyalty where they have the inspiration given them by the company really caring for their welfare. He held that the safety movement was the greatest and grandest gesture that humanity has yet made.

President T. B. Wilson, in his annual address, touched on the electric railway and bus situation. He said that no one in the electric railway industry holds any doubts as to the future of that class of transportation in large cities. The electric car has demonstrated thoroughly that it will remain the backbone of mass transportation. The small city line still is a problem.

Harry Reid, president of the National Electric Power Company, New York, told of incidents in the growth of power and light utilities in Kentucky during the last twenty years. Mr. Reid, a former president of the association, entered the utilities field at Versailles, Ky., twenty years ago.

Officers for the coming year, as named at the conclusion of the program, were as follows:

President, W. R. Power, Ashland, Ky., general manager Ohio Valley Electric Railway, Huntington, W. Va.

First vice-president, Samuel Riddle, Louisville.

Second vice-president, L. B. Herrington, Louisville.

Treasurer, A. A. Tuttle, Louisville.

Secretary, E. F. Kelley, Louisville.

The new executive committee is composed of the officers, along with T. B. Wilson, Louisville, retiring president; J. P. Barnes, Louisville; W. H. Harton, Covington; J. P. Pope, Lexington; P. S. Pogue, Louisville; H. D. Fitch, Bowling Green; W. S. Cramer, Lexington, and H. J. Cochrane, Maysville.

Transportation a Community Problem*

By W. H. Sawyer

President American Electric Railway Association

PUBLIC utilities as a group have much in common, and especially are their aims and desires to serve their communities distinctly in common. There are, however, phases of the electric railway problem which appear to me more complex than those of any other industry.

The light and power and gas utilities meet their customers perhaps once a month. We meet ours twice a day, and every time we ask them for money. The major item of our expense is for employees who meet the public as our representatives. This item is comparatively an inappreciable portion of the expense of the electric light and power or gas company. We want our conductors and motormen to be courteous and helpful, and taking into account the conditions encountered, I believe we are far more than fairly successful, but I just want you to realize that with 30 per cent of our total operating expenses paid to motormen and conductors we have a real problem, and one that is seldom fully appreciated.

You electric and gas men have your peak loads, and satisfactorily to meet peak demand conditions adds to your responsibility, but only to a comparatively minor extent. It is an economic impossibility with the street car or with the bus to give every customer a seat during the rush hours. Nor is it always practicable even approximately to meet this desirable condition. If we were to give a seat to every passenger during the rush hour a 15-cent fare would not give as much net revenue as would a 10-cent fare if we carried during the rush hour standees up to, but not to exceed, the number of seated passengers. To obviate one of the most common complaints, therefore, is economically impracticable. Please keep in mind that I am referring to city transportation with either buses or street cars used to take care of all the transportation requirements. The public generally does not appreciate that with bus operation in the street car field the bus has to take care of only a portion of the total traffic. I have in mind particularly a more western city where bus service is given, paralleling and competing with the street car service in the cream of the traffic. The bus in this instance may give a seat for every passenger and charge but 10 cents, but it does not take care of all the traffic which may present itself. All it purports to do is to take care of traffic up to the seating capacity. When the blizzards and the rains come and the automobile user seeks public transportation it is the street car that must take care of his needs. Therefore, do not let yourself be misled into making an unfair comparison between the vehicle or system which takes cream traffic or limited traffic only and is not prepared at all times to take emergency and abnormal traffic.

Plenty of Advice in Operating Street Cars

There is one other peculiarity about the street car business. Our customers become so familiar with our cars and our schedules and are brought into contact with us so intimately and so often that they really think they know all about our business, although we who have spent a lifetime in it realize that we have yet much to learn.

There is one other feature with which you other public utilities do not have to contend. You furnish light, power or gas to all classes and conditions of people, rich and poor, honest and dishonest, white and black, but when the electric wires or gas pipes enter one's home those wires or pipes are considered personal and individual. They furnish service for that one family or that one industry. On the street car the bitterest enemies may of necessity sit or stand shoulder to shoulder. There is also that eternal human desire to take the first car though it be crowded and a comparatively empty car follows closely.

---

*Abstract of an address before the Kentucky Association of Public Utilities, Louisville, Feb. 18, 1927.

I have served as an executive of electric light and power and gas companies. The same executive in charge of a joint light and power and railway property will spend of necessity three-fourths of his time on his railway problems. This is also a fair comparison to make for the gas company. You other utilities should not judge us solely by financial results. Our public relations problem, our intimate contact with the public, the conditions under which we must do business with our customers are more personal and individual than yours.

A year ago I was down in Australia, called there to make a report on a government-owned utility. I had every opportunity to study public ownership from the inside. In Australia there is, broadly speaking, no graft or corruption in connection with the operation of the public utilities. The employees of the publicly owned public utilities there are not subject to political changes. They are not selected for their political leanings.

Nevertheless, I came back from Australia with the most definite conviction that those theorists advocating municipal ownership of our public utilities were not only in error, but that if their theories were put into effect the results would be disastrous. I was forced to the conclusion in my study there that no set of men will administer a public property as economically and in as businesslike a manner as would that same set of men if their own money were invested in that property. It just is not humanly possible to expect as economical results from a property administered by politicians as from one privately administered. I might add, also, that there is no attempt over there to confiscate privately owned corporations, as has been so many times attempted here.

UNFAIR TRANSPORTATION COMPETITION INDEFENSIBLE

Before the war practically all our city and interurban transportation was by electric cars. Then came the jitneys, followed by makeshift buses, operated by the same irresponsible element that had previously operated the jitneys. The street car man had a rightful, definite prejudice against the jitney. This prejudice followed the earlier buses. But today the electric car man has little or no prejudice against the bus. He wants and needs the bus and recognizes it as a progressive transportation tool.

We do most definitely object to the uses to which buses are put by irresponsible pirates who seek to blackmail us and jeopardize our investments so that we will buy them out. In thus objecting we are acting for the best interests of our communities, which must eventually pay the cost of such destructive competition. We also have definite objections to the shortsighted bus manufacturer who will willingly be a party to such competition. Irresponsible transportation operation is always a public nuisance. Keep in mind also that the responsibility of the so-called independent operator is measured in part by his ability to pay a $100,000 loss if the bus you were riding in has an accident such as may happen and does happen at times even with the most careful of the responsible companies.

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 4—**American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.**

March 8-10—**Oklahoma Utilities Association, ninth annual convention, Huckins Hotel, Oklahoma City, Okla.**

March 17-18—**Illinois Electric Railways Association, seventh annual joint convention, Hotel Abraham Lincoln, Springfield, Ill.**

April 26-29—**Southwestern Public Service Association, convention, New Orleans, La.**

May 31—June 1-2—**Canadian Electric Railway Association, annual convention, Winnipeg, Man.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Oct. 3-7—**American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.**

I have said before and I say again that we will need and use many more buses in the future than we do today, but those buses should be and will be co-ordinated with electric cars. Undoubtedly there are communities and some interurban lines where the bus should and will entirely supersede the electric car. A number of electric car lines, both city and interurban, were built because they were community builders, and those who constructed them were building for the community's future. Real estate values were increased manyfold and the electric railway builder was welcomed with open arms. This would not have been true if these railways had not been constructed by responsible people with something worth while to offer, and it is essential that due and careful consideration should be given to the protection of these community investments to the greatest extent practicable.

TRANSPORTATION CHARGES TOO LOW

Today a very considerable number of people are using the privately owned automobile who previously used public transportation, but public transportation still remains a civic necessity if our communities are to grow and prosper. In that connection I want to draw attention to what I believe is a fundamental fallacy. There is entirely too much agitation for too low a transportation charge. I do not find fault with my neighbor because he wants to buy his ride cheaper, but I do say to him and to you that what he really needs above all else is service. I maintain that the better service would be worth far more than the extra pennies it would cost and that no better community investment could be made from the standpoint of economy and of prosperity. The day will come, too, when more money will not be forthcoming for needed improvements, unless the rate of fare pays the cost of the service, including the cost of money.

I believe that there are but few cities or systems where there has been as yet real co-ordination between street car and bus. The car must of necessity remain the vehicle to carry large masses of people at the lowest rate of fare. There is open a new and most attractive field for the bus, catering to those who desire a more expensive, more exclusive or faster service. The bus in semi-competition might carry a considerably less number of people per vehicle, give a seat to every passenger and make but comparatively few stops, or a limited car and local bus service might better serve the community. In many of our cities, even large ones, there are sections where, when the old track becomes worn out, new track should not be installed but buses should take the place of the electric car.

When I say that I see a broader field in many communities for the bus than has as yet been utilized, with that statement must go two others: first, the community must pay the cost of the ride whether it be by bus or electric car, or service such as I am speaking of is not possible; second, there must be co-ordination to the extent that is only possible when the electric cars and the buses are under one management and that management a responsible one.

There is also admittedly a prohibitive cost entailed if too much additional service is provided. There may temporarily be actual competition between the bus and the electric car. Such competition cannot eventually continue. It is against all economic laws. The community cannot afford to pay the price of duplicate service.

Referring directly to Louisville, I do not know what eventually will be the legal outcome of the bus competition and street car situation here, but I do know that eventually the people of Louisville cannot have a bus company in here taking away the cream of the traffic from the electric railway company and still continue to have that street car service which is necessary for their very lifeblood. An irresponsible pirate operating solely for his own benefit and under no obligation to serve all the people all the time has no moral right to take the cream of traffic and thereby weaken or break the organized transportation enterprise which operates under public control for the public benefit. I want here to commend those far-seeing bus manufacturers who with vision and foresight have so shaped their individual sales policies as to withhold aid or assistance to bus operators seeking to undermine the established transportation of a community.

When hard-headed business men like these bus manufacturers visage the fact and appreciate the necessity of doing business with responsible transportation companies, it would seem to me that there should also be a full community appreciation of the underlying facts and consequences.

BUS A MERCHANDISING VEHICLE

The bus has some undesirable features, due primarily to the mechanical limitations of the present status of the art, but the bus is a merchandising vehicle and we electric railway men must go farther than we have in our appreciation of what the bus can do, not only as a transportation vehicle, but as a selling and merchandising tool, a vehicle with many features inviting to our customers. We recognize that we cannot meet the competition of the private automobile and other new and changed conditions of today if we continue to operate the same cars under the same conditions as we did ten years ago. We must not only modernize our equipment, but we must do what a considerable number of the progressive properties down in this part of the country are doing. Take the Louisville Railway, the Kentucky Traction & Terminal Company, and the Interstate Public Service Company—three properties with which I happen to be reasonably familiar—they are not doing today what they were doing ten years ago. There is a new order in effect. Their car equipment is meeting today's conditions, and further, these companies are recognized nationally as leaders in a public relations policy, in a desire to satisfy their customers. It remains for the people of these communities, as of communities elsewhere, to choose and be given just the kind of transportation service they desire, but I must say again, and I say it in no mean way, that they must pay the cost of the service rendered. Here are men able and willing, and the financial groups behind them are able and willing, to go forward as distinct assets to the community served. It is for the public—our customers—to decide, but I believe that I as a representative of the electric railway companies would not be doing my duty did I not point out the underlying facts.

Air Brake Requires Proper Installation and Maintenance*

By W. M. C. Horner

Mechanical Expert Westinghouse Air Brake Company

For many years the installation of the brake equipment on electric cars in many cases did not receive the consideration it merits. Consequently there are a great many cars which have been in service for a number of years that are equipped with brake cylinders much too small to provide a satisfactory brake and at the same time keep the leverage ratio within the prescribed maximum of 12 to 1. There are some cases where cars have had as high as 18 to 1 total leverage. Inasmuch as this is a subject in which every operating man is interested, I wish to take this opportunity to review a few of the essential factors involved in the design of an efficient air brake.

First, as to pressure: If more than 2 per cent braking power per pound of cylinder pressure is attempted, a very high braking power for light cylinder pressures is obtained and, therefore, the cars cannot be handled without shocks at low speeds, and either the range between the maximum and minimum braking power obtainable must be very narrow or else wheel sliding will result when the maximum power is used.

Second, as to area of brake piston: If the ratio of cylinder piston area to cylinder pressure is excessive, it means either a low leverage, which means great shoe movement, or higher leverage with low pressure, which means very narrow range between maximum and minimum braking power.

Third, as to leverage: If the leverage is too low, it means excessive air consumption and too much shoe movement; if too high (that is, brake cylinder too small for weight of car, and it is here that the principles governing brake design are violated most frequently), smooth and accurate handling of the car or train becomes impossible and the shoes are constantly grinding on the wheels, consuming energy, wearing out the shoes and causing loss of time; or else piston travel must be lengthened out, thus greatly increasing the air consumption, lengthening the time of application and release and reducing both service and emergency braking power. The high leverage makes necessary a frequent adjustment of piston travel. Otherwise a constant and very rapid decrease of braking power will result. If high leverage is accomplished at truck levers, it necessitates low hung brake shoes, which, when suspended from a spring-supported part of the truck, will result in great increase of piston travel and consequent decrease of braking power with the loading of the car. The action of the brake itself tends to compress the truck springs and magnifies this condition. Consequently when the air pressure in the brake cylinder is released and the car is unloaded the brake will remain applied because all the shoe clearance has been absorbed by the false travel. This always occurs at a time when readjustment of piston travel is impracticable and when instead of a decrease of braking power an increase is greatly to be desired. In addition, the danger of the levers fouling is increased, particularly where the truck leverage ratio is high, and for that reason very frequent and careful inspection is required or the total loss of the brake may result.

Satisfactory Brakes Require Proper Installation

All of the preceding could be very much elaborated upon, but it is thought that enough has been said to show that the braking problem warrants careful consideration with regard to both the kind of brake and its proper installation.

Coming to the mechanical requirements of the foundation brake gear, the most desirable features in connection with this matter are a motor truck that will permit a brake design providing a lower truck leverage ratio and an unobstructed movement throughout the range of brake shoe wear—say 1½ in. There should also be provision in motor truck construction for the best location of the brake shoes on the wheel and suspension of the brake head or beam hangers at a proper angle and at such a point on the truck as will maintain a fixed location of the shoes on the wheel, regardless of whether the car is light or loaded.

Economy and safety are prime requirements in railway operation, and as the brake is a most vital safety factor it should have consideration commensurate with its importance. In the design of cars and trucks, ample space should be allowed for the application of the proper brake equipment, including a suitable foundation brake gear right down to the brake shoes. In the event of piston travel adjustment being neglected, the piston should strike the head before the radius bar, or levers foul.

Satisfactory Performance Limits Lever Ratio

While a total leverage of from 9 to 1 or a maximum of 12 to 1 is proper, yet the total truck leverage ratio should not exceed 6 to 1; i. e., 1 lb. exertion on the truck pull rod should not give more than 6 lb. of force distributed at the four wheel shoes. This, of course, would mean a ratio of 3 to 1 for each truck lever, but 2½ to 1 is even preferable. This latter would mean a total truck leverage ratio of 5 to 1. When this is exceeded, the travel of the top end of the lever becomes too great as compared with shoe wear. In addition the shoe has to be placed very low on the wheel and there is increased danger of the lever fouling on the shoe. The lower the truck ratio is held the less change of angle there is for a given shoe wear.

Uniform Piston Travel Is Important

Proper provision should be made for maintaining as near a uniform piston travel as practicable for the following reasons: (1) That the air consumption may be kept low; (2) that the braking power may always be uniform, and (3) that a full power brake is assured at all times. For satisfactory brake operation the following factors should be considered: Release springs of proper strength; brake shoes of proper thickness, area and friction; live and dead truck levers of the same proportion when motors are on each truck axle, or, if otherwise, proportioned to allow for motor and non-motor axles; ample provision for take-up of shoe wear, slack, etc.; levers and rods so proportioned that they will be at right angles to each other when brakes are fully applied; elimination, as far as possible, of lost motion in journal boxes, pin holes, center plates, etc. The car should have reasonably large truck centers to admit of proper connection of body levers to truck levers by means of pull rods; the hand brake should be equalized and the multiplication made so that a large force can be applied to the hand brake chain with comparatively small amount of chain wrap-up.

An important phase of brake maintenance which is often troublesome at this season of the year is the question of moisture in the air brake system. The amount of this moisture, of course, depends on the humidity of the atmosphere at any given time. Frequently these atmospheric conditions are such that a considerable quantity of water will enter the air brake system. The water contained in the air is in the form of a vapor which saturates the air to a lesser or greater degree. Relative humidity is expressed in percentage and is a measure of the degree of saturation of the air at any given pressure and temperature. If air is at 100 per cent humidity it contains all the moisture it can hold at that pressure and temperature. When the pressure of the air is changed the ability of the air to hold moisture changes. As the pressure is increased the ability of air to hold water is decreased. The effect of temperature is exactly the reverse; as the temperature is increased the ability of air to hold moisture is increased.

---

*Paper delivered before meeting of Central Electric Railway Master Mechanics Association, Toledo, Ohio, Feb. 3, 1927.

As air is compressed its temperature increases. Consequently there is little moisture in evidence near the compressor or for a considerable distance beyond, even though the pressure has been increased. However, as soon as the air cools down its ability to hold moisture at the increased pressure decreases. All the moisture which is present in excess of the amount necessary to saturate the air 100 per cent will be deposited in the reservoir or cooling pipe. The amount of water deposited depends on the percentage of moisture in the air when it is drawn into the compressor. After the air is thoroughly cooled to the atmospheric temperature it will be more or less expanded as it passes into the air brake system. This expansion will, of course, further cool the air, but the reduction of pressure and the tendency toward increase in temperature due to the then higher atmospheric temperature will operate to keep the air dry; i. e., at less than 100 per cent saturation.

WATER CAUSES MANY TROUBLES

The presence of water in the air brake system is decidedly objectionable from two standpoints: (1) Because of the harmful action of moisture on the working surfaces of air brake devices, and (2) because of freezing. Moisture distributed in the air brake system causes rusting of the interior iron surfaces, and frequently this rusting action is extremely rapid because of certain gases which are present in the atmosphere. These gases, such as carbon dioxide, tend to make this moisture of an acid nature. When water is present in any considerable quantities it tends to wash the rust and other dirt that may enter the air brake system into the triple valves, emergency valves and other devices, with the result that the operation of the brake equipment will be errratic, or even defective, unless the equipment devices are frequently cleaned. The cleaning of air brake devices is an expensive proposition and is frequently unnecessary if proper means are employed to eliminate moisture.

The freezing of moisture in the air brake system is, of course, a well known objectionable feature, because all air operated devices can be blocked by ice and rendered inoperative if sufficient moisture is present under such conditions. The solution of this problem is, of course, to keep the water out of the air brake system. This can only be done where an adequate cooling system is installed. There are many railway cars now in service which have adequate cooling facilities provided in the main reservoir portion of their brake systems, and these operate daily in severe cold weather without freezing troubles. There are other brake installations which are not so satisfactory and therefore need a carefully planned arrangement of radiating pipe to obtain the desired cooling effect.

Unless care is taken in the installation of radiating pipe the full effectiveness will not be obtained. Sufficient length of pipe is often installed, but it is located above the sills, where it does not get a free circulation of air, and very often it runs close to resistance units which throw off considerable heat, thereby defeating the purpose of the installation. When radiating pipe is properly installed freezing troubles can be invariably eliminated.

FREEZING ELIMINATED ON THE N. O. P. & L.

Last winter the Northern Ohio Power & Light Company had a real epidemic of freezing, which was attacked in a real business-like fashion by making certain changes along the lines referred to above, that gave satisfactory results. The changes on some of the cars were rather elaborate and involved considerable expense. However, I believe Mr. See, master mechanic of that property, will tell you that the cost has been repaid. The man who thawed out cars last winter told me the other day that he formerly used 2 gal. of gasoline every day in a blow torch, but that he forgets to bring the torch out most of the time now as he has no need for it.

By way of contrast, it might be interesting to mention another property that could not be convinced that radiating pipe, properly installed, could be depended upon to obtain the desired results, and therefore refused to use it. In order to protect its equipment against freezing the emergency valve, governor, quick release valve, main reservoir cut-off valve and a combined check valve and strainer were installed in a well-made box which was lined with felt. In spite of this there was freezing, which was later eliminated by installing two 23-watt lamps inside the box along with the apparatus. On tests made when the outside temperature was 12 deg. below zero the inside of the box registered 36 deg. I have examined the valves on this property a number of times and have found that in two months the inside of the valves have become very rusty, showing the presence of considerable moisture. It is necessary to clean these valves every two months.

I have just examined several valves which have been in service approximately twelve months on a property where freezing is avoided by eliminating moisture by radiation and found the emergency valves in very good condition, free from rust and evidence of moisture. The difference in maintenance expense as compared with the other road mentioned where the valves have to be removed, cleaned and lubricated every two months is obvious.

I wish to lay special emphasis on the desirability of suitable protection of the air compressors against the entrance of dirt. If an air compressor is kept clean it will run almost indefinitely without excessive wear. It was my privilege recently to examine some compressors which had been in service for six years on a property which has no regular general inspection or overhauling periods for compressors. The only time they get to the shop is when something goes wrong, but they have a very efficient suction strainer arrangement. The oil was almost entirely free of any sediment, the gear and pinion were in fine shape, it was only necessary to take out one shim in the connecting rod crankshaft bearing and we could detect only 0.0015 in. wear in the cylinders. The condition of this compressor showed very forcibly how simple it is to increase compressor life with very little cost for maintenance if clean air is furnished at the suction.

I would like to add a word or two concerning the composition packing which our company developed primarily for brake cylinder packings, but which is now being substituted for leather in all air brake devices except in a few cases where leather seems the best suited. We were obliged to go into the manufacturing of composition packing for brake cylinders because of the tendency of leather cups to lose the filler with which they are impregnated, causing them to become porous in a short time.

The new material, known under the trade name of "Wabco," is highly oil resisting, which insures against excessive brake cylinder leakage during the life of the cup. The packing cups are made fairly firm in order that a uniform bearing be maintained against the cylinder wall without the aid of an expander ring. Therefore, it is necessary to exercise reasonable care in handling, in order that the material is not cracked or broken before being installed. Rubber, which is used as a base in this composition, has a natural tendency to vulcanize with age. This results in gaskets becoming harder than they should be when carried in storeroom stock for a considerable period. Gaskets that appear to be too hard for application to a device can be softened temporarily by soaking in warm water for a few minutes. We recommend that not more than a six months stock be carried.

Men of National Prominence to Address Oklahomans

SEVERAL men of national prominence in the public utility industry will address the ninth annual convention of the Oklahoma Utilities Association at the Huckins Hotel, Oklahoma City, on March 8, 9 and 10. They include L. S. Storrs, who will address the morning session; Frank LeRoy Blanchard, New York; H. S. Bennion, New York; Martin L. Pierce, North Canton, Ohio; H. O. Caster, New York; W. S. Vivian, Chicago; H. B. Flowers, New Orleans; Samuel A. Chase, Mansfield, Ohio; Earl W. Hodges, New York. The latter will be the principal speaker at the annual banquet to be held at the Oklahoma Club on Wednesday night, March 9.

The News of the Industry

Higher Rates in Fort Worth

Northern Texas Traction Hopes to Sell 5,000 Nickel Passes a Week—Intensive Campaign

Negotiations between the city of Fort Worth, Tex., and the Northern Texas Traction Company culminated on Feb. 1 in a unanimous vote by the City Council granting a fare adjustment. The conferences occupied only about two months. The company made formal application on Dec. 1, 1926, to the Fort Worth City Council for an adjustment of the rates. The rates finally agreed upon and mentioned in the ELECTRIC RAILWAY JOURNAL issue of Feb. 12, page 307, were: Cash fare, 10 cents; three tokens for 25 cents; nickel pass at 40 cents a week, plus 5 cents per ride; half fares, 5 cents cash with six tokens for 25 cents.

These new rates replace a 7-cent adult and 3½-cent children's fare. Fares on the motor coaches remained at 10 cents straight, this fare entitling the rider to transfer to and from cars.

The new rate embodied in the nickel pass is a departure. With twelve rides a week, the average fare on the ticket is 8⅓ cents. In its plea before the Council the railway stated that from 25 to 30 per cent of its passengers would ride on the nickel pass.

Having sold the nickel pass idea to the City Council, the next job on the part of the railway was to sell it to the public. This was accomplished by holding a week-end bargain sale of street car rides. On Feb. 2 at noon the operators on every city car handed a pamphlet to every street car rider. This pamphlet reproduced the nickel pass, good until midnight Feb. 6, and invited the public to use it with the railway's compliments. The result was that within 24 hours practically everybody in Fort Worth understood the nickel pass, how it worked and what its possibilities were. The effect was, of course, to carry everybody for a 5-cent fare from Feb. 2 noon until midnight of Feb. 6. During the 4½ days the riding increased about 10 per cent, while the city revenue decreased about 20 per cent. In addition a kindly feeling was created among the public that brought the railroad many compliments. It is the plan of the company to have the public educated to the point where it can sell 5,000 to 6,000 nickel passes a week.

The railway at Fort Worth, in addition to handing out the explanatory pamphlets, had inspectors and commercial representatives canvassing all of the stores and large establishments, giving out booklets describing the nickel pass. The result was that the railway received checks from a number of concerns to cover passes for all of the employees. Some concerns presented these to their employees with their compliments. For example, the railway sold Sanger Brothers, one of the leading department stores, 300 nickel passes at 40 cents each, and to another concern it sold 100. The railway hopes to make this a permanent arrangement and to intrigue other concerns to follow suit.

As a preliminary to the installation of the new fares the company has been holding meetings of its city trainmen and adopting many novel stunts, with the result that when the new rates went into effect on Feb. 7 the company had about 500 of the most enthusiastic salesmen ready to do duty. The complete application was reproduced as a page "ad" in several of the daily papers and pamphlets addressed "To Our Patrons" were distributed to many outbound passengers.

In addition to the beneficial effects of the new fares on the infrequent rider, the casual rider and the wholesale rider, the management sees an added advantage in the new schedule, namely, the getting away entirely from odd pennies. This is considered to be a tremendous help in speeding up service and relieving platform congestion, as service on the city lines is 100 per cent one-man.

Utilities Not Stressed in Messages

Only Slightly Do Governors' Addresses Affect Railway or Bus Industry—Motor Vehicle, Home Rule and Commission Regulation Mentioned

LEGISLATIVE sessions are being held this winter and spring in nearly all the states. Of the messages studied little is said on the subject of public utilities. Most of the governors made no plea or promised no legislation for the railways or their subsidiaries, but many of the chief executives stressed the need for continued construction and development of the highway, discussing in connection with the good road movement, the importance of renewed vigilance of safety for the public. The states from which this message of highway development emanated included New Hampshire, Maine, Delaware, Montana, South Dakota, Vermont, Minnesota and North Dakota. Of the 35 addresses to the various legislative bodies considered seventeen contained some pertinent remarks of interest to utility operators. This proposed legislation would affect motor vehicles, gasoline and other taxes, service commission duties, bus regulation and home rule. These were made in the states of New York, New Jersey, Ohio, Maryland, Rhode Island, Tennessee, Pennsylvania, Kansas, Oregon, Washington, North Carolina, Iowa, Connecticut, Wisconsin, Idaho, Massachusetts and California. Extracts of the messages in New York, New Jersey, Ohio, Maryland, Massachusetts and California follow:

NEW YORK

Governor Smith of New York called attention to the still unsolved phase of home rule, namely, the administration of local public utilities. He said that he had consistently called attention to the injustice to local governments brought about by the amendments to the public service law, made in 1921. In his opinion the state should return to the municipalities the free hand they once had to deal for themselves with the corporation with which they made contracts at any time in the past. He was never able to find any fault with a policy of decentralization that would delegate to municipalities, where they desired to exercise it, the right of the state to regulate all public utility corporations operating wholly within their borders. The state should be empowered to delegate to localities when they so request or to an agency established and designated by the local government the regulatory powers now held by state agencies. He said: "It is time we ceased to hamper the freedom of municipalities to own and operate public utilities. Public ownership and operation are not untried theories."

The successful co-operation between the public at large and the officials charged with the administration of the motor vehicle law was in no small measure responsible for the decrease in deaths due to motor vehicle operation during 1926 compared with the year previous.

NEW JERSEY

The problem of improved transit facilities among the communities of northern New Jersey and between those communities and New York City, which has been the subject of serious study by the North Jersey Transit Commission, was referred to by the Hon. A. Harry Moore, Governor of New Jersey, in his message to the 151st Legislature. He said that this commission would report as to the progress of its work during the 1927 legislative session, that a careful study of that report would serve not only further to demonstrate the far-reaching importance to the state as a whole of these studies but also the tremendous difficulties and the enormous amount of work confronting this unsalaried commission before there could be solved the legal, financial and engineering problems involved in the establishment of a rapid transit system functioning not only within the boundaries of New Jersey but requiring, as well, the crossing of the political geographical barrier of the Hudson River. He said that such a plan, when fully developed, would affect in one way or another every railroad with terminal facilities on the west bank of the Hudson and would require the active co-operation of the authorities of New York for its practical realization. Much work remains to be done.

OHIO

On the subject of public utilities, Governor Donahey asserted it was the duty of this session to submit three names for an entirely new commission, because of the failure of the last Ohio Senate to confirm his appointments to the Public Service Commission. The law, however, contemplated the appointment of only one new member every two years. He said the new appointment would be sent to the Senate for consideration in the near future and asked the present Senate not to adopt the policy of the two preceding ones in permitting important appointments to lie dormant in committee for weeks or months. He said that after consultation with the new commission he proposed to submit for the Legislature's consideration some concrete recommendations as to needed statutory changes in methods of operation and procedure of the Public Utilities Commission. He recommended an excise tax on motor transportation companies operating as public utilities "which up to this time have escaped this form of taxation," and this in addition to the special taxes which are paid for the privilege of using the streets and highways for the purpose of transporting passengers and property for hire.

MARYLAND

Gov. Albert C. Ritchie told the General Assembly of 1927 that experience had shown that certain amendments were needed to strengthen the powers of the Public Service Commission. He said that among the measures that would be submitted in this connection were bills providing for indeterminate rate orders; requiring the consent of the commission for the abandonment of franchises acquired and exercised before as well as after the enactment of the public service commission law; empowering the commission to fix the minimum as well as the maximum rates; empowering the commission to suspend proposed rates, pending a determination of their reasonableness; authorizing joint investigations, hearings and orders in conjunction with the commissions of other states or of the federal government in the case of interstate utilities, and restoring the office of general counsel to the commission.

MASSACHUSETTS

Gov. Alvan T. Fuller, speaking before both branches of the Legislature on Jan. 6, recommended further consideration of a gasoline tax of 2 cents a gallon with a corresponding reduction in the present registration fees. This would have the advantage of raising a substantial amount from visiting tourists, he claims, who now contribute nothing toward the upkeep of the highways.

On the subject of public utilities, he said that the Department of Public Utilities should be responsible to the public for establishing and maintaining reasonable rates. The Public Utilities Commission should be the guardian of the public interest. It should require reports and be able to analyze them so that a proper relationship could be secured between returns to the stockholder and charges to the consumer, "always bearing in mind that the consumer has not been afforded that best protection which can be given to any consumer, namely, competition for his patronage." The advantage of this competition had been denied him by giving utility companies a monopoly. He asked if it were not surprising that all public service companies had not learned the lesson that the interests of the company could be best served by meriting the confidence and good will of the public.

On the control of public utilities he recommended legislation to meet the situation of public utility companies passing under the control of interests outside the state through the medium of holding companies. He quoted Section 10 of Chapter 181 of the General Laws and recommended that the statute be amended so that it would provide that whenever it should appear that a majority of the common or other stock having voting power in the domestic company was owned or controlled by a foreign corporation the Supreme Judicial Court should have jurisdiction in equity to dissolve such domestic company. As there were a number of these holding companies organized under the laws of the Commonwealth, the amendment to the law should be so drafted as to apply to holding companies, whether domestic or foreign.

Governor Fuller's message stressed the problems growing out of the Boston Elevated Railway, with its varied equipment for transporting the public. Among other things he suggested for public consideration legislation continuing the present public control of the Elevated for a period sufficient to effect a substantial decrease in dividends and interest. The assurances necessary to obtain these concessions in the return to be paid on capital could be given without actually involving the treasury of the Commonwealth in the least or binding the public trustees to do more than keep fares at a proper rate. In all that is done he believed the two great objects of suitable transportation and the lowest possible expense for the capital required ought to be kept constantly in mind.

CALIFORNIA

In his address before the Legislature of California on Jan. 4 Gov. T. S. Young recommended that the present Legislature provide for a commission to investigate whether the existing tax system, with periodic justifiable increases in the public utility tax rate, would continue to provide necessary revenues for the state's normally increasing expenditures, and if not, what modification should be made in the present system to put it on a safe, permanent and equitable basis.

Tacoma Survey to Be Concluded

Officials of the Tacoma Railway & Power Company, Tacoma, Wash., have interviewed thousands of Tacoma citizens in the past few weeks in an effort to get data on what the public thinks of the city's railway service, and to learn what is wanted by the public in the way of additional or improved service. The survey is being made by the Beckmann-Hollister Company, San Francisco, with Miles F. Hollister of the company personally directing the work. The City Council and Mayor Melvin G. Tennant have been co-operating with railway officials in an effort to solve the railway problem.

New Reserve Clause Inserted in Kansas City Franchise

A reserve fund for maintenance purposes of approximately $400,000 will have to be set up by the new Kansas City Public Service Company, Kansas City, Mo., under a clause just inserted by the special committee in the proposed franchise. The reserve fund would be created gradually out of the earnings of the company and could be used only for emergencies. It is thought that this reserve fund is the only new feature not already made public that will appear in the proposed franchise, a 30-year grant to replace the one under which the company is now operating. The other terms of the franchise are said to follow closely the committee's recommendations made to the Council last December.

The new franchise is virtually ready to be presented to the Council. It remains only to be drawn up legally. One more meeting of the committee will then take place before the franchise is presented to the Council. After its introduction in the Council the grant would be referred to a committee, which would hold a public hearing within a week. The measure would come up for passage at the third reading in the Council.

Rearrangement of Akron Operation Proposed

A. C. Blinn, vice-president and general manager of the Northern Ohio Power & Light Company, Akron, Ohio, has proposed a plan for changing railway and bus routes and schedules in Akron that will save approximately 1,600,000 operating miles annually, better the service and decrease operating costs. It will be put into effect when approved by City Council.

Alterations proposed by the company will help keep city bus and car fares down by enabling the company to reduce its operating losses on the Akron transportation system, Mr. Blinn told councilmen. He said:

> N.O.P. transportation operations went heavily into red ink during 1926, as against a net of $48,813 after taxes in 1925. If we fail to operate with a profit this year, there will be no alternative but a higher fare when we seek a new franchise in 1929.

The transportation changes affect duplicating operations during dull periods, which eat heavily into operating costs, according to Mr. Blinn. Improved service is planned in rush hours.

New Proposals Expected in Toledo

Following a lull of two months in railway negotiations at Toledo, Ohio, which were aiming at a revision of the Milner ordinance or a complete new plan of unified traction and bus service it is believed some new proposals may be made soon by the representatives of the Community Traction Company. An ordinance was prepared but after receiving disapproval of the street railway board of control and a special committee of the Chamber of Commerce was abandoned for the time being. Possibly the new negotiations may seek to use this ordinance and the construction suggestions as a basis for a new plan. Original negotiations to secure better service, lower fares and better street paving and maintenance arrangements were started nearly two years ago and involved a study of the transit system of Toledo by Prof. H. E. Riggs of the University of Michigan.

The Rocky Mountain Canary Carols Its Tune in Denver

In the city of Denver, Col., there is an eight-page paper, 12 in. x 17 in., called the *Rocky Mountain Canary*. It is published every Saturday and the Denver Tramway is evidently one of the main distributors, the paper being placed in an open box in a prominent part of the cars, a sign thereon reading "Take One." Ten thousand copies are printed each week. In every edition there is an invitation to the public to submit a slogan for the big placards carried on the front of all the company's cars. The prize to the winner of slogan contests is 100 car checks, of a value of $7.50.

As a sample of the winning slogan, the issue of the *Canary* for Jan. 22 prints: "Denver gets you in the end. It's a great place to live."

In the same issue the tramway offers a $5 prize for the best letter of not more than 100 words on "Why I Ride the Street Cars." For any other letters on the subject that are used by the *Canary*, $1 is paid, and then the *Canary* is going to print news of grocery bargains close to car lines, clothing bargains, meat bargains, etc., and says that in this way "we will make your car slugs pay."

Rehearing on Syracuse Fares

Chairman Prendergast of the Public Service Commission on Feb. 17 heard the application of Mayor Hanna of Syracuse for a rehearing on the order of the commission establishing a rate of seven tickets for 75 cents, 10 cents cash fare, on the New York State Railway Lines in Syracuse. The commission had previously denied the application for a suspension of the order dated on Feb. 2, to be effective Feb. 10, pending this rehearing.

The city's request for a rehearing was based on the valuation of the property of the company and the order requiring that tickets be sold in blocks of ten for 75 cents, which it believed was injustice to the small wage earner. Mayor Hanna petitioned the commission to require that two tickets be sold for 15 cents with four tickets for 30 cents. The railroad maintained that the order of the commission was fair to all parties and that to increase the number of transactions by selling tickets as suggested by the city would delay the operation of cars. Decision on the application for rehearing was reserved.

Relief from Paving Cost Sought by Detroit Municipal Railway

Upon the suggestion of Del A. Smith, acting general manager of the Department of Street Railways at Detroit, Mich., the City Council has passed a resolution instructing the Corporation Counsel to prepare a charter amendment to relieve the municipal railway of the burden of paving between tracks. The amendment will place the cost of such paving between tracks on the general tax roll. The matter will be voted on by the people at the April 4 election.

In bringing the subject to the attention of the Council, Mr. Smith cited that between July 1, 1925, and Dec. 31, 1926, the D.S.R. expended $542,652.02 in paving between tracks. John C. Lodge, president of the Council, in commenting on the proposal, cited that under the present system of making the car rider pay for the pavement between tracks. Mr. Smith cited the general tendency to relieve street railways of the paving burden, and said that the money expended in this direction in Detroit, if diverted to exclusive railway purposes, would most certainly add materially to transportation facilities.

Postponement in St. Louis on Fare Hearing

Three federal judges, including two district and one appellate jurist, were not available at Kansas City, Mo., on Feb. 15 so the hearing could not be held on the application of Rolla Wells, receiver of the United Railways, St. Louis, Mo., that its 8-cent basic fare rate be made permanent. A postponement until Feb. 25 was ordered by United States District Judge Reeves, who issued the temporary restraining order against the Missouri Public Service Commission and other state officials under which Receiver Wells put the new rates into effect on Feb. 7.

Prior to announcing the postponement of the hearing Judge Reeves in Chambers listened to motions by City Counselor Muench of St. Louis and Attorney-General Gentry on behalf of the state, and J. P. Painter, counsel for the Missouri Public Service Commission, for a dismissal of the case on the grounds that the federal court lacked jurisdiction. The judge indicated that the points raised had caused serious doubt in his mind as to the right of the federal court to assume charge of the rate question. These motions will be taken up first on Feb. 25, when Judge Kimbrough Stone of the United States Court of Appeals and Districts Judges Reeves and Otis will pass on the case.

City Counselor Muench contended that inasmuch as Receiver Wells on behalf of the company on his own motion had appealed to the Missouri Public Service Commission for a higher fare no action in the federal court should be had until the state commission has handed down its decision. The commission has had the rate question in charge since last June. However, Receiver Wells has contended that the state body has needlessly delayed a decision and that its failure to act has resulted in the confiscation of the company's property in violation of the United States Constitution.

Early Subway Building Is Promised by Chicago Mayor

Assurance that Chicago's vital subway question would be disentangled, for the time being at least, from the main body of local transportation problems now confronting city and traction officials and apparently destined to indefinite delay was given by Mayor William E. Dever in a pre-election address on Feb. 17.

The Mayor revealed that a subway ordinance drawn up by Major R. F. Kelker, Jr., city engineer, in conformity with the Mayor's own recommendation and, in many respects, with the report of the citizens' subway commission, will be reported to the local transportation committee of the City Council in the next few days.

Mayor Dever has incorporated subway construction along the lines proposed in this ordinance as one of the chief planks in his campaign for re-election next April and is demanding immediate action toward that end.

He indicated that if the ordinance should be approved by the Council, it will probably be submitted to the voters at the judicial election in June. Then, if the referendum is carried, assessment proceedings will be started in the courts and construction begun at once.

Local regulation of public utilities is another important plank in the Mayor's platform. A petition sponsored by Mr. Dever is now being circulated by his party workers for a referendum on the question of home rule on April 5, the date of the mayoralty election. In order to give the city of Chicago control over its local utilities, enabling legislation must be obtained from the State Legislature at Springfield.

Railway Project in Missouri

Willard E. Winner, pioneer developer, has associated himself with several citizens of Liberty, Mo., in the organization of a company to build and operate an electric railway from Liberty to Kansas City. A corporation capitalized at $300,000 is being formed. The projectors plan to cross the Missouri River with their line at a point east of the city limits of Kansas City, at which place the river is especially narrow. From the river the line would go almost directly to Liberty, passing just east of Birmingham. At a point 3 miles out of Liberty there would be a branch east to the Atwood quarries.

The men listed as directors are: Lee Clark, Mayor of Liberty; C. P. Atwood; A. W. Lightburne; J. A. Reed; Robert Don Carlos, circuit clerk of Clay County; Pascal Parker; Harry Griffith; E. T. Brant; J. W. Pryor; J. S. Conway, and W. E. Barnes, city engineer of Liberty.

New Crimson Limited in Texas Makes 1927 Appearance

The new 1927 Crimson Limited operated by the Northern Texas Traction Company between Dallas and Fort Worth was placed in service on Feb. 12 after having been exhibited in Fort Worth on Feb. 9 and in Dallas on Feb. 11. The new model was described in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 5, page 246. Whereas the trailer is practically the same as on the new train put into service last October, the motor car has been completely changed, the biggest improvement being a very comfortable, heavily upholstered, genuine leather bucket seat.

In spite of the rain and sleet more than 1,100 people went through the train when it was exhibited and received a copy of the pamphlet describing service. Another 1,000 people went through it in Dallas in the Interurban Terminal. A check-up on the riding in Fort Worth reveals that already a number of local people who have been using their automobiles between Dallas and Fort Worth have now gone back to the interurban.

On the occasion of the installation of the 1927 Crimson Limited the company distributed an interesting and informative booklet on the advantages of riding in this de luxe interurban. The purpose of the booklet was to get the public to thinking along proper lines on the place of the bus and interurban in transportation.

Another Fare Hearing in New Jersey Case

Decision on motion made on Feb. 16 to dismiss the application of the Public Service Transportation Company and the Public Service Railway, Newark, N. J., for adjustment of fare zones on eleven bus lines and one railway line will be reserved by the Board of Public Utility Commissioners of New Jersey until the entire case has been presented.

This was announced in an opinion by the board, at which motion by counsel of affected municipalities to adjourn the case three months was denied. The board set March 21 and 25 for the next hearings. In delaying decision on motions for dismissal, the board said:

> At the close of the testimony given by the petitioners counsel for the various municipalities addressed motions to the board to dismiss the petitions on the grounds of lack of jurisdiction on the part of the board and also because of the insufficiency of the evidence to support the allegations and prayer of the petitions. Without going into the detail of the reasons raised by the motions, the board is of the opinion that the motions should be reserved to the end of the case and should not be considered until after all parties have had an opportunity to present their evidence.

Speaking on the request to adjourn the case three months, the board pointed out that the petitions of the companies were filed on Dec. 14 and they were brought on for hearing on Jan. 19. Adjournment was then taken until Feb. 16. The board said:

> Under the circumstances the board feels that an adjournment to March 21 should allow ample time for the counsel of the municipalities to obtain the necessary data for the preparation of their case.

News Notes

Eight Cents in Sioux City.—Fares on the lines of the Sioux City Service, Sioux City, Iowa, will be 8 cents cash or two tickets for 15 cents after March 1. The present rate is 7 cents cash or four tokens for 25 cents. Diminishing revenue since 1921 forced the change, according to W. J. Bertke, general manager. Competition of the automobile is blamed by the railway officials for the falling off in passenger revenue.

Would Bar One-Man Cars.—About 1,500 residents of Norwood, Ala., have requested the immediate removal of one-man cars from the Norwood line and intimated that refusal to remove the pay-as-you-enter cars would mean a demand for return of the jitneys. This was the message in two petitions presented recently to City Commission.

Amplifiers in Montreal Cars.—The Montreal Tramways, Montreal, Que., has decided to install amplifiers in its cars to enable passengers to hear street names as they are announced by trainmen. Difficulty arose when the one-man cars were placed in operation for the motorman has to announce street names with his back to the passengers, and it has been practically impossible to hear him. The device will be placed in front of the operators of the cars, who will speak into it in an ordinary tone which will be audible to every passenger in the car.

No Change Expected in Transfer Charge.—Following a recent hearing, attended by representatives of the Indianapolis Street Railway, before Clyde H. Jones, member of the Indiana Public Service Commission, it was learned there was little likelihood that the commission would alter an order of more than a year ago in which the transfer fee was fixed at 2 cents. The order for the increase from 1 to 2 cents was for a year, ending Jan. 1. It was continued at that time pending a hearing.

Survey Under Way. — The town of Irvington, N. J., is making a survey of its bus and electric railway transportation with especial respect to their coordination and to the plan for re-zoning recently submitted by the Public Service Transportation Company, a subsidiary of the Public Service Railway. To conduct the survey, the town has employed Fisk & Roberts, consulting engineers, New York.

Group Insurance for Employees.—The St. Louis & Hannibal Railway, Quincy, Ill., has adopted a group program providing the working personnel with approximately $80,000 of life insurance, sick and non-occupational accident benefits and the advantages of a visiting nurse service. The insurance plan, underwritten by the Metropolitan Life Insurance Company, is co-operative, with the employer and employees sharing the cost through joint contribution toward the payment of premiums. Employees in the main group covered each receive $1,000 of life insurance. Sick and accident benefits, based on weekly earnings, average about $10 a week. Included in the group contract is a clause which guarantees payment of the full amount of an employee's life insurance to him, if he becomes totally and permanently disabled before age 60.

Foreign News

Swiss Railroad Electrification

Traffic on the Swiss Federal Railroads has been slowly declining. This has been accompanied by a falling off in the receipts, the effect of which has extended to the railroad authorities' plans for further developments. The budget for 1927 provides a sum of only $17,600,000 for new extension work as compared with $21,400,000 in 1926. As in recent years, the bulk of the money, about $11,000,000, is to be utilized for further electrification work. During the coming year this will be mainly centered in eastern Switzerland.

Among the lines in this district which are in progress of electrification or scheduled for electrification are the Richterswil-Sargan-Chur, Sargans-Buchs, Winterthur - Romanshorn - Rorschach and Winterthur - St. Gall-Rorschach routes. The budget also includes a large sum for the extension of the power generation plants; thus $800,000 is allocated to the extension of the Vernayaz hydro-electric station and $1,400,000 to the construction of additional transformer stations. The budget provision for new rolling stock for the electrified railroad shows a considerable diminution compared to previous years, but a sum of $4,400,000 is allowed for expenditure in this direction next year.

New Hydro-Electric Station to Give Power to Brenner Line

Electric trains probably will be running over the Italian and Austrian sections of the Brenner line by next year if the hydro-electric station now under construction is completed in time. This station is located in the mountains about 3 miles from the railway depot of Innsbruck. Power available will amount to about 100,000,000 kw.-hr. a year. All power produced over and above that required for railway operation and for the zinc mines of Schneeberg, as arranged between the Societa Generale Electrica Tridentina and another Italian company, will go to feed the system of the first-named company.

Polish Electrification Plan Progresses

Government and representatives of European and American utilities corporations are reported to have agreed upon the main points of the electrification project for Poland, involving an outlay of £5,000,000. The financing is to be guaranteed, it is said, by the Polish State National Economy Bank. The machinery required is to be imported from the United States.

Glasgow's New Fares Successful

Graded fares in Glasgow, Scotland, of 1 penny, 1½ pennies, 2d., the latter being the maximum rate for any distance, are proving successful from the point of view of revenue. This new scale has been in operation since last summer. There has been a decided increase in comparison with the receipts shown during a corresponding period the year before, while there was a large decrease in the revenue from shorter journeys. This was more than counterbalanced by the increase from the 2d. fares.

Liverpool Report Praises Trams

Belief in the tramcar as the best vehicle for handling heavy traffic was emphasized in the report of P. Priestly, general manager tramways department, recently submitted to the Liverpool Council, and accepted. Buses have their sphere of usefulness as feeders on routes where the traffic does not warrant the expenditure necessary to undertake tramway operation. If buses were to replace trams in Liverpool, it would require about 50 per cent more vehicles. This, in turn, would result in a bigger mileage and increased cost. Moreover, the additional vehicles would cause serious congestion.

In reply to a recent suggestion to "scrap the trams," the report went on to say that the Liverpool undertaking had a capital of nearly $3,000,000 and payments for sinking fund and interest would have to be made from the bus revenue. In addition, there would have to be new capital expenditure on the purchase of buses and this would have to be repaid in seven to ten years, as against fifteen to twenty years for a tramcar. The tramway system paid approximately £45,000 per annum in taxes, and in addition £50,000 toward road maintenance. If the trams were scrapped the latter would have to be paid out of taxes, so that a total of £95,000, equal to nearly 4d. per £1, would have to be met out of general taxation instead of being paid by the tramway as at present.

Accidents caused by electric railway cars in the past year were fewer per mile than for any other passenger vehicle, the report stated. In foggy weather tram service can be run when all motor vehicles are brought to a standstill.

Floor Signs Used to Direct Passengers.—Traffic direction signs are being tried by the London Underground at the Charing Cross station. There are two types in use, one composed of aluminum letters inlaid in rubber and the other having illuminated glass letters. They are set into floors of passages to direct passengers.

Trolley Line Proposed for Kavala, Greece.—Influx of refugees to the city of Kavala has so greatly increased the population of that city that despite the narrow streets the proposal is being considered to build a single-track trolley line. The present population of 80,000 people is now transported almost entirely by taxicabs.

Recent Bus Developments

Another Respite in New York Bus Wrangle

No action was taken by the Board of Estimate, New York City, N. Y., at the meeting on Feb. 24 toward approving the franchise contracts on bus operation because of the plea of Deputy Comptroller Frank J. Prial, representing Comptroller Berry, that time was needed to study the proposed forms, which had just been submitted by the Board of Transportation. The matter went over for a week. This made it necessary to abandon the date, March 22, fixed by a resolution for the statutory public hearing on the contracts as the law requires the advertising of these contracts for 27 days. It was decided to fix a new date for a vote at the subsequent meeting.

Toledo Bus Ordinance Being Prepared

Toledo, Ohio, has been without any bus regulatory legislation for nearly two years and in response to a public demand in recent weeks following a severe accident a comprehensive bus ordinance was prepared by city legal authorities. It was referred by the Council to the street railway board of control.

After study the board has stated that there was great need for protection of the public and regulations regarding equipment, safety and insurance; that nothing should be written into the ordinance which would embarrass the city in its effort to work out a unified system of bus and street railway service at some later date under a single company, and that in event of passage such an ordinance should be strictly enforced with licenses granted only to lines which would not compete directly with the Community Traction Company. The Council has indicated that it will follow the proposals of the board of control in completing the ordinance.

Gary Line Prepares Site for 90-Bus Garage

The Shore Line Motor Coach Company, a subsidiary of the Gary Railways and the Chicago, South Shore & South Bend Railroad, recently announced the purchase of a site for a large modern garage in the city of Hammond, Ind., to be built and ready for occupancy by June 1 of this year.

The garage will have storage space for about 90 motor coaches and will contain a machine shop and an overhauling department where coaches will be repaired. The cost of this improvement, including the land purchased, will be approximately $150,000.

Merger of the Calumet Motor Coach Company, which formerly operated ten local bus routes in Hammond and adjacent communities, into the Shore Line Motor Coach Company was approved by the Indiana Public Service Commission last month, making the latter company one of the largest operators of motor coaches in the Middle West. Of the total of 132 motor coaches now owned by the Shore Line Motor Coach Company, 83 operate out of the city of Hammond.

Eastern Massachusetts Receives Part Fare from Bus Company

The Public Utilities Commission of Massachusetts has granted authority to the New England Transportation Company, the bus subsidiary of the New York, New Haven & Hartford Railroad, to operate buses on the Boston-Providence route alternately operating through the towns of Walpole and Norwood in Massachusetts. The route thus covered by the bus company encroaches upon territory served by the Eastern Massachusetts Street Railway. An agreement between the two companies provides for the payment of 18 cents to the Eastern Massachusetts Street Railway for each passenger between East Walpole and Boston and between Boston and East Walpole. This agreement was not favorable to the commission. The commission says:

> However unjustifiable and unwarranted the payment to the street railway of a portion of the fare received by the transportation company may be, it does not affect the question which presents itself on this petition. The sole issue before us is whether public convenience and necessity require the operation of motor vehicles over the proposed route.

This the commission believed necessary. It did, however, say:

> In the operation of buses over the proposed route, the electric railway will not do anything to entitle it to compensation. The consideration of this payment, apparently, is in the electric railway refraining from objecting to the issuance of a certificate of public convenience and necessity.
>
> We are of the opinion that expenditures of money of a public utility is unjustifiable. If the question of the reasonableness of the rate charged by the transportation company were now before us, we would without question disallow, as an item of expense, these payments to the electric railway.
>
> However unwarranted and unjustifiable the payment to the electric railway of a portion of the fare received by the transportation company may be, it does not affect the question which presents itself on this petition. The sole issue before us is whether public convenience and necessity require the operation of motor vehicles over the proposed route. We think they do.
>
> The certificate of public convenience and necessity heretofore granted by the department on April 30, 1926, to the New England Transportation Company for the operation of buses for the carriage of passengers for hire between Attleboro and Boston is hereby amended to the following extent:
>
> Said petitioner shall be permitted to operate such buses over the following alternative route through the towns of Walpole and Norwood; from Walpole Square over Main Street, East Street, Short Street, Washington Street to the junction of Washington Street and Walpole Street in Norwood. And on said alternative route shall be permitted to make a stop in the town of East Walpole at or near the post office to take on passengers for Boston, or to let off passengers taken on at Boston.
>
> Provided, however, that no local passengers shall be accepted at any intermediate point between any stopping place in East Walpole and any point in Norwood. and provided, further, that any other restrictions in the original certificate shall remain in force.

De Luxe Service Between Newark and Hackensack

De luxe express bus service was started between Newark and Hackensack, N. J., on Feb. 13, when the Public Service Transportation Company started the operation of a line of "parlor car" buses between the two municipalities. This is the first line of the kind to be put in operation in that section of the state.

Under the schedule adopted the first bus leaves Hackensack at 7 a.m. and Newark at 8 a.m. and the last bus leaves Hackensack at 11 p.m. and Newark at 12 midnight and buses leave both terminals on the hour and half hour during the intervals between.

The through fare between Newark and Hackensack is 50 cents. The minimum fare northbound is 25 cents, good for a ride from any point in Newark to the north line of Lyndhurst. The minimum fare southbound is 10 cents, good for a ride from any point in Hackensack to Williams Street and Terrace Avenue, Hasbrouck Heights. The running time of buses between Newark and Hackensack is 50 minutes.

Service Between New Haven and Guilford to Be Resumed

Bus operation by the New Haven & Shore Line Railway between Guilford and New Haven, Conn., was resumed on Feb. 9, following a suspension of a month. It was noted recently that the bill presented in the Legislature by Representative Harry R. Durant, Guilford, would be withdrawn. This bill asked that the charter granted the New Haven & Shore Line be repealed.

William Walker, manager of the New Haven & Shore Line Railway, in making the announcement regarding bus service stated that the people had demanded this type of transportation. It was brought out that the territory between Branford and New Haven also would be served by the cars of the Connecticut Company, but that the 8 miles between Guilford and Branford was too thinly populated to net much revenue.

Representative Durant had previously branded the company's suspension of the bus line as outrageous and something that should not be tolerated. He scored the argument of the Shore Line that it could not make any money with buses on that line in the winter. It was his belief that the railway had to take the bitter along with the sweet, exactly like other public service corporations in Connecticut.

Bus Losses Concern Cincinnati

Increasing losses on several of the coach routes of the Cincinnati Street Railway, Cincinnati, Ohio, have caused the public and city officials much concern, due to the fact that under the "service-at-cost" franchise the loss is made up by the return from railway fares.

These losses are not regarded by the management as being of an alarming nature, but because the situation is looked upon by the public as serious, the management and the city are studying the problem with the view of making the operation of these routes less costly and more profitable.

Walter A. Draper, president of the railway, has prepared an analysis of the situation showing how to reduce the losses. This he is now submitting to Edgar Dow Gilman, Director of Public Utilities, for his consideration and approval.

Permits in Minneapolis

Permits to operate buses on East River Road have been granted by the Park Board at Minneapolis, Minn., to the Northland Transportation Company and the Jefferson Highway Transportation Company. These companies operate also on River Road in St. Paul on a through intercity route, without picking up passengers, and have been doing so for some time, between the Franklin Avenue and Lake Street bridges over the Mississippi River.

This decision will have a bearing on the Terminal Motor Bus Company, which has applied to the Minnesota Railroad and Warehouse Commission for permission to operate bus service between St. Paul and Minneapolis. At present three intercity bus lines are operating, all owned by the Twin City Motor Bus Company, a subsidiary of the Twin City Rapid Transit Company.

It is contended by C. G. Calderwood, the company's president, that residents of the midway district of St. Paul have for years felt the need of more direct transportation facilities, especially for students at the University of Minnesota in Minneapolis.

The Terminal Motor Bus Company is five years old. It operates out of St. Paul to St. Paul Park and to Prescott, Wis., and Durand, Wis., also chartered buses to various points in the United States and Canada. It will install on the new line 26-passenger coaches with parlor seats, heated by hot water. The same fare as other lines will be charged, or 25 cents a trip, but in addition the company proposes a 20-cent commutation ticket rate.

On the other hand the Park Board, Minneapolis, Minn., has granted permission for the Twin City Motor Bus Company to operate a bus line on Cedar Lake Boulevard, supplying service to a district now without transportation of the sort. The route is from the end of the Bryn Mawr car line on Cedar Lake Road, Superior Boulevard, Twenty-second Street and Cedar Lake Boulevard.

The ordinance passed by the Minneapolis Park Board on Nov. 3, 1926, permitting bus companies to operate on parkways and through parks upon payment to a minimum fee of $10 and a maximum of 20 per cent of the state motor vehicle tax for each bus, has been attacked in the district court in a suit by A. S. Dowdall, through Attorney F. W. Booth. The fee money is utilized to maintain and improve city parkways. Default in payment of a bus fee may result in a fine of from $5 to $1,000. It is sought to have the ordinance nullified on the complaint that the ordinance is a public menace and that the rights the board extends to commercial transportation companies are beyond the powers and contrary to the traditions of the Park Board.

Denver Tramway Gets Bus Permit.—The Bus Transportation Company, a subsidiary of the Denver Tramway, Denver, Col., was given a permit on Feb. 16 to operate buses from Englewood, Fort Logan and Loretto Heights Academy. This service is a substitute for the former electric railway, abandoned because it did not pay.

Buses May Replace Cars.—The Yakima Valley Transportation Company, North Yakima, Wash., will probably replace its last street cars with buses as soon as a line of paving is completed along half a mile of streets which the city and county are doing jointly. The two buses now operated on the Yakima streets are said to be very satisfactory.

New Line Starts. — Operation of a bus line between Philadelphia and Doylestown, Pa., was started on Feb. 6 by the Philadelphia Rural Transit Company, a subsidiary of the Philadelphia Rapid Transit Company. The buses, which run in conjunction with railway service, pass over Old York Road from City Line to Willow Grove and over the Easton Highway from Willow Grove to Doylestown.

Buses Replace Cars.—Permission has been given by the Board of Public Utility Commissioners of New Jersey for the suspension of service on the Sixth and Eighth Streets lines of the Public Service Railway, in Camden, N. J. The board at the same time approved of operation of eleven buses by the Public Service Transportation Company, a railway subsidiary, on the Mount Ephraim route, between Camden and Woodlynne, N. J. The buses will replace the suspended railway service.

Would Operate on White Plains Route.—The Westchester Street Transportation Company, Inc., on Feb. 23 filed petition with the Public Service Commission for an order authorizing the operation of buses on a portion of its route in White Plains. The petition is filed under the provisions of Section 50-A of the Public service commission law. This company is a subsidiary of the Third Avenue Railway System of New York City. It proposes to substitute buses for street cars over a route beginning at the tracks of the New York Central Railroad on Main Street, in White Plains, to the city line and the town of Harrison. A public hearing will be held on this application.

Bus Request Refused.—The Public Service Commission recently dismissed the petition of the Rochester Interurban Bus Company, Inc., for permission to operate bus lines from Rochester, N. Y., to Manitou Beach, Grand View Beach and Island Cottage. Petition for these bus routes was filed on July 24, 1925. Subsequently, the company advised the commission it proposed to have these routes operated by the Rochester Railways Co-Ordinated Bus Lines, Inc., and asked that decision be withheld. Both of these bus companies are owned by the New York State Railways. In January, 1927, the Rochester Railways Co-Ordinated Bus Lines, Inc., filed a petition for these routes and hearing has been held on this petition also. The company agrees that the first petition be refused and the proceeding on the application be closed.

Financial and Corporate

International Claims 10-Cent Fare on Commission Valuation

In a formal statement filed with the Public Service Commission the International Railway, Buffalo, N. Y., asserts that a 10-cent fare would do no more than provide the additional revenue required by the company on the commission's own showing. A Public Service Commission accountant recently reported that the company was earning a fair return, assuming a rate base of approximately $20,000,000, whereas the commission has alowed a rate base of $23,000,000, two of the five members holding that it should be $32,000,000.

On the basis of the commission's own valuation, which is one-third that claimed by the company, I.R.C. fails by $460,000 to earn the return to which it is entitled, says the company's statement.

Decreased employment on the Niagara frontier causes a loss of riding, so that the additional revenue required to give the company a legal return would make a 10-cent fare necessary.

The company's statement alleges many errors in the report of the accountant for the Public Service Commission. It points out that while the subsidiary company, International Bus Corporation, pays International Railway $1,000 a month as rent for Walden Avenue carhouse, and the commission accountant included the rent in income, he deducted a sum set as the value of Walden Avenue carhouse from the rate base. Many items of smaller amount were rejected because the necessity for the expense arose in a previous period. More than $60,000 was deducted covering payment for actual service rendered and expenses incurred.

An item of $10,551 expenses in connection with the investigation of the dynamiting of the high-speed train in 1922 was also deducted by the commission's accountant. The company's statement says:

> There can be no justification for these deductions unless the commission takes the view that the collection and preparation of evidence against lawbreakers attaching the company's property and its patrons is beyond the scope of the company's duty.

Balance Increased on Detroit System

The total operating revenue of the Department of Street Railways at Detroit, Mich., for the year ended Jan. 31, 1927, was $24,713,591, against $23,485,313 for the year ended Jan. 31, 1926. In these figures are included a railway operating revenue and a coach operating revenue of $22,411,611 and $2,301,979, in the 1927 period respectively, against $22,556,758 and $928,554 in 1926. The total revenue from all sources was $24,985,481, against $23,680,745 for the year ended Jan. 31, 1926. Total operating expenses were $19,119,770 in 1927. Of this amount $16,931,548 was for railway expenses and the remainder for coach expenses. The total operating expense for the 1926 period was $17,644,205. Of this amount $16,746,622 was for railway operation and $897,583 for coach operation. Net revenue from all sources totaled $5,865,711 in 1927, against $6,036,539 in 1926. Following the consideration of interest and other deductions a net income of $3,183,299 remained, against $3,389,536 in 1926. The balance for the period was $583,001 in the 1927 period and $570,940 for the year ended Jan. 1, 1926. The railway passengers totaled 481,011,056, against 484,509,830 for the 1926 period. Total coach passengers numbered 29,096,028, against 12,388,021 for the 1926 period. Railway revenue car-miles amounted to 52,419,362, against 53,463,391 and coach revenue coach-miles were 9,410,300, against 4,028,384 for the year ended Jan. 31, 1926.

Fonda Road Protests $1,442,130 Condemnation Figure

Work on the dam to be built in the Sacandaga River at Conklingville, N. Y., will be started within a month, Edward H. Sargent, engineer of the Hudson River regulating board, said on Feb. 21. This is in spite of the intention of the Fonda, Johnstown & Gloversville Railroad to appeal an award of $1,442,130 made on Feb. 19 by a condemnation commission for 7 miles of the railroad's right-of-way along the Sacandaga River near Sacandaga Park.

William J. Maider, acting as attorney for the railroad company, said if the award is confirmed by the court the company will appeal. The railroad company put in a claim for more than $4,000,000.

Within the month the board probably will advertise for bids for relocating the highways and for the big dam itself. The dam will impound 32,000,000 gal. of water and the land will be inundated a distance of 30 miles in length by 3 miles in width.

Income Balance Higher

Washington Company Earns Less than 4 Per Cent on Property Value—Decline of 1 Per Cent in Passenger Traffic

For the year ended Dec. 31, 1926, the balance of income credited to profit and loss of the Washington Railway & Electric Company, Washington, D. C., was $773,200, compared with $644,857 for the preceding year. This fact was disclosed in the annual report of President William F. Ham submitted to the stockholders at the annual meeting on Jan. 15, 1927.

During the year the company's system carried 76,797,163 revenue passengers and 24,272,542 transfer passengers, or a total of 101,069,705 passengers. This is a decrease of 708,473 in the number of revenue passengers carried compared with the previous year, or slightly less than 1 per cent. The primary cause of this continuous loss in traffic is the increase in use of privately owned automobiles, the total now registered in the District of Columbia being 131,362, or 12.6 per cent more than those registered in 1925.

COMPARATIVE STATEMENT OF WASHINGTON RAILWAY & ELECTRIC COMPANY

	1926	1925
Gross earnings from operation	$5,012,619	$4,775,285
Miscellaneous income (including dividends from Potomac Electric Power Company)	1,149,113	1,025,501
Gross income....	$6,161,733	$5,800,786
Operating expenses (including depreciation), taxes and miscellaneous charges	4,140,222	3,915,959
Interest on funded and unfunded debt	688,151	730,600
Payment of dividend on 5 per cent preferred stock.......	425,000	425,000
Payment of dividend on common stock (5 per cent)......	325,000	325,000
	$5,578,374	$5,396,559
Balance of income for year 1926 credited to profit and loss..	583,358	404,227
Miscellaneous items credited to profit and loss	189,841	240,630
Total credited to profit and loss during the year	$773,200	$644,857

The rate of fare in effect on the street cars during 1926 was the same as that in effect since the spring of 1922—that is, 8 cents cash or tickets sold at the rate of six for 40 cents. Notwithstanding considerable improvement being effected in 1926 in all the operating departments of the railway, the results for the year show a return of less than 4 per cent on the value of the property within the District of Columbia as determined by the Public Utilities Commission.

In spite of this the policy of liberal expenditures for maintenance and reconstruction of way and structures was continued in 1926. The amount expended for general maintenance of track and roadway, together with allowances for depreciation, was $904,511. The more important reconstruction projects completed during the year included the rebuilding of 8,175 ft. of underground conduit track and 21,905 ft. of overhead trolley track, at a cost of approximately $312,156. In the summer of 1926 the company placed in operation fifteen modern up-to-date cars, with automatic rear-exit doors and leather-covered de luxe seats. The amount expended for the cars was $235,000, or approximately $15,700 per car. Fifteen new buses were purchased during the year, all of the Yellow Coach type, one with a seating capacity of 21 and the rest with a seating capacity of 29 each, at a total cost of approximately $125,000. These additional buses acquired now bring the fleet to

57 buses, operating over routes with an aggregate mileage of 54.9, representing an investment of $378,938 and all operating as auxiliaries to the railway lines.

The direct cost of operation of buses since they were started in May, 1922, has been $175,916 in excess of the receipts, but the results for the year 1926 are somewhat more encouraging, President Ham said, than at any time since the company entered the field of this form of transportation.

There was a slight increase in the number of accidents compared to 1925 due to added congestion on the streets. Seventy-five per cent of the accidents in 1926 were with automobiles. Aside from the constant alertness of the supervising forces and the operators themselves to guard against accidents, quarterly "Safety" meetings are held throughout the year, where the subject of safe operations is discussed at length. These efforts are productive of results, as demonstrated by the fact that the expenditure for settlements of claims in 1926 was a little more than 3 per cent of the total operating revenues. This is not quite so good a showing as in 1925, but when considering the increase in vehicular movements in 1926 it indicates a degree of co-operation on the part of the employees of the operating departments that is worthy of mention and praise.

The total outstanding bonded indebtedness of the Washington Railway & Electric Company and subsidiary companies, including the Potomac Electric Power Company, is now $25,906,900. This amount, added to the $15,000,000 capital stock of the parent company, and $2,002,850 outstanding capital stock of the subsidiary companies, makes the total outstanding capitalization at this time $42,909,750. This excludes bonds purchased for the sinking funds and for temporary investments.

STATEMENT OF PASSENGERS CARRIED BY WASHINGTON RAILWAY & ELECTRIC COMPANY

	Revenue Passengers Carried	Decrease Compared with Previous Year
1919	91,488,735	
1920	87,782,784	3,705,951
1921	85,481,656	2,301,128
1922	82,716,756	2,764,900
1923	81,518,607	1,198,149
1924	77,786,675	3,731,932
1925	77,505,636	281,039
1926	76,797,163	708,473

The total payroll for the year 1926 of the Washington Railway & Electric Company and subsidiary companies, including the Potomac Electric Power Company, was $4,794,140, an increase over that of the previous year of $135,112.

The number of employees in the service of the entire system is now 2,943, of whom 2,114 are members of the Washington Railway Relief Association.

Valuation Case to Be Appealed by Washington Company

The United States Supreme Court will be asked to pass on the authority of the Court of Appeals in deducting $5,150,000 from the figures representing the valuation of the properties of the Capital Traction Company, Washington, D. C.

The appellate tribunal was asked on Feb. 17 by Attorney George E. Hamilton and G. Thomas Dunlop to stay its mandate long enough for the company to apply to the highest court for a writ of review. A request of this sort is usually granted, especially when important questions and large figures are involved.

On Feb. 7 the Appellate Court fixed the value of the company's properties, for rate-making purposes at $25,756,880, or the sum of $5,150,000 less than the figure arrived at by the lower court. The sum of $5,150,000 was added by the lower court as the amount representing the cost of the franchise and good will of the old Washington & Georgetown Railroad in 1895. This road, when merged with the old Rock Creek line, became the present Capital Traction Company.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 137 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Refinancing of Dayton & Western Completed

Refinancing of the Dayton & Western Traction Company, handed back to its original owners when there was a dissolution of the merged Ohio Electric System, has just been completed by stockholders. This includes the payment of outstanding obligations through the issuance of $312,500 in coupon bonds, bearing 5 per cent interest. The Winters National Bank is made trustee. A first mortgage on the property and all equipment, along with a deed of trust, was filed by President Valentine Winters.

International Railway Reports Small Net Income

The yearly income account of the International Railway, Buffalo, N. Y., shows a net income of $48,610 for 1926, compared with a deficit of $210,355 for the year 1925. This is the first time in nine years that the company's receipts have exceeded expenses. For nine years no dividends have been paid to stockholders, who, according to President Bernard J. Yungbluth, have contributed in cash during this period for the maintenance of service $4,140,445. During the same period more than $5,000,000 has been paid to the various municipalities served by the company.

INCOME ACCOUNT OF INTERNATIONAL RAILWAY

	1926	1925
Operating revenue..........	$10,650,372	$10,695,695
Operation and taxes..........	9,193,277	9,408,102
Operating income..........	$1,457,095	$1,287,593
Non-operating income..........	49,799	48,094
Gross income..........	$1,506,894	$1,335,687
Income deductions..........	1,458,284	1,546,042
Net income..........	$48,610	*$210,355

*Indicates deficit.

The company is now faced with demands for track and paving reconstruction in each of the municipalities served, totaling in Buffalo alone more than $2,000,000. This paving is within the tracks and 2 ft. outside, and constitutes 55 per cent of the total width of the street. The railway has contended that this cost is the result of antiquated laws, making the car rider responsible for paving, notwithstanding the fact that street cars are the only vehicles on the streets that do not use the paving.

Applications for higher fares to meet these costs and to provide the legal return to stockholders are now pending before the Public Service Commission and the federal courts.

The accompanying statement shows the results of 1926 compared with 1925.

$2,500,000 of Notes of Baltimore Company Offered

The United Railways & Electric Company, Baltimore, Md., has sold to Alexander Brown & Sons $2,500,000 of three-year notes of the company. They are to be dated March 1, 1927, due March 1, 1930, and bear 6 per cent interest. They were offered on Feb. 23 to banks and other investors at 99¼ and interest to yield about 6.28 per cent. The Safe Deposit & Trust Company of Baltimore is trustee. Proceeds of the sale are to be used to refund company notes which mature on Aug. 1, 1927, and preference in allotments on subscription to the notes now offered will be given to those who agree before the subscription books are closed to make payments for the new notes with the old notes at par and interest.

Directors Elected at Worcester—New Cars and More Buses

Seven new directors were added to the board and two of the old board resigned at the annual organization meeting of the Worcester Consolidated Street Railway, Worcester, Mass., on Feb. 23, the first meeting since the New York, New Haven & Hartford Railroad resumed ownership of the property. Henry C. Page, general manager, and Leverett Candee, treasurer, resigned as directors. Arthur P. Russell, one of the new directors and a vice-president of the New Haven, was elected vice-president to fill the vacancy caused by the death a few months ago of Col. George Bullock.

The new directors are: John E. White, president of the Worcester Bank & Trust Company and president of the Worcester Chamber of Commerce; Forrest W. Taylor, T. Hovey Gage and Harry W. Goddard, all of Worcester; E. G. Pearson, president of the New Haven; E. G. Buckland, vice-president of the New Haven, and Mr. Russell. The following directors were re-elected: Charles M. Rogerson and W. E. McGregor, Boston; Charles E. Ware, Fitchburg; Clark V. Wood, Springfield; Francis H. Dewey, Worcester.

The officers of the corporation are: President, Clark V. Wood; vice-president, Arthur P. Russell; secretary, William F. Crowe; chairman, Francis H. Dewey.

President Wood, in discussing plans for the future of the road under the management of the New York, New Haven & Hartford Railroad, said recently:

> I believe that when the new cars are placed in service the patronage on all the lines will be increased and that the losses noted during 1926 will not be so large this year. We plan to increase the number of buses. This will lessen our operating expenses. Our profits in 1927 should be larger than in 1926.

Mr. Wood stated that plans for new cars were in the hands of officials of the railroad and that bids will be requested soon. The number of buses also will be increased. Several electric lines will be discontinued in favor of bus service. Mr. Wood said there were several lines in Worcester which could be taken care of by buses. There may also be many changes in schedules to serve the patrons better.

As further evidence that the rehabilitation program is already being followed, Mr. Wood stated that plans are being drawn by the Henry R. Kent Company, Rutherford, N. J., for a new carhouse and for a garage for the buses which the company operates. Many of the cars now being operated will be overhauled and others, in service a long time, will be junked.

Abandonment of Mesaba Railway Sought

Hearing on a petition for permission to abandon operation of the Mesaba Railway, Virginia, Minn., was set to take place in district federal court at Duluth on Feb. 23, under an order signed by Federal Judge John B. Sanborn and made public on Feb. 14 by James C. Chestnut, a receiver of the railway.

The petition, seeking authority to abandon the operation of the line and to dismantle and dispose of the property, was made by Mr. Chestnut and Oscar Mitchell, receivers. The line has been operating at a loss for a number of years, according to the receivers. If authority is granted, the line will probably be abandoned about April 19. The company operates 40 miles of line.

Denver & Interurban Railway Sold

The Denver & Interurban Railway, Denver, Col., which operates an electric railway from Denver to nearby northwestern points, was sold on Feb. 17 at auction by the federal court for $88,850. The road will be dismantled. The sale was at the instigation of the Guaranty Trust Company, New York, which is trustee under the first mortgage bonds for $1,078,000.

Increase In Net Income.—For the seven-month period ending Jan. 31, 1927, the total operating revenues of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., were $27,177,699, against $26,142,270 for the period ending Jan. 31, 1926. Total operating expenses increased from $17,008,778 to $17,525,563 in 1927. Following the consideration of income deductions there was a net income of $3,752,623 for the seven-month period ended Jan. 31, 1927, against $3,378,057 for the same period of the year previous.

Loss in Schenectady Larger.—The Schenectady Railway, Schenectady, N. Y., reports to the New York State Public Service Commission for the quarter ended Dec. 31, 1926, a net loss of $291,397 after fixed charges, compared with a net loss of $10,851 in the corresponding period of 1925.

New Directors Named in St. Louis.—Two new directors for the United Railways, St. Louis, Mo., were named at the annual meeting of the stockholders on Feb. 8. Walter W. Smith, vice-president of the First National Bank in St. Louis, and Herman C. Stifel, broker, replaced A. Siegel, who died recently, and A. C. Brown, who declined re-election.

Net Corporate Income Lower.—For the six months period ended Dec. 31, 1926, the passenger revenue on the Brooklyn City Railroad, Brooklyn, N. Y., was $5,677,845, against $5,688,734 for a similar period the year previous. Operating expenses and taxes increased from $4,852,726 to $4,900,749 in 1926. After the consideration of income deductions there was a net corporate income of $624,466 for the 1926 period, against $721,516 for the period ended Dec. 31, 1925.

Would Increase Stock Shares.—The Indiana Service Corporation, Fort Wayne, Ind., in a petition just filed with the Indiana Public Service Commission, has asked to increase by 30,500 the number of shares of its preferred stock and by 200,000 the common stock shares in order to reimburse the company for betterments and extensions for 1926 and those planned for 1927. The petition states that the present authorized stock is 40,000 shares of preferred with a par value of $100 and 500,000 shares of common.

Discontinuance Threatened. — Employees of the Peterboro Radial Railway, Peterboro, Ont., Canada, have been notified that the service may be discontinued after April 1. The notice from the management, the Hydro-Electric Power Commission, was posted in the power house. It is said that the intimation of the possible abandonment of the system is the result of higher power rates in Central Ontario.

Lease Extended.—The Capital Traction Company, Washington, D. C., on Feb. 18 announced it had extended for six months its lease with the Washington-Maryland Railroad on the latter corporation's line from Fourteenth and Kennedy Streets northwest to Takoma Park, Md. Negotiations are pending for purchase of the line by the Capital Traction Company, but there has been disagreement over the terms of transfer. The present lease expired on Feb. 20 and the extension is for the purpose of permitting further negotiations.

Will Hear Abandonment Plea.—Hearing on the application of the Lake Shore Electric Railway to abandon its line between Sandusky and Norwalk, Ohio, will be held on March 3, before the Public Utilities Commission of Ohio. The railway points out that there was a decrease in receipts from $65,045 in 1920 to $17,616 the first eight months of 1926. During the entire time the expenses have exceeded the gross revenue. The deficit of this division from Jan. 1, 1920, to Aug. 31, 1926, is placed at $74,618. The company has paid $30,500 in taxes on this property. It points out that the territory covered by this division is not thickly populated, and that transportation needs will be fully cared for before the establishment of a bus line between Sandusky and Norwalk, as proposed by the Lake Shore Motor Coach Company, a subsidiary organized by the railway.

Personal Items

H. R. Whitney in Worcester

Operating Vice-President of Massachusetts Road Enters Upon His New Duties

Howard R. Whitney, recently named operating vice-president of the Worcester Consolidated Street Railway, Worcester, Mass., has begun his duties in that city and already a start has been made on the rehabilitation program planned for that road by the New York, New Haven & Hartford Railroad, which has again come into possession of the line.

Mr. Whitney has been associated with railroading, both steam and electric, for the past twenty years and his various connections have taken him all over the United States. Equipped with a mind that has shown ability to grapple with major problems, he has been called upon to supervise some of the most important transportation questions that have come up for consideration in various places.

Mr. Whitney is essentially an engineer, both by professional training and bent of talent and mind. He rejoices in working out problems that present obstacles. Quiet and unassuming, he studies his problems, finds the solution and then moves to put his ideas into effect. It is these qualities that have led to his consistent advancement in connection with the Springfield and the Worcester railways.

He became affiliated with electric railways in 1914 after he had accumulated a wealth of valuable engineering experience in the transportation field in the West. His first job with the electric railways operating in the cities of Worcester and Springfield was engineer of maintenance of way, and the thoroughness with which he did his work soon attracted the attention of his superiors. It was not long before his engineering responsibilities were increased. The augmented work acted as an incentive to spur him to greater effort and industry, and the reward in the form of an appointment as a special assistant to Clark V. Wood, the president, was the result. In this position, his ability to accomplish things and his talent for solving vexing problems came under official eyes in a more intimate way and he was made a vice-president of the railways.

Mr. Whitney got the railroad fever almost as soon as he had finished his college course in 1905. He was born in Boston, educated in the grammar schools and the English high school of that city and then entered Tufts College. He matriculated in 1905, returned to the college to teach mathematics for a time and then got his first chance in the field of endeavor which was to be his life work.

G. M. Thompson, a consulting engineer of Boston, much impressed with the enthusiasm and industry of young Whitney, employed him on various projects which his firm was handling. In this way Mr. Whitney had the good fortune to come under counsel and advice that was to stand him in good stead in his future railroading activities. He helped in surveying for a projected electric railway from Fitchburg, Mass., to Boston, Mass., and in working out plans for the elimination of grade crossings on the Boston, Revere Beach & Lynn Railroad and for the four-tracking of the road. Early in his career he virtually built the branch of the Lowell & Fitchburg Street Railway that runs from North Chelmsford to Westford.

The year 1907 found him with the Missouri Pacific engineering force in St. Louis as assistant on the engineering corps, a position which could not have been more humble. But here again his talents were manifest and in rapid order he passed through the various grades of assistant engineer, resident engineer on construction and acting division engineer. Finally he became acting division engineer of the important central division with headquarters in Van Buren, Ark.

H. R. Whitney

But the East called to Mr. Whitney. His home ties and his boyhood memories were in that part of the country and he returned to New England as resident engineer of the Grand Trunk Railway with headquarters in Woonsocket, R. I. From the Grand Trunk Mr. Whitney went to the Boston & Maine Railroad as assistant engineer and then as resident engineer. Then he ventured into business for himself, becoming actively affiliated with a contracting firm in Nashua, N. H., which handled many big engineering jobs in New England.

His affiliation with the electric railways at Springfield and Worcester followed and he has been connected with them since. He has an attractive personality and has the ability to make employees work with him. The manner in which he has begun his work in Worcester is typical of the man. He has shown a disposition to get at the bottom of things, to scrutinize conditions carefully and be fully informed before going ahead. Once he has gained the knowledge he desires there is no hesitancy in his decisions or determination. Mr. Whitney was not constrained to talk about his work, but he did consent to go on record to this effect:

> The big job of a public transportation company is to furnish adequate and satisfactory transportation, to satisfy the public as far as can reasonably be expected and profit from the good will which is bound to come from a public that knows you are trying to serve it.

Lachlan Mackinnon Succeeds Mr. Dalrymple

Lachlan Mackinnon, hitherto deputy manager of the Glasgow Corporation Tramways, Glasgow, Scotland, has been made general manager in succession to James Dalrymple, retired. He was selected by the corporation for the post by a vote of 54 to 23, following a recommendation by the tramway committee. No other name was suggested, but the minority, consisting largely of Socialists, contended that the vacancy should be advertised. Bailie Burt, chairman of tramways committee, pointed out that London was the only center in which the city could hope to find a man with tramway experience equal to that of Mr. Mackinnon. All other administrators capable of filling the position were associated with undertakings smaller than that of Glasgow. He was satisfied that Mr. Mackinnon was the best man the corporation could select, for he was admirably qualified by experience, personality and local knowledge to succeed Mr. Dalrymple.

Changes on Interstate Property

Charles D. Hardin, Seymour, Ind., who has been acting traffic manager for the Interstate Public Service Company, Indianapolis, Ind., since the death of Bert Weedon, several months ago, has been appointed to the position. Mr. Hardin has been connected with the company for a number of years.

L. D. Halstead, Louisville, Ky., has been appointed general agent for the Interstate Public Service Company to succeed C. D. Hardin. He has moved to Seymour, Ind., to take up his new work.

Harry Bullen of Detroit Resigns

Harry Bullen has resigned as general superintendent of the Detroit United Railway, Detroit, Mich., effective Feb. 1, after being with the company for nearly 40 years. At the time of his resignation he was the oldest officer of the company in point of length of service.

He started work in Detroit in 1888 following construction of the old Citizens' Company lines. His rise included promotions from dispatcher to assistant division superintendent, division superintendent, assistant general superintendent and general superintendent in turn. Since Jan. 1, 1904, he has been general superintendent of all the city and interurban properties of the Detroit United Railway.

Mr. Bullen was born in England in 1864, and when he was six years old his parents moved to Toronto, Ont. He was associated with Albert Stanley, now Lord Ashfield, head of the London underground system, when Lord Ashfield was connected with the Detroit United Railway and is a close personal friend of the head of the London system.

Mr. Bullen plans to divide his time between California and his cottage and hunting lodge in Michigan.

Changes in Title in Montreal

Alfred S. Byrd has had his title changed to superintendent, power department, Montreal Tramways, Montreal, Canada. He was previously superintendent of power plants, including the power houses, substations and power distribution.

William M. Bolan, who was assisting Mr. Byrd, but without a title, was appointed assistant superintendent, power department.

Promotions Announced on Pacific Electric System

Due to the death of W. C. White, late superintendent of the Western division, Pacific Electric Railway, Los Angeles, Cal., and H. C. Ward, trainmaster, Southern division, changes in the staff of the transportation department have been put into effect.

O. P. Davis, superintendent of the Southern division since 1913, has been transferred to the Western division post vacated by the death of Mr. White. Mr. Davis has had long experience as an operating officer.

Edwin Clark, formerly assistant superintendent of the Southern division, has been selected to fill the post vacated by the transfer of Mr. Davis. Mr. Clark began service with the Pacific Electric Railway as a conductor in June, 1903, and successively was promoted and served as switchman, dispatcher, chief dispatcher, carhouse foreman, trainmaster, and assistant superintendent of the Northern, Western and Southern divisions.

S. H. Cox, previously assistant trainmaster, succeeds Mr. Ward as trainmaster, Southern division. Mr. Cox entered the service of the company as passenger conductor in December, 1913, later serving as motorman, freight switching foreman, dispatcher and assistant trainmaster.

S. H. Hand, formerly supervisor, was appointed to succeed Mr. Cox as assistant trainmaster. He entered the service in August, 1912, as a motorman, Southern division, and in 1920 was appointed supervisor, which position he held until his present appointment.

A newly-created position—terminal trainmaster, Southern division—was given to E. B. Whiteside. This position involves jurisdiction over the division's freight service and within the switching limits of the Santa Monica Air Line. Mr. Whiteside entered the service of the Los Angeles & Redondo Railway as timekeeper in August, 1906, serving successfully as assistant agent in Redondo, wharfmaster, assistant trainmaster and trainmaster (freight.)

J. G. Blake was named as the successor of Mr. Whiteside, formerly trainmaster, Southern division. Mr. Blake also is a veteran, having entered the service of the company as a motorman in December, 1911, successively having served as freight conductor, terminal foreman and assistant trainmaster, until his present appointment as trainmaster of the division.

The post vacated by Mr. Blake was filled with the appointment of F. O. Bradley as assistant trainmaster. Mr. Bradley entered the employ of the company as car clerk, Los Angeles yards, in April, 1912, which post he filled until September, 1919. He later was employed as freight conductor.

G. J. Kerwin Chief Adjuster at Grand Rapids

George J. Kerwin has been appointed new chief adjuster Grand Rapids Railway, Grand Rapids, Mich., to succeed the late F. M. Webster. Announcement to this effect is made by L. J. DeLamarter, vice-president and general manager. Mr. Kerwin is known in the industry as a very capable adjuster. He began his service with the Grand Rapids Railway in June, 1905, in the adjustment department and for many years was assistant to Mr. Webster.

G. J. Kerwin

Changes in Dayton

At the stockholders' meeting of the City Railway, Dayton, Ohio, on Feb. 10 George G. Shaw was elected president, succeeding J. M. Markham. R. K. Landis was elected secretary, replacing W. S. W. Edgar in that capacity.

D. H. Goodwillie Reappointed to Toledo Board

David H. Goodwillie has been reappointed a member of the Board of Street Railway Control at Toledo. Mr. Goodwillie has just completed a two-year term as chairman of the board. He has served the entire six years since the Milner ordinance became effective. Under the rotation plan adopted by the board Henry C. Truesdall, vice-president of the Toledo Trust Company, has been named chairman and W. W. Knight of the Bostwick-Braun Company becomes secretary.

W. N. Albertson Heads New Holding Company

Walter N. Albertson, Milwaukee, has been chosen president and general manager of the $10,000,000 holding company formed in Omaha to operate public utility properties in Iowa, Nebraska, Minnesota, North and South Dakota to be known as the Central West Public Service Company, Inc. Mr. Albertson is president of W. N. Albertson & Company, Milwaukee, public utility engineers and president of the reorganized Central West Public Service Company. He expects to move from Milwaukee to Omaha soon to establish headquarters of the new enterprise there.

George N. Kalweit, formerly general auditor of the Milwaukee Electric Railway & Light Company, who held the post of vice-president and treasurer of the old Central West Public Service Company, will continue in that capacity with the new holding company.

Homer B. Carter, Sioux City, Iowa, has been appointed general counsel; R. C. Hill, Milwaukee, operating engineer; E. T. Sadler, Milwaukee, auditor, and J. F. Bailey, Jamestown, N. D., construction engineer.

Ezra Brainerd Confirmed as Commerce Commissioner

President Coolidge's nomination of Ezra Brainerd, Jr., of Oklahoma to the Interstate Commerce Commission has been confirmed by the Senate. Mr. Brainerd is a New Englander, the son of the late Ezra Brainerd. He is a lawyer and vice-president of the oldest bank in Oklahoma. He was graduated from Colgate University and the University of Michigan Law School.

P. Leroy Harwood, New London, was recently elected treasurer of the Groton & Stonington Traction Company, Mystic, Conn., following a reorganization of the company. He replaces E. A. Harris.

L. C. Lemon, present assistant general manager of the Tri-City Railway of Iowa and of the Clinton, Davenport & Muscatine Interurban Railway, Davenport, Iowa, has been given the additional duties of assistant general manager of the Tri-City Railway of Illinois. This change was made in connection with the promotions previously announced by the company following the assignment of T. C. Roderick to the post of general manager of the Ottumwa Gas Company, Ottumwa.

R. M. Vaughan, engineer with the California Railroad Commission for the last twelve years and valuation engineer for the last six years, resigned that position to become associated with the H. M. Byllesby Company of Chicago. Mr. Vaughan completed his electrical engineering course at the University of Missouri in 1903, and since that time has been actively engaged in engineering in Chicago and on the Pacific Coast, having been associated with Bion J. Arnold, Stone & Webster, J. G. White & Company, Puget Sound Power & Light Company and British Columbia Electric Railway.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Public Service Orders 212 New Buses

Public Service Transportation Company, Newark, N. J., a subsidiary of Public Service Corporation of New Jersey, has placed orders for 147 buses with the Mack International Motor Truck Corporation and for 65 buses with the American Car & Foundry Motors Company, according to an official announcement made Feb. 24 by John L. O'Toole, vice-president in charge of public relations.

Forty of the Mack buses will be of the gas-mechanical type, 70 of the gas-electric type, with four-cylinder engines and one electric motor, and 37 will have six-cylinder engines and one motor. The electric equipment of the 107 gas-electric buses will be manufactured by the General Electric Company.

The 65 A.C.F. buses will have six-cylinder engines, driven by two electric motors. The electric equipment will be manufactured by the Westinghouse Electric & Manufacturing Company. Bodies for all of the 65 buses are to be constructed by the company in its own shops. They will be equipped with air brakes manufactured by the Westinghouse Traction Brake Company.

The new orders will bring the company's new equipment up to 953, of which 567 will be gas-electric and 386 gas-mechanical type.

Cincinnati, Hamilton & Dayton Acquires New Carhouse

Involving an expenditure of upward of $500,000, the Cincinnati, Hamilton & Dayton Railway has purchased the buildings of the Smith Gas & Engineering Company at Morraine City, Ohio, which will be converted into carhouses and modern shops.

Purchase of the plant is part of the $1,500,000 program of reconstruction and rehabilitation recently launched by the company. The property, acquired early in February, consists of one large concrete, brick, steel and glass building, 422 ft. x 111 ft., and another structure 160 ft. x 101 ft. They are located on a 7.9-acre lot on the west side of the Springboro Pike.

In connection with the sale, 1.23 acres was purchased from the Morraine Development Company on the east side of the pike in order to provide space for the track layout. In addition to providing for the comfort of workmen and the housing of the supervisors, the new plant will contain a modern shop, all machinery to be operated by electricity. At the new plant also will be located the general offices of the company, which will be removed from the National Bank Building in Dayton.

Migration Ill-Adjusted to Business Cycles

The flow of human tide that sweeps into the United States in boom times and out during depressions is not well timed with the fluctuations in employment opportunities, the lag varying from a few months to one year, according to a report entitled "Migration and Business Cycles," just completed by the National Bureau of Economic Research.

The report, prepared by Dr. Harry Jerome, contains the findings of an investigation intended primarily to deal with the shortage and surplus of labor in the United States and it is the first of what is to be a comprehensive series dealing with the general effects of migration upon the economic activities of the nation.

In general contour, the curves showing the fluctuations in male immigration and factory employment in the period from 1890 to the outbreak of the great war bear a marked resemblance, according to Dr. Jerome, who points out, however, that "when the two curves are closely examined to determine the extent to which the major turns in the two curves coincide, it appears that they agree most closely when it is assumed that the fluctuations in immigration lag from two to four months after the corresponding fluctuations in the employment curve."

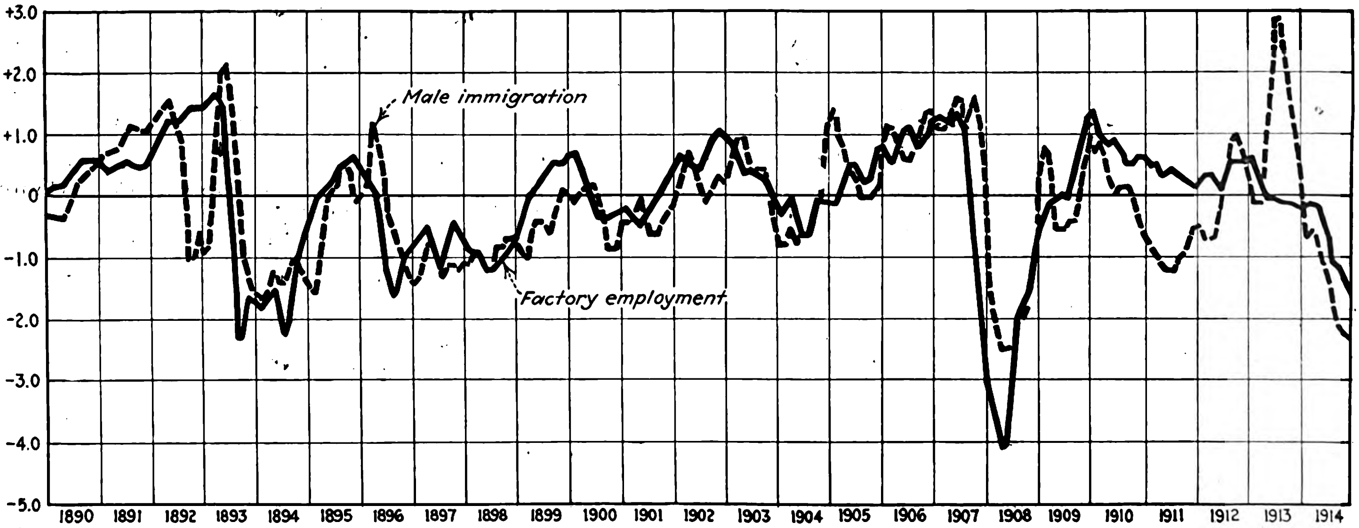
Regarding the sensitiveness of migration to business conditions, Dr. Jerome observes:

"A comparison of data pertaining to male immigration, pig iron production and factory employment in the pre-war period reveals the fact that cyclical fluctuations in male immigration are ordinarily associated with prior changes in the same direction in production and employment. The influence of a major cyclical change in industrial conditions is usually apparent in immigration within less than half a year. The cyclical movements in emigration are inversely correlated with those of immigration and employment with large emigration in depression periods and relatively small emigration in boom periods.

"The fluctuations of 'net immigration' exhibit a high degree of sensitiveness to employment conditions in the United States. This is evident when immigration and emigration are jointly considered either in terms of the ratio of emigration to immigration or in terms of the numerical excess of arrivals over departures or of departures over arrivals."

The pre-war period is more significant for the investigator's purposes, because there were at that time, on this side of the Atlantic at least, fewer legal or unusual barriers to the free flow of migration in accordance with the pull of economic motives.

During the war ordinary migratory movements were hindered by the hazards of ocean travel, the restraints placed upon their nationals by the belligerent countries and similar obstacles to the normal movement of migrants.



Courtesy National Bureau of Economic Research.

Curves of Factory Employment and Immigration 1890-1914

"Yet we must not conclude that there were no migratory movements actuated by economic motives in this period," Dr. Jerome warns. "Prior to our entry into the war a considerable fraction of the usual flow continued from neutral countries and even from the allied countries and the number of 'immigrants' recorded from British North America increased, exceeding 100,000 in each of the fiscal years 1915-16 and 1916-17. The numbers from Mexico also increased, particularly if we include those admitted during and immediately following the war period by special provision waiving the literacy test and admitting for temporary conditional sojourn to help meet the demand for labor.

"On the return of transportation to something akin to normal conditions, thousands of foreign-born residents of the United States who had been forced by war conditions to postpone a trip to their former home sailed for Europe. Among these were many returning because of changed political conditions. For example, in the three fiscal years 1920, 1921 and 1922 the emigrant aliens destined to reconstituted Poland numbered more than 90,000, most of them of the Polish race.

"Immigration, likewise, was somewhat slow to recover, not quite reaching the 250,000 mark in 1919 (calendar year). The incoming movement, however, exhibited a growing momentum and reached a total of more than 700,000 in the calendar year 1920, not including non-immigrants and even in 1921, despite industrial depression, did not drop below 50,000 per month until June, 1921, by which time the 3 per centum quota law had gone into effect.

"This law was apparently due, in part at least, to the fear that the volume of immigration in 1920 was but an indication of the growing momentum of a flood of immigrants which had been dammed up by war conditions and which now, spurred by actual or impending economic and political chaos in Europe, threatened to inundate this country with an unprecedented volume of aliens.

ECONOMIST'S PROBLEM MORE DIFFICULT

"Whatever the facts may be concerning the probability of the expected inundation, steps were taken in the law of May, 1921, which make the disentanglement of the economic trends in the subsequent period more than usually difficult. Because the quotas began to be available in July, and 20 per cent of the quota of any country could be admitted in a single month, the law has tended to concentrate the arrivals in the second half of the calendar year, thus creating a seasonal movement materially different from that characteristic of the pre-war period and obscuring the effects of industrial prosperity and depression except for those countries which were obviously falling short of the quota or, like Canada and Mexico, were not subject to the law.

"Since 1921 emigration has been consistently low, not only because of the industrial recovery from the depression conditions of 1921-22, but also because of the fact that the restriction of the incoming flow and the fear of those who are here that they may be unable to return readily if they once leave, combined with the deterring effect of unsettled political conditions and industrial depression in European countries, have kept emigration to a minimum.

MOVEMENT FROM CANADA

"The post-war movement of immigration from Canada is of special interest because the 1921 quota law did not apply to natives of Canada or to persons born in other countries who had resided there for five years.

"Leaving out of consideration citizens and non-immigrants and including only the 'immigrant alien' group, the immigration in calendar years from Canada and Newfoundland to the United States is recorded as follows:

IMMIGRATION FROM CANADA

1919	81,179
1920	85,249
1921	52,929
1922	63,089
1923	182,369

"When adjusted for typical seasonal variation, the curve of immigration from Canada exhibits a substantial decline during the greater part of 1921; in fact, through most of 1920 a slight tendency to decline is evidenced in immigration from Canada, though the general movement of immigration from all countries is still on the up-grade, suggesting that the decline in industrial activity in the United States affected immigration from Canada more quickly than from Europe.

"That the wage-earning element in migration is most susceptible to depressions in this country may be illustrated by the fact that in severe depression years the ratio of laborers (farm laborers plus general laborers) to total immigration decreases, while the 'no occupation' group becomes a larger fraction of the total. The fiscal years 1904, 1908, 1911, 1914 and 1922 correspond with industrial depressions, and in each one of these years the 'laborers' group, in terms of percentages of the total, decreases relatively and the 'no occupation' group increases."

Canadian Car Company Slated for Montreal Car Order

According to latest reports from Montreal, the order for the 50 new cars required by the Montreal Tramways will be placed with the Canadian Car & Foundry Company in the near future. Definite decision on a few details of construction is the only thing delaying the official issuance of the order.

It is understood the contract will cover 25 motor and 25 trail cars, to be operated as two-car trains. As the approximate cost of the cars is around $17,000 each, the total amount of the contract will run in the neighborhood of $850,000. Delivery is scheduled to commence during the fall, which will give the car company the summer months in which to complete construction.

The addition of this order to the business already booked since the beginning of the year gives the Canadian Car Company around $10,000,000 worth of work with only two months of 1927 having passed. The carry over from last year amounted to $1,800,000. Taking into account the passenger and freight car orders totaling $5,000,000, approximately $1,000,000 for steel castings and specialties to be supplied to other car building plants, the present street car order, at $850,000, and some small business from the C.P.R. amounting to about $100,000, the total is $8,750,000.

Other miscellaneous business, including springs, switch and trackwork, should bring this up to the $10,000,000 mark, which is in excess of the total business handled in any year since 1924.

Worcester Consolidated Uses 500 Tons of Salt

Worcester Consolidated Street Railway recently gave the citizens of Worcester, Mass., an insight into some expenses which it must meet that are not generally known. In response to the inquiry of the city editor of a local newspaper, the company revealed that it expends about $5,000 a year for salt, which is used in winter to keep switches open. Officials of the road estimate that they use about 500 tons of salt a year at an average cost of $9.50 a ton.

Start Work on Wilkes-Barre Shops March 1

Work on a new quarter of a million dollar car shop for the Wilkes-Barre Railway Company will be started at Wilkes-Barre, Pa., on March 1 by the H. K. Ferguson Company, engineer and builder of Cleveland, which has been awarded the general contract. The car repair shops and machine shops will be completed by the middle of July, according to provisions of the contract.

Percy Owen Heads Brake Materials Corporation

The American Brake Shoe & Foundry Company, New York, announces that its new subsidiary company, American Brake Materials Corporation, which will manufacture and sell American "brakebloks," with main offices and factory in Detroit, will be under the presidency of Percy Owen, for years prominently connected with the automotive industry. Other officers are largely leading officials of the American Brake Shoe & Foundry Company.

The manufacture of American "brakebloks" is the result of years of study on the part of the American Brake Shoe & Foundry Company, to find a method whereby the railroad principles of braking may be applied not only to automotive vehicles but also to all industrial uses where long life and the elimination of replacement are essentials.

The problem was to evolve a material which should be so hard as to be practically non-wearing, thus largely eliminating replacement, and yet of a character which would not score brake drums; which would be so effective that it could be placed in segments, rather than in a continuous unit, thus allowing the dissipation of heat as well as the dissipation of destroyed surface material which would otherwise invalidate the friction surface. The company says of the new product:

> After a great deal of research and experimentation, a material was invented which has the hardness of 35 carbon steel, but which will not score brake drums, which is not readily conductive of heat, which acts equally well even when drenched with oil or water, which does not squeal and which is of such durability as to outwear by three or four times all previous friction materials developed.
>
> It will be seen, therefore, that the invention of this material makes possible an entirely new system of automotive braking, which will of course at first be of particular interest to bus and truck manufacturers and manufacturers of passenger cars who wish to equip their vehicles with the ultimate in safety, eliminating at the same time for the car user the necessity for frequent replacements, with resultant loss of vehicle use.

The company is arranging for production at its factory in Detroit to supply some of the largest manufacturers of buses and trucks with American "brakebloks" for utilization in their braking systems.

B.-M. T. Equipping New Triplex Cars

Work has been begun by the Brooklyn-Manhattan Transit Corporation in its new Coney Island shops on equipment of the first of the 67 new triplex cars ordered about a year ago from the Pressed Steel Car Company and delivered two weeks ago. Mechanics commenced equipping this three-car unit early last week. The single car now undergoing completion is the first triplex unit of the original group purchased by the B.-M. T. Within a week five more of the 67 are expected to reach Brooklyn, and ten days later regular deliveries of two or three a week are expected.

Rolling Stock

Lorain Street Railroad, Lorain, Ohio, is reported as a possible purchaser of new street cars and other equipment. Engineers and traction experts are now making an investigation to determine the type of cars and kind of equipment which can be used most successfully, according to Martin Ackerman, general manager of the Lake Shore Electric Railway, the parent company.

Stark Electric Railroad, Alliance, Ohio, has purchased three one-man cars from the Boston Elevated Railway, Boston, Mass. One car is in service, while the others are en route. The equipment thus secured will replace three cars borrowed from the Northern Ohio Power Company, when one-man service was adopted for Alliance city service several months ago. The Northern Ohio Power cars are to be returned.

Track and Line

Worcester Consolidated Street Railway, Worcester, Mass., has filed three petitions for track changes with the city authorities growing out of the city's assent to the act authorizing the New York, New Haven & Hartford Railroad to resume control of the trolley property. The first petition seeks authority to lay a single track through Commercial Street from Foster to Front Street. A second petition asks permission to add a second track on Foster Street from Main to Commercial Streets. A connection for the proposed double-track line on Foster Street with the Summer Street tracks is covered by the third petition recently filed.

Pacific Electric Railway, Los Angeles, Cal., has approved more than $650,000 worth of roadbed improvement for attention by engineering department forces at various points on the system. The work, for the most part, involves replacement of worn trackage to the amount of approximately 15 miles, with 90 and 128-lb. rail and fittings. In addition, the work of constructing temporary shoofly track is now under way, preparatory to the construction of the Pico Boulevard grade separation on the West Sixteenth Street line at Vineyard Junction.

Power Houses, Shops and Buildings

Worcester Consolidated Street Railway, Worcester, Mass., has taken the first steps toward the erection of a new carhouse in the parking space which it has used for car storage on Grove Street in that city. Henry R. Kent & Company of New York, engineers, have been engaged to study the possibilities of the site not only from the operating carhouse point of view but from that of the garage facilities as well. If the plans of the company are followed the carhouse will be used for minor repairs and the yard facilities employed for storage. The Market Street carhouse, which is located nearer the center of the city, will then be overhauled and used only for major repairs to cars. The proposed new carehouse will be 200 ft. x 190 ft., of brick construction, and will have a capacity of about 40 cars. There will be a starter's office, a lobby for the men, stock room, repair shop and car washing room.

Trade Notes

Hill Clutch Machine & Foundry Company, Cleveland, Ohio, recently appointed Charles C. Phelps, 473 Getty Avenue, Paterson, N. J., as sales engineer for the metropolitan New York and northern New Jersey district. The Hill Clutch Machine & Foundry Company manufactures everything for power transmission such as shafting, couplings, bearings, clutches, pulleys, sheaves, belt tighteners, speed transformers, agitators, gears and sprockets. The featured products of the company are the Cleveland type oil-film bearings, Smith type friction clutches, steel arm automatic belt tighteners, forged cast spur gears, industrial type spur gear speed transformers and flexible couplings.

Root Spring Scraper Company, Kalamazoo, Mich., is making life guards for the sixteen cars being built by J. G. Brill, Philadelphia, Pa., for the Honolulu Rapid Transit Company.

New Advertising Literature

Electric Controller & Manufacturing Company, Cleveland, Ohio, has just published two bulletins, 1037-C and 1042-F. Bulletin 1037-C describes type B limit stops for use with alternating and direct current motors. Bulletin 1042-F describes automatic compensators for 100 to 550-volt a.c. squirrel cage and synchronous motors.

Irving Iron Works Company, Long Island City, N. Y., is issuing a descriptive folder of its subway flooring grills which are applicable to street car steps, etc.

Ohio Brass Company, Mansfield, Ohio, has issued a novel folder directing attention to the co-operation of its engineers in the recent catenary installation on the Chicago, South Shore and South Bend Railroad. The text matter is a reprint of an article "High Current Capacity with Exceptional Flexibility Feature of Catenary" by L. W. Birch, line material engineer of the company, which appeared in the ELECTRIC RAILWAY JOURNAL for Nov. 27, 1926.

Lebanon Steel Foundry, Lebanon, Pa., is mailing out a descriptive folder covering its steel castings for electric furnaces.

Crouse-Hinds Company, Syracuse, N. Y., is issuing bulletins Nos. 220, 2097 and 221 setting forth electric flashing beacons, groundulets and its type B automatic variable timing switches and control cabinets, respectively. Bulletin No. 220 has some interesting diagrammatic sketches illustrating the use of electric flashing beacons as a protection for safety zone platforms in street railway work.

D. B. Flower, manufacturer of electric railway accessories, Philadelphia, Pa., has just issued two booklets describing the application of the Flower new type brush-holder. The design and performance of this new device are adequately presented by pithy text matter and illustrations.

J. G. Brill Company, Philadelphia, Pa., has a new bulletin in the mails describing its 76-E truck with outside hung motors. The bulletin also contains information on such accessories as solid forged side frames, transoms, side bearings, bolster guides, graduated spring systems, etc.

Metal, Coal and Material Prices

Metals—New York	Feb. 23, 1927
Copper, electrolytic, cents per lb.	12.746
Copper wire, cents per lb.	15.00
Lead, cents per lb.	7.40
Zinc, cents per lb.	7.16
Tin, Straits, cents per lb.	69.875
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.625
Somerset mine run, Boston, net tons	2.00
Pittsburgh mine run, Pittsburgh, net tons	1.85
Franklin, Ill., screenings, Chicago, net tons	2.175
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.425
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N.Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.80
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.50
Turpentine (bbl. lots), N. Y., per gal.	$0.69

Prejudice Must Necessarily Recede Before Analysis

MUCH has been written in the last five years about the place of the bus in the field of transportation, but few men have been more specific about their ideas than was R. N. Graham, manager of railways of the Pennsylvania-Ohio Electric Company, in his paper before the Metropolitan Section of the Society of Automotive Engineers. The experience of Mr. Graham's company has extended to the fields of both urban and interurban service. He has viewed the bus with a sympathetic eye, but he has not allowed himself to become enamored of that vehicle to the extent that his admiration of it has been allowed to warp his judgment. To him there is very little that is tangible in the so-called rubber urge. This is not a theory with him. He has studied the matter at close range. Any choice between the two vehicles on the part of the passenger is simply one of greater convenience. His reflection about the rubber urge is worth pondering, namely, that inferences have been hastily drawn ascribing to this intangible element an influence which it never really wielded. Mind you, this is not derogatory of the bus! Neither was he derogatory of the bus when he said substantially that single-deck buses cannot be operated at a profit even under the most favorable conditions of traffic at the average city rate of fare for a distance greater than 3 miles.

No statement that Mr. Graham made shows better the impartiality with which the matter has been considered than the one to the effect that his company did not intend to operate a street car where a bus could be used more effectively; nor did it intend to operate a bus where the use of a street car produces a more satisfactory result in the service to the public and in financial results to his company. That certainly is specific. It is playing no favorites. The problem is an economic one, and Mr. Graham intends to keep it one so far as his ability goes to interpret events in terms of the best interests of his own company and the greatest convenience of his patrons.

So much was said by him that is significant that in writing about the matter the tendency of the reviewer becomes almost irresistible to repeat the axioms with which Mr. Graham's paper is replete. That, of course, would defeat the ends sought by comment such as this. To everybody everywhere interested in this matter the statement made by the author is significant that there is hardly a city in the United States of 150,000 population that could not well support a supplementary bus service at a 25-cent fare and that the demand for vehicles for this service would furnish a more stable market to the bus manufacturing companies than the attempt to force into mass transportation at standard rates of fare vehicles wholly impracticable to operate from a standpoint of profit.

As for electric railway men, what could be more significant to them than that the company at Youngstown is now operating nearly as many buses as street cars and as a result the railway situation has been improved and bus operation made self-sustaining! Was ever stronger vindication offered of the policy of coordination and not of substitution? In that they were very specific Mr. Graham's remarks should tend to preserve a sense of proportion as regards the places of the two vehicles. His statements about the street car and the bus were not iconoclastic of either of these vehicles. The answer to the question of the use of these vehicles is to be found more in analysis and less in prejudice. The farther the first of these practices is carried the more will the other be compelled to recede.

Where Angels Fear to Tread

UNFORTUNATELY, in most large cities, the individual is not permitted to select his transportation service to fit his particular desires and pocketbook. Transportation companies have been forced to develop within narrow limits as to character of service and price. They have not been permitted to provide a different grade of service for the man who is willing to pay more for additional comfort and luxury.

This is not directly attributable to any deficiency on the part of transportation companies. The responsibility lies primarily on the shoulders of those who have exercised regulatory authority over them. And because low-priced transportation service has proved an effective issue on which to ride into office, politicians have too often forced a low-priced, low-grade service (in terms of comfort) whether or not we were willing to pay for more.

The only other choice in local transportation is the private automobile or the taxicab, but the cost for such individual service jumps to five or ten times that of the common carrier. Although the bus afforded an excellent new agency with which to build a new character of service at an entirely different level of rates, and was unrestricted by precedents, its proponents have not always risen to their opportunity. Most of those interested in the development of buses are busy making them into street cars on rubber tires at street car rates, so that the man who is willing to pay more for greater comfort in his daily transportation still has little choice outside the taxicab or private vehicle.

As Mr. Graham has indicated full advantage has not been taken of the opportunity to develop a distinct character of common-carrier service at a level of rates ample to permit a substantially higher grade of transportation service to be rendered. Already in New York, where the scramble for bus franchises pitted a large number of eager bidders against each other, the 5-cent piece has been permitted to become in the popular mind the unit for measuring bus fares. Despite the fact that this bit of political bait which has sufficed to distract the attention of the long-suffering riding public over many years has so starved the existing transportation companies as to make their so-called valuable perpetual franchises mere obligations to render service at a loss, there are apparently many bus optimists who are anxious to rush into an obligation to run buses at street car rates on the bland assumption that a franchise to conduct a service at a loss is worth a lot of money. Of course, there can be no particular quarrel with those who are willing to put up their money under such conditions, but in the fact that these promoters are dragging the bus down to the level of the sadly starved New York street car they are establishing precedents for the bus that will be difficult to overcome in the future.

Marking the Price on the Package Does Not Guarantee Its Worth

CRITICISM of the present popular practice of issuing no-par-value stock is one of a number of interesting points emphasized by Prof. William Z. Ripley in his recent writings on various phases of corporate financing. Like most generalizations, his comment fails to fit in many instances. So far as electric railways are concerned, his criticism seems to have little application, and the arguments in favor of no-par-value stock appear to be at least as strong as those against it.

Briefly stated, Professor Ripley's objection is that the issue of stock without par value makes it difficult to determine how much money actually has been invested in the property and hence to some extent shrouds in obscurity the financial status of the company. In the case of a utility under the jurisdiction of a regulatory commission, there are two groups which have a legitimate interest in its financial affairs—its security holders and its customers. It is difficult to see how either group would benefit greatly by the establishment of a par value for every share of stock.

No fixed relation exists between the actual value and the par value of any stock. The actual value is determined by the equity behind the stock and by its potential earning power. Frequently, earnings are plowed back into the property, thereby increasing the value of the stock far above what it was originally. Many electric railways at times when it was deemed inexpedient to issue securities have financed improvements out of earnings. To those not in a position to know all the details of the company's affairs, the establishment of a definite par value for its stock may easily be more misleading than informative. Records are always available, however, to show the capital expenditures that go into a property. In these records lies the stockholders' best protection.

The customer's interest in the financial affairs of a utility concerns only their effect upon rates. At present, rate determination depends almost universally upon a valuation which is entirely independent of the face value of outstanding securities. A reasonable return is allowed on the so-called "actual value" of the property. Par, therefore, means nothing to the customer. His interest is protected by a regulatory commission. Under these circumstances the value of the stock may well be left for determination to the law of supply and demand.

South Shore Line a Trail Blazer

IN ITS revolutionary step of placing in service all-steel, six-truck, parlor-observation and dining cars, the Chicago, South Shore & South Bend Railroad has delivered a smashing blow to competition as well as to a case-hardened precedent of the industry—the practice of false economy.

In the latter case, such service aligns the South Shore with those trail blazers in the field who long have realized that men and fashions change, that today comforts are not considered luxuries as they were ten years ago. To prove this assertion, one has only to walk through any of the steam railroad express trains. Gone are the lunch boxes and crowded day coaches. From every walk of life can be counted those who are availing themselves of the creature comforts afforded by de luxe service. With the economic upheaval incident to the World War has come a demand for a better class of traveling facilities. What was good enough for father is not good enough for son. The people are willing to pay for better service, and if the electric railways will not supply it, then they will seek that form of travel commensurate with a new social status.

While not all public utilities can afford the refinements of the South Shore, they can, nevertheless, follow its example in proportion to their means. Clean cars, paint, courteous service, a few little appeals to the new tastes of passengers, and informative publicity will, in proportion, place the little fellows of the industry in the front rank of trail blazers.

Progress today is a huge juggernaut that pursues us relentlessly. If we hold to the old fanatical precedent, then sooner or later, like the Indian ascetic, we will be mashed flat. Such adherence to hidebound precedent is a beautiful gesture with a meaningless purpose. It is creating a lot of industrial morons.

Temper Your Tools Before You Cut

SINCE public relations, as the name implies, covers all phases of a company's dealings with its public, no possible element of contact should be slighted. Least of all should those in charge of a railway's destinies discount the important rôle which the platform men may play in stimulating that somewhat intangible, but none the less essential, asset of good will.

Should a surgeon exercise the greatest diligence in preparing his instruments for use in an operation, sterilizing them with minute attention, and then fail to give equal attention to the hands which will guide those instruments, he would fall far short of his duty. And the conductors and motormen are the very hands of the railway. It is they who come daily in personal contact with the passengers. The public relations department may talk till it is literally blue in the face; it can publish house organs and lay out advertising campaigns which will indicate beyond peradventure that the company's first and primary consideration is the welfare of its passengers. But the yardstick by which Mr. Average Man measures the railway and its service is simply the attitude of the rank and file employees toward him. This is of course assuming that the company is playing fairly with its patrons and is endeavoring to give frequent and comfortable service.

Complaints of discourtesy, of personal shortcomings of individual employees, are most difficult of all to handle satisfactorily. With a complaint of inadequate service in a certain section of a community it is possible to determine specifically whether the requested improvements are feasible. Service complaints may be reduced to more or less simple considerations of profit and loss. But not so with the personal factor. It is difficult to obtain fair and incontrovertible proof of an employee's culpability. The unsubstantiated word of the complaining passenger cannot always be accepted. Possibly the patron deliberately set out to stir the animus of the employee and is endeavoring to wreak his vengeance upon the individual for real or fancied grievances against the company.

But it may safely be asserted that where the total of personnel complaints on a given property is exceptionally high there is some fire to justify all of the smoke. The direct dealings of an established public relations department with the public are essential and worthy of careful attention. But the best way of reaching the passengers is not through the newspaper columns or over the radio. It is simply through the smile on the face of Conductor Brown or Motorman Jones. There is no use in theorizing with the men. Show them specific instances in which they can establish themselves in the eyes of their passengers as transportation salesmen. They are not blind to the importance of their own jobs, but they need thorough enlightenment on the important subject of public relations. They must be shown the how and the wherefore of adopting merchandising principles in the collection of fares and the operation of street cars. Let the individual once feel his personal responsibility for the success of the public relations campaign that his company is making and half the battle is won.

New Money for a Regulated Utility Is in Competition with Industry

DISTINGUISHED from a manufacturing establishment, the utility is supposedly non-competitive. This condition is only partly true, but because of it the utility is hedged in with many laws and regulations intended to limit its earnings and to control its financing. This control is either by public service commissions which establish the status of utilities from time to time as operating or economic conditions dictate, or by service-at-cost franchise in which the rates and the rate bases is determined once for all in advance.

Frequently it is overlooked that two streams of money must be continually flowing into a utility property serving a growing community. One stream, in the form of revenues derived from the sale of service, must pay all of the operating costs, the maintenance of the physical equipment, interest on borrowed capital and a profit to the owners. The second stream is the new capital that is necessary to keep the property abreast of the times, to build extensions and make possible service to new customers. The utility, therefore, must for this reason frequently go into the open market to borrow money. To be successful it must pay the market price and must meet the market conditions of the moment. If not free to do so new money will be diverted to other channels and the company cannot properly grow to serve its public.

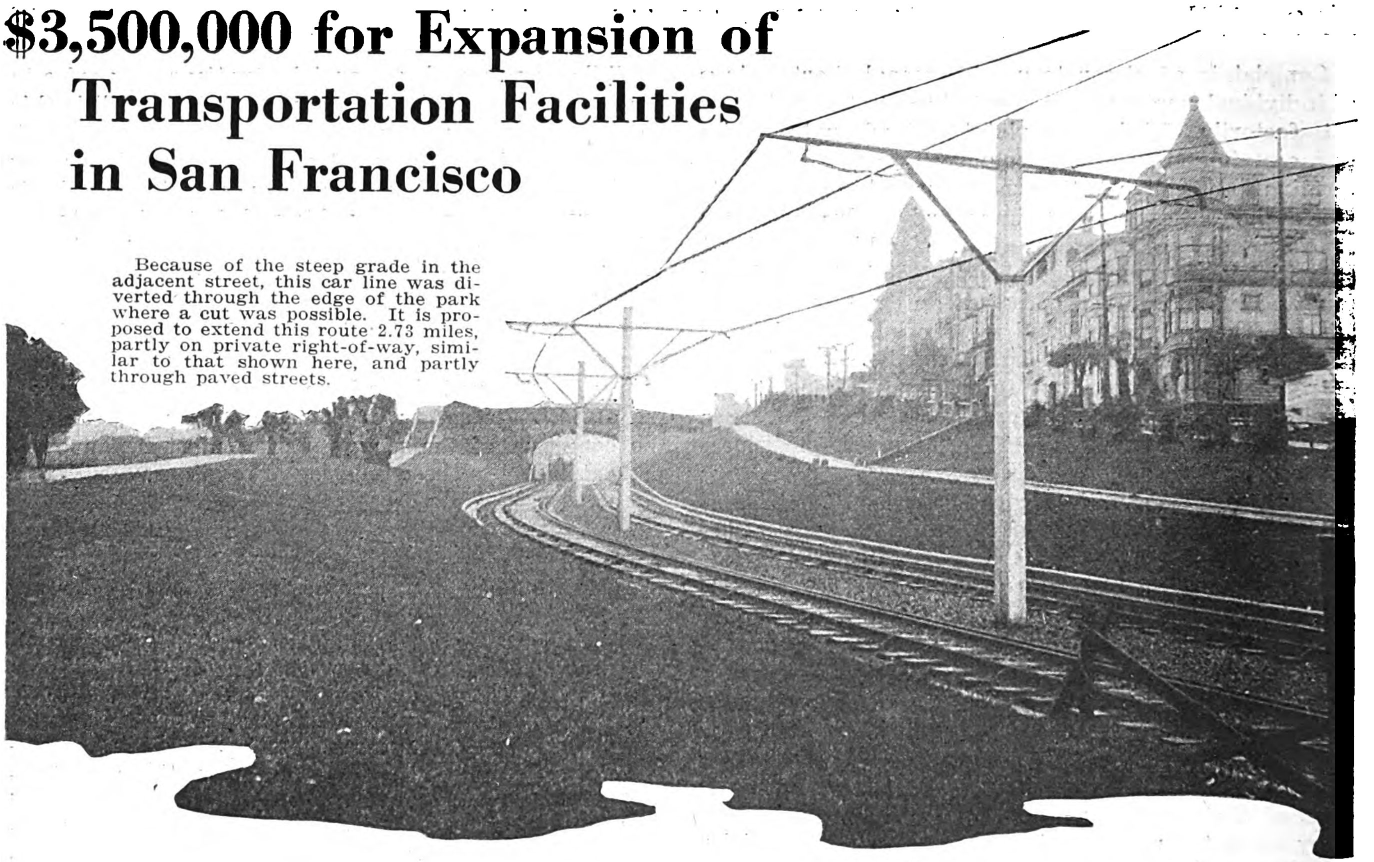
While many complex financial situations may arise in the operation of utilities, at the base of them all is this situation that the utility, no matter how it is regulated, is in competition with all industry in the search for new funds. It is one thing for a regulatory body to limit earnings on money already obtained, but it is quite another to hold them so low that investors cannot be induced to supply the capital necessary for expansion. A commission may control the fare charged and the rate of net earnings that may be allowed. It cannot, however, force the investor to put his money in an enterprise where there is little hope of profit and no guarantee of ultimate safety of principal. For this reason, the condition of the money market must be an ever-present factor in the regulation of earnings.

Twin Cities Confident of the Results of Co-ordination

NOT the least important of the statements contained in the annual report of the Twin City Rapid Transit Company is the expression of confidence on the part of the management that the services of the company can be successfully co-ordinated. This is particularly significant because co-ordination there contemplates the welding together of electric railway, bus and taxicab services on a scale of no mean proportions in its contemplation of the use of the bus and the taxi. The net earnings of the buses for the year 1926 were small, but the explanation given is that complete control of the bus lines was not acquired until the early part of 1926. Time is the element needed to consolidate operations on an efficient basis. With the start well made on that program, the management is satisfied that the bus properties will earn a much larger return during 1927. As for the acquisition of the taxicabs, their ownership has been a matter of only a few weeks duration. About them, too, the management is optimistic. It feels that the unification of the competitive cab companies will materially improve public transportation by reducing congestion. Certainly that end would not be achieved under competition.

These things are in the future. As for the past, the company closed 1926 with a net income of $1,436,805 transferred to profit and loss compared with $1,037,427 for the previous year. In addition to the dividends on the preferred stock it paid four quarterly dividends of 1¼ per cent on the common stock, or 1 per cent more than was paid during 1925. Gross revenue was up about $1,500,000 and the recession in passengers carried was inconsequential compared with the grand total carried the year before. Some kinks still remain to be ironed out under the settlement plan which governs the terms under which the company is now operating in St. Paul and Minneapolis, but the progress made indicates that the cities and the company face a future auspicious for both of them. This statement is perhaps subject to the reservation that nothing comes of the so-called Brooks-Coleman legislation, now pending in Minnesota. The case against that legislation is very strong. Repeal of the state regulatory act, contemplated by this measure, would, to say the least, destroy much of the effect of the recent harmonious moves in the Twin Cities. That is not a prospect which the people of these cities can contemplate with equanimity.

$3,500,000 for Expansion of Transportation Facilities in San Francisco



Because of the steep grade in the adjacent street, this car line was diverted through the edge of the park where a cut was possible. It is proposed to extend this route 2.73 miles, partly on private right-of-way, similar to that shown here, and partly through paved streets.

By M. M. O'Shaughnessy
City Engineer San Francisco, Cal.

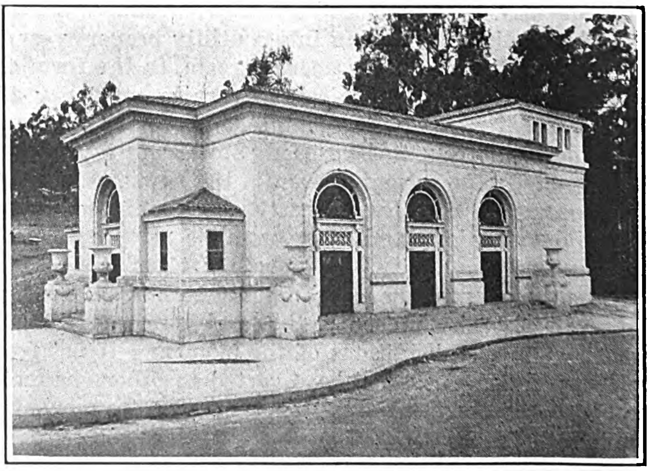
Municipal Railway Will Open New Ocean View Line This Summer—Track Extensions Totaling 11.6 Route-Miles Are Planned—47 Additional Cars and 26 Buses Will Be Bought

RECENT improvements made by the Municipal Railway of San Francisco and new projects planned for the near future involve extensive changes in the local transportation system of that city and surrounding territory. A new car line to serve the Ocean View district will be opened this summer. The Duboce tunnel, an undertaking similar to the famous Twin Peaks tunnel, will be completed in the latter part of this year or early in 1928. A four-track addition is being made to the Mariposa Street carhouse. New shops and garage facilities are planned. Track extensions of considerable length are contemplated and much additional rolling stock will be bought. These improvements are to be financed by a bond issue of $3,500,000.

At present the railway operates 188 double-truck and 21 single-truck passenger cars on about 70 miles of track. It is planned to add 47 double-truck cars. The majority of the present cars are of the California type, 47 ft. 1 in. long and 9 ft. 2 in. wide with seating capacity for 54 passengers. The average weight is 50,000 lb. They are of semi-steel construction and on account of the severe grades are equipped with four 60-hp. or 65-hp. motors per car. In the near future 26 new buses will be added to the thirteen now in operation. Thus the next year will see a substantial expansion in the transportation system which originated fourteen years ago through the taking over of the Geary Street cable line from the Park & Ocean Railway, whose franchise had expired.

At that time the cable construction was torn up and the old road was converted into an electric line, with extensions reaching west to the ocean and east to the ferries. The first section of this line was placed in service in December, 1912, and in June, 1913, the balance of the Geary Street line was placed in commission with 15.08 miles of single track, together with 1.10 miles of sidings and turnouts.

To handle the traffic to the Panama-Pacific International Exposition, held in 1915, a bond issue of $3,500,000 was voted in 1913. The line of the Presidio & Ferries Railroad, whose franchise had expired, was acquired in December of that year, and in less than twelve



Type of Station Used at Intermediate Points of Tunnel. Elevators Lower the Passengers to the Train Level months from the time of voting the bond issue new lines, constructed from these funds, were placed in commission.

In general, the policy of planning new lines has been to supplement the privately owned system of the Market Street Railway by building only where the new routes would serve territory not otherwise taken care of. Only such competitive lines have been built as were considered necessary to make the municipal system an operating entity. Thought has been given to the trackage necessary for a unified system, combining both privately owned and municipally owned lines. This is the ultimate end in view as it is believed that only through the unification of transportation facilities can maximum service be secured.

San Francisco is a city of hills and these have had a marked influence on the layout of the street car lines. The cable railway was first developed here and to this day a considerable number of routes must be operated by cable in order to negotiate the grades. These lines are slow and inflexible as to routing. It is impossible to replace them by trolley lines without making detours or resorting to expensive private rights-of-way, neither of which will give direct service as do the cable lines.

To provide access to some of the desirable residential property lying on the remote side of the hills from the main business district it has been necessary to drive two tunnels through intervening ridges and the construction of a third is now in progress. The shortest of these is the Stockton Street tunnel, approximately 900 ft. long, which leads from the main business section to the North Beach district. This was completed and used in connection with the 1915 exposition. In 1918 the Twin Peaks tunnel was opened. This is exclusively rapid transit, 12,000 ft. long, 25 ft. wide and 18 ft. high, providing a high-class residential territory with transportation many minutes faster than it had previously.

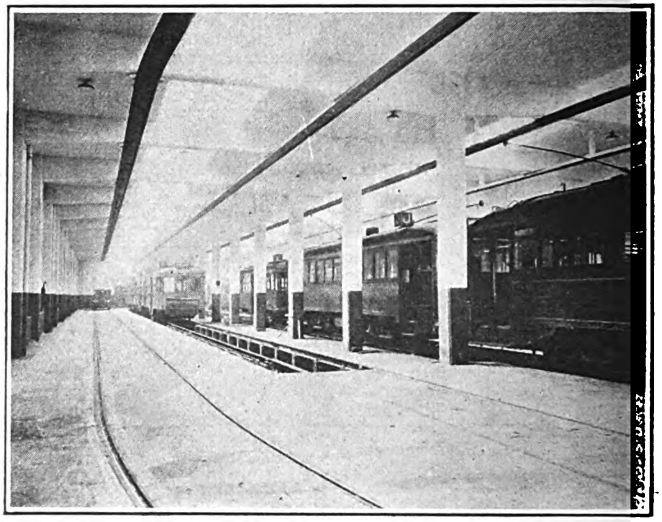
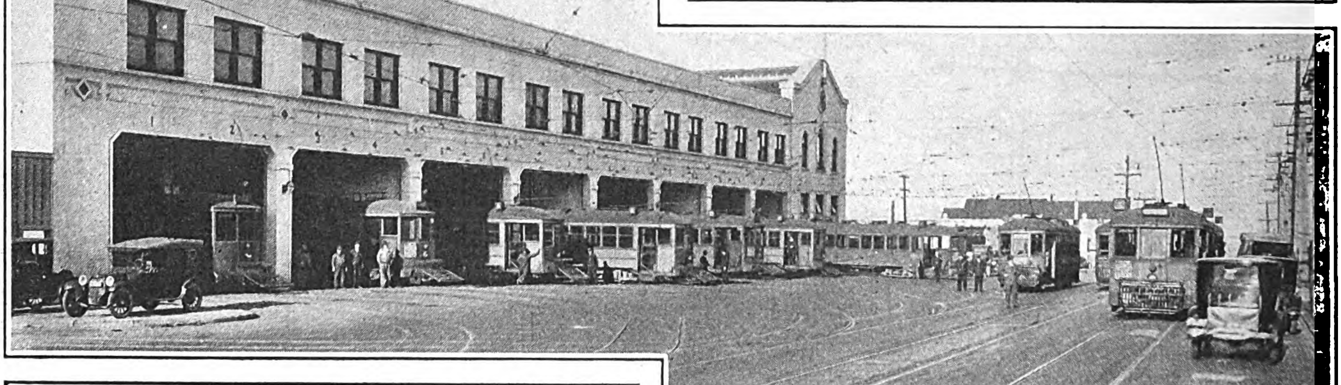
Track Extensions Totaling 11.6 Miles of Route Will Substantially Augment Transportation Facilities in San Francisco. (A) Marina Track Extension, (B) Downtown Loop Connection, (C) Duboce-Sunset Extension, (D) Excelsior District Extension, (E) Balboa Street Extension

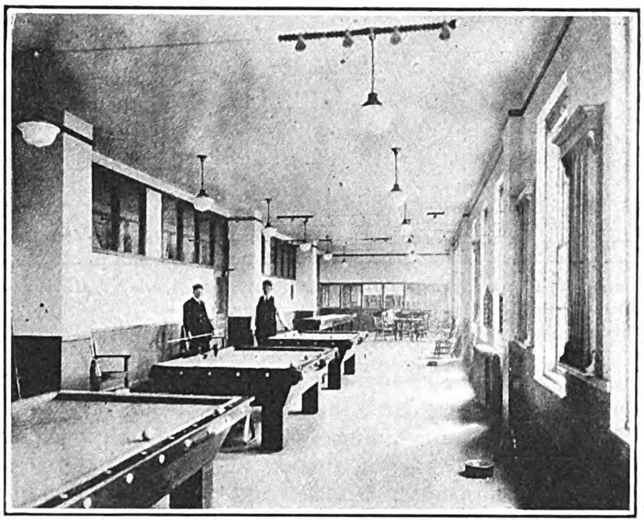
The Duboce tunnel, now being built, has the same cross-section as the Twin Peaks tunnel. Through it a new line to the Sunset District will be operated. This tunnel has a length of 4,200 ft. and will be placed in commission late in 1927 or early in 1928. All of these tunnel projects have been paid for by assessments levied on the property directly benefited.

Grading for the extension of the railway into the Ocean View district, running from St. Francis Circle through the Merced Rancho lands, was completed about a year ago. It was necessary to make two large earthfills across gulches which, on account of the dryness of the season, were expected to settle. This made it inadvisable to lay track at once. Experience during the past wet season showed the wisdom of this delay. Trolley poles, wires and feeder cables have already been erected and contracts recently were awarded for the track laying. This will be completed during the coming summer.

Several track extension projects are planned for the near future. The area once occupied by the Panama-Pacific exposition has been subdivided, streets have been paved, sewers built and 200 houses are now being constructed. The whole district is being settled very rapidly, but is without adequate transportation, although the Municipal Railway is adjacent to it on two sides. It is proposed to construct 0.69 mile of new route to serve this area. By the construction of 1.9 miles of new track a downtown loop can be built to relieve congestion at the ferries and provide an emergency route in case of a blockade on Market Street. Completion of the Duboce tunnel already referred to will necessitate the construction of 4.54 miles of new double track from Market Street to the beach. At present a large territory known as the Excelsior district is without any transportation. It is proposed to extend the Church Street line via private right-of-way and existing streets to a point near Geneva Avenue, a total distance of 2.73 miles. Between Fulton and Geary Streets is an area approximately 2,640 ft. wide without transportation facilities. The growth of this district during the past few years has been phenomenal. Proper handling of the traffic necessitates the construction of 2.79 miles of double track on Balboa Street, roughly bisecting the unserved area. In all, these projects total 10.94 route-miles and would cost $1,395,000 for track construction. A summary of the mileage and cost is given in an accompanying table. Their locations in relation to the transportation system as a whole are shown on a map on another page. Other short additions bring the total of proposed new routes to approximately 11.6 miles.







Carhouse Facilities of the Municipal Railway of San Francisco

At top—New inspection and storage tracks recently constructed on the upper level of the Mariposa Street carhouse.

Center View—Carhouses of the Municipal Railway of San Francisco are designed to permit entrance at different levels from two streets. This shows the front entrance of the Geary Street carhouse.

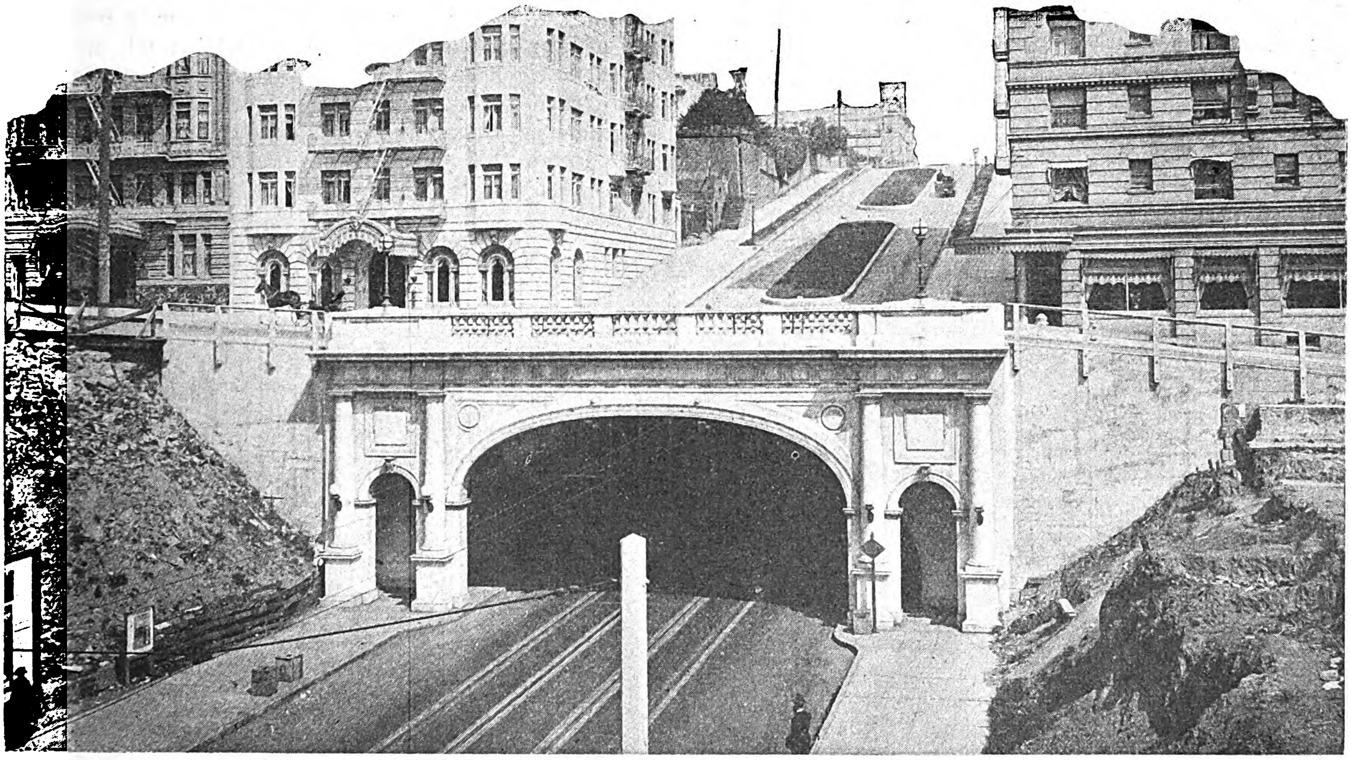
At left—Recent improvements at the Mariposa Street carhouse include a recreation room for employees.

Proposed extensions of bus operations involve five new routes and 7.67 route-miles. Details concerning the bus operation of the Municipal Railway will be given in an article to appear in a future issue of ELECTRIC RAILWAY JOURNAL.

At present two steel and concrete carhouses are in use in different sections of the city. The sites were selected with a view to double-decking, cars going into the lower level from one street and onto the upper level

SUMMARY OF RAILWAY PROJECTS

		Route-Miles	Cost of Track
A	Marina tract	0.69	$60,000
B	Downtown loop	0.19	70,000
C	Duboce-Sunset	4.54	567,000
D	Excelsior district	2.73	343,000
E	Balboa Street	2.79	355,000
	Total	10.94	$1,395,000



Entrance to Stockton Street Tunnel. The Duboce Tunnel, Which It Is Hoped to Complete by the End of the Present Year, Is Similar in Purpose Although Considerably Longer

from another street at a higher elevation. The Geary Street carhouse will accommodate 120 cars and that at 17th and Mariposa Streets 140 cars. During the past year a second story was added to the carhouse at the latter location. This does not cover the entire area of the lower story, but provides four extra storage tracks with inspection pits, giving an added capacity of 32 cars. Offices for the assistant superintendent, dispatcher, inspectors and cashier, as well as a waiting room, recreation room and reading room, have been provided.

Provisions were made in the original Geary Street carhouse for a small repair shop to take care of the 43 cars then owned. The Municipal Railway now has 213 cars, thirteen buses and other equipment which must be maintained. No addition has been made to the original shop space and it has now become impossible to keep up with the work to be done. An appropriation of $250,000 is desired for the construction of a modern car maintenance and repair plant.

Subway Building Filmed

CONSTRUCTION work on the Eighth Avenue subway system in New York City is shown in motion picture film recently released by E. I. du Pont de Nemours & Company of Wilmington, Del. This film, which is entitled "Building New York's Newest Subway," is printed on safety stock, is one reel in length and requires fifteen minutes for showing.

The film is a veritable trip along the line of activities, as it shows not only scenes underground where great ledges of rock are being blasted away in the tunnels but also work in the open trenches and cuts. How windows are safeguarded from vibration caused by blasting, how monuments are propped up and how telephone and electric cables are kept in operation are pictured in the reel, as are the great tools used in the work, such as telphers, caterpillar shovels, powerful trucks and steam hoists. Scenes showing how explosives are used and stored on the job are interesting features. Other views show partially finished sections where the steel framework is in place.

This film may be obtained upon application to the publicity bureau of E. I. du Pont de Nemours & Company of Wilmington, Del.

Vienna Slowly Recuperating

Statistics of Traffic During Last 21 Years Show Many Fluctuations and Recent Large Increase in Passengers—Flat Fare Now Used

LOCAL transit conditions in Vienna during the past 21 years are treated in an interesting review in a recent issue of *Verkehrstechnik* by Dr. A. Winter of the Vienna Municipal Railway System. The period covers nine years prior to the outbreak of the war, five war years and seven post-war years. The means of communication in Vienna are an extended surface railway system, an elevated and subway rapid transit system and buses. All of these are now owned and operated by the city.

With a population of 1,800,000, Vienna has today about as many inhabitants as it had in 1905. The steady growth of population in pre-war years reached a maximum of 2,200,000 at about the beginning of the war at the end of 1914. During the war the figure fluctuated, but by its close a heavy decline had set in. Since 1920 the city has recuperated slowly in population. Fully dependable statistical investigations carried on for many years past disclose the notable fact that within recent years the total number of rides on public vehicles has been constantly growing. In spite of the greatly decreased number of inhabitants, the average number of daily rides on trolleys and rapid transit systems is today about the same as it would have been had the old ratio been maintained and the city grown steadily at the rate of pre-war years.

Various factors are responsible for this rather paradoxical development. The chief reason is the gradual shifting of the center of population away from the business center, so that people have longer distances to cover to get to and from their work.

Up to 1916 Vienna used the zone fare system with three graded fares. In that year, owing to the rapid increase in the number of maximum fares, as compared with the two lower rates, the lowest fare was dropped. This left only two rates, and in 1921 one unit fare was adopted for all rides.

The average distance traveled per passenger per ride grew gradually but constantly from slightly over 4 km. (2½ miles) in 1908 to 5.6 km. (3½ miles) in 1926. Like most metropolitan cities, Vienna has shown during the last twenty years a decided "city formation"; that is to say, the center of the population is moving more and more away from the inner part of the city, which is the business district.

During the war years a very large increase in business was done by the surface lines, the peak being reached in 1918. The reasons were the enormous devaluation of money, the greatly increased number of male and female workers in war industries and the large number of business people and soldiers called to Vienna, as the war center of Austria. During the following year, 1918 to 1919, a decline set in, more violent than the previous rise, caused by restrictions of operation due to scarcity of coal and cars, and the general poverty of the people. During 1920 and 1921 a distinct improvement in traffic was again recorded. This was again followed by the deflation panic of 1922, when the lowest point was reached. Money became next to valueless, causing the cost of living, expressed in this money, to soar to unheard of values. Families depending upon a fixed income, like annuities, had great financial difficulties, but wages and salaries were raised as the value of the currency declined. During this period the trolley system carried practically all of the traffic, as bus lines and entire sections of the rapid transit system had to suspend operation.

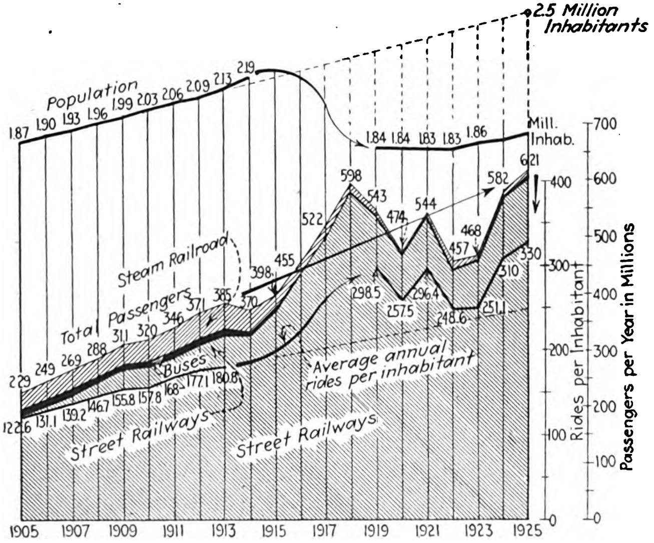


Chart Showing Data of Vienna Local Transit

Conditions began to improve at the end of 1922, showing immediately a rise in traffic again. Another factor in favor of increased trolley riding was the exceedingly acute scarcity of living quarters. Building had practically stopped since 1915, and while it was previously customary for the workman to move nearer to his new place of employment when he changed his job, he had to stay now where he lived, regardless of how far he had to travel to his new place of work. A large army of workmen is thus being transported daily by the trolleys between their homes and their factories. More than 80,000 persons are at present seeking more convenient living quarters. An extensive building program, covering the erection of 25,000 houses for some 100,000 people, is now in progress. The houses are being built in blocks, scattered over the entire area of Vienna.

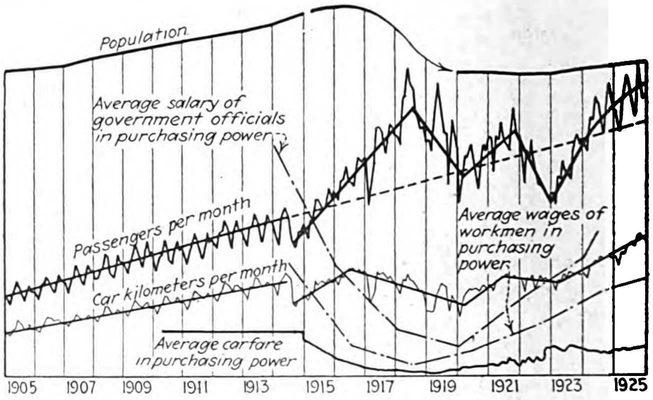

Chart Showing Purchasing Power of Wages and Other Data Affecting Riding in Vienna

Another and very important impetus to more frequent riding on public conveyances was given by the electrification of the Stadtbahn (elevated and subway line) in 1925, with the same ticket valid on all rail lines, both trolley and rapid transit. With the greater speed and comfort on the new electric trains the passenger traffic on the Stadtbahn more than doubled. At present 270,000 passengers are carried daily. During morning rush hours (if this expression can be used for Viennese traffic), between 7 and 8 a.m., an average of 22,000 passengers are transported.

On pleasant Sundays and holidays in the summer as many as 60,000 persons have been carried during a four-hour afternoon period. A noticeable addition to the number of public carriers is contributed by motor buses, which operate radially from the center of the city to the outer trolley lines.

A final impetus to travel which should be included is no doubt the very low unit fare, which is only 80 per cent of the pre-war average fare. This percentage corresponds to two-thirds of the purchasing power of the fare in 1914. For this reason a further increase in passenger traffic may be expected.

Indiana Utilities Important Revenue Producers

SEVENTEEN per cent of the taxes collected in Indiana are paid by public utility companies, Fred A. Sims, formerly chairman of the Indiana tax board, recently told classes in public utilities and public utility law at the School of Commerce at Indiana University. He said that the importance of these properties as revenue producers might be illustrated by the fact that in 1924 they represented 12.88 per cent, while in 1926 they represented more than 17 per cent of the total value of property for taxation in the state.

One of the fare zone limit signs along the route. This view shows the type of concrete highway over which the coaches run and the character of much of the territory.

Interurban Service Offers Broad Field for the Bus

By R. N. Graham

Manager of Railways Pennsylvania-Ohio Electric Company

Electric Railways Have Never Covered the Field that Exists for Transportation Outside the Cities, and Today Buses Are Able to Handle a Great Share of This Business—Operating Refinements Overlooked in Bus Design Should Be Given Attention

IN THE field of suburban and interurban service there is a tremendously great future for the motor bus. Here we are no longer limited by a flat fare. Every ride is a zone ride. The territory where interurban street railways were never built is vastly greater than the unfilled field in city operation. Since the ratio of initial investment to the number of passengers carried is so much less in the case of the bus than the street car, it is possible to operate bus lines where under no conditions was it possible to operate any form of transportation requiring a fixed investment in way structures.

Thus the communities without adequate public transportation connection with other communities which are either natural markets, sources of supplies or in which there are other community interests are rapidly being connected with motor bus lines.

Where interurban railways have already been built the bus can be used by such properties in an intensive development of their territory such as was never possible without the bus. On our own property prior to 1922 we operated approximately 60 route-miles of interurban and suburban railway. We are now operating nearly 400 route-miles of coaches. The comparison of our present interurban operation with coaches and street cars is as shown in the accompanying table.

The number of coaches and street cars shown in this table is the number required for regular runs. We own 29 modern interurban cars and 43 interurban coaches. Parallel to our interurban lines the coach service is a high-class express service operated at a higher rate than the electric cars, which carry heavy industrial loads that could not easily be handled by the smaller capacity coaches. The connections of Youngstown with Cleveland, with Akron and with Meadville are natural transportation routes which it would not have been possible to establish by building interurban railways in recent years. It is thus apparent that the use of the motor bus has enabled us to give not only a more comprehensive service to points where our rail lines already operated, but has enabled us considerably to extend our service to the public.

On our main interurban coach lines we maintain complete and adequate terminal facilities in the larger cities. In cities such as Cleveland, Youngstown and Akron to maintain a modern waiting room in the heart of the city represents a great expense, but we feel that we cannot offer our fa-

THIS is the second article based on an address before the Metropolitan Section, Society of Automotive Engineers, by Mr. Graham in New York on Feb. 17. The first article, which covered the place of the motor bus in urban transportation, was published in last week's issue of ELECTRIC RAILWAY JOURNAL. Mr. Graham has taken up the field for interurban bus operation and also points out to manufacturers some of the features of bus design which cause difficulty in operation.

cilities to the public as a real service without extending all necessary conveniences to it in its use of our service. In all the towns through which we go we also maintain depot arrangements. Our routes are marked with zone markers, and stations, both in the great cities and small towns, are equipped with electric signs. On our line from Youngstown to Cleveland we maintain garages in Youngstown, Warren and Cleveland, with relief coaches for use that the service may be certain. On our line between Youngstown and Akron we maintain garages at Youngstown, Edenburg and Akron for the same purpose. We have never annulled a trip on account of ice, snow, fog or road conditions. We have operated this interurban service during wintry months when the operating expenses were more than twice the revenue obtained, feeling that when we have finally established the fact in the minds of the people that coach transportation is perfectly dependable they will feel as safe in undertaking a trip in zero weather as in balmy midsummer.

Comparison of the Extent of Interurban Car and Bus Service by Pennsylvania-Ohio System

BOTH EARNINGS AND EXPENSES HIGH

That our hope in this line is justified is indicated by the fact that our Youngstown-Cleveland line produces a gross operating revenue of 44 cents per coach-mile, which is the highest revenue per mile of either car or coach in our entire operations. However, our expense on these interurban lines, due to cost of terminal facilities, the elaborate arrangements made for maintaining our schedule and the high class of maintenance upon which we insist, is far beyond any figure that I have heard or seen quoted by proponents of bus operation.

For the first three years of our operation we charged off depreciation on our coach equipment at the rate of 25 per cent per year based on four years life of the operating units. In January, 1926, the condition of our original coaches and buses was such as to indicate that the four-year life predicted was too short and we changed our basis of depreciation to five years.

It has been our experience that maintenance expenses increase steadily over the life of the coach or bus in order to maintain the same degree of upkeep. We have seen many reports of bus operation indicating handsome profits which would have a tendency to deceive the promoters since it was a first year's operation, before heavy maintenance was reached.

In order to illustrate this point take the operating expenses of the Youngstown Municipal Railway for its bus operation by years. These were shown in Table IV in the article in last week's JOURNAL, page 376. To get a true picture of what can be produced in this operation and strike a parity between depreciation and upkeep, if buses were to be depreciated on a four-year period I believe the depreciation should be charged off as follows: 40 per cent the first year, 30 per cent the second year, 20 per cent the third year and 10 per cent the fourth year. Including depreciation as a part of the operating expenses, the operating expenses would be practically uniform over a four-year period.

As a result of our experience, I have a few thoughts that I would like to submit to the motor bus manufacturers. The engineers seem vastly concerned about improving the design of the power plant, the shape of the combustion chamber, the contour of the heads and other refinements of this character. In our operation the maintenance of the engines themselves has never been a major problem. One of our principal worries is the matter of brakes; the largest number of interruptions to our schedule results from brakes and the largest amount of time spent in maintenance of any one item is on brakes. We have no unit in which we believe that the brake proposition has been solved. The brakes require adjustment too often, too much time is spent in relining and the job of relining is too much of a job. The use of air brakes has introduced another serious proposition and that is extraordinary wear on tires.

OPERATING FEATURES OVERLOOKED IN DESIGN

The chassis builder does not seem to be concerned about time lost in filling buses with fuel. A large proportion of our buses require ten to fifteen minutes to fill the tanks on account of flat filling pipes. Our state laws require the use of accurate speedometers. We have never had favorable results from speedometers themselves, or adapters or speedometer drives. I am the chairman of the committee on bus operation of the American Electric Railway Transportation and Traffic Association and I find that this complaint is universal throughout the industry, and have been asked to take it up with the motor equipment manufacturers in order to obtain some dependable and satisfactory means of ascertaining the speed of our units.

There have been great developments in the strength of such parts as frames, driving spindles, propeller shafts and other parts that take the strain of these heavy moving vehicles, but in our experience there is no excess strength in any unit that we operate. We do not believe that aluminum castings should be used in any chassis part where strain is to be undergone. We have had several cases of serious near-accidents due to breaking of the aluminum spiders on steering wheels.

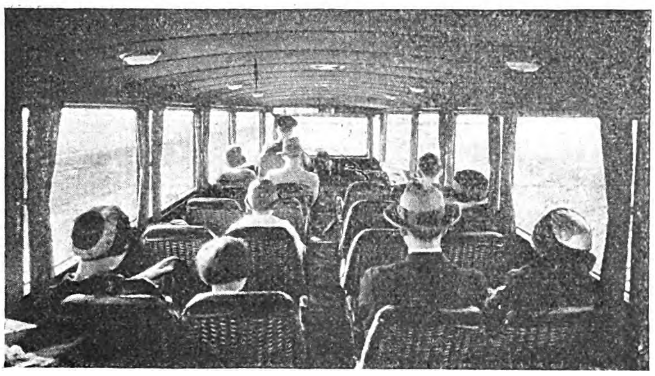
MUFFLERS INADEQUATE

It is necessary for a company operating buses and coaches to preserve pleasant public relations. More friction is developed between our company and the public with which we must live through inadequate mufflers than from any other source. In only one make of vehicle that we have used is there freedom from complaint on this source. Within the past months we have had several drivers arrested for operating with open cut-outs when we have no cut-outs on our coaches. We have been compelled to detour operations around hospitals and schools on account of noise complaints. One of the chief complaints against street railway service has been noise produced by cars. With the use of the automobile there is a chance to get away from this unpleasant factor, and yet after years of engineering on motor coaches and buses it seems impossible to have the engineering end of the manufacturing industry even give serious attention to this important matter.

Too little attention is given in coach design to safety considerations. There have recently been brought out designs in which it is impossible for the driver to see his right front fender or right curb except at some distance ahead of the vehicle. In our operation every other consideration is secondary to safety and we would never feel we were discharging our duty to the public and to our stockholders by operating a vehicle hopelessly handicapped from a safety standpoint.

Too little consideration has been given to the matter of providing for the use of chains in icy weather. I have heard it contended that certain vehicles do not need chains. We operate a great many different standard types of vehicles, and on the heavy grades on our interurban lines under the icy conditions that have prevailed this winter there have been a number of days when it was impossible to complete a trip without installing chains.

These matters are not of fundamental importance and of course will eventually be taken care of. The modern motor bus is a substantial, sturdy and useful vehicle.



From Any Seat in the Coach a Clear View of the Country Is Obtainable at All Times

On our property altogether we have 125 of them, representing an investment of nearly $1,000,000. The garages which are used by us represented an investment of $200,000 and parts and auxiliary property $150,000 additional.

Prior to our use of the bus in Youngstown there was not a single first class bus operated in the city. On our interurban operation we have purchased from time to time approximately eight operations. Only two of these owned any rolling stock that we would be willing to place in the service of the public. In the case of the two operations that did have rolling stock we could use, we paid a large part of the original purchase price to the manufacturer after we had purchased the property, notwithstanding the fact that the vehicles themselves were practically worn out.

We have increased the service substantially on every line that we have bought. We have co-operated with every independent bus operation in our territory. In Youngstown, Warren and Sharon we furnish the terminal facilities for all interurban bus lines and for a large part of the lines out of Cleveland. In co-operation with the leading independent bus lines in our territory we sell an interchangeable mileage book which enables the traveling public to ride easily and freely over northeastern Ohio. We sell through tickets from Cleveland to a great many different points in which a part of the ride is on our own line and a part of the route over independent bus lines. We have joint ticket arrangements with at least half a dozen independent bus lines that have no connection whatever with electric railway properties. We advertise their service in our schedules and in many cases extend the assistance of our schedule and traffic departments to those independent lines to help them to form their schedules and tariffs intelligently and to comply with the rather technical requirements of our public utilities commission.

COMPARISON OF INTERURBAN COACH SERVICE AND INTERURBAN CAR SERVICE PENNSYLVANIA-OHIO SYSTEM—YEAR 1926

	Coaches	Cars
Number operated	29	27
Revenue	$584,116.54	$661,943.73

If our history and attitude is in any manner typical of that of the electric railway industry, there certainly is every reason for co-operation between the electric railway industry and the great manufacturing industry furnishing bus equipment.

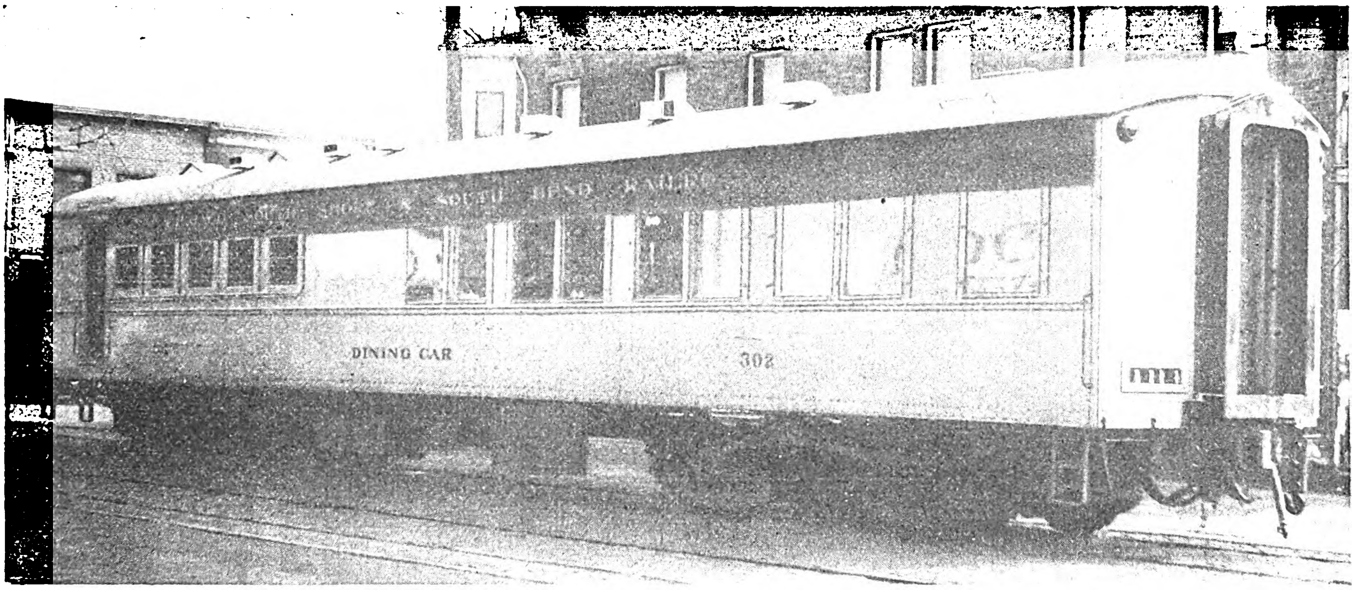
McClintock Recommends Laws Against Slow Driving

ESTABLISHMENT of minimum as well as maximum speed limits is recommended by Dr. Miller McClintock, director of the Albert Russel Erskine Bureau of Street Traffic Control, to help relieve the growing traffic congestion in American cities. While excessive speeds are condemned as causes of delay and oftentimes accidents, Dr. McClintock suggests that minimum speed regulations be made of about 50 per cent the maximum on busy arteries. In discussing this problem Dr. McClintock said:

"Drivers who insist on holding up traffic to a snail-like pace of 5 or 10 m.p.h. on important streets should be subject to a certain amount of legal prodding. When streets are filled with vehicles the slow driver regulates the speed of all following traffic and by his selfishness or carelessness often delays hundreds. Slow drivers are also the unwitting cause of many accidents by making it necessary for overtaking motorists to cut into the opposing traffic stream to pass."

The Erskine Bureau has completed an extensive survey of street traffic in Chicago which discloses a typical set of obsolete laws, that according to the report were obsolete ten years ago. "Their chief service," says Dr. McClintock, "is to permit technically inclined public officials of some of the small cities of the Chicago region to levy unwarranted toll on the motoring public."

One of the recommendations in the Chicago survey abstracted in the ELECTRIC RAILWAY JOURNAL Jan. 8, 1927, will be to urge the state legislature to pass laws that will permit the city to enact ordinances regulating minimum as well as maximum limits on the streets.



This Exterior View of the South Shore Line's New Diners Vies in Beauty with the Interior of the Car. Streamlines and the Orange Color Enhance the Mechanical Perfections

South Shore Line Starts Dining and Parlor Car Service

Pullman Built Equipment Now Operating Between Chicago and South Bend, Ind., Provides Most Modern Facilities and Comforts for Windy City Passengers—Seven Thousand View Cars During Six-Day Exhibit Trip

REGULAR operation of the new all-steel parlor-observation and dining car equipment of the Chicago, South Shore & South Bend Railroad between Chicago and South Bend, Ind., was inaugurated on Feb. 20, following a six-day exhibition of a train made up of the four new cars in the larger towns along the company's lines. The number that visited the cars during the public showing was estimated at more than 7,000 persons.

Names significant from the standpoint of the localities served have been chosen for the three dining car and two parlor-observation car trains that now operate in each direction daily. The dining car trains leaving Chicago at all mealtimes are known as the "Notre Dame Limited," "Indiana Limited" and "St. Joe Valley Limited." Parlor-observation trains in this direction in the forenoon and mid-afternoon are the "Duneland Limited" and "Marquette Limited."

The new cars, which were built by the Pullman Car & Manufacturing Corporation at a total cost of $185,000 and delivered to the railroad late in January, are of standard steam road Pullman car dimensions. Each car is equipped with six-wheel trucks, said to be the first of their type operated on any electric railroad in this country.

Finished with walnut woodwork, the parlor cars, 64 ft. x 10 ft., have glass-inclosed platforms at each end; they are furnished with comfortable folding chairs, and are heated by automatic electric radiators, while full-length windows afford an unobstructed view to the rear. The cars are arranged with the men's and women's lavatories, kitchen, switch cabinets and other appurtenances in the center, thus providing a parlor compartment at each end, next to the observation platform. A built-in writing desk and magazine table is located in each compartment. Every comfort has been provided

Great Care Has Been Exercised to Arrange the New Cars Conveniently. Above, the Diner; Below, the Observation Car

for feminine passengers in the women's retiring room, which is attractively furnished with a small boudoir table, a full-length mirror and several smaller mirrors. Special care also has been exercised in equipping the men's lounging room.

Designed for buffet service only, the kitchen is a model of compactness. In its small area an ice box, sink, electric heater, humidor, water cooler and various cupboards are included. Among other interior decorations are dome ceiling lights, handsome side fixtures, two large electric fans and deep plush carpets.

Longer than any equipment now in service on the South Shore Line, the new diners, 64 ft. x 10 ft., are designed to serve 24 persons at a time, the seating arrangement conforming with that in vogue on the steam roads. The color scheme for the interior is green, decorated enamel, which is enhanced by dome ceiling lights, plush carpeting, and individual lighting fixtures over the tables. The kitchen compartment is designed for the maximum speed in serving, and besides the customary range there are several refrigerators, cabinets for linen, china, silver, provisions and fruits, three sinks and several large electric fans. Egress and ingress are obtained through centrally spaced doors as in the case of the steam road equipment. Rounded ends, streamlines and the striking orange color, standard for the South Shore, are some of the exterior features.

More than 125 newspaper men, city officials and other prominent residents of South Bend, Michigan City, Gary, Chicago and other cities reached by the South Shore Line were guests of the company on an official inspection tour in the new cars on Feb. 10. Aboard the train were Britton I. Budd, president of the railroad; B. J. Fallon, C. E. Thompson and H. M. Lytle, vice-presidents; Charles H. Jones, general manager, and other officials of the company and affiliated railroads and Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL. The new de luxe limited trains now supplement the regular hourly express service between Chicago and South Bend and the half-hourly service between Chicago and Gary.

Incidentally, since the South Shore line has been under the control of the Insull interests, during the last two years $4,500,000 has been spent in rehabilitation of the property and an additional $2,000,000 will be spent in the next twelve months. Twenty-five new steel passenger cars have been placed in service and twenty more cars will be added during the summer.

Headway Recorders Centralized in Dispatcher's Office at Denver

By Nelson R. Love

Chief Engineer Denver Tramway, Denver, Col.

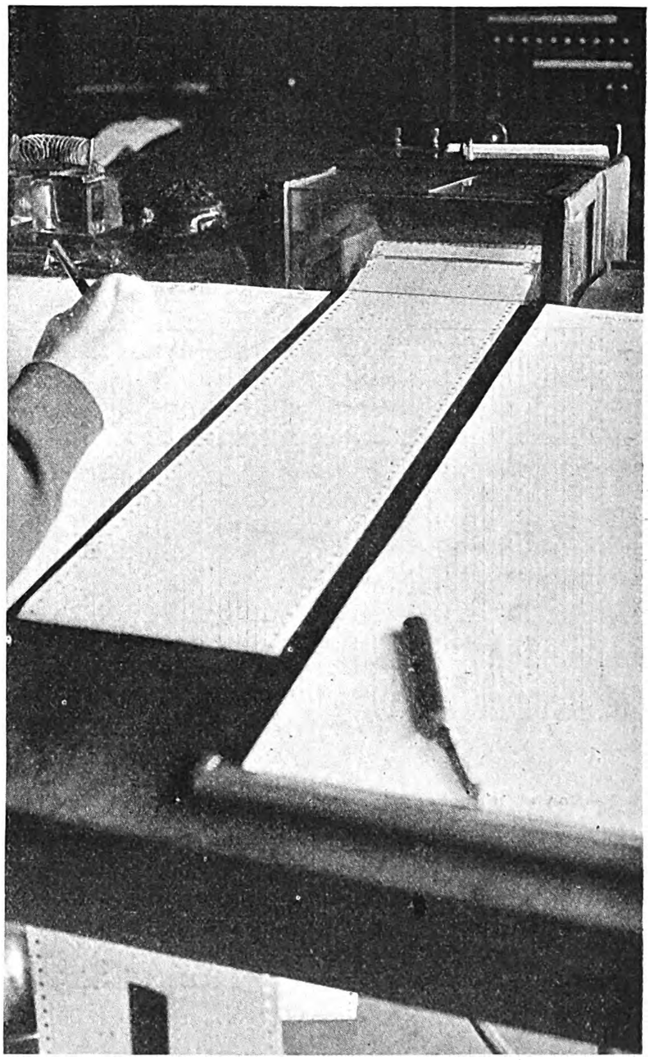
Continuous Check Provided on Operation of Ten Car Lines—High Voltage Spark to Burn Paper Is Used Instead of Ink—Single Wire Suffices for Registering in Two Directions

HEADWAY recording apparatus, arranged to register separately the time inbound and outbound at which cars pass given points on ten lines, has been installed in the dispatcher's office of the Denver Tramway. This centralization of equipment permits a continuous check-up by the dispatcher. Each route of the Denver Tramway is equipped with a telephone connecting with the dispatcher's office, located at approximately the center of the system. Cars are operated on printed schedules that are in the hands of all trainmen, but if any car is more than three minutes late the motorman reports to the dispatcher at the end of the line. Thus the dispatcher is able to issue such orders as may be required to operate the line to the best advantage under the circumstances. The method of dispatching used in Denver was given in detail in an article in this paper for Aug. 23, 1924, page 275.

For recording headways the apparatus used is a continuous strip-chart type of instrument, with spaces for twenty indications. One is used for the outbound cars and one for the inbound cars on each of the ten lines at present connected. The chart speed is 6 in. per hour, or 0.1 in. per minute, making one-half minute variations in time readily distinguishable. An accompanying illustration shows the arrangement of the headway recorder on the dispatcher's desk. It will be noticed that the chart passes over the top of the desk with approximately three hours of chart visible at all times. The dispatcher marks the schedule time for each car in red on the chart as it passes over his desk, thus showing up immediately every car not on time.

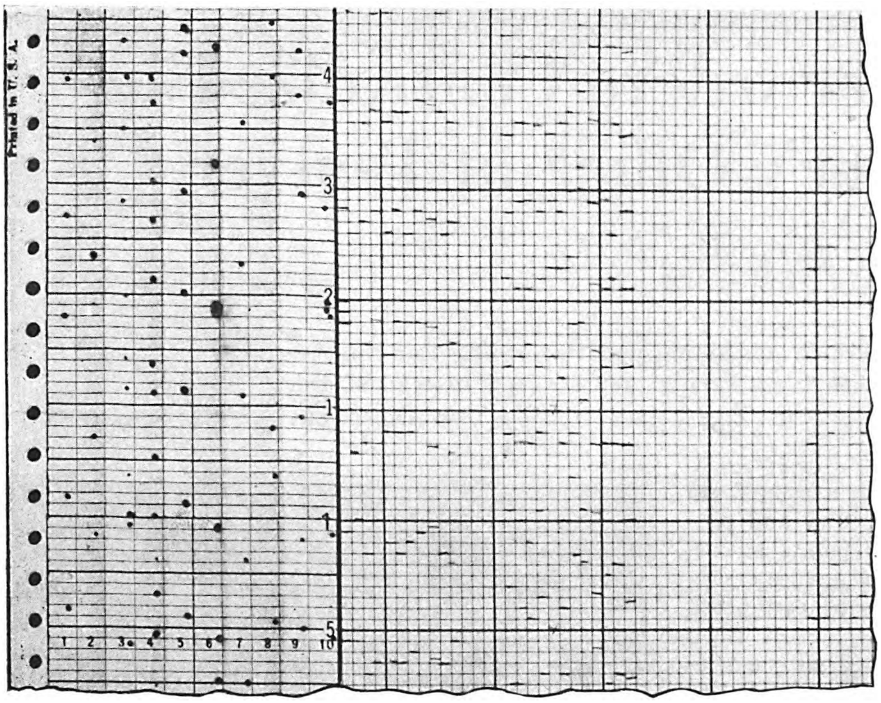
The time scale employed on the chart renders the transfer of the daily chart record to a comparative line record a simple matter by using standard cross-section paper ruled ten lines to the inch in sheets 20 in. wide by 9 ft. long. This sheet suffices for recording 90 days' performance of one line, showing Saturdays, Sundays and week days, inbound and outbound, separately at the right. A portion of one of these records is reproduced. The mark at the extreme left of each series of days is the time at which the car is due.

One clerk is able to take care of all of this work. The process of transferring the record consists in folding the original chart so that the line desired is at the edge. This is laid on top of the permanent record, alongside of the column for the day involved, and the time scale matched properly. The clerk then makes a mark for each mark on the chart, without reading or interpreting either the original or the new mark. About twenty minutes is required to transcribe the record for one line for one day.



Chart, on Which Are Registered the Headways on Ten Car Lines Operated by the Denver Tramway, Passes Over the Dispatcher's Desk

As originally set up, the recorder used capillary pens, each pen tracing a continuous line on the chart, and each car passage causing a horizontal offset to appear in the line. On account of passing over the dispatcher's desk, this method of marking the charts proved unsatisfactory. Various combinations of ink were tried. Oil would not dry at all. Water dried so quickly that the pens clogged. Alcohol made the ink run so freely that it dripped. Glycerine and water did fairly well, but would not dry completely. When the glycerine con-



Original Headway Record Made by Electric Spark (at Left) Placed Alongside a Large Sheet of 1-In. Cross-Section Paper (at Right) for Compilation of the Comparative Chart

tent was kept down, the paper buckled from expansion, and so on. Finally the use of ink was given up entirely and an automobile spark coil was pressed into service. This has operated with no trouble whatever, each car passage being registered by a small round hole burned in the chart. It has black edges and so is readily visible on either a white or black backing.

The paper drive is operated electrically with a contactor on the pendulum of the master clock located in the dispatcher's office. This insures synchronism of time by which cars are dispatched and the record made by the automatic recorder. The master clock being a high-grade instrument with a mercury compensated pendulum, the error in the chart drive is only a few seconds per week. This is much smaller than the accuracy with which the chart can be read, and is not cumulative, as the paper chart must be renewed and the chart set anew each week. The driving mechanism consists of a 60-tooth ratchet wheel driven by an electromagnet energized once each second by the master clock. The ratchet wheel moves forward one notch upon release and is geared to the paper drive roll to give a chart speed of 6 in. per hour.

An interesting feature of this installation is the transmission of separate indications for outbound and inbound cars over the same wire. This is done by a polarized relay of telephone type at the recorder end of each wire. Current in one direction closes one contact, and current in the opposite direction closes another contact, operating the recorder itself with a local battery. Reversal of current is secured by connecting one terminal of the relay coil to the midpoint of a 100,000-ohm resistance between trolley and ground. The other relay terminal is connected to the line wire. Outbound cars connect the distant end of each line wire through a trolley pan direct to the trolley. Each inbound car operates a relay from a trolley pan connection, which in turn connects the line wire to ground. In order to prevent short circuit in the event that outbound and inbound cars of the same line strike pans at the same time, a resistance is connected between the trolley contact and the ground contact. This limits the current to about 0.25 amp. in such an event and does not interfere with the sensitive polarized relay used. Lightning protection to each polarized relay is provided by a vacuum type of spark gap arrester, with fuse in the line wire.

The spark to burn the indications in the chart is provided by a Ford spark coil. Its primary circuit is closed by a relay connected in the common local wire to the polarized relays, so that when one of the latter is operated the flow of local current causes a spark hole. The spark is distributed to the proper position on the chart by using the pens of the chart as relays to close the proper high-tension circuit through the appropriate spark gap, utilizing the movement of the metal pen to close a gap in the circuit.

One coil serves for all indications. If two cars were

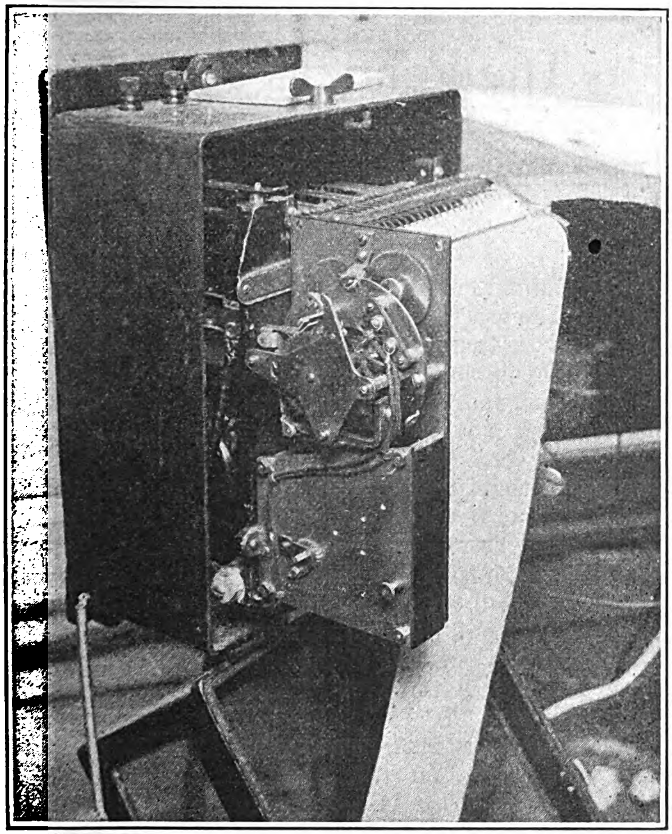
Wiring Arrangement by Which Inbound and Outbound Cars Register Over the Same Wire



Driving Mechanism for the Headway Chart Is Actuated by the Master Clock in the Dispatcher's Office

to cross contactors at exactly the same time, and for the same duration, only one indication could result. The chances of this happening, however, are extremely remote. Up to the present this never has taken place. Though two indications have been observed to come in so close together that the coil relay closed only once, two separate indications have always resulted. The wiring diagram for the polar relays, spark coil and recorder coils is reproduced herewith.

An inexpensive 14-volt storage battery supplies local current for all purposes, namely, paper drive, spark coil and recorder coils. This storage battery is charged continuously at a low rate by an electrolytic type of trickle charger, so that the storage cells used are of very small capacity. This battery has given excellent service and found to be ample for the requirements.

First Electric Railway in Oklahoma Celebrates Birthday

THE Oklahoma Railway on Feb. 3 celebrated the 25th anniversary of establishment of street car service in Oklahoma City, Okla. The Metropolitan Railway, which afterward became the Oklahoma Railway, was the first electric railway established in Oklahoma. It started with less than 6 miles of single-track railway and has expanded until it now has 65 miles of track within the city limits as well as interurban lines.

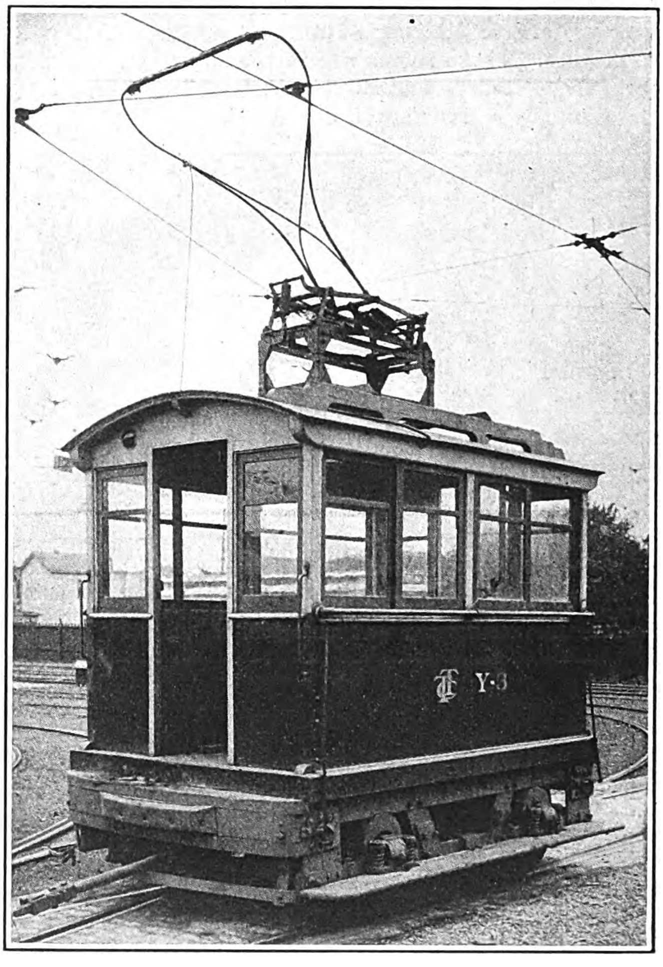
Lawrence Paulson, veteran operator, now on the El Reno interurban line, was at the helm of the first street car that operated in Oklahoma City 25 years ago. The city declared a holiday to see the strange phenomenon. Crowds lined the streets and cheered. Bolder spirits swarmed inside and others, unable to get inside, climbed to the roof and hung their feet over the sides.

Automatic Reversing Bow Collector

One-Man Operation of a Small Shifting Locomotive Has Been Made Possible by Designing a Bow Trolley that Will Reverse Automatically

FOR handling passenger trailers in the yards and shops, the Toronto Transportation Commission uses a small locomotive which is called a "shifter" or "shunter." This railway operates 258 trailers in its passenger train service. Due to the number of these it has been found most economical to have the special car, since the movements are usually quite short and reversing is very frequent.

An automatic reversing trolley was found desirable so that the locomotive could be operated by one man. As a result, the car is equipped with a bow collector of quite novel construction and quite different from the usual form of pantograph. When the car is reversed the direction of the bow collector automatically changes without breaking contact or without attention from the operator. In changing from one position to another, the supporting mechanism, which is ordinarily held in operating position by springs, is caused to depress against the spring action and thus provides space so that the bow collector will reverse and still keep uniform contact against the trolley wire at all times.



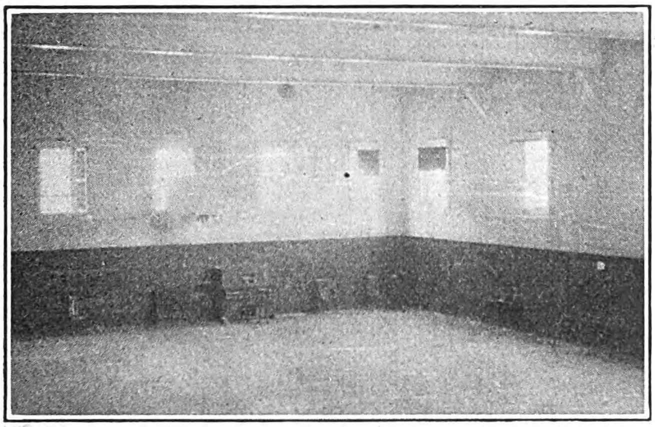
The Bow Collector Is Shown in the Trailing Position on the Car Used for Shifting Trailers

The use of a collector of this type has several advantages over the ordinary collector for this particular type of work. The locomotive is used only to shift trailers. The fact that the collector cannot leave the trolley wire results in a considerable saving in time, labor and maintenance, since it is unnecessary to have a second man to handle the trolley pole.

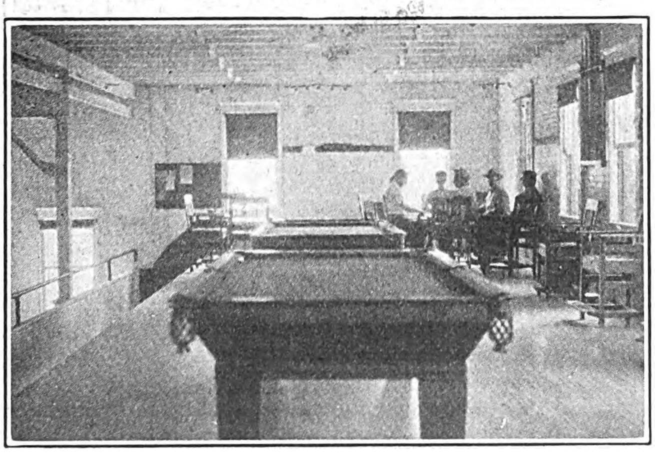
Some minor changes were necessary in the overhead construction in order to provide for the use of this bow collector. It was necessary to have the trolley wire at quite uniform height and this does not vary by more than a foot between highest and lowest positions. It was also necessary to reverse the single and double-curve pull-overs, so that none of the overhead would be below the plane of the trolley wire. The standard trolley frogs, cross-overs and section insulators work equally well with the bow collector as with the standard trolley wheel.

Huntington Completes New Trainmen's Rooms

NEW quarters designed to provide means for recreation in off hours have been provided by the Ohio Valley Electric Railway, Huntington, W. Va., for its employees. These rooms are in the same building with the general offices and directly across the street from the company's Huntington car station.



A Corner of the Main Floor Used for Basketball and Assemblies in the Recently Completed Trainmen's Quarters of the Ohio Valley Electric Railway at Huntington, W. Va.



On the Balcony of Huntington's New Rooms Devoted to Trainmen Are Pool and Card Tables. To the Left Are Seats Overlooking the Main Auditorium Floor.

A large room that can be fitted out as a gymnasium is provided for basketball, dancing and other general assemblies. On a balcony at one side pool tables are provided and several rows of steps or seats which will accommodate a small audience.

"Motormen's Badges Are Poor Advertisements for Heavy Interurbans"

SAN FRANCISCO, CAL., Feb. 26, 1927.

To the Editor:

Years ago practically all interurban electric lines were nothing more than extended street car roads, frequently using city equipment. No one seriously regarded them as main line railroads. The steam roads thought them more or less a joke. Some of these interurbans, however, have changed with the years. They have come to realize that their service and equipment must be brought up to the standard of the steam railroads.

Changing from extended street car line to heavy electrified main line has cost many millions of dollars. Street car methods were dropped, because the public would not stand for a street car on a 50-mile run. But, strange to say, one relic of the past has remained. His name is Mr. Motorman, or "Scissorbill," as the steam roads call him.

Generally he is made conspicuous by a badge. If a sign were painted on each interurban coach, sleeper or diner reading, "This is a street car line," it wouldn't have any worse effect on public opinion than does the motorman's badge. Why? Simply because "motorman" is a street car word. It is out of place in heavy interurban service. The public is used to coupling the word "engineer" with railroads. If electric interurbans would use the title when referring to their motormen it could not but be beneficial.

Almost any one can be a "motorman" after a couple of weeks training, but a locomotive engineer is different. The public has learned that he is a highly trained man, and he is. It takes almost as long to train an interurban motorman as it does a steam railroad engineer, but few people know this, because they usually think of only one kind of motorman—the street car motorman.

Personally, whenever I ride on one of the electric lines that designates its trainmen as "motormen" I cannot help but wonder how safe the man is, or how long since he was promoted from city service. Surely if this feeling is shared by many, a motorman's badge is not a good advertisement. I believe it would be a good idea for the heavy interurbans to abolish the motorman's badge and adopt an engineer's badge. That is the practice in the West on heavy interurban lines owned by steam roads.

If the steam roads can designate a man as "engineer" at the controller, so can the electric lines. Many of the latter have abolished the blue uniform for interurban motormen and adopted in its place a locomotive engineer's outfit—overalls and jumper. Motormen on such lines haven't swelled up and asked for more pay. Neither would they if they had engineers' badges. Interurban motormen, as a rule, are highly intelligent men and they do not expect standard steam road pay, but they do not like to be known as motormen, as I have found out by talking to several of them.

I believe also the use of gongs in motormen's cabs instead of air whistles cheapens the road in the eyes of the public. Ding! Ding! let's go, street car! The street car foot gongs are bad; use the air whistle and be a railroad. A locomotive bell attached to the roof is another good thing to dispel the street car impression.

AN INTERUBRAN PATRON.

Older Cars Should Not Contrast Too Greatly with Recent Purchases

UNION STREET RAILWAY
NEW BEDFORD, MASS., Feb. 10, 1927.

To the Editor:

If we are to continue to exist as a transportation agency, and I firmly believe that we are, we must devise methods of attracting more patronage to our vehicles. Economical operation, while in itself of great importance, is not derivative of increased gross incomes. Our vehicle, whatever its kind, must be sufficiently attractive to invite patronage. Otherwise individual transportation units are bound to be used. One way to secure this increased patronage is by the operation of modern, attractive rolling stock. Careful consideration of modern cars makes one realize that they produce more intangible than tangible benefits. Even though up-to-date cars may not bring immediate large increased receipts, it is certain that the continued use of old, untidy cars will not encourage new traffic and will, as a matter of fact, discourage more and more of the present riding.

The general public is not willing to buy the same kind of merchandise for any length of time. Styles are continually changing and merchants are constantly endeavoring to satisfy the demands of their public. With this desire for new things uppermost in the minds of our patrons, it is no wonder that they expect us to improve and there is no better way of calling our improvements to their attention than by keeping our rolling stock up to date. The private automobile has taught people to enjoy a more comfortable method of transportation, and if we are to encourage this class of patronage we must appeal to them from the standpoint of service and comfort, as well as from the economical side of the question. Street cars are of a size and construction that afford greater opportunities for producing a more finished piece of workmanship than is possible to obtain in the smaller transportation units.

In New Bedford attractive and efficiently maintained rolling stock has done more to develop a spirit of friendly co-operation between the public and the company than any other individual item. For years cars have been painted or varnished every year, and a very thorough system of cleaning has been followed closely. No matter how attractive and comfortable new cars may be when delivered, their benefits will be short-lived if not accompanied by a very thorough system of maintenance and cleaning. Plush seats will not remain attractive very long unless they are cleaned nearly every day. It is also important that our de luxe improvements should be practical and easy to keep clean, as well as be attractive.

New appliances have been added from time to time to the existing rolling stock in New Bedford, so that there is not a great contrast between the older cars and those recently purchased. The public judges a railway's physical condition more from its complete complement of rolling stock than from a few pieces of equipment that were recently purchased.

It has been our endeavor to have our cars operate as quietly as possible and as a means to this end we have given special attention to the proper maintenance of our car trucks. Bearings, gears, wheels, journal boxes, brake riggings, etc., have been inspected and repaired constantly so that they would not produce rattles when the car was in motion. The track has also been efficiently maintained so as to give a very smooth ride; in many instances smoother than that obtained by the best of motor coaches.

In the last analysis it remains for the "men who man the cars" to sell our "product." The training and supervision of this personnel is very important, and the use of a modern training school, full-time instructor and several supervisors have played an important part in developing an efficient corps of transportation salesmen. Friendly co-operation and a thorough follow-up have been the secret of our success along this line.

HAROLD E. POTTER,
Assistant Superintendent of Transportation.

Popular or Mass Transportation?

MOUNT VERNON, N. Y., Feb. 16, 1927.

To the Editor:

'Twill be recalled that when Miss Julia Capulet learned that her Romeo was of the hated Montague clan, she cried: "What's in a name—a rose by any other name would smell as sweet."

So does one feel with regard to the efforts being made to foist new words on the public in cheerful disregard of the fact that most really popular words like "trolley," "jitney," "wow" and "movies" are the inspiration of the man in the street and not the perspiration of the press agent in the office.

You can call a morgue a "mortuary chapel," but the corpse is just as dead in his "casket" as in a coffin. The slithering wight who dresses him for eternity is still an undertaker or funeral director rather than a something rhyming with logician and mathematician.

A barber is still a hair-cutter who barbs and bobs—not a person addicted to tonsils. The alligator pear will taste no sweeter for being called by a name suspiciously like "advocate" in Spanish. And now the dentists want to be called gnathists, which makes us gnash our teeth.

A bus is a bus and a coach is a coach despite the effort to identify a lower form of street car with the luxury of an enlarged limousine.

Coming still closer home, know ye that since the horse car disappeared the ELECTRIC RAILWAY JOURNAL has tried to encourage the use of "carhouse" or "car station" for "carbarn," but even the younger generation sticks to "barns."

It may be that "mass transportation" carries implications of wretched service and poor equipment. However, in the writer's judgment, this term is rather a technical one used among ourselves to express the handling of business *en masse* as distinguished from transportation of small groups at special fares and under special conditions. To substitute "popular" for "mass" would rob the term of its precise meaning. Which is more popular if you have the price: A public utility car or bus, or a private motor car? Let us say directly to the public: "This Is Popular Transportation" only when we are doing something to make it more beloved, whether in fares, in service or in quality of equipment. This writer, for one, sees infra-red when a high-falutin' name beplasters a low-down object. Shades of "Euphues"!

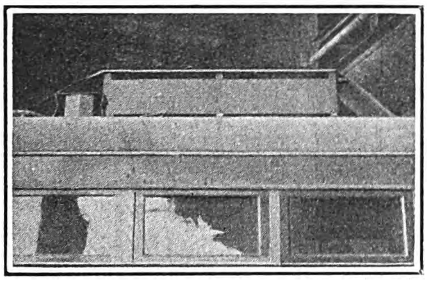
WALTER JACKSON.

Maintenance Notes

> *Neglect your maintenance, and equipment upkeep,*
> *And you're on the "One Way Street," to the scrap heap.*

Motor Rheostats Installed on Car Roofs

MAINTENANCE of motor rheostats was a large annual expense to the Jamestown Street Railway, Jamestown, N. Y., until J. L. Conner, superintendent of motive power, removed them from beneath the car and reinstalled them on the roof. Broken grids and grounded rheostats were a source of continual trouble when the rheostats were located beneath the car. Although suitable splash guards were installed between the rheostats and the truck wheels, the mud and water entered, causing insulation breakdowns and burnouts, with resulting road delays. Also foreign particles were being continually picked up and deposited against the grids, causing breakage.



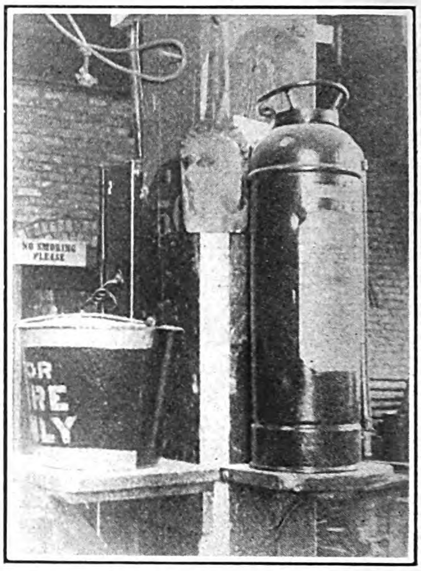
Trouble with Resistors Has Been Eliminated by this Car Roof Mounting in Jamestown, N. Y.

To eliminate this source of failure the rheostats have been reinstalled on the roof of the car. They are mounted on a piece of 1-in. asbestos lumber, fastened to the trolley board through suitable porcelain insulators. Protection from the elements is afforded by $\frac{1}{16}$-in. sheet metal plates fastened securely to 2-in. vertical steel angles, forming a box around the rheostat. These angle posts are bolted to the trolley board. The side plates are so installed as to permit of free air circulation and heat dissipation by leaving openings near the top plate and the trolley board. The cover plate is fastened to the vertical post. It is sloped to cause deflection of rain and snow.

The cost of labor and material was approximately $50 per car. The company claims that these rheostats have not needed a penny of maintenance expense since they were installed in their new location, and therefore they consider the expense of the installation was a very good investment.

Fire Equipment Location Shown by Striking Colors

LOCATIONS of fire extinguishers and sand pails in the shops of the Grand Rapids Railway, Grand Rapids, Mich., are painted red with a yellow border. These colors can be seen at a considerable distance and are sure to attract attention. Each fire station is numbered and a man is assigned to each particular station. For convenience, many of these are located on posts throughout the building. An accompanying illustration shows such a fire station.

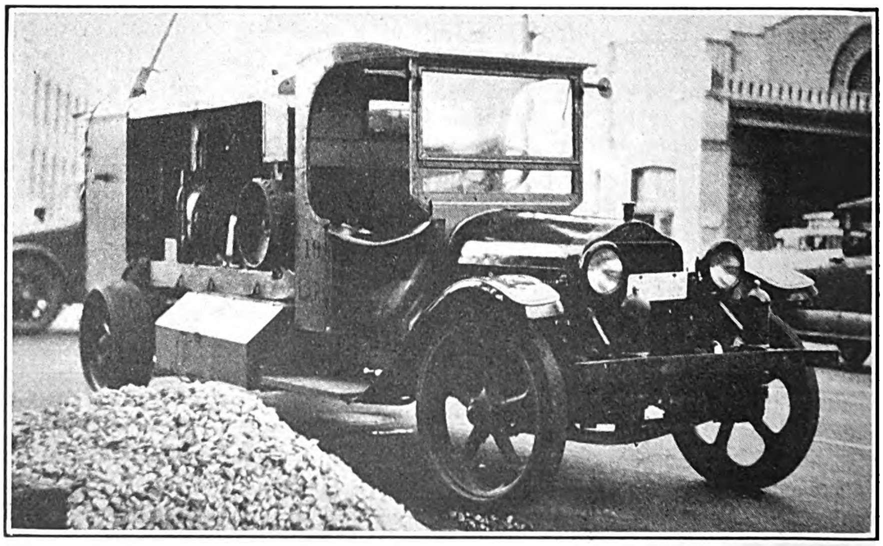


Fire Station Located on Central Posts in the Shops of the Grand Rapids Railway

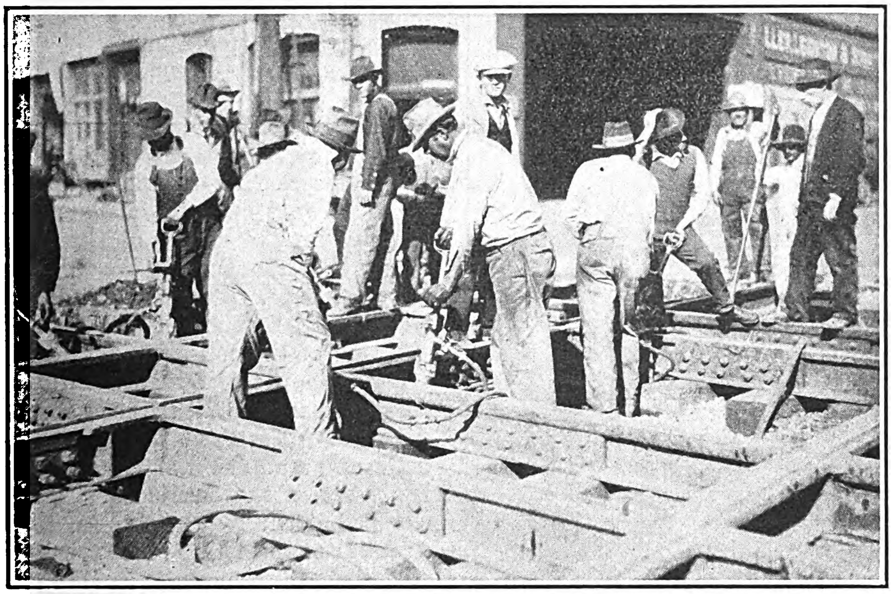
In this case the number for the fire extinguisher is 55 and that for the sand pail 56. A small shovel is also used as part of the equipment for spreading sand.

Compressor Outfit on Bus Chassis

USE is made by the Los Angeles Railway of a standard White 15-45 bus chassis for mounting a large size portable air compressor outfit. The chassis, about to be scrapped by the bus department, was reclaimed by the way and structures department and with some minor modifications fitted for its new duties. Additional springs were placed on top of the regular springs at the rear. The pneumatic tires and wheels were replaced with solids of the same type as those used on double-deck buses.



Portable Compressor Outfit Assembled in Bus Chassis by Los Angeles Railway. Boxes on the Sides Hold Various Air-Operated Tools.



At Work with Air-Operated Tamping Tools on a Double-Track Crossing. The Air Used Is Furnished by the Portable Outfit Mounted on Bus Chassis

The compressor unit, consisting of an Ingersoll-Rand 245-cu.ft. pump driven directly from the trolley by a 600-volt motor, is carried on a channel sub-frame. This in turn is fastened to the main frame. The size of the chassis allows for a generous spacing of the several parts as well as the installation of tool boxes on the sides and a hose reel on the rear. This reel is inclosed in a sheet metal cabinet having double swinging doors which open to the rear. About 200 ft. of air hose can be carried on the reel, which has a diameter of 18 in. and a length of 30 in. with 30-in diameter flanges at the ends. The shaft of the hose reel extends through the side of the cabinet to take a cranked handle for winding in the hose.

On top of the outfit is carried a folding arm for making contact with the trolley. This is made of 3-in. x 2-in. ash jointed about 6 ft from its upper end. It is fastened to the top rear edge of the hose reel cabinet by a bracket and pin. The point of attachment is about 3 ft. from the lower end. The pin allows the boom to be raised by depressing the end which extends to the rear. The upper end is fitted with a piece of bare trolley wire, which is connected through jumper cable to the controller of the motor.

When down, the boom is folded back on itself and rests on a bracket support on the roof at the forward end of the compressor outfit. On the job, the folded boom is raised, the upper portion extended by a rope and the bare contact wire placed against the trolley. The weight of the boom maintains the contact.

Tool boxes on the sides are made of ¾-in. wood sheathed with sheet metal. They are of such size as to hold conveniently the air tools used for tamping ballast and other operations for which the air outfit is used. The metal covering protects the boxes and also gives a finished appearance.

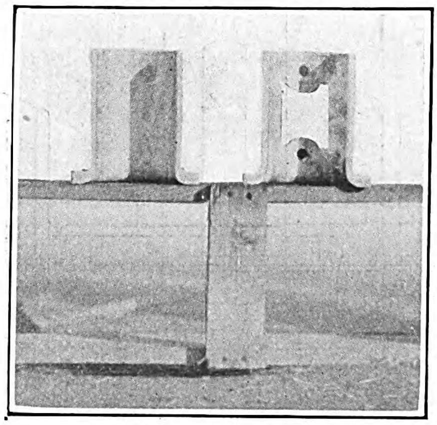
Another feature of the installation is the air-distributing manifold with its six operating outlets. A piece of 2½-in. pipe is brought out of one end of the air tank and carried in a double bend back to the compressor frame base. Here the manifold, made of 3-in. steel tubing, is supported by brackets on the base of the compressor. The supply pipe enters one end of this manifold. The other end is closed. The service outlets, spaced on about 4-in. centers, leave the top of the manifold. A valve controls each outlet.

This installation on a bus chassis has proved so satisfactory that the department now has under construction an electric track welding outfit on a similar chassis.

Axle-Bearing Maintenance Decreased

CAREFUL analytical study of motor axle-bearing maintenance expense on the Danville Traction & Power Company, Danville, Va., indicated that a very appreciable saving could be obtained if a bearing having a high percentage of zinc was adopted as standard.

The annual expense of axle-bearing maintenance formed a major portion of the total annual motor expense, as considerable trouble was experienced with axle-bearing breakage. Practically all of these broken bearings had to be scrapped and new bearings substituted. Some of these broken bearings were practically new, whereas others were only half worn out. Nevertheless, it was found necessary to scrap them due to the character and location of the breaks and the expense of making repairs.

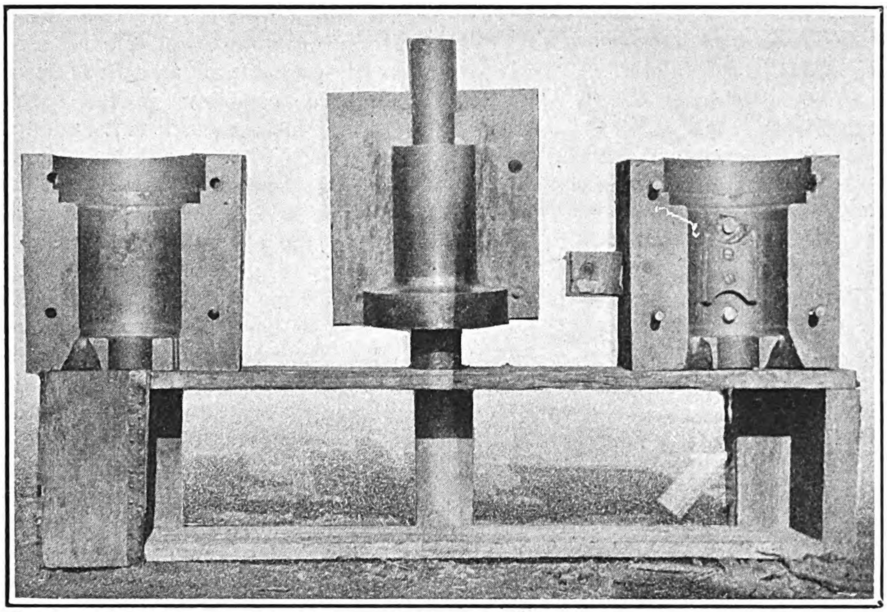


Set of Composition Axle Bearings Removed from Mold and Ready for Service

Experiments were started on the axle bearings of the GE-265 motor. A three-section steel mold was made in the shop. Careful consideration was given to the expansion and contraction factors of this mold, together with the shrinkage of the bearing metal, in order that a bearing could be removed from the mold and placed in service without any machine work other than slight filing of the edges. This mold is of rugged construction and is provided with heavy straps and dowels, so that the parts are held together accurately when assembled for the pouring of the metal. Provision is also made for casting the bearing waste window and dowel holes.

Bearings with various combinations of zinc, copper, tin and aluminum were cast and tested in service. After several trials, it was decided that the most satisfactory composition for toughness, nonbreakage and long life was 75 per cent zinc, 5 per cent copper, 10 per cent tin and 10 per cent aluminum. All of the GE-265 motor axle bearings have been equipped with bearings of this composition. Results obtained have been far better than was expected.

It is stated that two men can manufacture twelve sets of these



Appearance and Construction of Three-Section Mold Used for Manufacture of Axle Bearings

bearings an hour and that the bearing maintenance expense has been reduced 75 per cent since their installation. All broken or worn-out bearings are cleaned thoroughly and remelted for the manufacture of new bearings, so that little or no waste is experienced.

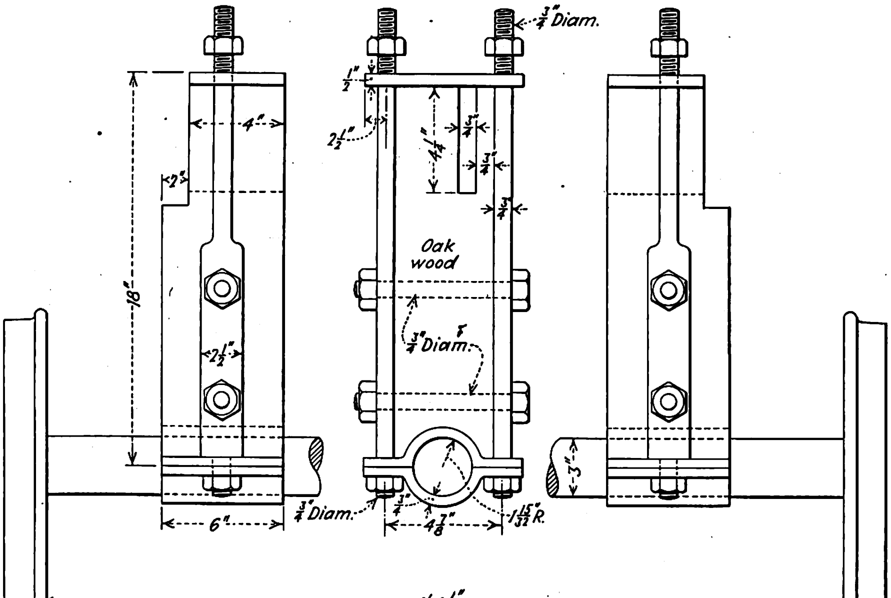
The results that have been obtained have been so encouraging that it is proposed to install these bearings on all motors in operation on the property.

> *Don't be a dead one, and have them "Say it with flowers,"*
> *Oil, inspect and overhaul your cars based on consumed power.*

Transporting Car Trucks with Broken Axles

SERVICE interruptions caused by broken axles have been reduced to a marked degree on the property of the Virginia Electric & Power Company, Richmond, Va., by the use of a dolly truck designed by the master mechanic, W. S. Hicks, and constructed in the shop. This truck consists of a pair of 11-in. flanged wheels with a 4-in. face, mounted on a 3-in. axle. Two pedestals are clamped to the axle and arranged for the support of the end of the truck frame. The body of the pedestal consists of an oak block about 17½ in. long, 6 in. wide and 4⅞ in. thick. The upper part of this block is notched to receive the steel angle frame of the truck and the lower end is fitted to the upper half of the axle clamp. A steel plate mounted on the top of the block provides a means for holding the truck frame angle rigidly in place. Two ¾-in. x 2½-in. flat bars, rounded on the ends and threaded, fasten the axle clamp to the axle and the truck angle frame to the pedestal. Two ¾-in. through bolts prevent splitting of the oak block and at the same time prevent shifting of the various parts. With the pedestal axle clamp fastened solidly to the dolly axle and the end truck frame angle set in the oak block slot and clamped down by the ½x4-in. plate a solid support for the truck is provided which permits skidding it to the place desired.

This equipment has afforded a means for rapid transportation of the car with the broken axle.

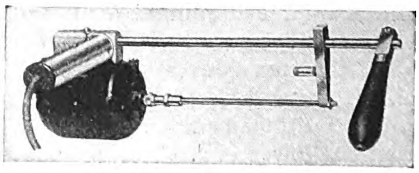


General Appearance of Assembled Dolly Truck. In Center, Appearance and General Dimensions of a Pedestal

New Equipment Available

Mica Undercutter Reduces Labor Costs

USE of a cutter of only $\frac{9}{32}$ in. diameter to facilitate ease in guiding and cutting commutator mica is a feature of a new electrically operated portable mica undercutter manufactured by the Hullhorst Micro Tool Company, Toledo, Ohio. This undercutter is sturdy and compact in construction and simple in operation. It can be operated at rapid speed by an unskilled man. An inexperienced workman can undercut mica to a depth of $\frac{1}{32}$ in. with this machine at a speed of 100 to 200 ft. per hour. The width of cut depends on the thickness of the cutter.



Portable Undercutter, Operating Handle and Other Details

The machine is driven by a Westinghouse motor and can be operated from any 110-volt lighting circuit by means of the attachment cord and plug. It is carried easily from one place to another by means of a case supplied with a leather handle.

Association News & Discussions

Central Traffic Meeting at Indianapolis

IN ACCORDANCE with the action taken at the last meeting of the Central Electric Traffic Association, the next regular meeting will be held at Lincoln Hotel, Indianapolis, Ind., on March 16 and 17, 1927, beginning at 9 a.m. Wednesday morning's session will be in the nature of a round-table discussion. Necessary committee work will be done the afternoon of March 16. The Thursday session will be devoted to reports of committees and such other business as may be properly presented.

Hotel reservations should be made with the Lincoln Hotel direct.

Southern Equipment Men Admit Manufacturers

MANUFACTURING companies or manufacturers' agents handling equipment or materials used by street railway operating companies may now be admitted as associate members of the Electric Railway Association of Equipment Men, Southern Properties. At the recent meeting of that association held in Memphis the by-laws were changed accordingly.

Dues for these associate members are fixed at not less than $10 per year, payable Jan. 1 for the ensuing year. Manufacturers or their agents wishing to become members should make application to the secretary of the association, A. Taurman, 2100 First Avenue, Birmingham, Ala.

American Association News

Rapid Transit

GENERAL discussion of rapid transit problems existing in the larger cities of the country took place at the meeting of the committee on rapid transit of the American Electric Railway Association held in New York on Feb. 25. An interesting point developed was that while rapid transit presents many peculiar problems individual to the local community, certain fundamental thinking should soon develop on principles. This should be set forth to guide cities facing the rapid transit situation in the coming few years. Managers of transportation companies in those American cities just below the fifth and sixth in size should have available fundamental data relative to types of systems, methods of financing and physical construction. These include relative advantages of two-track versus four-track tubes, minimum width of street to accommodate each and the economic conditions necessary for the various steps in the development of rapid transit business.

Members present were G. A. Richardson, chairman; D. L. Turner, Edward Dana, S. E. Emmons, R. E. Kerins representing J. S. Doyle, J. B. Stewart, Jr., Thomas Fitzgerald, E. J. McIlraith, R. F. Kelker, Jr., C. A. Burleson representing H. L. Andrews and H. E. Ehlers.

Special Rolling Stock Committee No. 2

DISCUSSION of essentials to be considered in the standardization of motor coach design and rules for inspection and maintenance of buses occupied the attention of special rolling stock committee No. 2, which met at association headquarters, New York, Feb. 7. Those present were V. W. Berry, chairman; H. C. Eddy, F. A. Klock, L. H. Palmer, T. L. Preble, A. J. Scaife and C. W. Stocks.

At the afternoon session G. H. Scragg, International Motor Company, who is also chairman of a committee formed to study and recommend uniform specifications for standard motor buses, was invited to describe the results which were being accomplished by his committee and work which they contemplated. He outlined a plan for a code of uniform requirements governing bus construction and explained that the work of his committee was sponsored by the N.A.C.C., which would print the final draft of the report. The report as at present outlined consists of five parts: (1) An introductory chapter giving general developments of the bus and looking forward to interstate regulation in 1928; (2) an analysis of the outstanding conflicts in the various state laws which have been analyzed to show how concessions can be made; (3) a discussion of every phase of regulation, both known and anticipated; (4) code of recommended practice to make possible the utilization or standardization of vehicles both as to size, weight and other requirements for the safety of passengers; (5) a complete index.

To avoid duplication of effort and save time, it was considered desirable to effect a close-working arrangement with Mr. Scragg's committee. This is to be done through Messrs. Stocks and Plimpton, each of whom is a member of one of these committees. Mr. Eddy, who is a member of the staff of the Board of Public Utilities Commissioners of New Jersey, explained how the standard motor bus specifications of that body were drawn up and told of the procedure used in reaching agreement. Mr. Eddy explained that there now are two sets of specifications being prepared, one to apply to buses of the city type, single deck, and the other to buses of parlor car design.

COMING MEETINGS
OF
Electric Railway and Allied Associations

March 8-10 — **Oklahoma Utilities Association, ninth annual convention, Huckins Hotel, Oklahoma City, Okla.**

March 16-17 — **Central Electric Traffic Association meeting, Lincoln Hotel, Indianapolis, Ind.**

March 17-18—**Illinois Electric Railway Association, seventh annual joint convention, Hotel Abraham Lincoln, Springfield, Ill.**

April 1—**American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.**

April 26-29—**Southwestern Public Service Association, convention, New Orleans, La.**

May 31—June 1-2—**Canadian Electric Railway Association, annual convention, Winnipeg, Man.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Oct. 3-7—**American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.**

With regard to the subject of inspection and maintenance standards, it was decided that questionnaires would be sent out asking for information as to methods that various companies are using. Members of the committee are also to communicate with companies in an effort to develop sufficient information on which to base recommended practices.

Public Service Section

UPWARD of 500 members attended a meeting of Public Service Company section A.E.R.A. on Feb. 18, at Newark, N. J. P. S. Young, vice-president of Public Service, and F. M. Rosseland, secretary-manager of the Newark Safety Council, spoke. Officers for the coming year were elected as follows: President, Philip F. Maguire; vice-president, Howard Briggs; secretary-treasurer, Joseph O'Driscoll; director for one year, William H. Shepherd; director for two years, James M. Symington; director for three years, George L. Walsh; director ex officio, Matthew R. Boylan.

There are now 395 members in the Public Service Company section, an increase of 77 since the gathering held last year in Jersey City.

The News of the Industry

New Franchise Draft in Omaha

A committee of 56, comprising leading business, professional men and labor leaders, has prepared a draft of a new franchise ordinance for the Omaha & Council Bluffs Street Railway, Omaha, Neb., that will be presented at once to the Council, with the request that it be voted on at the general city election on May 3. The franchise drawn by the company and submitted a year ago was voted down.

The new draft provides that the franchise shall run for 30 years instead of 40; that it may not be assigned to any out-state corporation or person; that the state royalty tax of $1,000 a year shall not be in lieu of occupation or similar taxes which may be assessed; that the Council may order extensions of lines, including bus service; that the company shall pay for paving, resurfacing and raising of track costs when ordered by the Council.

John L. Kennedy, a prominent citizen, who took the leading part in the negotiations, said that this step was necessary in order to save the railway system for the city. Action was vitally necessary this year as the company's $9,000,000 of bond indebtedness becomes due Jan. 1, 1928. Mr. Kennedy said that if the franchise election failed the city would be confronted with the danger of a receivership and a crippled system of transportation that might involve suspension of operation.

Discussion Put Over Until After Chicago Aldermanic Election

On Feb. 9 the committee on local transportation of the City Council of Chicago held its most recent meeting. At that time Alderman Joseph B. McDonough, chairman, complained of his inability to get all sides into a meeting at one time. It was suggested that three meetings be called on the theory that at one of those three meetings it might be possible to bring all the interested parties in.

A few of the Aldermen were frank enough to admit that they were not interested in traction matters or anything else just then, being in the midst of the aldermanic campaign. A motion to postpone all meetings until after Feb. 22, however, was defeated.

Bankers, traction officials and chairmen of the various bondholders' protective committees are prepared to tackle the situation, after the Aldermanic election. Now it appears that nothing is to be done until after the election on April 5.

Inquiry at the office of the transportation committee elicited the information that no meetings have been called and that none is contemplated until after that date. It is possible that some consideration will be given Mayor Dever's subway plan, but this does not involve any of the ordinances now before the committee.

Clarence E. Richard, writing in the *Journal of Commerce*, said:

> While the city hall seethes with pre-campaign turmoil and Aldermen are busy building their political fences and lining up their supporters for the mayoralty election in April as well as for the run-off between the high men, the traction problem has been lost sight of.
>
> Frequent attempts to get some one to discuss the question met with only puzzled looks—as if the city hall was unaware that settlement day is fast approaching, that the surface lines are now operating on a day-to-day grant that expires in a few months even if the maximum period is used up.

International Schedule Approved

The Public Service Commission on Feb. 24 revoked orders suspending schedules filed by the International Railway on Sept. 16, 1926, making increases in its rates for transportation in Lockport and on the Buffalo-Niagara Falls High-Speed Line and the Buffalo-Lockport-Olcott Divisions, and permitted the company to make the schedules, as filed, effective March 1 and to remain in effect for one year thereafter or until further order of the commission. The new fare in Lockport will be 8 cents. Six cents is now charged. The rate on the two other division will be increased from 2½ to 3 cents a mile.

Hearings were held by Commissioner Fooley in Buffalo and evidence was submitted covering operations in Lockport to Sept. 30, 1926. The commission's accountants allocated the fixed capital of the International Railway to the various communities served by it and also the revenues and expenses. The result of the commission's examination showed an operating deficit in Lockport of $37,640. The commission holds that the present 6-cent rate in Lockport is "insufficient to yield reasonable compensation for the service rendered and is unjust and unreasonable." The fixed book capital, as allocated to the city of Lockport, was $1,092,580.

The new mileage rate tariff applies to and from stations on the Buffalo-Niagara Falls High-Speed Line, also from Buffalo and Niagara Falls to Lockport via Division Street in North Tonawanda and to and from all stations between Buffalo and Olcott on the Buffalo-Lockport-Olcott Division, also from Buffalo and Lockport to Niagara Falls via Division Street.

The investigation by the commission brought the examination of the company's books down to Sept. 30, 1926, showing investment in road and equipment and operating results, segregated by localities. This investigation, based on book figures, disclosed an operating income of $113,488 for the year ended Sept. 30, 1926. The operating income of $113,488 provides a return of 1.61 per cent on the value of the road and equipment, $7,035,738, used in giving service on the two divisions.

Seven Cents in St. Louis—Grant Before Voters

The United Railways, St. Louis, Mo., on March 1 returned to the 7-cent fare as a result of the decision on Feb. 25 by a special court of three federal judges at Kansas City, Mo., which held that the company was not entitled to a continuation of the 8-cent fare or two tokens for 15 cents, a rate which went into effect temporarily on Feb. 7. The special court ruled that the federal court at Kansas City lacked jurisdiction so long as the railway's application for increased fare was pending before the Missouri Public Service Commission, inasmuch as the state body had not unduly delayed a decision. Under the terms of the court's ruling the railway is supposed to return to each patron the excess fare charged from Feb. 7 to March 1. The sum so to be returned is not believed to exceed $3,000 as receipts for extra fare were given to passengers only on request.

The United States District Court at Kansas City had previously issued a temporary restraining order against the Missouri Public Service Commission and other state officers to prevent interference with the charging of the higher rate of fare.

On Jan. 7 Receiver Wells had informed the commission that the company would put into effect the increased fare schedule in 30 days. The commission later suspended this schedule and it was then the company appealed to the federal courts.

The special court pointed out that the state commission had proceeded to examine into the fare situation as expeditiously as its machinery would permit and that the company should not have sought to override this process by filing its arbitrary schedule on Jan. 7. The three judges agreed that there was no evidence of dilatory tactics on the part of the commission.

The commission is expected to complete the audit of the company's books by March 10 and a decision in the application, which was filed June 7, is anticipated shortly after the commission audit is filed.

Mayor Victor J. Miller of St. Louis, Mo., will not officially present to the Board of Aldermen at this session of the board the measure to grant a blanket franchise to the St. Louis Public Service Company, which plans to purchase the properties of the United Railways at foreclosure sale in the near future. The Mayor has already made public the terms of the measure as tentatively drawn following numerous conferences with representatives of the company. It is the present plan of the Mayor to permit the company to propose the bill to the Board of Aldermen or to the voters by initiative petitions. He prefers a direct submission to the people. The company also wants the voters to pass on the measure.

The bill as drawn provides for a 30-year franchise if passed by the aldermen and a 50-year grant if the people approve. The company will operate on the service-at-cost plan under the bill. The time is now too short to get the proposition on the ballot at the municipal elections on April 5. The bill provides that should a special election be necessary the company must defray the cost of holding such election. This would amount to almost $50,000. The present session of the Board of Aldermen ends on April 11. A new president and fourteen of the 28 members of the board will be elected in April.

Open House in Williamsport—Carnations for the Ladies

During Saturday afternoon and evening, Jan. 22, the new carhouse and shops of the Williamsport Passenger Railway, Williamsport, Pa., were visited by more than 2,000 citizens of Williamsport. The company had invited the public to inspect its new quarters at West Third and Park Streets, and from 2 in the afternoon until 9 at night the place was thronged with visitors.

A number of very interesting and unusual features in the building were explained, and on exhibition were three new cars. On the new cars were signs describing them, and on the old car was a sign calling attention to its dilapidated condition and stating that after all the contemplated improvements were completed the company did not expect to operate cars of that character except in emergencies.

On the walls of the building were signs and charts and one large map showing the new trackwork that was done in 1926 and the cost of each item. Another sign described the "weekly pass," which the company was to put in use under the new fare plan, arranged to go into effect about March 1. Another sign had a large drawing of the metal tokens that will be sold two for 15 cents under the new fare plan and also contained two sample tokens, so that those visiting the exhibit could become familiar with them.

Music was furnished throughout the afternoon and evening by a ten-piece orchestra and coffee and doughnuts were served, the doughnuts being made in a motor-driven doughnut machine in full view of the visitors. Upon entering the building visitors were directed upstairs to the office portion, where women visitors were presented with carnations.

The lighting of the new carhouse was very brilliant and apparently every possible facility has been installed to make convenient the maintenance and repair of cars. Visitors to the building found that much attention had been paid to convenient arrangement and to easy supervision, as practically all partitions are of clear glass, so that operations in any department can be easily supervised.

Saturday evening at 6.30 L. W. Heath, the general manager of the company, gave a dinner at the Lycoming to the presidents and secretaries of the Rotary, Kiwanis, Lions and Exchange Clubs, Newberry Progressive Association, Merchants' Association, officials of Williamsport and South Williamsport, members of the traction investigation committee, bankers and representatives of the press, and at this dinner Mr. Heath gave a short talk, which he termed "A Report of Stewardship."

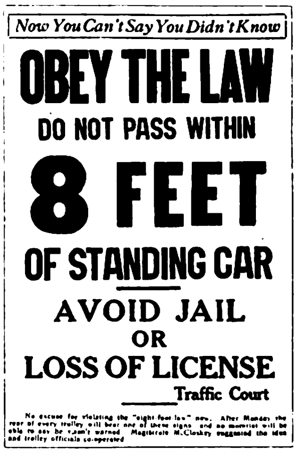
He briefly related the real progress to date, since the report of the railway investigation committee was made to the City Council a year ago, and stated that the railway situation in Williamsport and the method followed in improving it, providing better service and facilities, had been termed by railway men "The Williamsport Experiment," because, as far as was known, no other railway had ever applied to the city in the same co-operative way as had the local company, asking that it be investigated by a committee of business men, and that the result of what was being done is being watched with much interest in a number of other cities. Facts and figures were given to show that the railway to date was ahead of the program required of it by the committee's report, which was adopted by the city, and that the company had deferred for a year the increase in fare for the reason that it wished to show the people of Williamsport that it was going to do all that was required of it.

George Frey of the J. G. Brill Company said that the new cars built by his company for the local railway were probably the most elaborate cars they had ever made for city service.

After dinner was over, the party was taken on a tour of inspection to the new carhouse and shops.

"Eight-Foot Law" Reiterated in Brooklyn

Car cards bearing the direct warning from the traffic court against violation of the "8-ft. law" are being carried on both ends of the cars of the Brooklyn City Railroad and the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y. This poster was developed at a conference with representatives of the traffic court, the Police Department and the transportation companies in Brooklyn. It was suggested by Magistrate Francis A. McCloskey of Homicide Court and indorsed by railroad officials.



Now You Can't Say You Didn't Know

OBEY THE LAW

DO NOT PASS WITHIN

8 FEET

OF STANDING CAR

AVOID JAIL
OR
LOSS OF LICENSE

_____Traffic Court

No excuse for violating the "eight-foot law" now. After Monday the rear of every trolley will bear one of these signs and no motorist will be able to say he wasn't warned. Magistrate McCloskey suggested the idea and trolley officials co-operated.

Warning Signs on Brooklyn Cars

In the same place usually occupied by theater advertisements, motorists following a trolley car see this court announcement, "Obey the Law. Do not pass within 8 ft. of standing car. Avoid jail or loss of license. Traffic Court." Police officials concurred in the idea and promised to conduct a campaign of enforcement. It was said that railways in Manhattan would likely adopt the idea, which took tangible form in Brooklyn on Feb. 21.

Engineers Go Ahead with Plans for Chicago Subway

Completion of engineering plans, costs and specifications for a downtown subway in Chicago awaits only advice from the City Council, according to a recent announcement by R. F. Kelker, Jr., engineer for the local transportation committee of the City Council.

Upon instruction received from the City Council, Mr. Kelker, in company with other city engineers, has been constantly at work for the last ten weeks on a field survey of the plan recommended last August by the citizens' advisory subway commission for the construction of two subway routes under the Loop district; one a rapid transit tube under State Street between Chicago Avenue and Roosevelt Road and the other a low-level loop subway for street cars only under Washington, Michigan and Jackson Boulevards. Having recently completed this survey, upon which it is hoped the City Council will presently frame an ordinance, the engineers are now working on general specifications for any subway plan that may be adopted, especially the difficult rearrangement of sewers and public utility conduits which subway construction would make imperative.

Major Kelker is also studying the possibility of creating a mid-city elevated trunk line in the neighborhood of Ashland Avenue, connecting the Ravenswood and Englewood branches of the Chicago Rapid Transit system and assuring residents of the west side of the city direct north and south transportation without making it necessary to take a circuitous trip through the Loop district.

Mayor William E. Dever strongly advocates immediate construction of subways. He has indicated in recent speeches in his campaign for re-election that he will do all in his power to have a subway ordinance submitted to the voters at the judicial election next June.

New York's Mayor Urges More Money for Subways

Doubt appeared to have been removed on March 3 that the Legislature of New York would pass the resolution to submit the proposed constitutional amendment empowering New York City to borrow $300,000,000 outside its debt limit to build new subways. Mayor Walker urged the passage of the resolution at the hearing the previous day, but he was no more specific than he has been in the past, merely repeating the 5-cent fare and other political shibboleths handed down from Hylan, the former Mayor.

Late on March 3 a movement developed to delay the submission of the amendment to the voters until 1928, which will be a Presidential election year. This was started by Senator John Knight, Republican leader of the upper house, who asked Attorney-General Albert Ottinger whether it would be legal to provide for the submission next year instead of at the November election this year.

The Attorney-General gave an informal opinion that the Legislature had the legal power to delay submission, the State Constitution providing that a proposed amendment might be submitted in the time and manner that the Legislature might direct.

Attack on Minneapolis Regulatory Act

Should the Brooks-Coleman street railway regulatory act be repealed at the present Minnesota Legislature chaos would result. This was the opinion expressed by Charles B. Fowler, counsel for the Minneapolis Street Railway; Pierce Butler, Jr., counsel for the St. Paul City Railway, and Oscar Mitchell of the Duluth Street Railway, at a hearing before the Senate committee on legislation recently at the Capitol. Proponents of the repeal had their inning a week previously.

The Brooks-Coleman act was passed in 1921. Since then the electric railways of the state have been regulated by the Minnesota Railroad and Warehouse Commission as to issues of stocks and bonds and as to rates of fare.

At the previous meeting a special committee of the Minneapolis Civic and Commerce Association presented the following opposing resolution:

> Minneapolis car service is second to none in the United States.
>
> The act was passed after careful consideration by legislators, and citizens and civic organizations.
>
> Before enactment the electric railway situation was constantly injected into politics.
>
> Expense of reaching valuation figures to fix fares would be wasted by repeal.
>
> Fare fixing should be left to disinterested arbitrators.
>
> Since passage of the law differences between the Minneapolis City Council and the railway have been largely composed.
>
> Repeal would lose all that has been gained by such harmony and improvement of service.
>
> Chaos would prevail in the legal status of city and company by repeal.

.The three railway attorneys said that repeal would not reinstate the old franchise even if they had not expired as in the case of Minneapolis in 1923. The attorneys for St. Paul and Duluth took the opposite view. Mr. Fowler said the Brooks-Coleman act extends local control over railways. The main object is to provide a workable, practical and equitable method for having a rate of fare determined from time to time as conditions change. The Council represents its constituents and cannot do otherwise. In the very nature of things it must be biased in favor of the citizens. He said further:

> To such an extent has this view been adopted that there are 39 states which have public utilities commissions to which much more extensive powers are granted with reference to the regulation and control of utilities within cities than is given by the Brooks-Coleman act.

In case of repeal the company would try to get the highest rate it could. The battle would be on with the city over fares, extensions, improvements, etc. The situation would be worse than in 1921.

The St. Paul City Railway counsel held that repeal would make it impossible to refund $10,000,000 bonds in 1928 and the result would be receivership. The Duluth Railway counsel said a $3,000,000 bond issue to be refunded in 1930 would be in danger of finding no market.

Editorials were quoted from Twin Cities and Duluth newspapers opposing the repeal.

A decision is expected soon by the general legislation committee of the Senate.

"Turn Backward, Oh, Time——"

WHILE in New York Mr. Lowry inspected the new invention of Van Depoele & Sprague, which is a horseless car. Motors are built into the floor of the car and by wire are connected with an overhead current which propels the car along a steel track without horses being necessary. Mr. Lowry said:

"The car isn't practical yet, but if the inventors ever do get it where it is usable, you can rest assured the system will be adopted for Minneapolis."

The above statement is part of a clipping taken from the Minneapolis *Journal* of Feb. 23, 1887, and included in a special edition of the *Journal* distributed at the fortieth anniversary of the Minneapolis Real Estate Board on Feb. 23 at the Hotel Radisson.

N. B.—Mr. Lowry has ceased to expand the horse lines, but each year renews his faith in the electric lines.

Free Parking Space at North Shore Stations

Free parking space at stations for the automobiles of customers is the latest feature of service on the Chicago, North Shore & Milwaukee Railroad. This extra bit of service, started in connection with the railroad's Better Business Campaign, is expected to increase passenger traffic materially. On the Shore Line route parking space is provided at the Milwaukee, Racine, Kenosha and Ravinia stations. On the Skokie Valley route eleven stations provide this service. A special booklet, containing information about this latest innovation of North Shore Line service, has been prepared and is being distributed by station agents.

Completion of First Hole of Moffat Tunnel

President Coolidge, by remote control, set off the blast which broke down the last barrier between the two bores of the preliminary work of the Moffat tunnel on Friday night, Feb. 18, at 8.10 o'clock mountain standard time. Elaborate ceremonies in honor of the event were staged in Denver, conducted by Governor Adams of Colorado and broadcast from radio station KOA of the General Electric Company in that city.

The Moffat tunnel, boring under the Continental Divide, will be 6.04 miles long, the second longest tunnel in the World. It will be 3 miles shorter than that of St. Gothard under the Alps. Its completion will mark the culmination of a heroic struggle for the construction of a transcontinental route through Colorado, running from Denver to Salt Lake City. It will open the western slope of the Rocky Mountains to all-year traffic, connecting in the west with Moffat's original railroad below the snow blockage line.

With the utilization of the proposed Dotsero cut-off, a 41-mile branch railroad to be built from the west portal of the tunnel, the distance from Glenwood Springs, on the west slope, to Denver, will be reduced from 343 to 173 miles. The railroad in the tunnel will be electrified, electric locomotives hauling the trains. The steam locomotives will have their fires banked and will be hauled through with the trains. Tunnel construction work was started in October, 1923.

Extracts of Governors' Messages Continued

A digest of the Governors' addresses to the Legislatures was started in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 26. Five more messages are now added. They are from the states of Rhode Island, Tennessee, Washington, Connecticut and Wisconsin.

RHODE ISLAND

Aram J. Pothier, Governor, stated in his message to the Legislature that of late years there had been an increasing tendency on the part of the state to control the matter of the issuance of the bonds and stock of public utility corporations from the outset by giving to the regulating commission the power to pass upon the issue of securities of such corporations and to scrutinize the arrangement under which these are paid for. The results to be expected from it are, in the end, a great simplification of the problem of regulation, as under it the outstanding securities will gradually come to be, at least *prima facie*, the measure of the real investment devoted to the public service upon which it may ultimately be conceded a proper return is due. The purchaser of such securities would be assured that proper application was made of the funds derived from the issuance and public confidence would be created in the integrity of such securities.

The exercise of such authority by the Public Utilities Commission would make necessary the employment of expert engineers and accountants in order that its duties might be properly performed. Inasmuch as such regulation would largely inure to the benefit of the utility and the holders of its securities, it would appear proper that any such extraordinary expenses involved in reference to a particular issuance of securities be charged to the particular utility concerned. He therefore recommended to the General Assembly the passage of suitable legislation vesting in the Public Utilities Commission the power to regulate all issues of bonds and stocks of all public utility corporations in the state.

He recommended an increase in the gasoline tax from 1 cent to 2 cents per gallon, to go into effect on July 1, 1928. The Motor Vehicle Department, during the past year, has made an earnest effort to reduce the terrible toll of highway accidents.

TENNESSEE

It is the plan of Gov. Austin Peay to continue during the next two years to build state highways. He opposed any increase in the gasoline tax, believing that 3 cents a gallon was enough tax to pay on gasoline. Further, because his state could build and complete its state system of highways on the present tax, it was generally a fine thing to maintain a lower tax. He referred to the report of the Commissioner of Highways and Public Works, which contained suggestions for the regulation of travel and traffic on the state highways. Parking automobiles on the traveled portions of these roads was causing many accidents resulting in loss of life and property.

On the subject of buses, he said that regulation had become necessary to safeguard the security and comfort of the public; that exclusive franchises to operate these bus lines would be sought. Such franchises, if granted, would be exceedingly valuable and could be sold for large sums. He believed that the state had a right to part of the receipts from all bus lines. He recommended that a commission be created and invested with proper authority to regulate schedules, fares and service on all buses and bus lines and such form of transportation, and to receive and collect a right percentage of all the receipts accruing from such use of the roads by these buses and bus lines, or in lieu thereof that an annual tax be levied and collected in keeping with the value of the franchises and rights that they are using, whether or not they be exclusive.

He recommended proper legislation on the distribution and price of gasoline. On the question of public utilities, he recommended the abolition of the Board of Public Utilities, which he claimed never functioned to the satisfaction of the people. He reiterated his thoughts on the subject which were expressed in opening the campaign for Governor a year ago.

He recommended the passage of a bill to simplify corporation laws so as to encourage the investment of foreign capital in the state, and to save the loss of fees and revenues which the state is now losing through the use of foreign charters to corporations whose business was largely domestic.

WASHINGTON

Gov. Rolland H. Hartley reminded the state Legislature that he had previously expressed belief that the state was spending too much money for highways and had requested the reduction of motor vehicle license fees. He said he was still of the opinion that a smaller construction program could be carried on with better supervision, less cost and more satisfactory results to the general public.

CONNECTICUT

In Connecticut the problems of motor vehicle regulation become each year more numerous and pressing. Governor Trumbull, in his message to the General Assembly, urged upon the Legislature the creation of a joint standing committee on motor vehicles which should have exclusive charge of the consideration of all proposed legislation dealing with these topics. He said that it must be recognized that transportation problems and regulations of the various forms of vehicular traffic are becoming each year more vital to the economic stability of the industries and specific conditions of the inhabitants of the state.

WISCONSIN

Gov. Fred R. Zimmerman, in his message to the Wisconsin Legislature, has approved the segregation of the motor vehicle department, placed under a commissioner to be appointed by the Governor. He recommended that the property tax on all motor vehicles should be removed and an increased tax on gasoline should be substituted.

Free Rides in Spokane

Two business institutions of Spokane, Wash., have announced the policy of free car rides. For the second time in six months, Culbertson's, a department store, chartered all inbound cars of the Spokane United Railways for its semi-annual assistant buyers' sale, paying the company direct for all passengers carried between 9 and 10 a.m. on the day of the sale. Thousands of shoppers took advantage of the offer.

The second institution was the Clemmer Theater, which has announced it will pay the fare of any patron at its theater who presents a transfer at the ticket office dated the day it was taken to the theater and presented between 11 a.m. the opening hour, and 1. p.m.

Trolley Topics, published by the Spokane United Railways, says that the department store and other houses realize how necessary it is to have reliable and responsible transportation always at hand.

Old Richmond Franchise Relinquished

The Virginia Electric & Power Company, Richmond, Va., has formally surrendered all its old franchises and certified the agreement as to the surrender of its three toll viaducts within five years at the option of the city. The deeds of surrender were handed to City Clerk Alfred H. McDowell, who gave an official receipt for them. The form and style of execution of the documents were approved by the city attorney. When the city approved the so-called blanket traction franchise ordinance on Aug. 19, 1926, it was agreed that within six months the company would surrender the franchises whose privileges were included in the blanket agreement. The old franchises, all of which were operative until the blanket franchise was drawn to replace them, were acquired by the Richmond Passenger & Power Company, the Virginia Railway & Power Company and the Virginia Electric & Power Company as the local railway system in the city of Richmond developed.

Missouri Line Receives Franchise

A franchise for the construction and operation of an electric passenger and freight line with its Clay County terminus in Liberty, Mo., and its Jackson County terminus in Kansas City, Mo., has been recently granted by the Clay County Circuit Court. The right of way is said to be under option. This project was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 26, page 393.

Articles of association have been granted by the Secretary of State to W. E. Winner and eleven business men and land owners of Liberty and its vicinity. Construction plans, according to Mr. Winner, call for a 150-ft. right-of-way in Clay County. The men associated with the project are planning a double track.

The road will run northeast to the Missouri River from the point contemplated, crossing on its own bridge at a point approximately 3 miles south of Birmingham and a trifle to the west. Following the river east a short distance, the line would then branch off northeastward, passing just east of Birmingham. At a point approximately 3 miles from Liberty the plan contemplates a branch line east to the Atwood quarries.

$314,000 Expenditure at Macon Suggested

Virtual rebuilding of the entire railway system of Macon, Ga., at an outlay of $314,000 is proposed in an exhaustive survey made by F. L. Butler, copies of which have been received by Mayor Wallace Miller and members of Council of Macon. Mr. Butler is vice-president of the Georgia Railway & Power Company, which is included in the system of the Georgia Power Company, which also controls the Macon property.

In return for this expenditure, a very large one for a city of the size of Macon, the company wants the gross receipt tax of 2 per cent imposed by the city lifted, the pavement assessment levy imposed by the city lifted, and a cash fare of 10 cents with three metal tokens for 25 cents.

In addition to the main points set forth above a multitude of minor changes are proposed and the public utilities committee of Council awaits a report from the city electrical engineer, Charles H. Humphreys, before giving the proposal consideration. At least several weeks must elapse before the city will be ready to take up the matter with the company for discussion.

Bill Against Indiana Commission Killed

The Indiana Senate has killed the Cann bill, providing for the abolishment of the Indiana Public Service Commission. The vote was 30 to 17. Seventeen Senators entered the debate. Howard A. Cann, who introduced the measure, declared that the state administration defeated the bill. Many of the Senators who voted against the bill said in their arguments that any opposition to the present personnel of the commission or to its decisions was not a reason for abolishing the regulatory form of adjusting public utility relations with civic government.

Amendments to the Moorhead public utility bill in the Indiana Senate have been made as follows:

> To bring holding companies, whether inside or outside the state, under the jurisdiction of the Public Service Commission.
>
> To fix the value of utility property in all proceedings other than for rate-making purposes "as a going concern at the actual present fair value thereof," the idea being to exclude good will and other matters as part of the valuation.
>
> To require utilities to exhaust every avenue of appeal through the state courts before taking an appeal from a decision of the commission to the federal court.
>
> To make the commission on law conform with the Interstate Commerce Commission act as regards suspension of rates and reparations.
>
> To provide for the appointment of members of the commission by the Governor. Members of the commission would be removable for cause by the Governor, or on verified petition filed by any taxpayer in the Circuit Court at Indianapolis, with right of appeal from that court to the State Supreme Court as in civil cases.

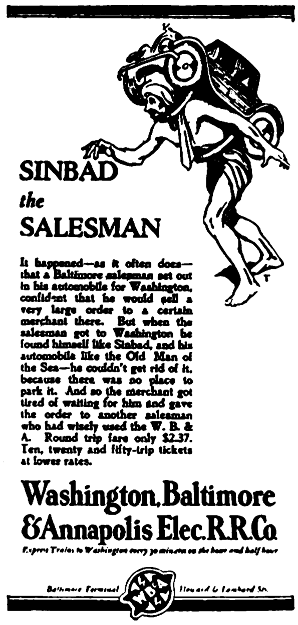
Developments in Los Angeles Fare Problems

In a message to the City Council on the railway situation Mayor George E. Cryer, Los Angeles, Cal., recommends the suggestion of the Municipal League that Delos F. Wilcox, traction expert, be brought to the city to advise on the railway problem now at the front with the application of the Los Angeles Railway for an increase in fares from 5 to 7 cents. The Mayor believes that Mr. Wilcox should be able to "assist us in the pending rate case," as well as to report upon other phases of the railway situation.

Meanwhile the application of the Pacific Electric Railway for fare increases on its urban and interurban lines operating in southern California is scheduled for hearing before the California Railroad Commission on March 10. The city of Los Angeles has already appropriated funds to oppose the rate raise.

Sinbad the Salesman in Bad

He couldn't get rid of it because there was no place to park and so the merchant got tired waiting for him and gave the order to another salesman. The latter was a wiser salesman because he had traveled from Baltimore to Washington on the Washington, Baltimore & Annapolis Electric Railroad. For him the round-trip fare was only $2.37, while the round-trip fare for the other salesman was too costly to be computed. The inability of Sinbad to rid himself of his burden, namely his automobile, is illustrated effectively in *Printers' Ink* of Feb. 3, 1927. In newspaper advertising the Washington, Baltimore & Annapolis Electric Railroad is meeting the problem presented by the motorized sales force.



SINBAD
the
SALESMAN

It happened—as it often does—that a Baltimore salesman set out in his automobile for Washington, confident that he would sell a very large order to a certain merchant there. But when the salesman got to Washington he found himself like Sinbad, and his automobile like the Old Man of the Sea—he couldn't get rid of it, because there was no place to park it. And so the merchant got tired of waiting for him and gave the order to another salesman who had wisely used the W. B. & A. Round trip fare only $2.37. Ten, twenty and fifty-trip tickets at lower rates.

Express Trains to Washington every 30 minutes on the hour and half hour

Baltimore Terminal Howard & Lombard Sts.

CONSPICUOUS EFFORT TO SELL SERVICE

The accompanying reproduction shows another conspicuous effort in the electric railways' campaign to urge the use of the electric line for transportation to the office, for shopping and to insure prompt attendance at the theater.

News Notes

Paving Question on Grand Rapids Ballot.—The City Commission at Grand Rapids, Mich., has approved by unanimous vote the plan to place on the ballot at the primary election on March 7 the charter change which will allow the commission to eliminate the charge now assessed against the Grand Rapids Railway for paving between tracks.

Fares in Annexed Region Reduced.—The Lynchburg Traction & Light Company, Lynchburg, Va., has reduced car fares in the annexed territory to 5 cents. The company has charged 6 cents since March, 1922, and since annexation sought to prevent the city from cutting the extra cent out. This was done by application to the federal courts for an injunction, but the District Court and Circuit Court of Appeals held they had no jurisdiction.

P. R. T. Released from Air Mail Contract.—Cancellation of the air mail contract for the route between Philadelphia and Norfolk via Washington is announced by the Post Office Department, the Philadelphia Rapid Transit Air Service, the contractor, having requested a release. The service was operated primarily as a passenger carrying line during the Sesquicentennial Exposition and had been suspended for the winter.

Wage Conferences in Augusta.—Negotiations are in progress between the management and employees of the Augusta Railway & Electric Corporation, Augusta, Ga. It is said that though both parties are agreed upon the main questions at issue, the company is unwilling to accede to certain demands involving money concessions upon the alleged plea of financial inability to meet added obligations under present conditions. Under the existing contract failure to reach an amicable agreement calls for arbitration.

Route Numbers for New Jersey Cars.—Trolley cars of the Public Service Railway, Newark, N. J., operating in the Essex Division are to carry route numbers, in addition to other signs indicating destination. The Central line cars already have been so equipped, and other lines will follow. Public Service bus lines have carried route numbers for some time, routes being designated by even numbers. Trolleys will have odd numbers, and the bus and electric railway lines operating in the same territory will have, so far as possible, contiguous numbers.

Rehearing on Permit Transfer Denied.—The Public Service Commission on Feb. 17 denied the petition of the Schenectady Railway for a rehearing on the commission's order, dated Oct. 6 last, consenting to the transfer of the certificate for the operation of a bus line between Schenectady and Guilderland, N. Y., from John Coons to Bohl Brothers, on the ground that sufficient reason had not been advanced by the railway for a further hearing. Bohl Brothers Inc., operating under another certificate covering a line between

Albany and Altamont, commenced through travel between Albany and Schenectady after the certificate covering the Guilderland-Schenectady line had been transferred to them. Following this action by the commission, the Schenectady Railway alleged that Bohl Brothers were operating between Albany and Schenectady by way of Guilderland in competition with it.

Expect Increased Revenues Since "Ride a Day" Urged.—"A Ride a Day Will Make Them Pay" was the slogan of the Ride the Street Cars Week in Seattle, Wash., which extended from Feb. 20 to 27 and which was sponsored by the Seattle Municipal Street Railway. Practically every civic club in the city co-operated in an effort to help lift the burden of debt from the lines. The Owl Drug Company gave away car tokens to all customers with purchases of 50 cents or more. All of the daily newspapers, in editorials and front-page stories, extended aid in advertising the plan.

Higher Fare in Johnson City. — A 7-cent fare for Johnson City, Tenn., was announced recently by D. R. Shearer, vice-president and general manager of the Johnson City Traction Company, following approval of the new rate by the State Railroad and Public Utilities Commission. An appeal for aid was prompted by the continued decrease in traffic, the deterioration of the cars and need for repairs to the tracks. Mr. Shearer said that at the present time the indebtedness was about $30,000. If the people would co-operate, he said he would put a plan in effect calling for a ten-minute schedule throughout the system and eventually would install buses to points of the city which are not now reached by the street cars. Any added income is to be diverted to improving the physical property.

Improvement Classes in Salt Lake City. — The Utah Light & Traction Company, Salt Lake City, Utah, has started night classes for supervisors, carhouse foremen and employees in general, by means of which they will be enabled to increase their knowledge of several subjects, including mathematics, mechanical drawing, English and spelling. Two nights each week are devoted to these classes. No charge is made. A large number has enrolled.

Higher Fare Approved. — The Citizens Railway, Clarksville, Tenn., has been authorized by the Tennessee Railroad and Public Utilities Commission to increase its cash fare by 2 cents. The new fare will be 7 cents with a 6-cent book rate and 3 cents for children. The old fare provided a 2½-cent fare for children. The railway system, with a trackage of only 3½ miles and at present operating only three cars is a semi-civic project, the stock being owned by citizens who fifteen years ago bought the system when operation was about to be discontinued by the private owners.

Express Service Discontinued.—The Jacksonville Traction Company, Jacksonville, Fla., has served notice of the discontinuance of its express service on the Brentwood line. The operation of the express cars has been carried on for the past two months as an experiment.

Recent Bus Developments

Bus Proposal Rejected

For Second Time Cincinnati Residents Vote Down Proposal to Replace Railway with Coaches

Two hundred and fifty citizens of Mount Lookout, a residential section of Cincinnati, Ohio, voted on Feb. 11 to refuse the offer of a four months trial of motor coach service to replace electric railway service. The proposal was made by Walter A. Draper, president of the Cincinnati Street Railway, after careful study of the transportation problem of that district and after many conferences with the special transportation committee of the Mount Lookout Business Men's Club.

The Cincinnati Street Railway is confronted with the necessity of reconstructing its tracks within a year or two on Delta Avenue, the route that serves Mount Lookout. Much had been said in conferences with the transportation committee about the feasibility of motor coach transportation, and it appeared that motor coach service might be more desirable to these people. The $175,000 necessary for new tracks would then be practically a loss. Work on the new tracks could not be started at once and the old tracks were already in rather poor condition.

It was proposed with the motor coach service to give a through line to the main business district of Cincinnati in both directions, whereas the railway furnishes through service only to the north. A transfer to Eastern Avenue at Delta is necessary if one wishes to go downtown, south on Delta. The rate of fare would remain the same as regular motor coach fare in Cincinnati.

In presenting the proposal to the people Mr. Draper said in part:

> In considering the suggestion I am especially desirous that it be understood that it is being made without any other motive than as outlined herein, and that is to give the people of Mount Lookout on Delta Avenue an opportunity to determine for themselves and by experience whether they prefer or can better be served by motor coaches or cars. Without trying motor coaches exclusively they cannot have the actual experience to be used as a basis for comparison. If they can best be served by motor coaches and prefer them after a trial, and if motor coaches are able to take the place of street cars in some communities, such as Mount Lookout, it would seem to me that it is desirable to find this out before expending the money and putting the new tracks in the street.
>
> It should be clearly understood that the matter is to be left to the people and that the temporary discontinuance of street cars should in every way be safeguarded so as to require the restoration of street cars in case your people should so desire.
>
> In conclusion I desire to say that this matter has been discussed with Edgar Dow Gilman, the Director of the Department of Public Utilities, and it is now being submitted to you with the approval of that department, the understanding being that the temporary operations proposed to be undertaken as a trial will be approved by the city if your people express themselves as desiring it to be done.

The real wishes of the people were expressed in the following motion:

> It is the sense of this meeting that we do not favor a substitution of motor coaches for street cars on Delta Avenue, even for a trial, but desire the street car service to be continued.

This is the second time the Cincinnati Street Railway has had a proposal to substitute motor coaches for railway service rejected in a thickly populated section. The other case was similar to this, except that the street paving was being renewed and the tracks were torn out. In that instance the company offered to substitute motor coach service for railway at once, or to have the center of the street left open and the sides paved while a trial of motor coach service took place. Both phases of the offer were rejected by the people in that district.

Connecticut Commission Reversed in Bus Case

Judge Newell Jennings of the Superior Court, sitting at Hartford, Conn., recently rendered a decision setting aside and declaring void an order of the Public Utilities Commission which granted to the New England Transportation Company a certificate to operate a bus line between Waterbury and Hartford via Milldale, Southington, Farmington and West Hartford.

In its original application the New England Transportation Company, which is a subsidiary of the New York, New Haven & Hartford Railroad, requested the Public Utilities Commission for a certificate to operate a bus between Danbury and Hartford via Waterbury. This it did despite the fact that the Waterbury & Milldale Tramway operates an electric railway between Waterbury and Milldale, a third of the distance between Waterbury and Hartford, and operates a bus line in conjunction with its railway between Waterbury and Milldale for some period of time. It applied to the commission for an extension of its bus certificate from Milldale to Hartford via Southington, Plainville, Farmington and West Hartford. The railway produced evidence to show that public convenience and necessity demanded the operation of a bus over the route which was proposed by it.

After the evidence had been closed, the Transportation company amended its route so that it paralleled that of the tramway. Notwithstanding the fact that the tramway had produced the evidence, the commission passed an order granting the certificate to the Transportation company. From this order the tramway appealed to the Superior Court and was successful when Judge Jennings recently decided that the commission erred in granting the certificate.

The decision in this case is of particular interest because a ruling of the commission has not been reversed by the Superior Court for some time. The appeal of the tramway acts as a stay, so that the Transportation company has been unable to operate between the terminals of the route.

The Transportation company has now appealed to the Supreme Court of Errors of Connecticut.

Worcester Consolidated Company Buys Lake Bus Lines

The Worcester Consolidated Street Railway, Worcester, Mass., has bought the Lake Bus Lines. Included in the transaction are seven buses, a large leased garage with a repair shop and the good will of the Lake Bus Lines, Inc. It is the first strictly "city" bus line bought by the railway and in a measure supplements the only other local bus lines operated by it.

When the Massachusetts Omnibus Company of Boston sent a fleet of eighteen buses to Worcester Mr. Carter, from whom the Worcester Consolidated Street Railway bought the Lake line, was in the trucking business. The bus company was forced out of business. Mr. Carter bought four of the buses for $1,600. He used them for a time to carry private parties, but finally established the Lake lines at the urgent plea of Lake district residents in Worcester. The Consolidated, in addition to its local routes, now operates buses to Marlboro, Clinton, Oakdale and Southbridge.

Bus Capacity Tax in Dallas Questioned

A test of a city's right in Texas to levy and collect from street car systems operating buses for carrying passengers the same per passenger capacity tax levied on other buses used as common carriers is to be made in Dallas, Tex. A temporary injunction was granted recently restraining John H. Cullum, county tax collector, from levying and collecting the $4 per passenger capacity tax, in addition to the regular registration fee, on seven of 21 buses operated by the Dallas Railway & Terminal Company. This company operates the railway lines in Dallas and runs 21 passenger buses as feeders. The petition of the railway sets forth that Tax Collector Cullum was tendered the regular registration fee for these trucks operated as passenger-carrying buses, but that he refused to accept such fee without the additional $4 per passenger capacity fee. The plaintiff also is asking that a writ of mandamus be issued directing Mr. Cullum to accept the registration fee and issue a license for authority to operate during 1927.

Holyoke Litigation Ends

The Holyoke Street Railway, Holyoke, Mass., has won a final and decisive victory over the appeal of the Interstate Buses Corporation, Hartford, Conn., for a rehearing of the case. The latter company has received notification from the United States Supreme Court that petition for a revival of the case has been finally denied. The final denial of the courts to hear an appeal will prevent the Interstate Buses Corporation from taking passengers between Springfield and Greenfield without the necessary licenses, which the company has been unable to secure.

The lines of the Holyoke Street Railway and Interstate Buses Corporation run parallel for a great distance between Springfield and Greenfield, Mass. The former company alleged illegal competition and sought to prevent the bus company from picking up passengers over any of this distance without first procuring licenses from the towns passed through.

The railway alleged that the bus company was acting in violation of a Massachusetts statute, while the Interstate company said the statute was unconstitutional. The trial a year ago was based on this argument and the result upheld the state of Massachusetts and its bus laws. The Interstate in its fight attempted to have an injunction issued to prevent officials from prosecuting bus drivers of the company. It succeeded in securing a temporary injunction in the state courts. Three judges of the United States District Court later ordered the bill dismissed. On an appeal the Supreme Court upheld the District Court.

Petition on Framingham Bus Substitution Heard

The petition of Franklin T. Miller, receiver of the Boston & Worcester Street Railway, Framingham, Mass., in which he seeks to gain permission to supplant bus service for electric railway service over parts of the lines, was heard recently before Judge Carroll of the Supreme Court.

Roland W. Boyden, representing the bondholders, said that any discontinuance of electric railway service would injure the good will at a sale of the property if a reorganization is effected. Mr. Boyden brought out that plans for reorganization were temporarily held up awaiting the action of the Public Utilities Commission regarding the valuation of property. Just recently the commission decided that the property had a valuation of $2,900,000. There is a bond issue of $2,500,000.

Mr. Boyden's request for a postponement for a month to permit plans to be made for a reorganization was granted.

New Line Authorized.—The Public Service Commission granted on Jan. 18 the petition of the Utica Railway Coordinated Bus Lines, Inc., for a certificate for the operation of another bus line within the city of Utica, N. Y. The line is about 3 miles long.

Certificate Granted.—The Public Service Commission on Feb. 25 granted the petition of the Rochester Railways Co-ordinated Bus Lines, Inc., for a certificate for the operation of bus lines from the city of Rochester to Manitou Beach, Grandview Beach, Island Cottage and West Greece, N. Y.

Bus Line Approved.—The Public Service Commission granted the petition of the Olean, Bradford & Salamanca Bus Line, Inc., for permission to operate a bus line between Olean and Salamanca and between Olean and the New York and Pennsylvania state line on the road to Bradford, Pa. This company is a subsidiary of the Olean, Bradford & Salamanca Railway, which is now in receivership, and which desires to replace cars with buses.

Bus Petition Granted.—The Public Service Commission on Feb. 25 approved the petition of the County Transportation Company, Inc., for a certificate calling for the operation of bus lines in Port Chester and Rye. Trolley service has heretofore been given in this territory by the New York & Stamford Railway, which discontinued its lines in December, 1926. The bus company is a subsidiary of the railway. The routes authorized by the commission are more extensive than the electric railway lines.

Abandonment of Unprofitable Service Favored.—A resolution was adopted recently favoring the proposal of the Wisconsin Public Service Corporation to abandon its unprofitable railway service in Two Rivers, Wis., and interurban service between Manitowoc and Two Rivers. The discontinuance was favored on condition that adequate bus service be installed under some plan agreeable to both cities.

Allowed to Run Bus Line.—The Public Utilities Commission has granted permission to the Connecticut Company to operate a bus line between Newington Junction and Hartford via West Hartford, Quaker Lane and Capitol Avenue. The company is planning to start operations over the new line about April 1. The service to be maintained will be decided upon after a trial period. The rate of fare between Newington and Hartford will be 20 cents or two tokens with the privilege of transfer. At the start an hourly headway will be arranged. It is planned to add a bus during the rush periods as the business grows.

Rush-Hour Service in Effect.—The bus service installed on Washington's Birthday by the Twin City Motor Bus Company to supplement railway service into Bryn Mawr of the Minneapolis Street Railway, under a recent permit of the Minneapolis, Minn., Park Board and the State Railroad and Warehouse Commission, operates only in rush hours. The service is every twelve minutes between 7 and 9:30 a.m. and 3:18 and 8 p.m. It is accommodating workers and school children in a newly settled community beyond Bryn Mawr and the center of Minneapolis. The settlement is not sufficient to warrant continuous service. The bus line is the first operated by the Twin City Motor Bus Company over parkways in Minneapolis and the fourth opened for the railway within the city limits since last fall. The regular fare prevails with transfer privileges.

Substitution by Bus Approved.—The Public Service Commission on Feb. 25 granted the petition of the Westchester Street Transportation Company, Inc., for authority to substitute bus service for street cars on a portion of its route in Scarsdale, N. Y., and authorized the putting into effect of its tariff of rates on one day's notice. This company is a subsidiary of the Third Avenue Railway. On Dec. 9, 1926, the commission authorized the substitution of buses for street cars in White Plains with the approval of the city authorities. On Jan. 26, 1927, the village of Scarsdale approved the substitution of buses for street cars, which the commission approves in this order. The company proposes to operate its lines in White Plains and Scarsdale in one continuous route. The rate of fare authorized within the city of White Plains or in the village of Scarsdale is 10 cents and from Scarsdale to White Plains or return 15 cents.

Financial and Corporate

Georgia Consolidation Concluded

Consolidation of six Georgia public utility companies into the Georgia Power Company has been completed with the issuance of a charter to the new company by Secretary of State S. Guyt McLendon. The new company begins operation at once.

Simultaneously with the granting of the charter the Georgia Power Company acquires title to and control of properties formerly operated by the Athens Railway & Electric Company, Georgia Railway & Electric Company, Georgia Railway & Power Company, East Georgia Power Company, Rome Railway & Light Company and the constituent Georgia Power Company, the last named including properties formerly belonging to the Athens Gas Light & Fuel Company, Georgia Southern Power Company, Georgia Utilities Company and Milledgeville Lighting Company.

In addition to the above companies subsidiaries of the new company include the Central Georgia Power Company, Macon Railway & Light Company and Macon Gas Company, serving the Macon district; the Mutual Light & Water Company, operating in Brunswick, and a number of others.

Officers of the new company, as designated in the charter, are: H. M. Atkinson, chairman of the board; P. S. Arkwright, president; G. W. Brine, Charles G. Adsit, F. L. Butler and F. P. Cummings, vice-presidents; W. H. Wright, secretary; I. S. Mitchell, Jr., treasurer; F. R. Mitchell, assistant treasurer; B. T. Simpson, assistant secretary, and Stephen A. Dawley, assistant secretary. With the exception of Mr. Cummings and Mr. Dawley, who reside in New York, all of the officers are of Atlanta.

Merger of the companies brings to an end, so far as names are concerned, some of the oldest utility companies in Georgia. At the same time it increases their scope of service in the new company. One of the oldest of the companies is the Georgia Railway & Electric Company, which came into existence in 1902. While this company continued to exist until the present, all of its properties were leased to the Georgia Railway & Power Company, organized in October, 1911.

The organization of the latter company was the first real step in the development of Georgia's vast water power resources, as it immediately undertook the development of the Tallulah, Tugalo and Chattooga Rivers in North Georgia, and this year will complete the last of a chain of six water power plants on these rivers, which have a total capacity of 284,500 hp. of electrical energy.

In addition to serving Atlanta with electricity, gas, steam heat and transportation, the Georgia Railway & Power Company has rendered service to many other towns and cities in the state. It was the largest of the companies involved in the consolidation and also the largest in the state.

The Athens Railway & Electric Company came into existence in 1910, and besides furnishing Athens with electricity, gas and transportation service, it also developed three water-power sites adjacent to Athens.

The Rome Railway & Light Company was chartered in 1906 and furnished electric light and transportation service to Rome.

The Georgia Southern Power Company, which served Dublin and surrounding territory, was organized in 1925. The Milledgeville Lighting Company was chartered in 1924.

St. Louis Sale Recommended

Special Master Williams in a report to the federal court on Feb. 24 recommended foreclosure sale of the properties of the United Railways, St. Louis, Mo., under a $9,790,000 issue of St. Louis Transit Company bonds in default since last October.

In this connection it has been indicated that United States District Judge Faris about March 20 will fix a date for the sale of the properties under foreclosure, as recommended by Mr. Williams. The court is also expected to fix the minimum or "upset" price at which the properties may be purchased. The foreclosure sale would quickly terminate the receivership, which began in April, 1919.

The recommendations of the special master was based on hearings for foreclosure under the mortgages securing the $9,790,000 St. Louis Transit Company 5s, the $4,500,000 St. Louis & Suburban general bonds and $3,000,000 of St. Louis & Meramec River Railway bonds. Interest on the Transit and the Suburban bonds has been in default since Oct. 1, 1926, and on the Meramec River bonds since Nov. 6, 1913. The bonds of the latter are held merely as collateral security for the Suburban generals. The Suburban general bonds cover that part of the car system taken over when the properties of the St. Louis & Suburban Railway were purchased by the St. Louis Transit Company.

The St. Louis Public Service Company has already been formed to acquire the United Railways properties at foreclosure sale. This company has been negotiating with city officials for a new franchise under the service-at-cost system, but no agreement has been reached on the rate of return to be allowed the company, nor on some tax questions, referred to elsewhere in this issue.

Financing of Porto Rico Railways Purchase Arranged

For the purpose of acquiring the Porto Rico Railways, Ltd., Ponce, P. R., and for extending and improving controlled properties, offering is made of $3,000,000 of 6½ per cent 30-year gold debentures of the International Power Company, Ltd., a public utility holding and operating company, which controls properties in Bolivia, British Guiana, Newfoundland, Porto Rico, Salvador and Venezuela. The debentures are offered by Royal Securities Corporation, Ltd., and G. E. Barrett & Company at 100 and interest yielding 6½ per cent and mature March 1, 1957. They are redeemable on 30 days notice at 105 and interest, payable at the rate of $4.86⅝ to £1.

Purchase in Norfolk Arranged

The stockholders of the Virginia Electric & Power Company, Richmond, Va., a subsidiary of the Engineers Public Service Company, have voted favorably on the propositlon to acquire the Norfolk Railway & Light Company, which is now operated by the Virginia Electric & Power Company under a 99-year lease entered into June, 1906. The Virginia Electric Company will acquire the capital stock of the Norfolk company on a basis of $33 a share in cash or one share 6 per cent cumulative preferred stock and $9 cash for each three shares of the latter. The Virginia company already owns 62,400 shares of the 66,000 shares outstanding of the Norfolk company.

Seattle Tax Decision Stands

The decision of the lower courts that the city of Seattle, Wash., must pay the Puget Sound Power & Light Company $545,370 to reimburse the company for taxes paid on the railway lines sold by the company to the city in 1919, together with interest, will stand. The United States Supreme Court on Feb. 28 refused to grant a writ of certiorari to review the case. Each side had appealed, the company from a decision by the Court of Circuit Appeals, which modified the decree of the District Court so as to provide payment from a special fund, and the city from the entire order. In a decision some months ago the Supreme Court held in a related case that the contract by which the company sold the street railway to the city was binding upon the city to pay the taxes for the year in which the sale was made.

Local Company Not Interested in Washington Interurban

The Washington Railway & Electric Company, Washington, D. C., has rejected a proposal that it take over and operate the Washington-Virginia Railway, now in the hands of receivers. The proposition which the Washington company was considering did not involve outright purchase of the holdings of the Washington-Virginia line, but called for a plan of joint control with certain Virginia interests, it was learned. Recently an announcement was made by the receivers that the holdings of the interurban would be sold at public auction.

The company operates electric cars from Twelfth Street and Pennsylvania Avenue over one double-track line to Arlington Junction, Va., where separate lines diverge to Alexandria and Mount Vernon and to Clarendon, Falls Church and Fairfax. The railroad also operates a bus line over the Lee Highway to Fairfax.

Twin City Expands

Net Income in Minneapolis and St. Paul in 1926 Shows Gain—Taxicab Control

The total operating revenue of the Twin City Rapid Transit Company and its subsidiary companies of Minneapolis and St. Paul, Minn., for the year ended Dec. 31, 1926, was $13,945,266, an increase of $1,566,914 as compared with the year previous. Total operating expenses were $10,322,488, compared with $9,234,088 for 1925. These facts were included in the annual statement of Horace Lowry, president of the company, to the stockholders.

CONSOLIDATED INCOME STATEMENT OF THE TWIN CITY RAPID TRANSIT COMPANY*

	1926	1925
Revenue from transportation	$13,825,851	$12,269,156
Revenue from other operations	119,415	109,196
Total operating revenue	$13,945,266	$12,378,352
Way and structures	$1,201,892	$1,215,796
Equipment	1,106,303	1,129,065
Power	1,198,256	1,270,698
Conducting transportation	4,475,622	4,391,692
Traffic	46,492	36,233
General and miscellaneous	1,217,687	1,248,919
Transportation for investment—Credit	*39,544*	*58,317*
Motor bus expense	1,115,778	......
Total operating expenses	$10,322,488	$9,234,088
Net operating revenue	$3,622,778	$3,144,263
Taxes assignable to operation	1,229,115	1,291,137
Operating income	$2,393,662	$1,853,125

Total non-operating income	$56,498	$184,631
Gross income	$2,450,161	$2,037,757
Rent for leased roads	$3,000	$3,000
Interest on funded debt	995,520	988,954
Interest on unfunded debt	5,887	......
Miscellaneous debits	7,311	8,375
Net loss miscellaneous physical property	1,636	......
Total deductions from gross income	$1,013,355	$1,000,329
Net income transferred to profit and loss	$1,436,805	$1,037,427

*The income statement for 1926 includes the operations of the Twin City Motor Bus Company.

The net earnings of the company's buses for the year 1926 were small because complete control and operation of all the bus lines operating between the cities of Minneapolis and St. Paul and local lines was not acquired until during the early part of 1926 and it required some months to obtain the authority necessary to consolidate operations on an efficient basis. The report stated that the management was satisfied that the operation of the bus properties would earn a much larger return during 1927.

During the latter part of 1926 a prominent Minneapolis investment house secured control of practically all of the taxicab companies operating in Minneapolis and St. Paul, as well as some outside points in the state, and was about to make an offering of the stock of the consolidated taxicab company. The railway management recognized that if this stock became scattered at the time it would be impossible for the company to enter that field of transportation in the future and for that reason, on Jan. 4, 1927, acquired a controlling interest in the taxicab combination. Mr. Lowry said that in view of the constantly increasing use of the motor-driven vehicle it seemed imperative that the Twin City Rapid Transit Company should engage, as far as possible, in all forms of public transportation, and inasmuch as it was already operating the local and intercity bus lines, it was only logical that the operation of the taxicab business should also be taken over.

The unification of the various competing cab companies will increase materially public transportation by the elimination of congestion, according to the management, which is satisfied that the Twin City Rapid Transit Company will be paid a fair return on its investment which has been made by it in the taxicab business.

During 1926 the company earned sufficient to pay regular quarterly dividends at the rate of 7 per cent per annum on its preferred stock and paid four quarterly dividends of 1¼ per cent on the common stock, which is 1 per cent more for the year than was paid during 1925.

Mr. Lowry referred to the previous report, which called attention to the provision in the commission's order fixing the rate of fare in the city of St. Paul. He referred to the general election in November on the city charter amendments for St. Paul and their non-passage by the voters, because of the fact, he said, that any voter not voting on the question at a general election had the effect of counting as a vote against the measure. He said that the management was now urging the St. Paul City Council to call a special election at which the city charter amendments only would be submitted. If the city did not take this action the company would be forced to seek other relief.

PROFIT AND LOSS ACCOUNTS OF THE TWIN CITY RAPID TRANSIT COMPANY*

Balance Jan. 1, 1926		$1,866,347
Additions for the year		1,436,805
Net adjustments	$30,247	
Dividends on preferred stock	210,000	
Dividends on common stock	1,100,000	
Balance carried forward	1,962,905	
	$3,303,152	$3,303,152

Revenue passengers carried	185,711,950
Transfer passengers carried	68,917,932
Revenue passengers per car-mile	6.34
Total passengers per car-mile	8.69

Stark Electric After Canton Lines

Negotiations for control of the city railway lines at Canton, Ohio, have been opened by officials of the Stark Electric Railroad, Alliance, Ohio, with offices of the Northern Ohio Power Company, which operates the Canton lines. The franchise of the Northern Ohio Power is about to expire. Launching plans for new operating rights that company asked the Council at Canton for an exclusive grant.

If this deal is consummated the Stark Electric will double its mileage. At present the company owns 30 miles of interurban track from Canton to Salem. The Canton system consists of 30 miles of track.

There have been several conferences between officials of the two companies, but no definite action has yet been taken. The outcome, according to E. W. Sweezy, general manager of the Alliance company, depends on the degree to which the Canton City Council cooperates with the Stark Electric in the proposal. Action in taking over the Canton city lines will not affect present interurban service to Canton and other near-by cities by the Northern Ohio Power Company. That company will continue to operate the intercity lines, surrendering only the city routes to the Stark.

Seattle & Rainier Property Tax Discussed

A resolution urging the City Council of Seattle, Wash., to enforce collection of a delinquent franchise tax owed by the Seattle & Rainier Valley Railway has been shelved by the Council utilities committee. The resolution, submitted by the Commonwealth Club, which is fighting the proposed purchase of the valley line by the city, states that over a period of years the railway is now in arrears approximately $75,000 in taxes. It was pointed out that the City Council, in closing the contract, to be voted on March 8, allowed in the price for the tax.

A new plan for collection by the city of the tax due has been proposed by Councilman Oliver T. Erickson and has been drafted in an ordinance by T. J. L. Kennedy for presentation to the City Council. Under present arrangements, the line exacts a 10-cent cash fare from patrons desiring a transfer to the municipal car lines. Of this 10 cents, half goes to the Seattle Municipal Railway and half to the company. Mr. Erickson proposes that the Rainier line reduce its fare, with privilege of transfer to the city-owned line, to 8⅓ cents, with the understanding that the city will credit the system with 1⅔ cents on each transfer accepted from the company's line, the amounts so credited to apply on franchise debt owed the city.

Wichita Property Reported Sold

Reports have it that the railway and bus lines run by the Wichita Railroad & Light Company, operating in Wichita, Kan., are to be taken over early in March by the Wichita Transportation Company. The latter corporation, it is said, is headed by Howard V. Wheeler, Robert B. Campbell and R. C. Clevenger, local capitalists.

Three Miles of Line Sold.—The board of directors of the Fort Loramie Railway, Fort Loramie, Ohio, and officers of the Western Ohio Traction Company recently completed the sale of 3 miles of railway line to the Western Ohio Traction Company of Lima. The latter company is now in possession of the holdings. The line was built in 1911 by the citizens of the section from Fort Loramie to Minister.

More Passengers Carried.—During the fiscal year ended Jan. 31, 1927, the Chicago Surface Lines, Chicago, Ill., carried 1,574,969,802 passengers, against 1,518,510,661 in the previous fiscal year, or an increase of 56,459,141 rides. Traffic handling facilities during 1926 were increased with the addition of 100 new cars and more than 99 per cent of the 3,639 cars now owned by the system are in service. October, 1926, marked the month of largest traffic for the system, when 135,878,579 passengers were carried. This exceeds by 2,929,063 rides the previous high monthly record made in December, 1925.

Rental Payment Declared on Manhattan Stock.—The regular quarterly dividend rental of $1.25 a share on stock of the Manhattan Railway is announced subject to the plan of readjustment by directors of the Interborough Rapid Transit Company, New York, which controls the former by lease.

Equipment Being Scrapped.—Scrapping of local railway and interurban equipment of the Ohio Service Company, Coshocton, has been started in Cambridge, Ohio. The work is being done by the E. P. Gaynor Company of Wheeling, W. Va. The company suspended its railway service between Cambridge and Pleasant City on Feb. 1. Bus service has been started in Cambridge and to points south, which had been served by the interurban line.

B.-M. T. Bond Rise in Effect.—The increased price for 6 per cent bonds of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., on sale by the War Finance Corporation went into effect on Feb. 15. Of an original offering of $18,199,200, the corporation has $10,262,000 unsold, the same total as on Feb. 3, when the increase in price was announced. The bonds are now offered at par and accrued interest against the price of 99½ and interest asked when the securities were first put on sale.

New Financing Arranged.—Day & Zimmermann, Inc., announce that the Southern Ohio Public Service Company, Zanesville, Ohio, has completed arrangements with Harrison, Smith & Company and Howes, Snow & Bertles, Inc., for new financing. Within the next few days, $2,100,000 first mortgage bonds will be offered, from the proceeds of which the company will pay off $690,750 first and refunding mortgage 6 per cent bonds of Southern Ohio Public Service Company. These will be called and redeemed on or about April 15, at 105, with accrued interest. The company is also paying off at par March 1 $1,000,000 Zanesville Railway Light & Power Company 6 per cent bonds. The Southern Ohio Public Service Company is the successor to the Columbus, Newark & Zanesville Electric Railway.

Legal Notes

ALABAMA—*Highest Degree of Care Must Surround Passengers.*

In a suit by a passenger who was thrown from the steps of a trolley car, as she was alighting therefrom, to the pavement, which was muddy and rough and which had been torn up by the defendant, in preparation of its resurfacing, the court charged that the duty of the railway was to exercise the highest degree of care and provide reasonably safe and convenient places for their passengers to ride, and see that no danger befalls them in and about the duty of their agents in carrying passengers on their cars. [Birmingham Elec. Co. vs. Sheppard, 110 Southern, 604.]

CALIFORNIA—*The Automobile Driver Is Not Without Responsibility.*

Plaintiff who was injured was a passenger in an auto, driven by her son, which was struck by a trolley car as it crossed the tracks. There was proof that the auto had been proceeding at a speed from 20 to 40 miles an hour; that the approach to the tracks was somewhat obstructed, but that the car could be seen at a distance more than 200 ft. west of the crossing; that the car bell was rung for a considerable distance from the crossing, and when about 50 to 60 ft. from the crossing the operator saw the auto for the first time about 6 to 8 ft. from the tracks. It was held that the last clear chance doctrine was only applicable to a defendant who actually perceived danger of plaintiff in time to avoid the accident by exercise of due diligence and it could not be held liable on the theory that it should have discovered the peril. [Chappel vs. San Diego & A. Ry., 251 Pac., 321.]

KENTUCKY—*Window Sash Falling on Passenger's Arm Not Necessarily Due to Company Negligence.*

Appellant's elbow had been resting on the window sash and the window fell, injuring his elbow. The contention was that the sash which fell was under the exclusive control of the carrier, and since window sashes, if in good order and properly fastened, do not fall, there arose a presumption of negligence. The proofs failed in this respect. The court took notice that window sashes are often raised and lowered by passengers acting independently and therefore the doctrine of *res ipsa loquitur* does not apply. [York vs. Cincinnati N. O. & T. P. Ry., 288 S.W., 750.]

MISSOURI—*Humanitarian Doctrine Held Inapplicable to Pedestrian Hit by Rear of Car.*

A person standing too near the track when a car rounded a curve was struck by the rear end. The motorman could not know the pedestrian would not step back to avoid the end of the car, especially as he had to look forward to avoid traffic. To recover under the humanitarian doctrine, the plaintiff must be seen in a position of imminent danger immediately impending, actually or constructively known to the defendant, and he must then fail to exercise ordinary care (proportionate to the calls of that danger), to avoid injury to the plaintiff. [Siegel vs. Wells, 287 Southwest. Rep., 775.]

MISSOURI—*Boy Climbing Tree Injured by Charged Guy Wire.*

A boy 13 years old, climbing a shade tree in a parkway, came into contact with a guy wire, originally installed by a telephone company, against which two sagging live wires of a power company had come in contact. The power company was held responsible. [Shannon vs. Kansas City L. & P. Co., 287 Southwest. Rep., 1031.]

NEW JERSEY—*Bus Drivers Must Not Turn Without Warning.*

A driver of a bus suddenly and without warning slowed down and turned to the left, crossing the entire width of the road. Plaintiff, who was following the bus in his auto, was forced off the road into a ditch, damaging his auto and injuring passengers. The court held that the jury was justified in finding negligence on the part of the bus driver. [Winter vs. No. Jersey Bus Co., 135 Atl., 473.]

NEW YORK.—*Sale of Bus Franchises in Cities of the Second Class.*

A statute requires franchises in cities of the second class to be sold at public auction to the highest bidder and provides regulations as to the giving of security, etc. The city of Yonkers offered certain bus franchises for sale, but reserved the right to reject any and all bids if not reasonably satisfied as to "the good faith, responsibility and legal capacity of the bidder or bidders." This clause was held not in accordance with the statute and tending to discourage bidders, hence would make the sale illegal. The ordinance also required the bidder to accept only a portion of a route if any such portion was considered a public convenience and necessity by the Public Service Commission. This also was considered illegal by the courts as it required the bidder to accept a franchise he did not bid for and which the common council did not sell. The proper course would be that if the route approved by the commission was materially different from that sold, the bidder should not be compelled or permitted to accept it. A provision in the ordinance requiring the bidder to connect with stations on a subway were held valid as they did not make the franchise indefinite and uncertain. [Yonkers R. vs. City of Yonkers, 218 New York Supp., 103.]

NEW YORK.—*State Controls Rapid Transit in Cities Unless It Has Divested Itself of that Power.*

An attempt was made to hold a city referendum by which the electorate of New York City might instruct the Board of Estimate as to its duty on rapid transit policies. On the plea of a citizen and elector, the City Board of Elections was required to omit from the ballot all reference to this matter. The State Court of Appeals held that the plan proposed was an attempt to supersede the State legislature and to take from the Board of Estimate certain powers and duties which had been conferred on it by state legislation. The plan also proposed to take away powers which the state had confided to the Public Service Commission. In the matter of rapid transit regulation, the cities of the state have not been fully emancipated from the power of the legislature. For these and other reasons given in its decision, a mandamus was granted. [McCabe vs. Vorhis et al., 153 Northeast. Rep., 849.]

NEW YORK—*Autoist Thought He Saw Red When That Was Impossible.*

A verdict was recovered as a result of a collision of a car and auto. One witness testified that as the car passed him it had a red headlight on it. All other proofs submitted were that the car was in proper operating condition; that a red headlight could only be shown as a headlight when the operator turned the so-called reverse lever in neutral position, in which case power could not be so transmitted to propel the car in either direction. The verdict was set aside, as against the weight of the evidence. [Baldwin vs. International Ry., 218 N. Y. Supp., 599.]

OHIO—*Attempt by Bus Operators to Preserve Individual Identity but Operate as a Unit.*

The Public Utilities Commission had issued certificates for the operation of buses to certain individuals along a state highway, in competition to the service furnished by the petitioner. An application was made by the petitioner to revoke the certificates on the ground that the holders thereof were operating as a partnership under the name of Red Star Transportation Company and that they had obtained the certificates of convenience and necessity by representing themselves to be engaged in operating as individuals when they were in fact a partnership and that they had renounced their certificates by operating as a partnership. The proof showed that the individuals had employed a common manager, had a joint schedule, shared certain expenses and purchased certain equipment from common funds. It was held that unless the evidence also shows that such operators so taking the profits shared them not only as principals in a joint business, but that each had an express or implied authority to bind the other as principal and agent, the relief played for will not be granted. [So. Ohio P. S. Co. vs. P. U. Commission of Ohio, 154 N. E., 365.]

WASHINGTON — *Certificate Properly Withheld from Bus Company, Even Though Promising Through Service.*

The Department of Public Works properly denied the application for a certificate for operation of through bus service between two towns where existing bus service required two transfers. However, in each of these two cases the transfers were made in the same bus station, through tickets were sold and no complaint had been filed that this service was inadequate or insufficient for the public need. [State vs. Department of Public Works et al., 250 Pacific Rep., 1088.]

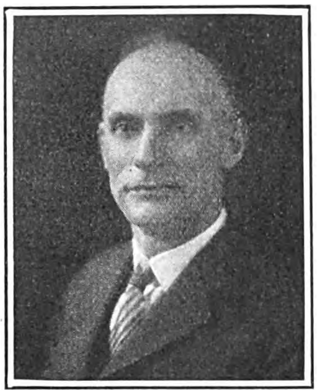
Personal Items

Del A. Smith General Manager at Detroit

Official Who Has Been Acting Manager of Municipal Railway Is Named to Succeed H. U. Wallace

Del A. Smith has been named general manager of the Detroit Department of Street Railways, Detroit, Mich., by the Street Railway Commission. He was made assistant general manager of the municipal system on Dec. 15, last, and became acting general manager on Jan. 1, when the resignation of Col. H. U. Wallace, former general manager, became effective.

During the absences of Col. Wallace last year, Mr. Smith had active charge of the municipal system and demonstrated his ability and his knowledge of street railway operations. His former appointment as assistant general manager filled a vacancy in that office which had existed after the resignation of H. M. Gould.



D. A. Smith

Mr. Smith has worked up through the ranks in various positions from conductor in the interurban service.

His electric railway experience began in 1905 when he started as conductor on the Jackson division of the Detroit United Railway, the Detroit, Ypsilanti, Ann Arbor and Jackson line. Prior to that he had been in the train service of the Chicago, Milwaukee & St. Paul Railroad. He was made carhouse foreman with the Detroit United lines in 1907. From that position he was promoted successively to assistant division superintendent in 1911, night superintendent in 1916, supervisor of fare collections in 1918 and division superintendent in 1919.

On May 15, 1922, he was transferred to the Department of Street Railways with the city lines when they were taken over by the city from the Detroit United Railway. He was made assistant superintendent of transportation in July, 1922, and superintendent of operation on Dec. 1, 1924. His next promotion was to general superintendent, Nov. 9, 1926, which position he held until he was made assistant general manager.

Mr. Smith's appointment as general manager was made by Street Railway Commissioners John J. Barlum and H. H. Esselstyn. The third member of the commission, G. Ogden Ellis, is making a world tour, but it was announced that Mr. Smith's appointment had his full approval. The salary of the new general manager is $12,000 a year.

Following the appointment several improvements and extensions of the municipal lines suggested by Mr. Smith were approved by the commissioners. The estimated cost of the extensions totals $280,000 and work will start as soon as weather permits. All the improvements and extensions are to be financed out of the revenues received from the lines. It was also announced by Mr. Smith that the Detroit Municipal Railway has begun the rehabilitation of about 1,000 cars, the work being done in the Highland Park shops. It is planned to continue this work at the rate of about 100 cars a month.

Mr. Smith's appointment has been very highly approved by his associates and other employees of the municipal system, whose interests he has at heart and whose problems he understands by virtue of his past practical experience. His selection was also pleasing to city officials in departments with which he has come in contact and co-operated during his long service with the street railway.

Other Changes in Stone & Webster Personnel

In furtherance of recent changes in the personnel of the Stone & Webster management announcement has been made of the following assignments:

George H. Clifford, formerly district manager of the companies located in the southwestern district, has been appointed division manager in charge of companies located in the southwestern district, the Virginia Electric & Power Company and subsidiaries and the northern district properties of Eastern Texas Electric Company (Delaware corporation). Mr. Clifford's headquarters will be in the Boston office beginning April 1.

Walter H. Burke, formerly manager of the Northern Texas Traction Company and Tarrant County Traction Company, has been appointed district manager of the companies in the southwestern district, comprising the properties located in Texas, Louisiana, New Mexico and Mexico. After March 15 Mr. Burke will be located at Houston, Texas.

Alfred F. Townsend, formerly manager of the Florida Motor Lines, Inc., and its affiliated companies and vice-president of Florida Motor Lines, Inc., has been appointed manager of the Northern Texas Traction Company and Tarrant County Traction Company.

Philip M. Wentworth, formerly manager of Cape Breton Electric Company, Ltd., has been appointed manager of Florida Motor Lines, Inc., and its affiliated companies, and elected vice-president of Florida Motor Lines, Inc.

Leon E. Seekins, formerly assistant to the manager of the Lowell Electric Light Corporation, has been appointed manager of the Cape Breton Electric Company, Ltd.

Luke C. Bradley, formerly president of the Virginia Electric & Power Company, assumed his new duties as president of the Rhode Island Public Service Company on Feb. 20.

William E. Wood is now president of the Virginia Electric & Power Company.

The two last-named changes were announced in the ELECTRIC RAILWAY JOURNAL issue of Feb. 12, page 313.

Los Angeles Superintendents Exchange Positions

Ernest R. Dye, superintendent at Division 3 of the Los Angeles Railway, Los Angeles, Cal., and George E. Ferguson, superintendent at Division 5, exchanged positions on Feb. 15.

Superintendent Dye went to the company in 1899, serving as a conductor out of Division 1, and was later transferred to Division 5. He resigned from the service in February, 1902, but was re-employed as conductor at Division 1 in August, 1903. In August, 1919, he became extra student instructor at Division 5, regular instructor in February, 1920, and was made superintendent of Division 3 in February, 1921.

Superintendent Ferguson entered the service of the company in October, 1905, as conductor out of Division 2. He resigned in April, 1912, and was re-employed a year later as motorman. In February, 1914, he was made extra dispatcher, and regular dispatcher in June, 1917. About three years later he entered the schedule department, was made special representative of the superintendent of operation in April, 1921, acting division superintendent of Division 5 in May, 1924, and regular superintendent of that division in January, 1925.

Neal Brewster was nominated by Governor Smith, and his name sent on Feb. 28 to the Senate for confirmation as a member of the Public Service Commission, to fill the vacancy caused by the expiration of the term of Charles Van Voorhis. Mr. Brewster was born at Weedsport, Cayuga County, N. Y., Jan. 30, 1879. He was graduated from Syracuse University in 1902 and was admitted to the bar the same year. Since that time he has been engaged in the practice of law in Syracuse, being a member of the law firm of Lee, Brewster & Johnson. He was Collector of Internal Revenue at Syracuse from 1915 to 1920 and City Comptroller of Syracuse from 1922 to 1926.

Sir J. Henry Lamperd, traffic expert of Melbourne, Australia, and head of the traffic system there, is on a visit to the United States to study traffic regulation. He arrived in Philadelphia recently for a brief study of Philadelphia's Traffic Bureau. He intends to survey conditions in other large American cities.

Richmond's New President

"Will" Wood Has Been with Stone & Webster Twenty Years in Many Capacities

Just twenty years ago a youth fresh from algebraic tussles at the Georgia Institute of Technology entered the already famous office of Stone & Webster at Boston to match his ingratiating South Carolinian accent against the more customary twang of the resident Yankees. It was "Will" Wood, and "Will" Wood it has remained to this day, although the more formal cognomen of "W. E. Wood" has been gracing more and more important documents with the passing years.

To be "cabined, cribbed, confined" to an office stool was not to young Wood's liking. After a year in Boston, he was transferred to Jacksonville to go through a realistic course of nuts to soup, viz., from the nuts on the controller to the superintendency of the Jacksonville Traction Company in the period 1907-1912.

Rising Stone & Webster men appreciate the adage that "a rolling stone gathers no moss," barnacles or other impedimenta toward an unclogged judgment. In 1916 "Will" Wood made his first shift by going to Houston as general superintendent. A little later he learned something of the noble width of Texas in becoming superintendent of the El Paso Electric Company, but in 1918 he returned as a neighbor to Houston in becoming local manager of the Galveston Electric Company. Two years later saw him manager of the Houston Electric Company and the Galveston-Houston Electric Railway.

W. E. Wood

UNDER MR. BRADLEY'S EYE

In these Texan years the ability, sincerity and likableness of "Will" Wood had been noted at first hand by the keen, kindly eyes of Luke C. Bradley, manager of the southwestern district of Stone & Webster. So when that firm took over the Virginia Railway (now Electric) & Power Company, with Mr. Bradley as president of the new concern, it was "Will" Wood who was invited to become ranking vice-president.

These two men, with other able companions brought up from Texas, took the reins at Richmond on July 1, 1925. Within the next year and a half the brilliant results accomplished there in better public relations led to a flattering offer to Mr. Bradley to accept the presidency of the Rhode Island Public Service Company, Providence, R. I. With twenty years service in the Stone & Webster organization, "Will" Wood, in February, 1927, had become president of one of its largest properties. Thus, the bare outline of achievement.

As "Will" Wood toiled upward, he never forgot to help his fellow-workers on or off the property. The records show that almost from the first he was an eager worker in territorial associations for mutual service. In 1925, his last year in Texas, he was elected president of the Southwestern Public Service Association. Perhaps he treasures even more than this honor from fellow-craftsmen the warm-hearted message which a group of big Houston men spread on the parchment, when he left for Virginia, to let him know he was loved as a man and respected as a useful citizen whose place in community affairs would not be easily filled.

As for the utility men of the Old Dominion, they waited no longer than the first convention to which Mr. Wood was a delegate to make him their president.

"How do they do it?" is the question always asked about men who get there. No copybook maxims will be quoted about "Will" Wood, but let this comment of a co-worker suffice: "He's so square and good-natured that you just can't get mad at him."

Obituary

Charles Sidney Baxter died recently at his winter home in Miami, Fla. He was in his 60th year. He was admitted to the bar in 1895 and for some years was in charge of the law department of the Boston Elevated Railway, Boston, Mass. He was Mayor of Medford, Mass., for four years and took an active part in many political campaigns.

Edward Carpenter Wood, president of the Mica Insulator Company of New York City, Chicago and Schenectady, N. Y., died on Feb. 17 in New York. Mr. Wood was a pioneer in the mica insulation industry and played an important part in the development of "Micanite," which was put on the market by the Mica Insulator Company in 1893 and of which the company has been the sole manufacturer ever since. Mr. Wood had been identified with the Mica Insulator Company since its inception in 1893.

Edwin Samuel Ely, consulting engineer for the Virginia Electric & Power Company, now under Stone & Webster management, died on Jan. 16 at Norfolk, Va. He had rendered a truly valuable service to his company, and, after all, a service in favor of the community. Through the 25 years that he was associated with the system and its people he was always to be found the same—a dealer in kindliness and fair play toward his friends and business associates and a clean influence for good throughout the organization.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Central Western Roads Go Ahead

Expenditures for Rolling Stock Feature $7,500,000 Programs of Nine Ohio Companies

Many electric railways in Ohio are planning betterments and improvements of rolling stock and equipment this year.

The Cincinnati Street Railway proposes capital expenditures in the amount of $3,000,000. This will go toward new shops, additions and betterments to way and structures and miscellaneous improvements.

The Cleveland Railway is planning an expenditure of $2,050,000 for carhouses, new cars and buses.

While the Community Traction Company, Toledo, has not definitely decided on the new capital expenditures for this year, due to the fact that the proposed ordinance under which such expenditures would be made has not been passed, it is estimated that approximately $1,500,000 is required for rehabilitation not absolutely essential to the operation of the property but highly desirable.

The Chillicothe Electric Railway, Light & Power Company and the Ohio Utilities Company, which are owned and operated by the same interests, will expend $500,000, but the bulk of it will go toward the electric light department.

The Wheeling Traction Company, which operates in Washington, Jefferson and Belmont Counties, Ohio, probably will spend from $200,000 to $250,000 on track and roadway in Belmont County this year. In this instance it seems unlikely that any new rolling stock will be acquired during this year.

According to J. M. Pogue, general manager of the Indiana, Columbus & Eastern Traction Company, with headquarters in Springfield, Ohio, about $130,000 will be expended this year. Of this amount $80,000 will go toward track improvements and $50,000 toward new freight equipment.

The Cleveland Southwestern Railway & Light Company will expend approximately $75,000 for way, structures and power.

Track of the Steubenville, East Liverpool & Beaver Valley Traction Company east of Steubenville will be relocated at a cost of about $30,000.

The Dayton & Western Traction Company is committed to no fixed program of capital expenditure.

The Toledo & Western Railway, the Lima-Toledo Railroad and the Lima City Street Railway have not made their estimates for 1927 up to this time.

The Lake Shore Electric Railway will spend $150,000. New car seats will cost $30,000, snow-fighting equipment $10,000, overhead construction $100,000 and track improvement $10,000. The Lorain Street Railroad, controlled by the Lake Shore, will spend $100,000, of which $60,000 will go toward passenger cars and $25,000 for substations and $15,000 for carhouses.

Lead Production Higher

January lead production by countries which supplied about 85 per cent of the world's output in 1925 was calculated last week at 131,783 tons, compared with 118,845 tons in January, 1926. The monthly average output in 1926 was 122,023 tons.

First Reservation Sought for Car Space at Cleveland

Fred Dell, director of exhibits of the American Electric Railway Association, announced on March 4 that he had received his first request for track space at the Cleveland convention. J. R. Blackhall, vice-president of the Chicago & Joliet Electric Railway, Joliet, Ill., has indicated that he will show a new type of city car in Cleveland next October. One of the interurban cars of this company was exhibited at Cleveland last year by the Cummings Car & Coach Company. The receipt of this request for reservation of space seven months prior to the convention indicates quick response to the appeal of President Sawyer to the industry for a representative car exhibit.

Electrification Extended by Mexican Railway

The officials of the Mexican Railway Company, Ltd., have arranged for the extension of the electric zone now operating over the Maltrata Incline eastward to Paso del Macho, a distance of about 22 miles. The most difficult portion of this grade section was converted to electrical operation in 1924, and during the past year an additional 17 miles was placed in service.

The extension now under way will require an additional substation which will be located at Portrero, a short distance east of Cordoba. Equipment for this extension, which will be supplied by the International General Electric Company, includes line material and bonding, and a complete 3,000-kw. substation, to contain two 1,500-kw., 3,000-volt synchronous motor-generator sets with transformers, switchboards and switching equipment. This station will be a duplicate of the present substation except in capacity.

When this extension is completed there will be a total of about 70 miles of electrified track running through the severest grade section of the line between Mexico City and Vera Cruz. Grades run as high as 5.25 per cent maximum, with an average of 4.7 per cent for about 25 miles. The remainder of the electric zone ranges from 2 to 3 per cent. All trains on these grades will be handled with regenerative electric braking and it is expected that the same 150-ton locomotives used on the original electric zone will be used on the extension.

The overhead line will be supported entirely by steel structures fabricated from used rails which the company has on hand. Due to the circuitous route followed by the railway tracks, the entire 70 miles will be fed from two substations. The motive power for the electric zone, all of which was furnished by the International General Electric Company, included ten locomotives of the six-axle type, with a normal hourly rating of 2,700 hp. These have been in service since 1924.

American Brake Shoe Has Record Year

American Brake Shoe & Foundry Company reports for 1926 net profit of $3,029,216, after charges, depreciation and federal taxes. This is equivalent, after preferred dividends, to $15.04 a share on the 156,928 shares of no-par-value common stock. It compares with $2,786,607, or $13.57 a share, on 156,093 shares outstanding in 1925.

The balance sheet as of Dec. 31 shows total assets of $30,108,590, against $28,747,182 at the close of 1925, and a profit and loss surplus of $9,640,486, compared with $8,119,314.

In his report to the stockholders, Joseph B. Terbell, president of the company, writes:

> A new wheel plant is under construction at Toledo, Ohio, similar in design to the new St. Louis plant. The building of this plant is necessary in order to take care of the increasing business in that district.
>
> A further extension of the car wheel company occurred in December by the purchase of the plant and equipment of the New York Car Wheel Company of Indiana, located at Hammond, Ind. Your companies have not heretofore sold wheels in the Chicago territory. The Hammond plant is located on one of the belt lines of Chicago, giving it access to the various railroads entering that city. Based upon the previous tonnage of wheels produced by this plant, we expect the earnings will justify its purchase.
>
> A new brakeshoe plant has been established in Pittsburgh, Pa., by converting the plant of the Pennsylvania Casting & Machine Works into a brakeshoe foundry. With the addition of this plant we now have, with few exceptions, brakeshoe plants at all of the larger railroad centers.
>
> During the year the American Brake Materials Corporation was incorporated to take over the manufacture and sale of "brakebloks" designed for use on automotive equipment. It is expected that by the first of April the corporation will begin operations at Detroit, where new machinery is now being installed.
>
> Our two principal associated companies, the Ramapo Ajax Corporation and the American Manganese Steel Company, have each shown satisfactory results, the latter having enjoyed the largest net earnings in its history.

Time Extended for Work on Texas Interurban

The City Commission at Dallas, Tex., has voted the Dallas Southwestern Traction Company until Dec. 31, 1927, to construct 5 miles of the proposed interurban line from Dallas to Irving.

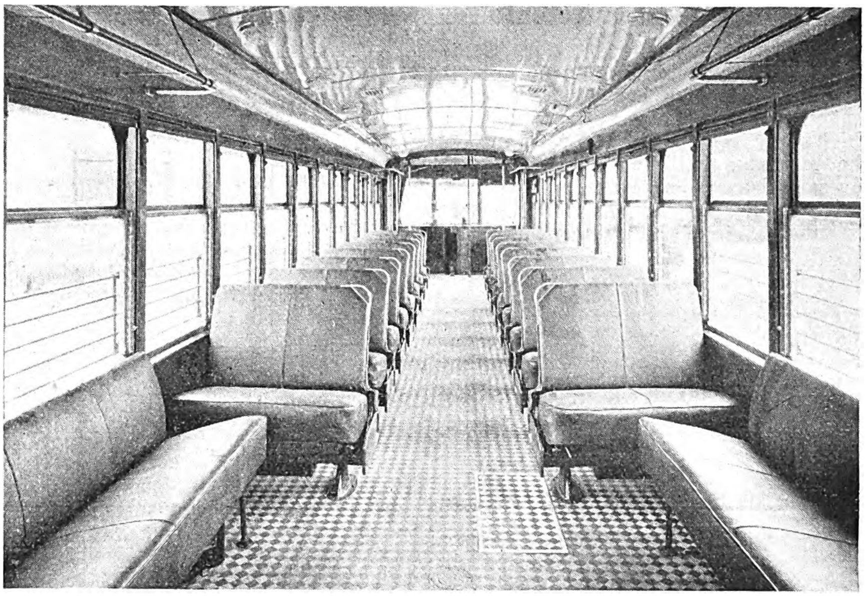
The action was taken at the request of E. P. Turner in compliance with provisions of the charter franchise granted the company and on payment by the company of a forfeit of $1,400 in bonus money of the $15,000 fund originally deposited with the city when the franchise was granted.

Mr. Turner in the application for an extension of time pointed out that at least 82 per cent of the grading for the line already has been completed, but that the company has so far been unable to dispose of bonds for financing the completion of the line.

It originally had been stipulated that the company must have completed 10 miles of the line by a certain date, which has been extended previously from year to year. By the action just taken the City Commission reduced the mileage that must be constructed in the time limit from 10 to 5.

Brill 177-E Trucks for Fitchburg Order

Brill 177-E trucks will be used on the four double-truck safety cars ordered by the Fitchburg & Leominster Street Railway, Fitchburg, Mass., and also on the 25 double-truck safety cars recently ordered by the Eastern Massachusetts Street Railway. In announcing the award of the Fitchburg & Leominster Street Railway order, the JOURNAL inadvertently gave the truck number as 117-E instead of 177-E.

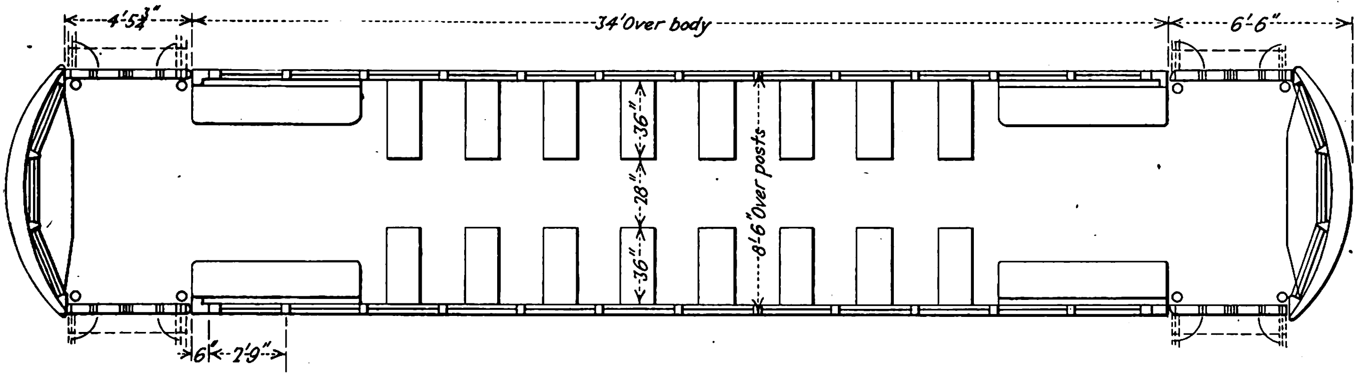


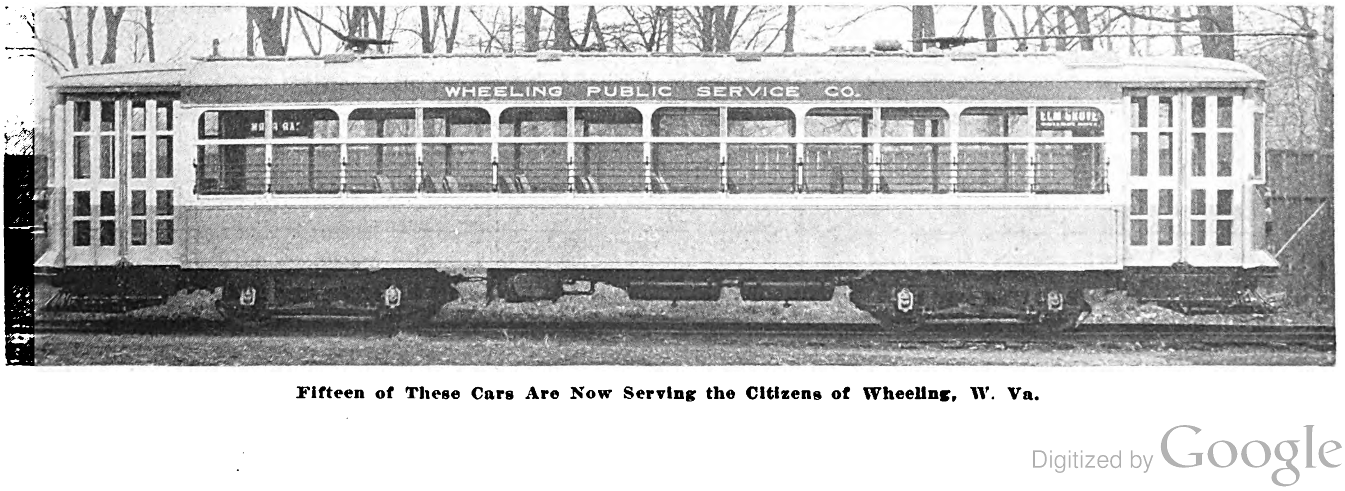
Spacious Interior of the New Cars Recently Delivered by the G. C. Kuhlman Car Company to the Wheeling Public Service Company

Wheeling Company Operating New Cars

Following are specifications for the fifteen double-truck light-weight cars mentioned in the JOURNAL of Sept. 4, 1926, as having been ordered by the Wheeling Public Service Company, Wheeling, W. Va., from the G. C. Kuhlman Car Company, a subsidiary of the J. G. Brill Company. The new cars were delivered on Dec. 27, 1926, and are now in service. Order for the rolling stock was placed July 25, 1926.

Seating capacity	48
Weights:	
Car body	17,600 (estimated) lb.
Trucks	6,110 (including gears) lb.
Equipment	9,420 (estimated) lb.
Total	33,130 (estimated) lb.
Bolster centers, length	24 ft. 0 in.
Length over all	47 ft. 0 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8 in.
Height, rail to trolley base	10 ft. 8 in.
Body	Semi-steel
Interior trim	Mahogany
Headlining	Agasote
Roof	Arch
Air brakes	Westinghouse
Axles	Brill
Bumpers	Channel
Car signal system	Faraday
Car trimmings	Kuhlman
Center and side bearings	Brill
Control	K-35
Curtain fixtures	Rex
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Fenders	Steel pilot
Finish	O'Brien enamel
Hand brakes	Brill, vertical handle
Heater equipment	Utility
Headlights	Golden Glow
Journal boxes	Brill
Lightning arresters	Westinghouse
Motors	Four Westinghouse No. 514-A, outside hung
Sanders	Nichols-Lintern
Sash fixtures	Rex
Seats	Brill 201-B
Seating material	Genuine Spanish grain leather
Slack adjuster	Westinghouse
Springs	Brill
Step treads	Kass
Trolley catchers	Knutson No. 5
Trolley base	U. S. No. 20
Trucks	Brill 177-E
Ventilators	Nichols-Lintern
Wheels	28-in.





Fifteen of These Cars Are Now Serving the Citizens of Wheeling, W. Va.

50 to 100 Cars for Toronto

The Toronto Transportation Commission is to ask tenders on 50 or 100 new cars, the number to be bought depending somewhat on the reduction which may be obtained for quantity. The purchase will be financed out of the commission's own reserves, which are available to the extent of $1,500,000. Chairman Ellis of the commission is reported to have said:

> We anticipate buying the cars in Canada, but will not build them ourselves. They are for use on existing routes. Their purchase will not mean the abandonment of cars already in use—the one-man cars, for instance? They will be additional. The one-man car is thoroughly established everywhere and the technical journals are full of its praises.

Charlotte Company Experiments in Building Cars

Mechanics of the Southern Public Utilities Company, Charlotte, N. C., recently turned out from the company's Charlotte car shops a new 18-ton, 40-passenger car which, with the exception of trucks and air brake equipment, was built from stem to stern by the company's force. The work was under the direction of W. B. Osborne, master mechanic, and the new car cost approximately $10,000.

Rolling Stock

Macon Railway & Light Company, Macon, Ga., if a program suggested to the city is approved, will purchase sixteen new cars and rebuild old ones retained.

Burlington Traction Company, Burlington, Vt., is putting Johnson D. M. fare boxes on its rolling stock in connection with a change to one-man operation.

Market Street Railway, San Francisco, Cal., is planning several new features for the 73 cars now being constructed in its shop. All cars will have crosswise seats, leather-cushioned. In the smoking compartments the latest model rattan and wicker seats will be used. The smokers will be glassed in on one side and open on the other. The open sides will be equipped with tight-fitting storm curtains. When these are in use there will be ample light from the glass windows opposite, and in the heat of summer the glass windows can be lowered.

Jamestown Motor Bus Transportation Company, Jamestown, N. Y., subsidiary of the Jamestown Street Railway, has purchased six 21-passenger buses from the Reo Motor Car Company, to be placed in service on the company's city bus routes. The new buses are of the street car type, with pay as you enter facilities. An especially attractive color scheme has been worked out. The bodies have been painted a Quaker gray, with a town car blue stripe and letterboard.

Western Ohio Railway, Lima, Ohio, has installed its first chair car, and an exhibition trip from Lima to Wapakoneta, Ohio, and return was arranged for a party of officials and guests. The new car is divided into three compartments. The major compartment is equipped with bucket type chairs, fitted with air cushions and luxuriously finished in plush. The seats in the smoking compartment are finished in Spanish leather. The company plans to complete the reconstruction of its cars at the rate of one car a month.

Los Angeles Railway, Los Angeles, Cal., has equipped all of its cars and buses with Johnson D. M. fare boxes, designed to accept pennies, nickels and dimes and also tokens of 0.650 in. diameter. The tokens are being sold six for 50 cents.

Trade Notes

Hubbard & Company, manufacturers of shovels, spades, scoops and railroad track equipment, recently held their third annual sales convention in Pittsburgh, Pa. The meeting was attended by all the company's salesmen, district managers, and three plant managers. In addition to discussing the sales and advertising program, the force heard several stirring sales talks made by officials of several larger manufacturing concerns.

Copper and Brass Research Association announces the appointment of H. A. Call of New York as mid-Western representative. Mr. Call has left New York to establish a branch in St. Louis.

H. D. James has been promoted to consulting control engineer of the Westinghouse Electric & Manufacturing Company, and **E. B. Newill** appointed manager of the control engineering department, according to a recent announcement by Vice-President Rugg. Mr. James, a native of Baltimore and a graduate of the University of Pennsylvania, has been continuously associated with the Westinghouse company since 1904. He has been president of the Engineering Society of Western Pennsylvania, chairman of the subcommittee of the Electric Safety Conference and chairman of the control section of the Electric Power Club and is an original Fellow of the American Institute of Electrical Engineers. Mr. Newill, a native of Atlanta, Ga., has been with the Westinghouse company since 1915. He is a graduate of the Georgia Institute of Technology.

Sullivan Machinery Company, Chicago, Ill., announces that it will occupy booths 122 and 123 at the Railway Appliance Exhibition in the Coliseum, Chicago, March 7 to 10 inclusive. Equipment to be exhibited will include portable and stationary air compressors; an operating model of the Sullivan air lift pump; one-man hammer drills; pneumatic concrete breakers; clay spaders; and a portable Turbinair hoist. The company will be represented by Joseph H. Brown, sales manager, Chicago; R. W. Scott and George Rowen, Chicago sales department; and by John Oliphant, manager pneumatic pumping department.

Metal, Coal and Material Prices

Metals—New York	Mar. 1, 1927
Copper, electrolytic, cents per lb	13.15
Copper wire, cents per lb	15.25
Lead, cents per lb	7.55
Zinc, cents per lb	7.16
Tin, Straits, cents per lb	69.55
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.625
Somerset mine run, Boston, net tons	1.925
Pittsburgh mine run, Pittsburgh, net tons	1.85
Franklin, Ill., screenings, Chicago, net tons	2.175
Central. Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.425
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.50
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.72

W. C. Stettinius, president of the American Hammered Piston Ring Company, Baltimore, Md., has been appointed a member of the merchandising committee of the Automotive Equipment Association, filling the vacancy caused by the resignation of T. H. Quinn of the National Lamp Works of the General Electric Company. Mr. Stettinius at the present time is president of the N.S.P.A., having been elected to that office at the association's meeting last November, and has also in the past served on the service parts committee of the A.E.A.

New Advertising Literature

Charles Cory & Son, Inc., 183 Varick Street, New York City, are now distributing their new bulletin, No. 60-29-A, describing annunciators, bells, button and signal equipment. The bulletin contains 60 pages of descriptive text, 117 illustrations, alphabetical, numerical and thumb indexes.

Ohio Brass Company, Mansfield, Ohio, has recently issued a folder describing its Form 4 trolley base. Outstanding features of construction, as claimed by the manufacturer, are: The use of hardened steel bushings on the hinged fork which pivots with the vertical movement of the trolley pole; the use of forged steel eyes within closed-in end tension springs; use of renewable bearing spools on the lower ends of the tension springs, where they are anchored to the turret arm studs; and the use of a long trolley pole supporting clamp.

United States Rubber Company is issuing a facsimile of *World's Work* magazine, in which is reprinted "The Story of Rubber," whicn appeared in that magazine for January, 1927.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., is mailing out a folder describing its industrial electric furnaces. The folder includes specifications on the type H box furnace, type O lead and salt baths, and type J lead and salt pots.

Wiswell Improved Railroad Crossing Company, Chicago, Ill., is issuing a circular letter descriptive of its noiseless crossings, to which is attached a testimonial letter from W. L. Roller, engineer of maintenance of way Hocking Valley Railway Company, Columbus, Ohio.

Mack Trucks, Inc., New York, N. Y., has just issued an elaborate poster illustrating the effect of torque or twisting efforts upon crankshafts of different diameters.

Attempt to Return to Home Rule Fails

LEGISLATION inimical to the best interests of the railways of Minnesota, and in the last analysis inimical to the best interests of the citizens there, apparently has failed. By a vote of 41 to 23 a committee has recommended an indefinite postponement of the bill to repeal the Brooks-Coleman law, which placed the regulation of electric railways in the hands of the State Railroad and Warehouse Commission. Senators Henry Morin and Charles Hausler, authors of the repeal bill, contended that the law had failed to work as promised and had been unfair to the people of the city. Senator Sullivan, defending the committee report, said that the 1921 Legislature passed the law because it realized that the railways in the large cities were being made political footballs. The chambers of commerce in the three interested cities opposed the repeal of the act. Quite naturally the railways were concerned. The position they took was made plain in the article in the JOURNAL for March 5, in which comment was made to the effect that the repeal of the state regulatory act was not a prospect which the people of the Twin Cities could contemplate with equanimity. They really stood to lose more than did the railways.

Since the legislation has failed this comment may seem like a case of much ado about nothing, but that is not really so. Administration of regulation in Minnesota appears to have been beyond suspicion. Attempts made there and elsewhere to undo the work of the past in building up regulatory structures that are essentially sound are persistent. Perhaps in some cases fault does lie in commission personnel or some phase of commission administration, but that is no reason for upsetting a plan which, by and large, has proved itself effective and in the best interests of all concerned.

Where Unification of Transport Facilities Sometimes Strikes a Snag

LITTLE things often influence a man's opinion more than do those of greater importance. This is particularly true of his ideas on public utility management. Months of dependable service are forgotten because of irritation over small shortcomings. Trifles rather than the actual merits of the situation are likely to determine his attitude toward the company. An evidence of such reaction sometimes is found in public opposition to the placing of all local transportation facilities under the control of a single management.

An important aspect that may have a great influence is the dehumanizing process that frequently follows the absorption of a small independent operator by a large transportation corporation. The individuality of employees is lost. Old familiar faces disappear. Mere numbers replace names. The patron becomes simply a passenger instead of being a friend of the company. New rules promulgated by some far-away office govern operation. "Step lively" is the slogan instead of the former "good morning." The rider cares not that the efficiency of transportation has been increased. For him a mechanical process has replaced a friendly journey.

To any one who has carefully studied this matter the advantages of unification seem self-evident and outweigh the minor disadvantages. The quantity and quality of transportation service must be adjusted to the traffic requirements. Only when the street car, the bus and the taxicab are rendering the service for which each is best suited will community transportation be on a sound basis. Obviously, this cannot be done when these various facilities are under separate managements.

If the human element is lost to sight in the change of management, the loss reflects chiefly the desire on the part of the company to supply a quick and efficient service. On every hand transportation companies are trying to establish friendly personal relations with their patrons. It is well that constant vigilance be exercised to this end, so that important unification plans of the future will find public opinion favorable.

Getting Down to Brass Tacks in Production Practices

NO MOVEMENT in American industry deserves higher commendation or support than the one that seeks simplified practice in production. Born in the hectic days of the World War, it has gained tremendous impetus due to co-operation between the Department of Commerce, producers, distributors and consumers. Elsewhere in this issue of the JOURNAL is a review of a primer just released by the Department of Commerce which not only outlines the results of six years intensive study in eliminating a needless variety of sizes, dimensions and types of commonplace articles, but reveals the enormous savings effected. From milk bottles to structural steel it is one splendid story of what common sense and co-ordinated effort can accomplish. Estimates of savings in money by some of the industries now producing on the simplified practice plan recorded in the primer are: Paving brick, $1,000,000; sheet steel, $2,400,000; steel reinforcing bars, $4,500,000; warehouse forms, $5,000,000; inquiry, purchase, order, and invoice forms, $15,000,000; and lumber, $200,000,000. These figures are proof that much so-called individuality in production in the past was superficial and useless, and further that odd sizes gave the producer no competitive advantage. As the primer points out, "the passing of this misconception has led to a point where today industries as a whole are very generally competing with other industries through simplification to broaden markets and induce the widest possible consumption of their respective products.

Perhaps one of the most gratifying aspects of the movement is that it has gained world-wide recognition, so that industrial experts, writers and others from foreign countries are urging their industries to follow the example of the American producers. Abroad the approach is for a reduction of variety through standardization rather than simplified practice. "In Anglo-Saxon countries," the primer states, "the relatively greater weight is put on specifications. In continental Europe emphasis is put on dimensional standards. Germany now has more than 1,000 approved standards, while Austria, Switzerland, Holland, Czechoslovakia and Sweden are working along dimensional standardization." All of this is a healthy indication that eventually our friends across the sea will come to simplified practices as the ultimate solution.

When considered from the standpoint of the electric railway field, the movement for simplified practices in production is one that should demand co-operation from every purchasing agent and manufacturer. Already there is sufficient evidence of what economies have resulted from co-operation in determining the essentials and non-competitive items that affect the needs of the industry. Nothing but good has resulted from such co-operation, and as the primer reminds us, elimination of the non-essentials and the false efforts toward individuality "still leaves room for the development of individuality." Every new friend of the movement will be reflected by decreasing production costs, greater efficiency and a broader conception of what is meant by getting down to brass tacks in production practices.

The Spirit Must Be Backed by Knowledge

MUCH has been said and written about the consequences of the car operator's dealings with the public. Discussion of the importance of courtesy and of the need for transportation salesmanship have occupied a prominent place in the councils of the industry and have been considered among its most important immediate objectives.

It may well be said that the success of public transportation depends on the attitude taken by employees in their contact with their riders. The spirit is the thing. That is the first and indispensable requirement. A disgruntled or a grouchy employee is the very antithesis of a salesman. Loyalty, interest, cheerfulness and courtesy constitute the big four of personality upon which the industry must build. With these factors anything is possible; without them failure is a foregone conclusion.

Consequently the industry has been wisely concentrating on the job of building up and improving the attitude of both management and employees toward the public. But something more is required. There is the need for knowledge and training. It is probably safe to say that every day, on every car, there arise public relations problems that require expertness in their handling. Without proper training the average man finds himself faced many times with situations in which the best of intentions may prove of no avail.

The transportation salesman must be trained for his work. He must know in advance the best method of handling a specific problem which arises in his dealings with the public. The principles and methods to be used are not established. Their determination is a job for experts with a peculiar combination of talents. After that, the problem or case method of instruction probably will be most effective in transmitting this to the men on the job. That is to say, the student will be required to handle in the class room definite situations that are set up to duplicate actual experiences gathered by careful surveys of the problems that arise on a car platform. Training of car men may be expected to become much more thorough than at present. The spirit of employees is important, but the activity of a salesman must be backed by knowledge.

Wood Preservation Becomes Increasingly Attractive

MANY times this paper has called attention to the desirability, if not the absolute necessity, of preservative treatment for ties and timber used by electric railways. It has been shown that treated wood lasts from twice to several times as long as wood in its natural state. Furthermore, it has been found possible to substitute cheaper grades of wood, particularly those which are not inherently able to withstand rot, for the so-called hard woods which formerly were used almost to the exclusion of others for ties and structural timbers.

In the past, most of the activity in wood preservation has been by the steam railroads. Though the A.E.R.E.A. wood preservation committee has done excellent work in showing the value of treatment, for some reason electric railway men have not taken kindly to the use of preservatives, and at times have attempted to prove that the cost of treatment offsets the gain in life and in ability to use the cheaper grades of wood. It also has been argued that treated wood is hard to handle. If complete refutation of statements of this character were needed, it is found in the article by C. A. Smith published in this issue. The Georgia Railway & Power Company, with which he is connected, was a pioneer in the use of treated timber, having begun it in 1895. Results have been so satisfactory that the company has extended the use of the process very greatly.

Proof of the value of treatment is seen in the cost figures presented by Mr. Smith. Savings as high as $290 per mile of open track have been made. Where the track is beneath paving, much depends on the type of pavement and the length of time it can go without being ripped up. Savings of $528 to $1,188 per track-mile have been obtained with creosoted ties in paving.

Proportionately, for ties the saving runs from 26 to 30 per cent of the cost for non-treated wood. For timber the saving shown is 17 per cent, while for poles it is as high as 52 per cent. This large economy is in part due to the use of a relatively cheap pine instead of chestnut, although the life of the treated pine pole is 22 years, against five years for untreated chestnut.

With such figures before him, it is difficult to see how an engineer can fail to appreciate the money value of preservative treatment. If unsatisfactory results have been obtained in the past it may have been due to wrong methods of treatment, and further investigation should be made to ascertain the reason for poor success. Incidentally, the supply of first grade timber is being exhausted at a rate so rapid that present costs are not likely to obtain for any considerable time. With all grades of timber becoming increasingly expensive, the value of preservative treatment is becoming greater at an accelerated rate.

"Look Here, upon This Picture, and on This"

PUBLIC debt today is much in the same position of a man taking one step forward and then slipping back two. A few statistics illustrate the point: From Jan. 1, 1920, to Jan. 1, 1926, the national debt was reduced about $4,250,000,000. During the same period state and local government debts increased about $6,750,000,000. Between these same dates expenditures of the national government were reduced about $2,000,000,000 a year, while on the other hand current expenditures by state and local governments increased more than $2,000,000,000 a year, and are still increasing—almost a clear case of inertia as regards removing the burden of taxation. And further, while the national debt is being reduced about $750,000,000 a year, state and local government debts are on the increase at the rate of more than $1,250,000,000 every twelve months.

Taking the same five years as a base it is revealed that state governments contracted new debts about twenty times as fast as they paid off old debts, and that the orgies in state and local government debt were being indulged in at a pace 4¼ times as fast as was the case before the war. And to cap the climax, the amount of state and municipal bonds sold during the past 25 years has risen from $131,549,300 in 1901 to $1,399,637,900 in 1925.

Top this off with the fact that the total public debt of all form of governments in this country is higher now than when our war debt was at its peak in 1919, and it is child's play to envisage the enormous sieve into which is being poured the people's money, to say nothing of that squeezed from public utilities and the manufacturers.

Examine this sieve closer and it is discovered that some of the big holes are formed by 40 per cent of national expenditures, 20 per cent of local expenditures and about 10 per cent of state expenditures being required to pay interest and to amortize existing public debt.

As Hamlet advises: "Look here, upon this picture, and on this," then decide who is the garroter that is strangling the life out of not only those who struggle to furnish adequate local and national transportation, those who manufacture what is vital to transportation, but those from whom public utilities receive their revenues. It is a tremendous problem, which can be solved only by a national movement. Those who sit in the council chambers, and those who dance while they fiddle, must be impressed with the truism that when transportation is strangled the heart of commerce ceases to beat.

Cincinnati Has a Problem in Co-ordination

OVEREMPHASIS should not be placed on the vote of residents of Mount Lookout, a residential section of Cincinnati, Ohio, to refuse the offer of a four-month trial of motor coach service to replace electric railway service, but the vote is not without its significance, particularly since this is the second time a similar proposal has been rejected. These two instances would seem to bear out the theory of R. N. Graham, also based on experience, that any choice between the two vehicles on the part of the passenger is simply one of greater convenience. But more important than this is the concern that the losses on its buses is causing the Cincinnati Street Railway. Particularly interesting is President Draper's answer to the question, why the motor coach operation of the company loses money when independent companies apparently made a profit.

The remedy suggested does not include discontinuance of any coach lines at this time. The ultimate object is so to fit the coaches into the service that they may be run to the best advantage. This is in line with the ideas of Mr. Draper that there is a place in a unified transportation system for all forms of transportation that can demonstrate their lasting qualities. Mr. Draper says that being charged with the responsibility and obligation of providing unified transportation, the company cannot neglect to adopt any reasonable form of transportation that the public desires and is willing to pay for. It is merely seeking to find out how best to attain its objective. The proposals advanced by Mr. Draper, outlined elsewhere in this issue, are of more than local interest in Cincinnati in that they represent to a considerable extent the objects sought by the industry as a whole in its efforts to co-ordinate service at a reasonable fare in a way least burdensome to the company and to the best advantage of the public.

Review of the Past Gives Hope for the Future

RETROSPECTION is good in that it makes the individual or the industry pause for a moment to take stock after a review of the past. That is what Lucius S. Storrs, managing director of the American Electric Railway Association, did in his address this week before the Oklahoma Utilities Association. His review of the past ten years of transportation history portrays vividly the worst period the industry ever has seen. Due largely to lack of understanding and failure to appreciate the situation, both by the operators and by their customers, the public, the electric railway industry all but collapsed under the combination of burdens thus heaped on it.

It is greatly to the credit of those men influential in the financial life of the properties that they had the vision to see that local transportation is essential to community growth and the courage to carry on despite every sort of discouragement. As Mr. Storrs pointed out, they are investing their own money and the millions of their stockholders in local transportation enterprises, confident that there is a demand for local common carrier transportation and that, having learned its lesson, adverse conditions similar to those of the past few years will not recur in the future.

While it is agreed that there always will be a demand for community transportation service, and that it can best be supplied with a co-ordinated electric car and bus system, there is still much work to be done. Heed should be taken of Mr. Storrs' statement that the bus problem has not yet been solved. The bus has proved a very efficient tool for certain phases of transportation, but it has been demonstrated also that it cannot effectively do the work that has been performed so well by the street car. The problem is being worked out, but it will require the careful attention of transportation men for some time to come if the most satisfactory solution is to be reached.

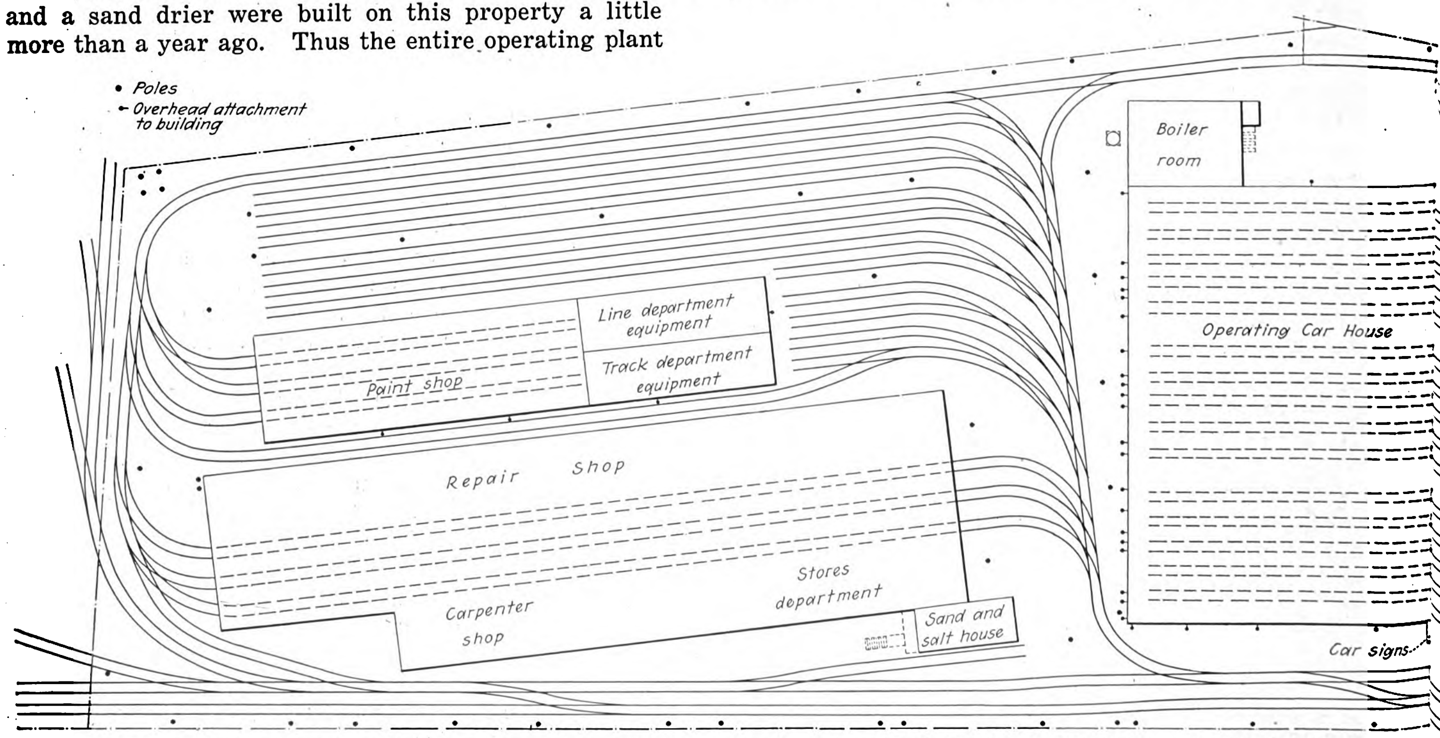
Extensive Improvements

Made at Waterbury

Connecticut Company Has Spent More than $600,000 in Construction of New Administration Building, Operating Carhouse, Sand Drier, Steam Heating Plant and Yard Track Layout

SINCE the completion last fall of extensive improvements to the property of the Connecticut Company bordering the Naugatuck River at Waterbury, this railway has had one of the most up-to-date car operating and maintenance plants in the country. The principal elements in this development are a new administration building accommodating all the local offices of the division, a new operating and inspection carhouse, and a central steam heating plant. A paint shop and a sand drier were built on this property a little more than a year ago. Thus the entire operating plant is new. Altogether more than $600,000 has been spent by the company in making these improvements.

Prior to this development, facilities at this location, excepting the general repair and overhauling shop, were antiquated and unsatisfactory. The administrative offices were housed in a two-story wooden building erected during the war to accommodate trainmen recruited in other cities who came to Waterbury and found it difficult to secure lodgings. This structure,



• Poles

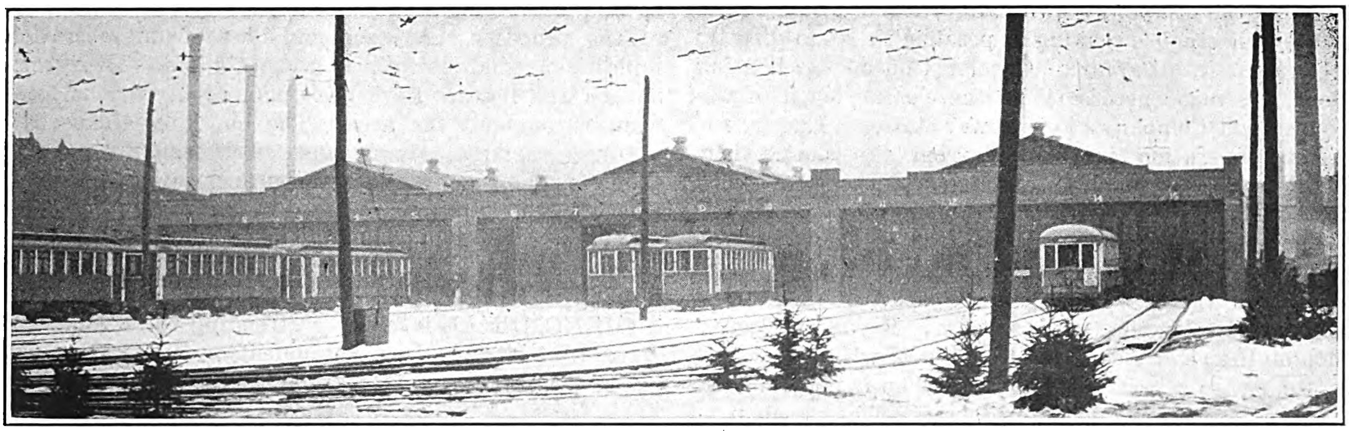
Improvements on Connecticut Company Property in Waterbury Include a New Administration Building, Operating Carhouse, Steam Hea



Three Bays of Five Tracks Each Accommodate a Total of 55 Cars Under Cover in the New Operating Carhouse at Waterbury

however, was ill-suited for use as an office building and was inconveniently located across the river from the operating headquarters. A shed of wood and corrugated iron, known familiarly as the "tin barn," and three other dilapidated structures constituted the only shelter provided for the rolling stock which was not in the overhauling shop. Plans had been under consideration for a long time to improve the car storage, operating and office facilities of this division, but their execution was postponed for various reasons. In 1924 the paint shop and sand drier were built, and last year the improvement was practically completed.

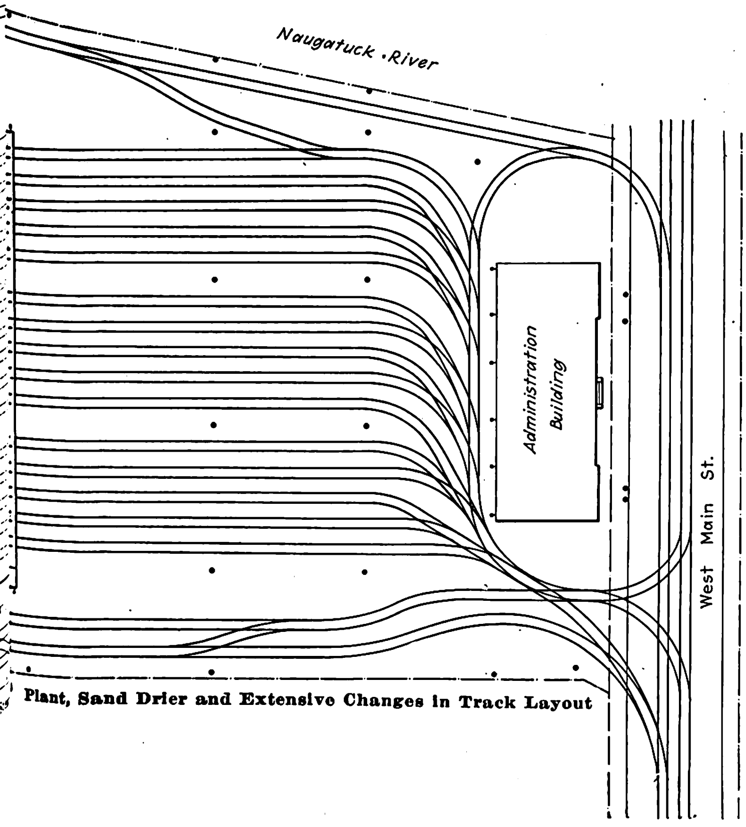
By itself, the Waterbury division of the Connecticut Company constitutes a good-sized local transportation system. Rail lines total approximately 85 miles of single track. In winter 95 passenger cars are operated. In summer this division has assigned to it some 30 additional open cars that are stored elsewhere under cover during the seasons when they are not in use. Bus operations require a total of 22 vehicles. The operating personnel consists of 150 trainmen, 20 bus drivers and eighteen inspectors and starters. The relatively large number of inspectors and starters is accounted for by the heavy rush-hour traffic characteristic of this industrial city. From the foregoing it will be seen that extensive facilities are required for car storage and inspection, as well as for operating and administrative offices.

Approaching the property from the center of town, one sees first the new administration building, fronting on West Main Street. Constructed of red brick and concrete colored to resemble Georgia marble, this building presents a simple and businesslike appearance. On the second floor are housed the offices of the division manager, the superintendent of transportation, the timekeeper, the dispatcher and the local officials of the claims, track and line departments. On the first floor are the office of the receiver, a trainmen's room, a locker room and a room for inspectors and starters. A school of instruction is located in the basement. This is equipped with the usual control and fare registering apparatus as well as with signal apparatus, because in the Waterbury division there is considerable single-track mileage protected by automatic signals.

Behind the administration building is an open storage yard with fifteen tracks. These tracks terminate in the new operating and inspection carhouse, which has three bays of five tracks each. Its walls are of red brick. The roof is of steel truss construction, supporting slabs of gypsum, making the structure thoroughly fireproof. Numerous glass skylights render the interior bright and cheerful. The general floor level in two sections is about 4 ft. 6 in. below ground, while the rails are supported on reinforced concrete columns spaced 5 ft. apart, as shown in an accompanying illustration. Between the tracks reinforced concrete flooring is provided, but the space between the two rails forming each track has been left open to facilitate inspection of equipment underneath the car. The construction of the building in this way was comparatively simple because it is located on filled land. The other or westerly section is not filled.

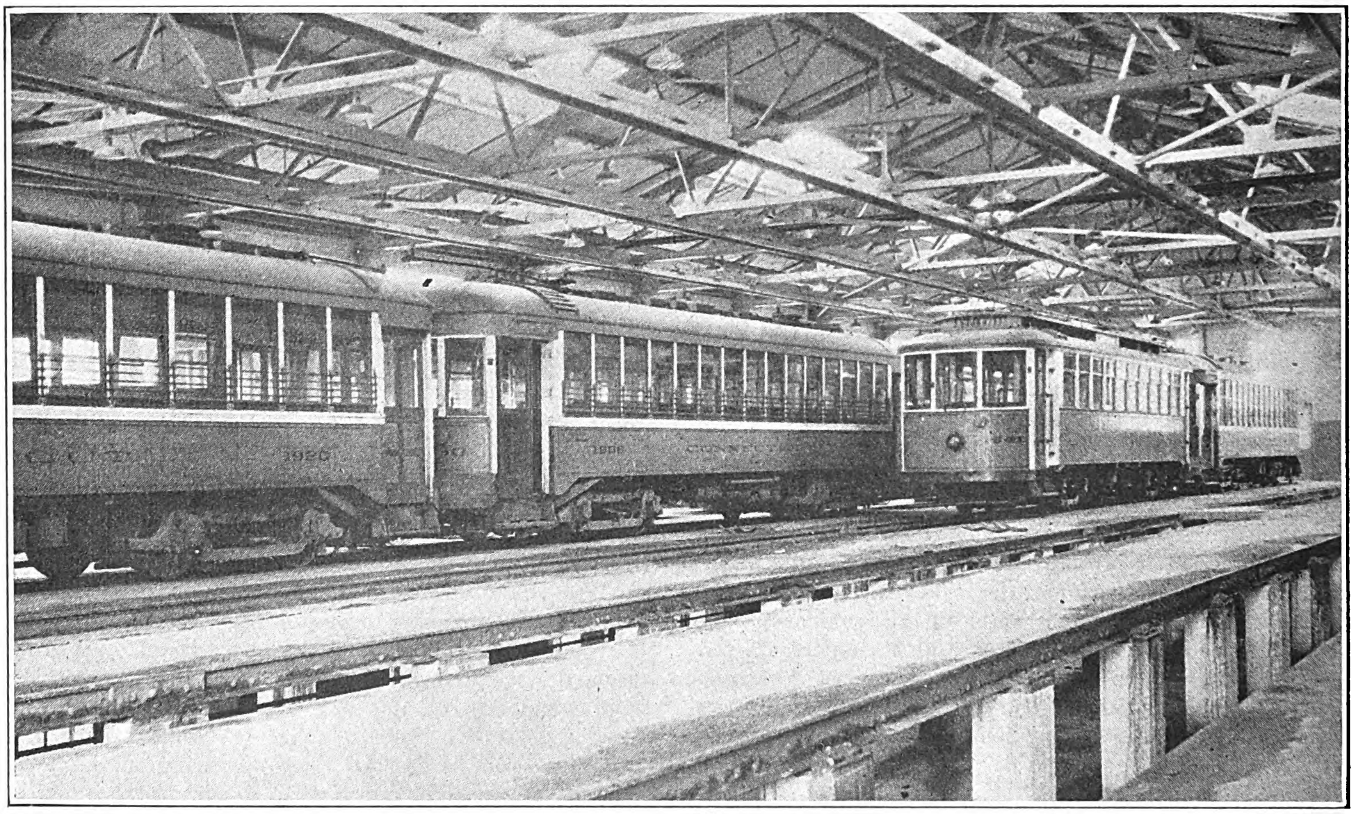
At present the capacity of this building is 55 cars, and it is planned to extend it in the direction of the administration building. Ample room exists in front of the present structure where there is now a car storage yard to build an extension equal in size to the part already completed. The overhaul and paint shops have capacity for a considerable number of additional cars, but these facilities are not used for ordinary night storage.

Alongside the operating carhouse a steam heating plant has been built. From this point steam is sent to all buildings on the property. Coal is brought to the



Plant, Sand Drier and Extensive Changes in Track Layout plant by the company's own cars, a track passing close to the boiler house making it possible to dump directly from a car into the bins. Construction of this heating plant was made necessary by the closing down of the Connecticut Company's local power station. Energy for railway operation is secured from the Connecticut Light & Power Company through a substation owned by the latter.

Behind the carhouse are the repair shop and the paint shop, housed in separate buildings. Each of these shops has three tracks, while a service track runs through between the two structures. Beyond the paint shop on the river side is a storage yard with six tracks. As the entire capacity of the paint shop is not required at this time for car painting, a section has been partitioned off for storage of equipment belonging to the line and track departments.



In the Operating Carhouse the General Floor Level Is 4 Ft. 6 In. Below Ground, with the Rails Supported on Reinforced Concrete Columns. The Space Between the Two Rails of Each Track Is Left Open to Facilitate Inspection of Running Gear of Cars

At one corner of the car overhaul shop a sand drying plant has been built. This is of unusual size on account of the hilly territory served by the lines of the Waterbury division and consequently large use of sand. Several unusual features have been embodied in its design. These will be dealt with in another article to appear in a future issue of ELECTRIC RAILWAY JOURNAL.

BUS GARAGE PROVIDES FOR ORDINARY MAINTENANCE WORK

To accommodate the 22 buses now operated as part of the local transportation system, a section of the trolley express building on this property has been converted into a garage. Facilities for ordinary maintenance work have been provided. Heavy overhauling of buses, however, is done at the company's New Haven garage. The remainder of this building is still used for trolley express purposes.

Particular attention has been paid in the execution of this improvement program to the general appearance of the property. At each end of the administration building a small lawn has been laid out. Evergreen shrubs and flowers have been planted in various locations throughout the area. The buildings themselves are necessarily of simple and substantial design, but their neat and businesslike appearance gives a pleasing aspect to the property.

Farm Demonstrations via Interurban

PHENOMENAL interest is attending the demonstration of electric farm equipment on board the farm electric railway car fitted out by Purdue University agricultural extension department in co-operation with the Indiana electric companies and interurban lines. The car is now making a tour over all the electric lines of Indiana. Farmers along the line interested in studying the costs and production possibilities of electricity on the farm will have an opportunity to inspect the car en route.

Truman E. Hienton of the agricultural engineering staff, who is in charge of the car, broadcast on the radio recently, telling of the purposes of the tour. The car is equipped with a model farm kitchen. Electrical appliances on board include milking machines, cream separators, poultry house lighting systems designed to increase egg production, ensilage cutter, feed grinder, incubator, fanning mill, water supply system, cider press, wood saw, churn and grindstone.

Officials of the university predict that many thousands of farmers will have seen the car before the tour is ended. Interest during the first few days of the tour was acute and those in charge were kept busy with explanations of costs and like information.

Transportation Winning Hardest Business Battle in History

By Lucius S. Storrs

Managing Director American Electric Railway Association,
New York City

Lucius S. Storrs

IN AN ADDRESS before the Oklahoma Utilities Association at Oklahoma City on March 9 Mr. Storrs presented an unusually strong plea for co-operation on the part of all utilities and portrayed in vivid manner the momentous economic struggle from which the industry is emerging head up and shoulders back. Every transportation executive will get new inspiration from this abstract of Mr. Storrs' thinking.

PROGRESS and prosperity of all utilities are closely identified with the growth of the communities. Just as cities go forward so do the utilities serving them grow and prosper. It behooves us for selfish reasons, if for no other, to do everything within our power to encourage and help them. Thus it becomes apparent that there is need for all of us to work together, shoulder to shoulder. We should extend our services jointly, have a common interest in seeing that all of us render the best possible service and obtain a square deal from public officials and the public generally.

I know that all of you will be pleased to hear that the industry is on a better basis than it has been at any time in many years and that there is no great problem before us today which does not seem possible of solution, provided we have the united support of all the branches of the utility business.

Not a little of this advance has been due to co-operation. Local transportation men are joining hands with other utility men in carrying out the plans of state committees on public utility information, state associations, sectional associations and, finally, national associations.

Initially, I want to impress upon you that the local transportation industry is not decadent. If you have been led to believe that its funeral is imminent, put that thought out of your mind now. It is not true.

In urban centers, particularly, there never has been greater need for high-class local transportation both by electric cars and buses than there is today. It has been proved conclusively that the bus is not going to replace the electric car in mass transportation, that private automobiles cannot furnish all of the required service and that co-ordinated electric railway and bus service under single managements is the logical solution of the local transportation problem. Electric railway men are going forward throughout the country to supply this great public requirement.

The industry is emerging from its ten or more years of reverses more physically fit, with a broader vision and with an increased appreciation of its opportunities, just as the United States emerged from the great World War a stronger nation. Today, instead of being a decrepit plant waiting for the undertakers to carry it away to the boneyard, the electric railway industry is charged with new energy and is more capable of rendering good service and more determined to render it well than it has been at any time in the last fifteen years. Out of ten years of discouragements, marked by rising costs, bus competition and many other reverses, the industry is emerging head up and shoulders back, working with keen mind and willing hands and going forward to a constructive and profitable future.

You have heard much of abandonments of electric railway mileage, so I want to set you right on that situation. Despite private automobile and bus competition, the total electric railway mileage in the United States today is only 4 per cent less that it was at the peak record for all time in 1917. And virtually all of these abandonments have been in towns of from 8,000 to 25,000 persons, or in rural sections where not one foot of the track ever should have been laid. The pioneer builders made two serious mistakes that have exerted a great influence on the industry during the recent years. First, they built many lines without regard to the traffic demands, and, second, they tried to operate them on a fixed 5-cent fare in cities and a much lower fare than steam lines in rural sections. Not one property in a city of 50,000 or over ever has been permanently abandoned. Those are the facts about electric railway abandonments in this country, and they supply a most eloquent answer to the assertion that the electric railway is doomed.

The cost of producing rides varies in different communities and, naturally, the sales price of them also will differ. The public generally, in most cities except New York, now has come to realize this, and practically all communities are willing that fares shall be adjusted with changing costs.

The advent of the European war, with skyrocketing wage and material costs, brought about revolutionary changes. Almost over night the cost of wages and material doubled, but fares were not changed. Service had to be continued, so it was necessary to meet these rising costs and hope that fares would be raised proportionately. Unfortunately, the industry had put in some 30 years educating the public to a fixed 5-cent fare, so it was impossible to change fares rapidly enough to meet rising costs.

For several years fare raises came about very slowly. Coincident with rising costs and almost stationary fares had come jitneys, private automobiles and bus competition. As a result, when President Wilson in 1918 appointed the Federal Electric Railways Commission, composed of representatives of the public, labor, financial houses and electric railways, to investigate the conditions of electric railways throughout the country, about one-sixth of the total mileage of the industry either was bankrupt or in receivers' hands.

The stock-taking by the industry before the commission in 1919 certainly showed a deplorable condition. The fact that the industry has come back to render the excellent service that it does today proves conclusively the essentiality of it and also the measure of the men engaged in it. If the industry had not been an essential one, or if it had been manned by weaklings, it would have passed out under the conditions existing shortly after the close of the European war.

The inquiry resulted, however, in a remarkably constructive report on existing conditions and a series of suggested remedies of a high order. The outstanding declaration was that public transportation by rail cars not only was a necessity but would be for many years to come and that good service could be obtained only by closer co-operation between the public, managements and men. The fixed fare system and independent jitney and bus competition were scored heavily as economically unsound and the need for better public relations, obtainable through frank dealings, stressed.

Mere acceptance of the federal report did not restore the industry to its present improved state. Local transportation men turned back toward home from those Washington hearings to face one of the hardest business battles in history. Included in the program they sought to carry out were creating better public feeling, obtaining equitable fares, eliminating unfair competition, improving service, co-ordinating the rail car and the bus and obtaining a readjustment of their taxes.

PUBLIC FRIENDSHIP BEING WON

The problem of enlisting public support was the initial one approached. Managements which carried their story to the public honestly and showed themselves willing to be friendly soon found a friendly response. The printed word was used widely, executives and employees made speaking campaigns and gradually public understanding began to be created. After a foundation had been laid through an explanation of conditions, the advertising campaigns quickly shifted to salesmanship, and today rides are being merchandised as intensively and as intelligently as are many commodities.

The bus problem is a grave one and it is not entirely solved to date. Although it has been demonstrated that the bus will not supplant the electric car, it also has been proved that the bus has a place in local transportation. It has, for instance, proved a very efficient tool in replacing some small electric railway lines which never should have been built. There is a place for it in new territories until their traffic is so dense that they demand rail lines. Likewise, it is a splendid tool to use in co-ordination with rail lines in cities. Progressive executives are using the bus where it can best serve.

That a bus ride cannot be supplied as cheaply as a street car ride and that buses occupy more street space per passenger than electric cars has been proved conclusively, and these two factors enter very largely into every proposal to supply bus service. Furthermore, although to date the bus has been able to escape regulation and taxation to a far greater degree than the rail car, this, of course, cannot continue indefinitely. It must compete with the rail car on a similar footing, and as the control of service and taxes becomes equalized, the economy of the rail car steadily becomes more apparent and its continued place more assured.

I beg you, however, not to labor under the delusion that electric railway men generally have tried or are trying to save their properties and restore their service to public favor merely by fighting the bus; far from it. They realize that the only way to obtain and retain public favor is to give good service. There is a great demand not only for buses but also for electric car service more nearly approximating automotive rides. To meet this demand the electric railway industry is modernizing its equipment rapidly and, happily, this modernized service—embracing principally lighter, faster and more comfortable cars and smoother roadbed —is increasing business.

ADVISORY COUNCIL BACKING MODERNIZATION MOVEMENT

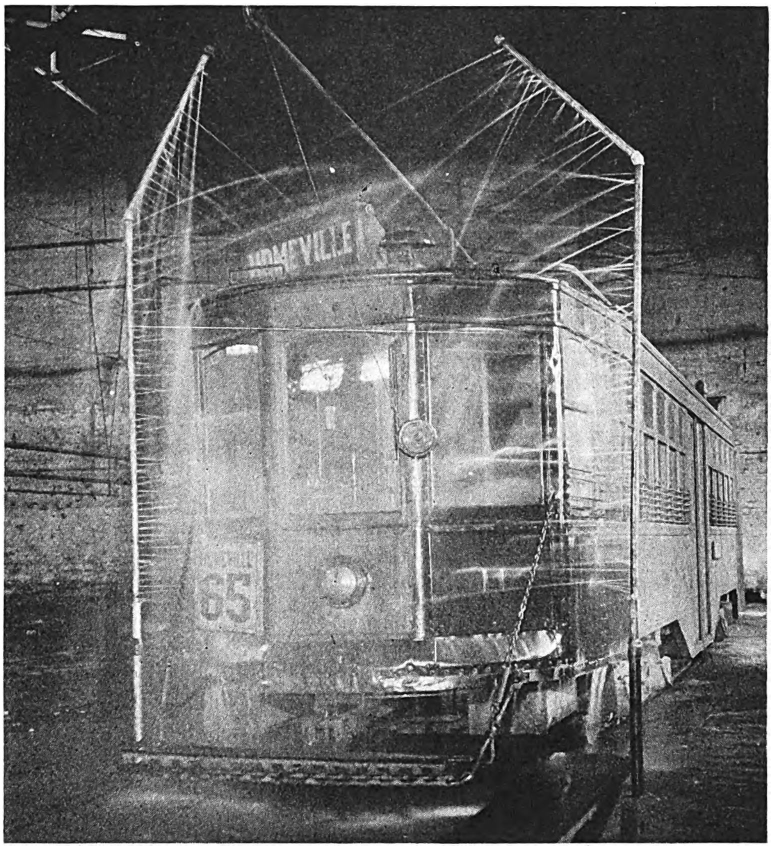
Standing squarely behind this great modernization movement is the Advisory Council of the American Electric Railway Association, formed in 1925. Under the leadership of B. C. Cobb of Hodenpyl, Hardy & Company, this council during the last two years has sought with all its power to convince companies that they must equip their properties with the most comfortable conveyances, both in rail cars and buses, and aggressively seek business. When I tell you that its members are convinced of the future of the local transportation business and are giving much of their valuable time and effort toward advancing its interests, you will realize fully the truth of the statement that it is not a "dead or dying industry." A very large majority of them, too, are investing their own money and the millions of their stockholders in local transportation properties, confident that there is a demand for local common carrier transportation and that soon all of the clouds of uncertainty will be rolled away and it will come into its own again.

As a result of the co-ordination movement more than 7,000 buses are now being operated by approximately 275 electric railway companies over more than 15,000 miles of route. Buses generally are being used in extending transportation routes and little service parallels the main rail lines. Destructive competition is growing less because buses cannot operate profitably at electric railway fares and also because it is no longer possible to purchase efficient buses except upon reasonable financial terms.

That there will always be a demand for common-carrier local transportation admits of no argument. That it can best be supplied with a co-ordinated electric car and bus system has been amply demonstrated. That eventually this service must be paid for in such measure as will give an adequate and fair return to managements and investors cannot be disputed. Accepting these three statements, the future of live progressive local transportation companies seems to be plainly charted. They cannot help but go ahead. It is inevitable. Even though they held back, which they did not, public demand for service would drive them into profitable progress.

Automatic Washing for Pittsburgh Cars

Electrically Controlled Equipment Providing for Rapid Washing Is Being Installed in the Various Carhouses of the Pittsburgh Railways—Details of the First Installation Are Given



Car Entering the Preliminary Wetting Spray by Passing Between Two 1¼-In. Upright Pipes Perforated with $\frac{1}{32}$-In. Holes Spaced 1½ In. Apart. By Staggering the Holes the Water Is Sprayed on the Car in Two Directions

REPEATED efforts have been made by various electric railways to design car-washing equipment which will combine the operations of brushing and washing as the car moves forward and do this mechanically rather than by hand labor. The Pittsburgh Railways has been working out such a process for some time and a preliminary description was published in the Aug. 14, 1926, issue of ELECTRIC RAILWAY JOURNAL. This device has now been perfected to a point where a complete shower bath equipment has been installed at the Craft Avenue carhouse of the company and it is planned to provide twenty additional showers at other carhouses. The equipment has been perfected and manufactured under the direction of John D. Barr, assistant engineer of the Pittsburgh Railways.

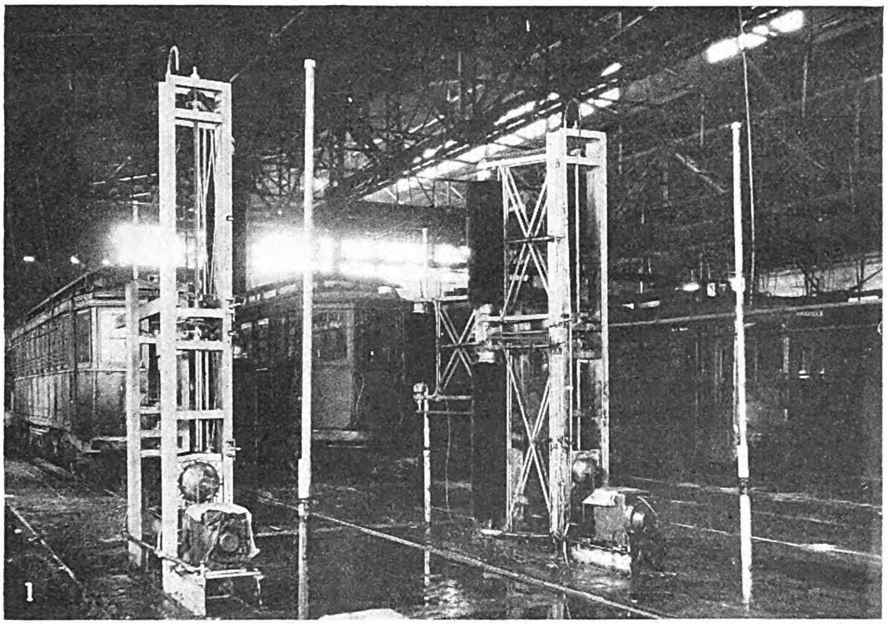
By use of the new equipment a car can be washed, brushed and rinsed in about five minutes, with only two men employed in the process. Compared with previous methods of cleaning used by the railway this is a great reduction, since previously about one hour's time for one man was needed to wash a car. A great advantage also lies in the increased number of cars that can be cleaned quickly between rush-hour periods. The reduction in time enables the entire equipment to be washed more frequently than by old methods, so that cars can be kept on the street in much better appearance, which is one of the essential details for keeping the public pleased.

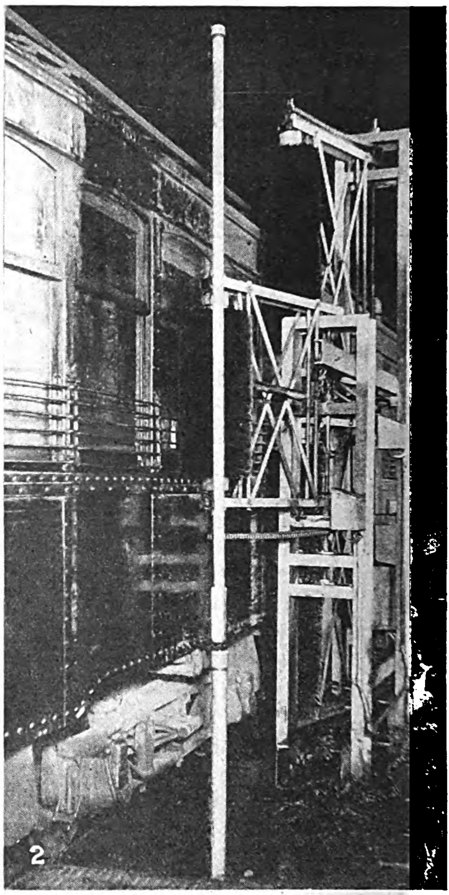
With the new apparatus the car is passed first between two spray arms which throw the water with sufficient force onto the sides, ends and top deck to moisten thoroughly any dirt and wash off a considerable portion of it. The 1¼-in. diameter upright pipes have $\frac{1}{32}$-in. holes spaced 1½ in. apart. The operation of the spray is controlled automatically by circuit breakers which start the flow of water as the front end of the car enters the spray equipment. The water is cut off automatically as the car passes out.

Following the initial wetting one man at each end of the car goes over the ends with a round bristle brush. The brush is 5¾ in. diameter and has a handle 4 ft. long. This scrubbing has been found better than mechanically operated brushes for the ends, as these at present have not been perfected so as to be entirely practicable. With a good type of brush this task can be performed easily without the use of any water additional to that which remains on the car after the initial sprinkling. If necessary a barrel of water can be placed in a convenient position alongside the car washing track for dipping the brush.

Following the brushing of the ends the car is advanced to the automatic brushing machine, which is equipped with additional spray apparatus. Circuit breakers start both the revolution of the brushes and the action of the spray as the car approaches the machine, and similar equipment shuts off both as soon as the car has passed through. The brushes used were developed by the Wolfe Brush Company, Pittsburgh, Pa., and are made on wooden cores with an over-all brush diameter of 13 in. The assembly of the brushes and also the number of brushes required depend on the profile of the cars that are to be washed. A total brushing length of about 14 ft. is required in Pittsburgh. A single brush of this length has not been found practicable on account of its weight and because one brush will not follow the profile of the car and properly brush all sections.

In the Pittsburgh installation three brushes on each side have been found satisfactory. The length of these varies somewhat according to the type of cars to be washed. The lower brush is a little longer than the flat





Scrubbing and Washing of Cars Are Made Automatic with This Equipment

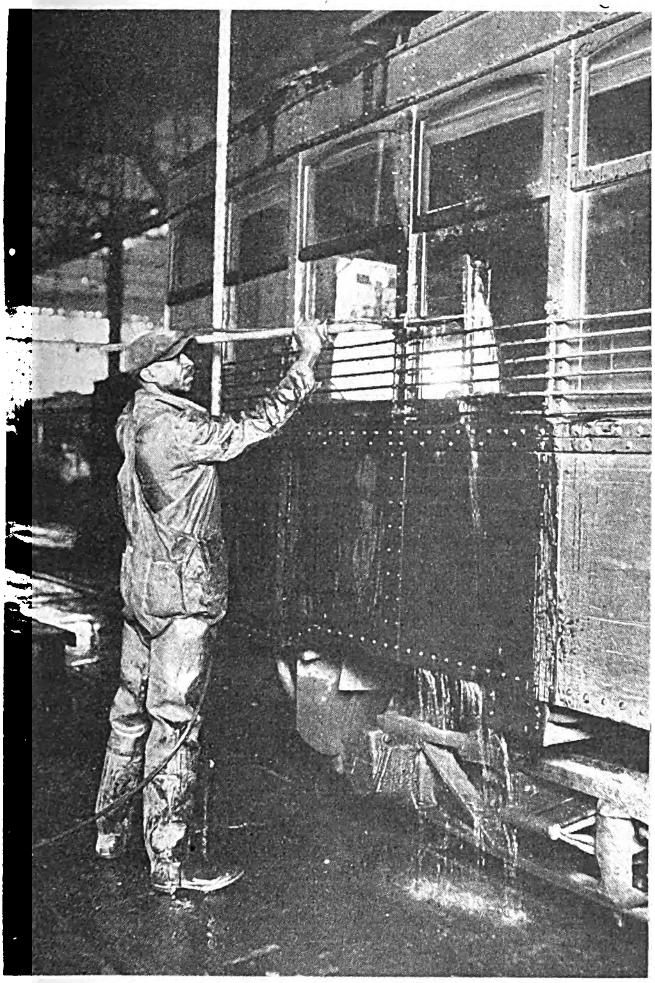
surface of the car side panel below the windows. The center brush is long enough to brush the window surfaces. The top brush projects farther from the body of the machine than the center one and must not be so long that its action will be hampered by contact with parts of the car which project as far out as the window guards. In Pittsburgh it has been found that to accommodate the various classes of equipment the most convenient axial lengths for the brushes are 60 in. for the bottom, 48 in. for the top and 33 in. for the center brush.

The brushes are placed so as to overlap each other and the whole equipment is designed so that as the car passes between the two sets each brush will be forced against its sides with just enough pressure to give the right brushing effect on the particular part of the surface it is intended to cover. The pressure of the car against the brushes operates the switch of the motor which revolves them. Brush rotation is contrary to the movement of the car and is adjusted at a speed necessary properly to scrub the surface. When pressure is released the brushes cease turning. As the car approaches the brushes it is sprayed first with water and then rinsed in a similar way after the brushes have done the scrubbing.



Method of Using Strip Brush to Clean Window Glass Behind Guard Rails When Rotating Brushes Do Not Remove Mud

The framework of the machine is made of ¼-in. x 8-in. channels and the arms are of light 4-in. channels, braced to make them rigid. A common type of sprocket chain is used throughout the machine for driving. A 5-hp. motor drives the equipment through a bevel gear. Ball bearings are used throughout the machine.

After the scrubbing and rinsing the car is placed for drying. It has been found that the appearance of the car is better than would have resulted had hand operation been used. There is no streaking or smearing with the mechanical method. When washing cars by hand it has been found that the appearance is usually fairly good as long as the water is on the surface, but that hand methods do not give sufficient scrubbing or washing and the result is that streaks and smears are observed as soon as the surface dries.

The hydraulic window washer which is used for washing the window glass back of the guard rails was described in the ELECTRIC RAILWAY JOURNAL, Aug. 14, 1926. This is used only in case the glass has been smeared with mud which cannot be removed thoroughly by the brushes. The hydraulic window washer consists of a thin metal holder 20 in. long which carries a supply of water from a small flexible hose so that it is distributed through the openings with a spraying effect. The strip is equipped with a brush just heavy enough to clean the surface of the glass and thin enough to allow its insertion behind the guard rails. When necessary this operation is performed just after the ends of the car have been washed and before it passes the large brushes. The rinsing of the car will then complete the window washing so that the glass will be perfectly clean. Extra hand cleaning of the window glass has been found desirable in some cases, although it can be dispensed with.

Davenport Tells the World

RADIO broadcasting has a value of unknown extent in reaching new fields. This was brought out when a lay listener hundreds of miles east of Davenport mentioned to the local railway executive that he had heard an interesting talk on electric railway transportation. The clue was followed up, with the result that ELECTRIC RAILWAY JOURNAL is enabled to present the high spots of an address made from radio station WOC by R. J. Smith, vice-president and general manager Clinton, Davenport & Muscatine Railway.

This particular evening had been set aside for a discussion of local industrial and transport problems. Talks were made by representatives of the Rock Island, Milwaukee and Burlington systems on steam railroad subjects, while Mr. Smith talked humorously about the little electric brother who had interchange connections and through rates with them all. He emphasized, in particular, that the electric line by its tie-up with the Chicago & Northwestern helped the other three great trunk carriers in serving the Tri-Cities.

After explaining the nature of the connections and the character of products handled, Mr. Smith presented some data in such a popular way that others may be interested in the text for the sake of doing likewise. Thus:

> In the past twelve months this 70 miles of electric road carried 263,000 passengers and 188,000 tons of freight. In order to do this, the Clinton, Davenport & Muscatine Railway ran just under 1,000,000 car-miles. How does that stack up with the past year's mileage of your Rolls-Royce? We moved 5,664 freight cars; and paid out more than $19,000 in taxes and more than $141,000 in wages. Two million kilowatt-hours of electricity were consumed in this work, or enough to run your washing machine, on the ordinary basis of four shirts a week and other apparel in proportion, about 100,000 years. Our statistician has calcu-

lated that this consumption of electricity would heat my Saturday night bath for 7,915 years.

This railway has been a part of this community since 1903, and although those 23 years have brought about many changes in the way of doing things, and particularly in transportation through the widespread use of the automobile, nevertheless a great need continues to grow for the movement cheaply of passengers and goods 24 hours a day and 365 days a year, regardless of weather conditions.

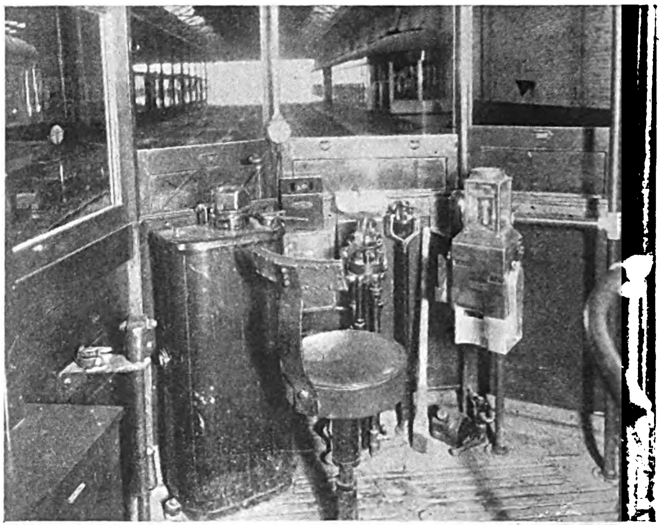
So great is this modern need of transportation of all sorts that each sort is sometimes wrongly chosen. The palatial flier of the trunk line railroad, or that same railroad's enormous coal "drag" of 70 cars; the airplane's flight; the interurban and street car; the automobile's flexibility; the ocean, lake or river craft; even the horse and our own feet—yes, our own patient "dogs" that in this modern age have almost forgotten how to walk—all have their proper place in the transport system.

That place must be determined by each individual for his own special need. And in determining it, cost and reliability must always be considered. For low cost and dependability the railroads are, more than ever before, this country's bulwark of transportation. The Clinton, Davenport & Muscatine Railway is proud, indeed, to furnish its small part in this great transportation scheme and to contribute to the further upbuilding of these thriving communities.

Modernization Continues in Memphis

Initial Investment of $475,000 for 32 New De Luxe Cars Followed by an Additional Expenditure of $130,000 for Reconstruction—65 Cars Remodeled for One-Man Operation

STIMULATION of riding and bettering its public relationship led the Memphis Street Railway, Memphis, Tenn., to decide on a program of modernization. The initial step in this program consisted in the purchase of 32 low-level, double-truck, semi-noiseless de luxe cars from the St. Louis Car Company, St. Louis, Mo., at a total cost of $475,000. Details of these new cars, together with the public reaction to their introduction, were given in the Sept. 4, 1926, issue of ELECTRIC RAILWAY JOURNAL.

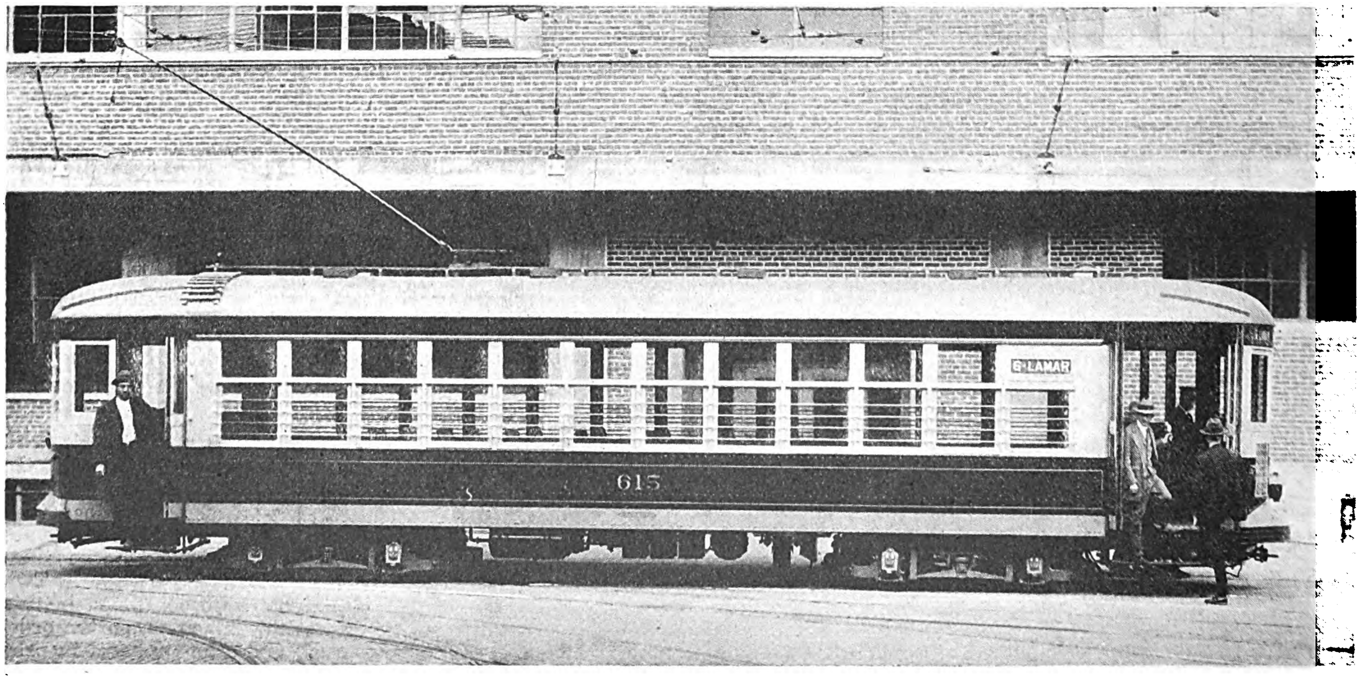


Comfortable Seat for Motorman and the Convenient Location of Controlling Apparatus Are Features in the Reconstructed Cars of the Memphis Street Railway

As they met with such hearty public approval it was decided to go a step further and rebuild 40 of the low-level cars purchased in 1923 to make them suitable for single-end one-man operation. Work was started last October and completed on Jan. 1, at a cost of approximately $80,000. The front platform was redesigned to provide sufficient space for the installation of an entrance and exit door with folding steps. The rear platform was rebuilt with only an exit door. The front and rear exit doors are treadle-operated. All platform apparatus was relocated to permit of unobstructed passenger entrance and exit and convenience of operation. They are now practically duplicates of the 1926 cars with the exception of seats and floor covering. These rebuilt cars were so well received by the public that it encouraged the company to rebuild along the same lines 25 cars purchased in 1914. They were completed about March 1 at a cost of approximately $50,000.

Of the 187 cars owned by the company 97, or about 50 per cent, are designed for single-end, one-man operation.

These cars with their bright color combinations present a very favorable appearance.



One of the 40 Cars of 1923 Type Reconstructed by the Memphis Street Railway. Arch Roof, Excellent Color Combination, Front and Rear Treadle-Operated Doors Present a Fine Appearance and Provide Safety Features

Substantial Economies Obtained by Use of Treated Timber

Georgia Railway & Power Company Has Reduced Cost of Ties by $1,188 Per Year Per Mile of Track—Prior to Installation All Timber Now Receives Preservative Treatment by the Rueping Process

By C. A. Smith

Superintendent of Roadway Georgia Railway & Power Company,
Atlanta, Ga.

MORE than 30 years of experience with preservative treatment of timber by the Georgia Railway & Power Company, Atlanta, Ga., has proved that substantial economies are produced by the practice. This company was one of the pioneers in wood preservation, having begun the use of creosoted timber as far back as 1895. Recently some ties laid in that year were taken up, and a large proportion of them were found to be in good condition. In comparing the costs of treated and untreated ties, however, twenty years is taken as the useful life of a treated tie. At the end of that time it usually is necessary to remove the tie for reasons other than deterioration. Wearing out of the rail or pavement may make it necessary to rebuild the whole track structure, and old ties are removed even when sound. Experience with treated ties shows savings ranging up as high as $1,188 per year per mile of track, as compared with untreated ties.

The original creosoting plant of the Georgia Railway & Power Company had one pressure cylinder 5 ft. in diameter by 40 ft. long with the necessary storage tanks, pumps, etc. It was located close by the power house boiler room from which it took steam, and was constructed in the open with simply a shed for shelter. The full cell pressure process was used, as creosote at that time was very cheap, costing around 6 cents per gallon. Timber was impregnated by this process with a retention of from 10 to 14 lb. per cubic foot of timber.

Good results were obtained by this old plant. In 1926 we removed ties from a stretch of track which was built in 1895 using creosoted pine. These ties had been in service for 31 years and a large proportion of them were in sound condition. The small amount of deterioration is seen in the accompanying illustrations showing these ties after removal.

In 1909 we rebuilt our creosote works and installed a

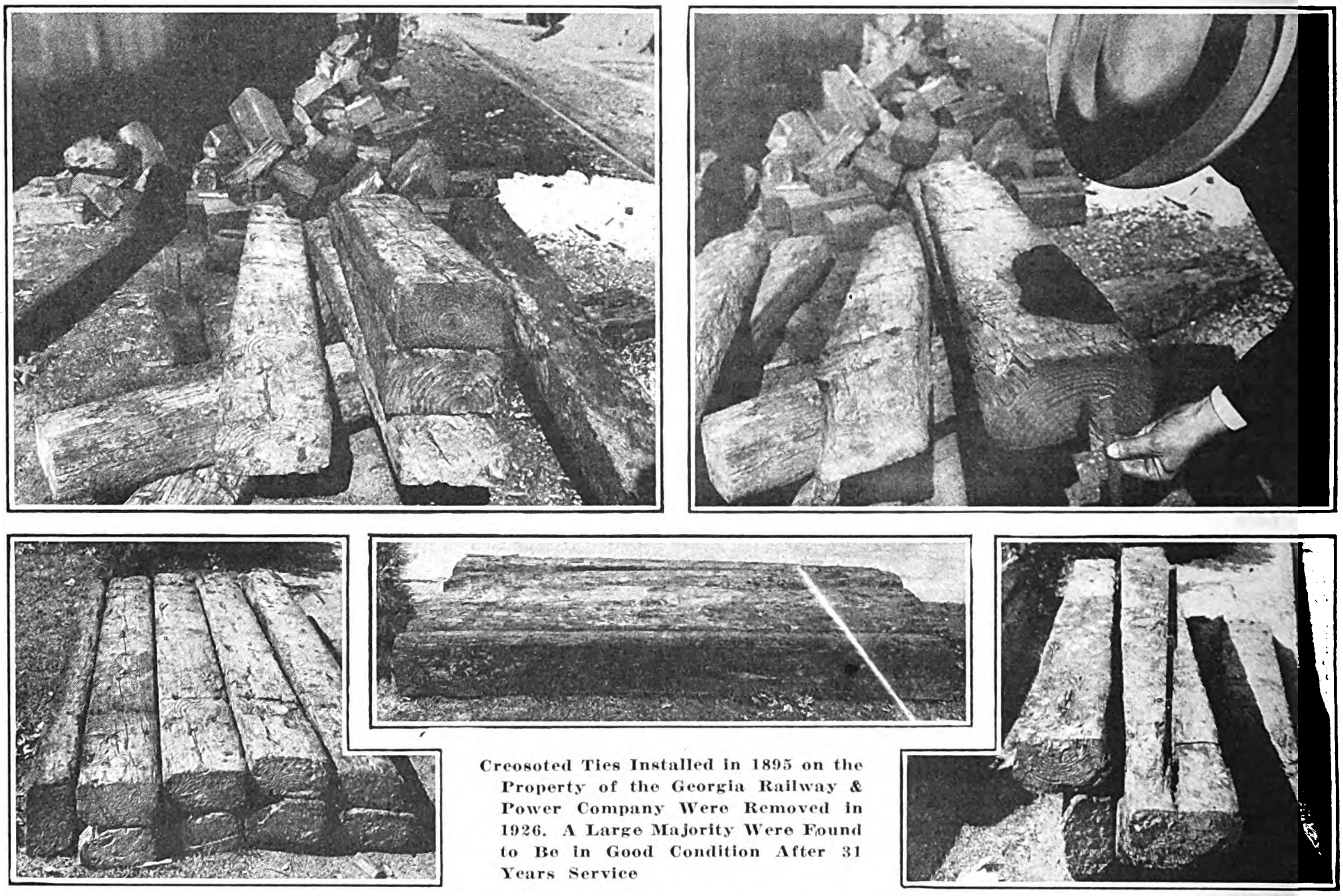
Creosoting Plant of the Georgia Railway & Power Company, Where All Tie and Structural Timber Is Treated by the Empty Cell Process new pressure cylinder 6 ft. in diameter by 50 ft. in length capable of handling 300 ties per charge. The cylinder, pumps, boiler, etc., were housed in a brick building. The storage tanks were located in a pit back of the building at such a level that creosote could be emptied from railroad tank cars by gravity into the storage tanks.

This plant was operated under the full cell pressure process until 1917. By that time the price of creosote had advanced from 6 cents per gallon to 15 or 20 cents per gallon. For that reason we rearranged our plant, adding a storage cylinder above the pressure cylinder and installing an air compressor with necessary piping so as to use the Rueping or empty cell process with initial air. By the use of this process, penetration is obtained equal to that obtained by the full cell process with a retention of about 6 lb. of oil per cubic foot of timber, instead of from 10 to 14 as with the full cell process. The layout of this plant and its general appearance are shown in accompanying illustrations.



Creosoted Ties Installed in 1895 on the Property of the Georgia Railway & Power Company Were Removed in 1926. A Large Majority Were Found to Be in Good Condition After 31 Years Service

Practically all of our tie and structural timber is treated. We use sap pine timber in all work which does not require a high fiber stress, because this timber can be bought at a very moderate price. In our track construction we use the same class of timber with a steel tie plate beneath the rail on each tie. A creosoted

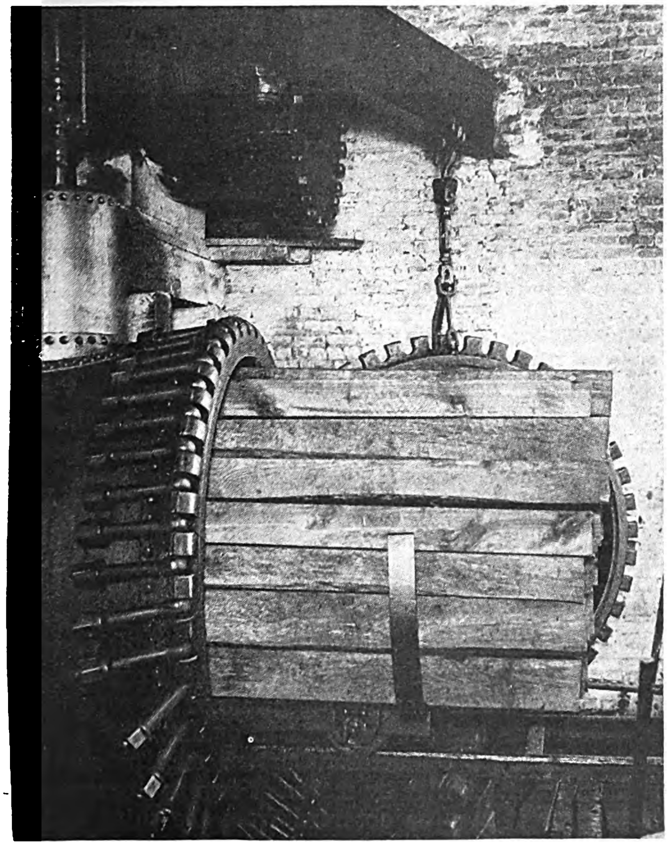
A Load of Ties Has Just Been Run Into the Treating Tank at the Atlanta Creosoting Plant

sap pine tie protected against wear by a steel tie plate will last as long as the rail under light traffic and frequently as long as two sets of rails under heavy traffic.

Cost figures for treated and untreated ties and poles are given in accompanying tables. In track with pavement costing $1 per square yard the annual saving has been found to be $528 per mile; with pavement costing $3.50 per square yard the saving is $1,188 per mile. In open track the saving is $290 per mile per year.



Ties for Treatment Are Stacked on a Carriage so that They Nearly Fill the Interior

Similar savings have been made by preservative treatment of structural timber and wood poles. Savings per year per 1,000 ft. b.m. are estimated at $1.72 Savings per mile of double-pole line are estimated at $281.95.

We must consider not only the actual economies in the use of treated timber at the present time, but we should endeavor also to anticipate conditions as they will be some years hence. The annual cutting of timber in this country far exceeds the annual growth. It requires from 35 to 100 years for a second growth tree to reach the size of pole timber, and this pole will last only from five to fifteen years untreated in the ground. It is estimated that with the present rate of cutting, the supply of commercial timber will be exhausted in 35 years. Under these circumstances every effort should be made to conserve the existing supply.

Louisville Editor Lauds Electric Dining Car Menu

Meal Set Before Minnie Maddern Fiske by Interstate Public Service Company Considered Good Substitute for What Once Made Kentucky Famous

DINING car service as supplied by the Interstate Public Service Company, Indianapolis, Ind., has recently aroused the enthusiasm of a Blue Grass editor, as evinced by the following editorial which appeared in the Louisville *Herald-Post* recently:

KENTUCKY'S NEW FAME

There is more than one road to fame. Kentucky used to rely on its production of fine whiskies, fast horses and fair women to lend distinction in foreign parts, but since one of this trilogy has been forcibly suppressed, the state has been considerably puzzled to supply a substitute. An idea of filling this hiatus is supplied by the *Interstate News*, which isn't a newspaper, but a house organ of the Interstate Public Service Company. It informs us that Mrs. Fiske and her company, who recently played an engagement of Ibsen's "Ghosts" at the Brown Theater, left Louisville for Indianapolis via electric car, and in a dining car operated by that company were served the following meal: Dix River tomato soup; Black Mountain turkey; Cranberry sauce à la Middleboro; Cynthiana dressing; Winchester spuds; asparagus Madisonville; hearts of lettuce, Richmond dressing; Harris pumpkin pie or Paducah plum pudding; Louisville roquefort cheese; wafers; coffee; mints.

The significance of this menu is more apparent when it is observed that every mouthful of food was consumed while the players were rolling through our sister state of Indiana. It is tantamount to the suggestion that if you want a good meal while anywhere in the Hoosier State run down to Kentucky.

A reputation for good food is not to be despised. For New Orleans and Paris it has won immeasurable affection. A single article of diet has made the names of some cities known the world over. Boston has lost her culture, but her pre-eminence in baked beans and brown bread is unchallenged. How many on this side would ever have heard of Bologna had not a patriotic butcher of that city once upon a time invented a convenient way of supplying soldiers with spiced minced meat while on the march? Munich and Muenchner, Bermuda and onions, Vienna and bread, Messina and lemons, Ireland and potatoes—they are as twined as roast beef and ale.

In honoring Kentucky's comestibles the Interstate shopped in the Blue Grass, in the mountains and in Louisville. It may never have occurred to Kentuckians before that they live uncommonly well. The Interstate deserves gratitude for discovering us to ourselves and to the rest of the world.

Powerful Locomotives Built for Paris-Orléans Railway

Record Made for Fast Long-Distance Operation—Designed for Maximum Speed of 81 M.P.H.—Each Axle Has Individual Drive

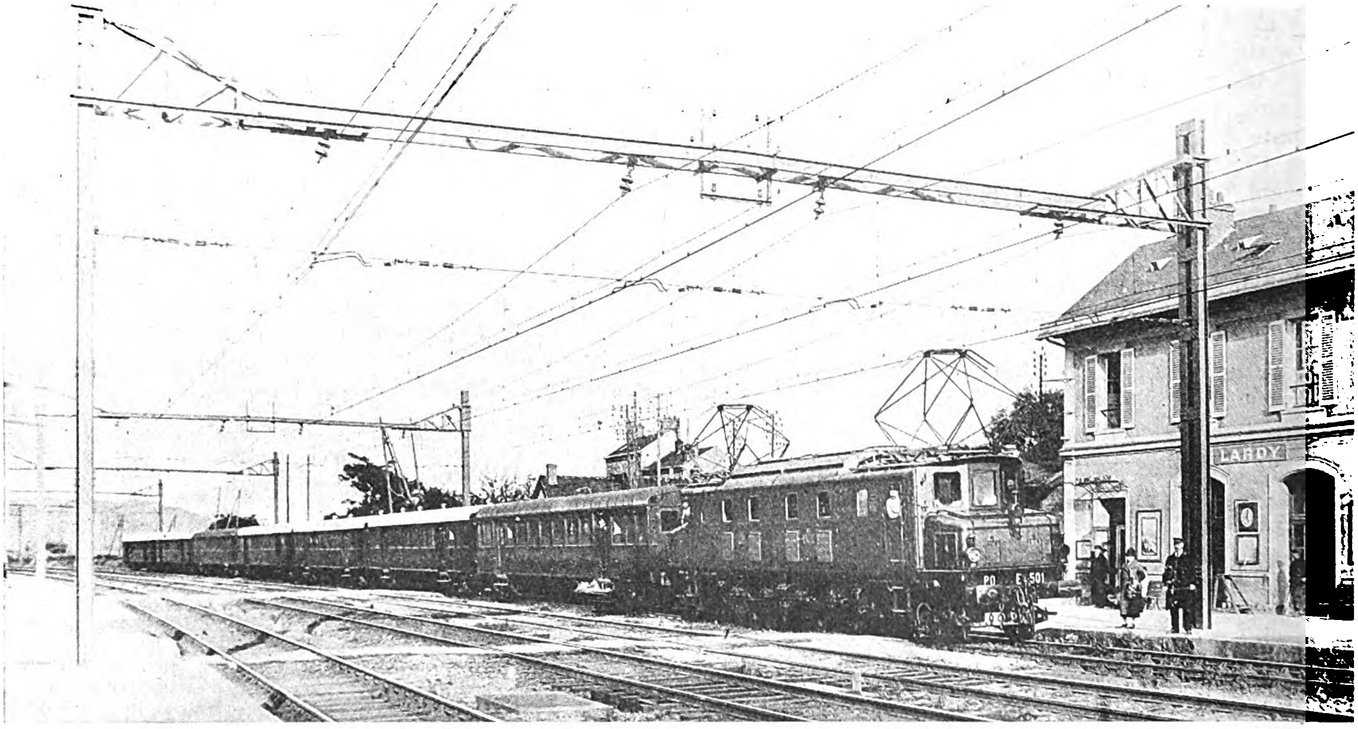
WITH the opening of the electrified section between Paris and Vierzon on the Orléans Railway in France, a new European record was made for long-distance, high-speed operation. On Dec. 22, 1926, the first train, drawn by a powerful express locomotive specially designed for this service, covered this run of 204 km. (127 miles) in one hour and 57 minutes, at an average speed of 105 km. per hour (65 m.p.h.). Over considerable distances a speed of 125 km. per hour (78 m.p.h.) was maintained. The locomotive used on this initial trip was one of two built by the Swiss Locomotive & Machine Works, Winterthur, and equipped electrically by Brown, Boveri & Company, Baden, Switzerland.

Since these express locomotives have been in use on the Paris-Vierzon section it has been possible to shorten the running time substantially. Formerly the journey between Paris-Austerlitz and Les Aubrais occupied 92 to 100 minutes, and that from Aubrais to Vierzon 74 to 76 minutes. After electrification it became possible for trains of 530 metric tons (584 U. S. tons) to operate over these two sections in about 75 minutes and 55 minutes respectively.

The axle arrangement used on the new locomotives is 2-D-2, there being a four-wheel guiding truck at either end, with eight driving wheels between. A one-hour rating of 4,000 hp. is obtained at the wheel treads at a speed of about 73 km. per hour (45 m.p.h.). A continuous rating of 3,300 hp. at a speed of about 78 km. per hour (48 m.p.h.) can be developed. The one-hour tractive effort on the wheels is about 31,960 lb. and that at the continuous rating is 25,350 lb. A drawbar pull of 47,600 lb. can be exerted at starting, i.e., 30 per cent of the 72 metric tons adhesion weight. The loading of the driving axles is 18 metric tons, which is the limit for this railway; the axles of the guiding trucks, which are non-symmetrically placed, carry 10.5 tons and 13 tons, hence the total weight of the locomotive is 119 tons.

Conditions of design were that the locomotives should attain a speed of 130 km. per hour (81 m.p.h.) on a suitable permanent way, and also, at low speeds, be able to traverse curves having a radius of 80 m. (265 ft.). These conditions led to the use on each locomotive of a two-axle truck, fitted with a spring centering device. Individual axle drive was used. This type of drive has been in service for a considerable period on 50 locomotives of the Swiss Federal Railways and elsewhere.

The electrical equipment consists of four 1,500-volt d.c. driving motors, provided with both self-ventilation and external ventilation. Motors can be connected in series, series-parallel or parallel, according to requirements. By the application of field-weakening taps and by shunting parts of the field eleven economical running steps are provided in one of the two locomotives and in the other, thirteen. By the arrangement of each motor group, twelve resistance steps can be obtained, so that besides the running positions already mentioned, 36 other steps are provided which make smooth starting possible. An auxiliary motor-generator set for 1,500/72 volts, connected in parallel with a battery, operates the pilot motor connected to the main controller. This auxiliary set also supplies current to the lighting circuit. The motor compressors and the ventilating motors are designed for a potential of 1,500 volts and are switched in or out, over a small resistance, by a contactor. Current may be obtained from the contact wire by means of two pantograph collectors, or it may be obtained from the third rail by shoes. Experience thus far indicates that the electrical equipment will prove satisfactory and suitable for the work required.



Paris-Vierzon Express on Paris-Orléans Railway Drawn by One of the New 1,500-Volt High-Speed Locomotives

What Does the Public Want—Low Car Fares or Service?

RICHMOND BOROUGH
NEW YORK CITY, Feb. 28, 1927.

To the Editor:

Staten Island, being the borough of Richmond of the city of New York, is vitally interested in the local bus situation. Trolley service has been given on Staten Island for the past 30 or 40 years. Two years ago an independent company started a bus system, most of which is in competition with the trolley company. There is, however, a real need for bus service in newer sections not reached by the rail lines, and also to replace the municipally operated trolley which the city seems anxious to abandon. The bus system now operates without a franchise.

Both the bus system and the trolley company, through a subsidiary, have made application to the Board of Estimate for a permanent bus franchise. The Staten Island Coach Company, the trolley subsidiary, offered an 8-cent fare with universal free transfers from and to all cars and coaches north of Richmond, which includes all but two unimportant lines. The Tompkins Bus Corporation offered a 5-cent zone fare. Transfers were offered at a 2-cent charge, at some points free and at other points none. The transfer feature of the offer was not well understood.

The borough president favors one of these parties, though he has expressed himself as willing to abide by the decision of the public. To obtain the general public sentiment, a local newspaper started a voting and letter-writing contest, in which prizes of $25 were offered for the best letters on the bus franchise question.

An examination of these letters as printed in the newspaper is very interesting. The following is a compilation of the subjects discussed in the 116 letters published:

Priority of service	23
Courtesy of employees	31
Amount and quality of service	84
Condition of equipment	37
Financial responsibility	45
Fare	70
Safety	12
Speed	7
Public relations	33

Naturally the number of subjects exceeds the number of letters, since each letter, on the average, discussed about three topics.

In interpreting these data, a number of things must be kept in mind. For one thing, the letter writers may not represent a fair cross-section of the community, since there were but 116 letters from a population interested of at least 125,000. Also the people of Staten Island may not be representative of the country at large, the people in New York City being notably uninformed about transit matters in general and unacquainted with the progress which has been made in cities where the political influence against efficient transit service has not been so great.

Many of the writers undoubtedly considered speed, safety and equipment under the general heading of service, although the topics discussed under service in most of the letters were about headway, reliability, freedom from breakdowns, territory covered, night cars, etc. The speed of both prospective operators may have been taken for granted as about alike. Courtesy must have been in the minds of those letter writers who discussed the service.

On the subject of fare, those who live within a 5-cent ride of the ferry were strong for the zone system. Those who live further out, where 10, 15 or 20 cents for two, three or four zones would be charged, preferred the 8-cent fare with universal free transfers. One thing stood out, that almost every letter admitted the absolute impossibility of a straight 5-cent fare. The losses of the municipal venture here were offered as proof. There was also a strong sentiment for a straight 10-cent fare with good service, although unfortunately a few writers haggled over pennies here and there. If a clear-cut conclusion may be drawn from the letters printed, with the complicated fare structure outlined, it was that the people wanted good service, and realized that they would have to pay a fare that would purchase the service desired.

The interesting deduction may be drawn that even in New York City service is preferred to the fare, though the fare looms large over other factors. The surprising thing is that speed and safety, at least in city service, were mentioned by so few people.

FELIX E. REIFSCHNEIDER.

Atlanta Devotes Much Attention to Car Appearance

GEORGIA RAILWAY & POWER COMPANY
ATLANTA, GA., Feb. 2, 1927.

To the Editor:

Atlanta is evidently doing her part to get rid of those 25,000 obsolete electric cars. In the last three years she has set the torch to 170 old cars, with ages ranging from 20 to 28 years, and in their place are 196 new four-motor, low-floor cars, weighing 37,500 lb. each. This has resulted in better looking cars, increased rates of acceleration, higher speed, quicker stops and a more satisfactory service.

Free discussion indicates that today individuals are expecting more comfort and speed, and in response to this many electric cars now have rubber tile flooring, deep-cushioned individual seats and streamline exteriors in attractive colors. Present-day cars cost a lot of money, all the way from $14,000 to $18,000 each, and there is no doubt that in many cases the providing of new equipment has been a Herculean task. Now that there are a lot of them in service throughout the country "all dolled up" and looking good an increased responsibility falls on the maintenance department in order to keep them attractive.

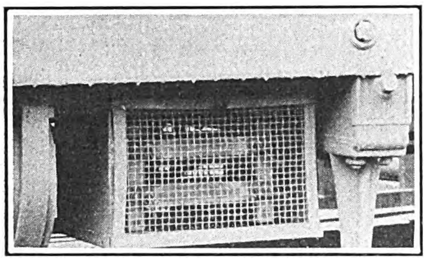
If the rubber tile floor cannot be kept clean, if the upholstered seats are not re-covered perhaps every two or three years and if the attractive exterior is not kept clean by running the car through the paint shop at least every sixteen months, much of the attractiveness may be lost. It is also necessary to provide a fairly smooth and comfortable track for these new cars to run on or else the looked-for gain in receipts may not be realized.

W. H. MCALONEY,
Superintendent of Equipment.

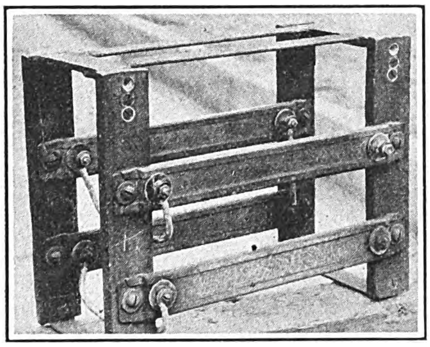
Maintenance Notes

Headlight Resistor Withstands Climate

SPECIAL headlight resistance units are being installed on the Key Route cars of the Key System Transit Company, Oakland, Cal. The unit is placed in series with the headlight to cut down the trolley voltage to approximately 110 so that a 250-watt, 110-volt lamp may be used. The unit is of a special material known as Chromalux, manufactured by the Edwin L. Wiegand Company. It has the properties for withstanding the salt air, fog and sewer gases encountered on the pier route of the Key System. The units are mounted on a wood framework which is suspended under the car, either at the center or under the end frame, where the resistor is subject to all climatic and road conditions. As will be seen in the accompanying illustrations, the resistors are protected by a copper mesh screen.



Special Headlight Resistor, Made of Chromalux Units, Which Withstands Sewer Gases, Salt Air and Fog on the Key Route



The Units Are Mounted on a Wood Framework Which Is Suspended Under the Car

Use best renewals; substitutes
Will soon leave you destitute.

Adjustable Armature Winding Stand

REPAIR and winding of armatures in the shop of the Lynchburg Traction & Light Company, Lynchburg, Va., has been simplified to a marked degree since Master Mechanic Cochran designed and built an adjustable armature stand. The adjustable feature provides a range of pedestal centers that will accommodate the smallest air compressor armature or the largest railway motor armature.

The stand is made of well-seasoned oak. When assembled it occupies a floor space of approximately 24 in. x 48 in. The base consists of two 3¼-in. x 4-in. x 24-in. oak beams and the armature supports are made of 1¾-in. lumber of semi-tapered design with a 12-in. base and a 6-in. top. Each base beam has a recess gouged out 1¾ in. x 2 in. x 12 in., in which is installed the base of the armature support, held in place by two ½-in. machine bolts. One end of an oak timber 2½ in. x 7½ in. x 45¼ in. is fastened to the commutator end armature support by two substantial steel angles. The other end is placed through a 2½-in. x 7½-in. hole in the pinion end armature support. This allows the latter to be moved toward or away from the commutator end support as desired for the armature to be worked upon. Two angles are fastened to the movable armature support. One has a projection extending down on either side face of the 45¼-in. beam and acts as a brace to prevent tipping and a guide to assure alignment at all times.

An added feature is a workman's semi-revolving seat 2 in. x 9 in. x 4¼ in., and a tool and material box 12 in. x 12 in. x 3 in. fastened to the commutator armature support.

Due to its portability this armature stand can be moved to any part of the shop to facilitate working conditions, especially to secure daylight.

Tilting Table Circular Saw in the Capital Traction Company Shop, with Lumber in Place and Table Set for Angle Cut

Modern Sawing Machine Saves Material and Labor

LUMBER for window, door and vestibule posts was a very large item in the carpenter shop budget of the Capital Traction Company, Washington, D. C., until W. H. McCarty, master mechanic, installed a modern sawing machine. The magnitude of the lumber item was not entirely due to the number of posts required for repair work but rather to the unavoidable waste of material on account of cutting posts with a certain angle by means of an obsolete circular saw. The machine installed to obviate this is an individual motor-operated American No. 10 Model 3 tilting table circular saw.

Where it was possible to cut only two door posts from a certain piece of stock three of these posts can now be made and the waste is extremely small. On this one class of work alone the lumber saving has amounted to at least 35 per cent and the number of operations reduced 75 per cent. Similar saving in material and operations has been shown in practically all of the work where angle cutting is required. It is believed that the machine has fully paid for itself in the few months it has been in service.

Improving Sweeper Brooms

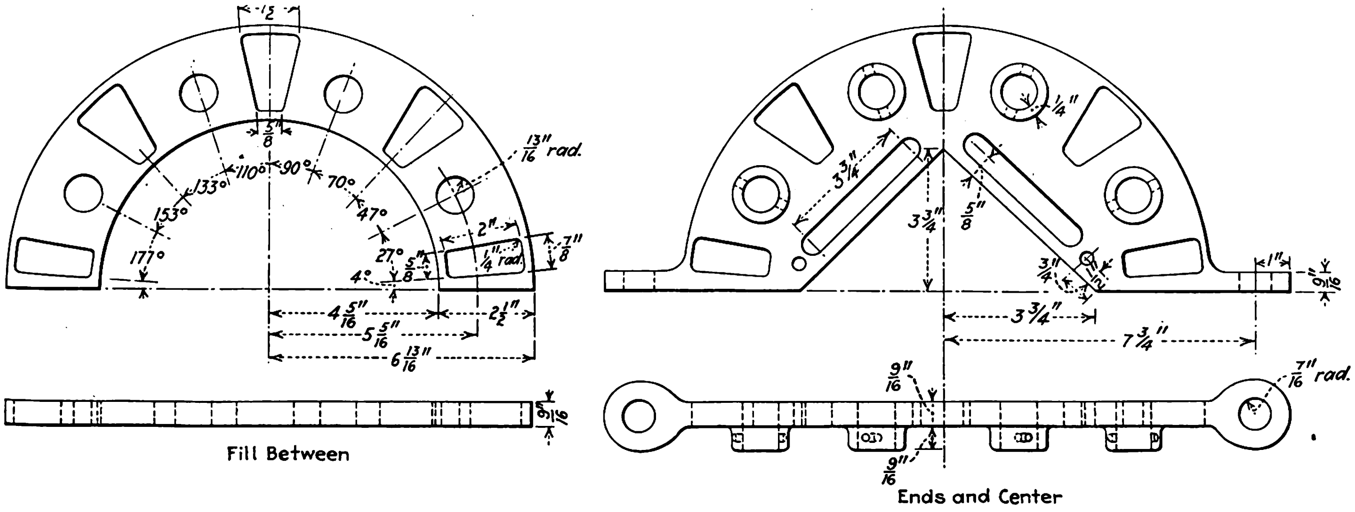
By William J. Smith

Master Mechanic Community Traction Company, Toledo, Ohio

SNOW fighting has not been so great a cause for anxiety on the lines of the Community Traction Company, Toledo, Ohio, since the development in the shop of a new casting for the brooms. Formerly the broomsticks for snow sweepers were inserted through small holes in an iron casting, turned through the back and pushed through a similar hole in the casting about 12 in. away. A board clamped to the back of the casting held the broomsticks in place.

This method proved very unsatisfactory. Not only did the sticks break when they were inserted in the small holes but the board clamped against them turned them at such a sharp angle that they soon broke off in service. During a snowstorm it was customary to have three or four men working overtime to keep the brooms in repair.

A new type of casting has now been developed in which the broomsticks are placed in position in a U-shaped aperture and held firmly in place by an iron rod run through after an entire row has been placed. Since this method was adopted no men have been worked overtime to keep the brooms in repair and they outlast the old style which they replaced.



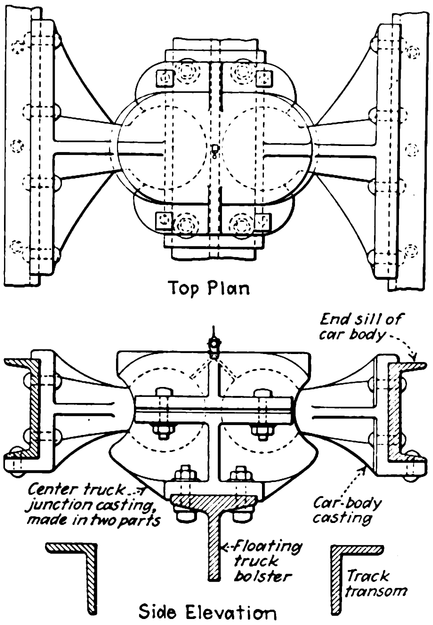
New Broom Castings Overcome Breakage Troubles

New Equipment Available

Universal Joint Coupler for Articulated Cars

For joining articulated car units a new type of universal joint coupler is being marketed by the Universal Car Parts Corporation, Baltimore, Md. The coupler is the invention of Joseph M. Suarez and includes four castings designated as lower socket, upper socket and two car end connections. Each of these latter parts has a ball which fits into a hemispherical socket in the lower and upper socket members. The lower member is secured to the bolster on the center truck and the upper one is fastened to the lower, thus providing two complete ball sockets which engage the respective balls of the car end connections.

Each car end connection is thus free from engagement with the other and can be disconnected from the center truck without interference with the other car end. The two-ball coupler is designed to take track curves of short radius such as are encountered in electric railway service. The lower sockets retain the lubricant and the pocket construction prevents waste. The upper and lower socket members are separated by gaskets which can be adjusted to compensate for the wear of the ball joints.



Construction of Universal Coupler for Articulated Cars

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 16-17—Central Electric Traffic Association meeting, Lincoln Hotel, Indianapolis, Ind.

March 17-18—Illinois Electric Railway Association, seventh annual joint convention, Hotel Abraham Lincoln, Springfield, Ill.

March 24—New England Street Railway Club, annual meeting and banquet, Copley-Plaza Hotel, Boston, Mass.

April 1—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

April 26-29—Southwestern Public Service Association, convention, New Orleans, La.

May 31—June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.

Association News & Discussions

Prizes to Be Awarded for Papers on Arc Welding

The sum of $17,500 has been placed with the American Society of Mechanical Engineers by the Lincoln Electric Company, Cleveland, Ohio, to be awarded by the society for the best three papers disclosing advancement in the art of arc welding, presented under the rules of the competition. The prizes to be awarded are $10,000 for the first, $5,000 for the second and $2,500 for the third. The purpose of the competition is to encourage improvement in the art of arc welding, the pointing out of new and wider applications of the process, the discoveries of improved methods of testing welds to insure their integrity, or indicating advantages and economies to be gained by its use.

The competition will be judged by a committee of the American Society of Mechanical Engineers and any one may compete. Papers must be sent in duplicate to the secretary, Calvin W. Rice, 29 West 39th Street, New York, N. Y. All exhibits must also be in duplicate and captions, titles, legends and notes must be in the English language. All papers must bear evidence of having been sent before Jan. 1, 1928, in order to be considered and must be received by Jan. 31, 1928.

Every paper should include necessary drawings, photographs or other exhibits, in order that the disclosures may be complete. Originality of design is preferable, either in the method of applying the weld or in the design of the welding parts for their arrangement. Designs which are of no practical use will be considered only in case they include suggestions which could self-evidently be applied in other ways than those suggested. Methods of applying the arc or the welding art, which will improve existing machines or make commercially possible machines which in the light of previous engineering have been regarded as impractical, are specially desired.

In submitting papers each competitor gives the American Society of Mechanical Engineers the right to publish the paper should the society desire to do so. No papers will be returned to any competitor. It is the purpose of the American Society of Mechanical Engineers to present these awards at the stated spring meeting of the society in 1928. All competitors will be notified promptly of the action of the judges. The American Society of Mechanical Engineers has issued a bulletin giving complete information regarding the competition. Copies of this may be obtained by addressing the secretary.

New England Club Banquet March 24

Plans are well under way for the 27th annual banquet of the New England Street Railway Club. As is customary, it will be held March 24 at the Copley-Plaza Hotel, Boston. Dinner will be served at 6:30 p.m. for members and gentlemen guests. Music will be furnished by the Connecticut Company Employees' Band.

Edward Dana, general manager Boston Elevated Railway, will be toastmaster. The speakers will be Gov. Alvan T. Fuller of Massachusetts, Mayor Malcolm E. Nichols of Boston, Hon. B. F. Cleaves, former chairman Maine Public Utilities Commission, and Frank P. Sibley, special correspondent of the Boston *Globe*.

The annual meeting of the club will be held at the hotel at 3 p.m., at which time officers for the ensuing year will be elected.

Central Master Mechanics Appoint Committee

Committee appointments of the Central Electric Railway Master Mechanics Association have been announced for the present year by President G. R. Green. A full list of appointments follows:

Executive — G. R. Green, president C.E.M.M.A., general superintendent Chicago, South Bend & Northern Indiana Railway, chairman; F. J. Foote, vice-president C.E.M.M.A., Springfield, Ohio; L. E. Earlywine, secretary C.E.M.M.A., Indianapolis, Ind.; Charles Sigler, Warsaw, Ind.; T. H. Nicholl, Anderson, Ind.; J. W. Osborn, Elyria, Ohio; A. W. Reddersen, Fort Wayne, Ind.

Arbitration—J. B. Corderman, master mechanic Lima Toledo Railroad, Lima, Ohio, chairman; R. E. Cornwell, South Bend, Ind.; H. F. Coleman, Fort Wayne, Ind.; Theodore Cox, Springfield, Ohio; R. C. Taylor, Albion, Mich.

Membership—R. E. Twiggs, master mechanic, Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, chairman; A. W. Brownsworth, Sandusky, Ohio; W. J. Smith, Toledo, Ohio.

Reclassification of Accounts—P. V. C. See, superintendent of equipment Northern Ohio Power & Light Company, Akron, Ohio, chairman; T. H. Nicholl, Anderson, Ind.; A. W. Reddersen, Fort Wayne, Ind.; C. M. Bange, Scottsburg, Ind; J. W. Osborn, Elyria, Ohio.

Standardization—T. H. Nicholl, superintendent of motor power and equipment Union Traction Company of Indiana, Anderson, Ind., chairman; A. W. Reddersen, Fort Wayne, Ind.; C. E. Snyder, Tippecanoe City, Ohio; Charles Sigler, Warsaw, Ind.; J. F. Seigle, Newark, Ohio; J. D. Barnhart, Decatur, Ill.; C. M. Bange, Scottsburg, Ind.

Subjects—A. J. Challeen, superintendent of shops Detroit United Lines, Highland Park, Mich., chairman; J. B. Corderman, Lima, Ohio; J. W. Osborn, Elyria, Ohio; W. J. Fox, Scottsburg, Ind.; G. A. Stiles, Columbus, Ohio.

Uniform Charges for Repairs to Interchanged Equipment—W. A. Coleman, superintendent Dayton & Western Traction Company, West Alexandria, Ohio, chairman; A. F. Rolston, Stratford, Ohio; Allan Karns, Bowling Green, Ohio; Theodore Cox, Springfield, Ohio; M. M. Lloyd, Michigan City, Ind.

American Association News

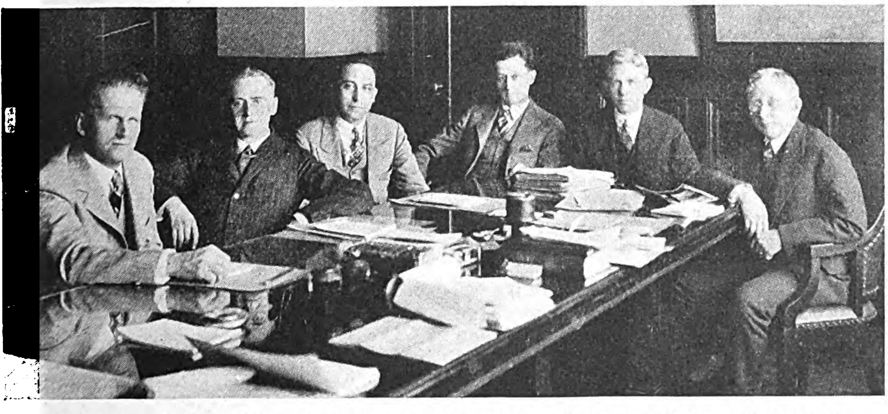
Exhibit Committee Appointed

PRESIDENT W. H. SAWYER of the American Electric Railway Association has announced the personnel of the exhibit committee for the 46th annual convention and exhibit, scheduled to take place in the Cleveland Public Auditorium and Annex, Oct. 3 to 7 inclusive. Col. J. H. Alexander, president Cleveland Railway and chairman of the exhibit committee, has called a meeting of the entire committee at his office, Hanna Building, Cleveland, Ohio, for 10 a.m., Friday, March 18. This meeting is for organization purposes, to go over and approve pending contracts, to lay out floor space showing detailed arrangement of booths, etc. The personnel of the committee is as follows:

Col. J. H. Alexander, president Cleveland Railway, Cleveland, Ohio, chairman.
C. E. Morgan, Brooklyn, N. Y., vice-chairman.
J. W. Welsh, New York, N. Y.
Fred C. J. Dell, director of exhibits, A.E.R.A., New York, N. Y.
H. H. Adams, Chicago, Ill.
L. D. Bale, Cleveland, Ohio.
Herman Bender, Cleveland, Ohio.
C. P. Billings, Pittsburgh, Pa.
R. M. Campbell, Philadelphia, Pa.
T. W. Casey, New York, N. Y.
C. H. Clark, Cleveland, Ohio.
J. F. Collins, Jackson, Mich.
S. G. Down, Wilmerding, Pa.
B. C. Edgar, Nashville, Tenn.
J. F. Egolf, Highwood, Ill.
H. F. Flowers, Findlay, Ohio.
Charles Gordon, New York, N. Y.
L. E. Gould, Chicago, Ill.
R. N. Graham, Youngstown, Ohio.
R. A. Hauer, New York, N. Y.
C. S. Hawley, Albany, N. Y.
B. A. Hegeman, Jr., New York, N. Y.
A. P. Jenks, Chicago, Ill.
A. E. Kasemeier, Cincinnati, Ohio.
H. J. Kenfield, Chicago, Ill.
G. L. Kippenberger, St. Louis, Mo.
S. P. McGough, Chicago, Ill.
J. S. Pevear, Birmingham, Ala.
A. L. Price, Mansfield, Ohio.
Harry Reid, New York, N. Y.
A. M. Robinson, Philadelphia, Pa.
S. P. Seward, Cleveland, Ohio.
L. W. Shugg, Schenectady, N. Y.
D. W. Snyder, Jr., Springfield, Ill.

Purchases and Stores

PREPARATION of the report to be presented at the annual convention of the Engineering Association occupied the attention of the committee on purchases and stores at a meeting held on March 1 and 2. The committee met in the offices of the Virginia Electric & Power Company at Richmond, Va., on invitation of J. Y. Bayliss, director of purchases and supplies. Other members present were John Fleming, chairman; B. W. Forkner, A. A. Ordway, W. J. Walker and A. E. Hatton.



Members of Committee on Purchases and Stores at Recent Richmond Meeting
From left to right—B. W. Forkner, A. A. Ordway, W. J. Walker, A. E. Hatton, John Fleming and J. Y. Bayliss.

Metropolitan Section Keeps Posted

NEW developments in the transportation industry were discussed at a well-attended meeting of the Metropolitan Section, A.E.R.A., held at the Engineering Societies Building, New York City, March 4. Various phases of the business were treated by the several speakers selected by the sponsor group committee, of which C. R. Jones was chairman.

J. B. Donley, director of public relations Pittsburgh Railways, told of the new ideas developed to sell transportation. He outlined the various steps through which the company has passed from receivership to its present enviable position. How new franchises were secured and friendly relations established with municipal authorities and with the general public were brought out. He gave interesting information on the recent "Ride the Trolley Week" which was the subject of a comprehensive article in ELECTRIC RAILWAY JOURNAL for Jan. 29. Particular emphasis was laid on the policy of the management to lay all its cards on the table in dealing with the public and its employees.

On account of the illness of Charles Gordon the subject of recent developments in car equipment was discussed by John A. Dewhurst, associate editor ELECTRIC RAILWAY JOURNAL. He brought out forcibly the influence which the automobile has had upon the local transportation situation. The industry has changed from a non-competitive necessity to a competitive convenience, he said. This has made it necessary to improve the common-carrier vehicle to a point where its service approaches that of the private automobile in comforts and attractiveness. He mentioned the importance of light-weight construction, improved seats, automatic treadle exits and similar features. His talk was illustrated by lantern slides showing new cars operated on various electric railways throughout the country and interesting details.

Moving pictures illustrating the latest transportation developments in the metropolitan area were presented by Horace Sisson of the Sisson Supply Company. Included in this were views taken on the properties of the Richmond Light & Railroad Company, Brooklyn City Railroad, New York Railways and Public Service Railway.

E. M. T. Ryder, way engineer Third Avenue Railway, spoke briefly about the latest things in track construction. He called attention particularly to the method used by his company in making butt-welded joints. H. F. Merker, chief engineer Brooklyn City Railroad, also spoke briefly on track matters, but expressed a view somewhat different from that of Mr. Ryder concerning butt-welds. He spoke of the importance of ELECTRIC RAILWAY JOURNAL as an agency to keep the industry posted on developments.

The meeting was concluded with a talk by James O'Shaughnessey, National Association Advertising Agencies. He told how advertising has made friends for countless manufactured products and pointed out its possibilities as a means of winning public favor.

The News of the Industry

Money for Bondholders

Redemption and Interest on Seattle Railway Paid—Extension of Time on Purchase Bonds Defeated

Ignoring an order of the Superior Court temporarily tying up the funds, City Treasurer Ed L. Terry, Seattle, Wash., with the concurrence of other city officials, on Feb. 28 telegraphed $1,142,835 to the city's fiscal agent in New York, for payment of the bond redemption and interest due on March 1 on the Seattle Municipal Railway, purchased from the Stone & Webster interests in 1919.

Attorneys for John G. Von Herberg, who is suing the city to force the payment of salaries and other costs of operation ahead of installments on the purchase bonds, refused to enter into a stipulation, as demanded by Corporation Counsel T. J. L. Kennedy, whereby the city would be permitted to make the bond payment when due. Mr. Von Herberg charges as unlawful loans totaling $735,000 from the city light department to aid the municipal railway in its present entanglement of finances and litigation. In Mr. Kennedy's diagnosis of the situation, a successful prosecution of the specific performance suit brought in federal court by the Puget Sound Power & Light Company against the city would be likely if the city defaulted on the purchase bonds, in which case the city would have to operate the railway from money of the general fund, leaving first revenues of the railway for the holders of the purchase bonds.

J. G. Von Herberg Continues Protest

Attorney Robert P. Oldham, for Mr. Von Herberg, asserts that his suit for payment of salaries still stands, and the fact that salaries now may be paid from an "unlawful transfer of funds" does not affect the situation. Mr. Oldham points out that the city has violated the temporary restraining order of the Superior Court, and Mr. Von Herberg in an open letter protests against such action, and strongly criticises the Council for its action in violating a court order.

Efforts of the Puget Sound Power & Light Company to amend the bill now pending in the Washington Legislature providing for an extension of time on the Seattle Municipal Street Railway purchase bonds have failed in the Senate committee on cities of the first class.

The bill that was favored by the city was voted out of committee with the unanimous recommendation that it pass without the Puget Sound company's amendment.

A. W. Leonard, president of the Puget Sound company, after a conference with Mayor Bertha K. Landes, announced that his company will not pursue further its efforts to attach an amendment to the bill, because while he feels that the amendment is justified, it is feared it may defeat the entire measure, with the result that all negotiations for bond extensions would be held up until another session of the Legislature.

The amendment, in the opinion of Corporation Counsel T. J. L. Kennedy, Mayor Landes and other city officials, would have the effect of making the extended bonds a general obligation of the city, instead of merely a lien on the gross revenues of the street railway utility. Puget Sound officials insist that the amendment was merely for the purpose of restoring the bonds to the same status they have at present.

Another phase of the railway financial troubles came up when the United States Supreme Court in Washington, D. C., on Feb. 28 announced that it would not act as referee in the $545,000 tax battle between the Puget Sound Power & Light Company and the city, and dismissed applications for writs of certiorari filed by the litigants. This decision means that the city's general fund is not liable for the payment of the city's share of the street railway taxes for 1919. The Circuit Court of Appeals held that the street railway must pay the taxes, but that the money must come from the revenue of the utility. The Puget Sound company filed application for a writ of certiorari on the ground that the taxes should be an obligation against the city. The city, contending that the city does not owe the tax money, filed application for a cross writ of certiorari. The dismissal of both applications leaves the decision of the Circuit Court of Appeals still in effect.

Fare Change Sought

Company at Houston Desires Sliding Scale—Needs $1,000,000 to Keep Pace with Growth of City—Auto Registration Increased in Six Years—Bus Service Unprofitable

N A petition filed Feb. 28 with the City Council of Houston, Tex., the Houston Electric Company proposes a fare adjustment based on a sliding scale, which would permit regular patrons to enjoy the same rate as heretofore, or possibly less, the occasional rider to pay as high as 10 cents. The company states that an increase in fare is necessary to realize an adequate rate of return on its investment. Profits for 1926 were scarcely more than 3 per cent. Expenditures totaling $1,000,000 will be necessary in 1927 to keep pace with the development of the city. In a full-page advertisement, signed by Jeff L. Alexander, manager, the people of Houston are acquainted with the plan of the company.

Mayor Oscar Holcombe said that the city would take time to consider whether the adjustment was merited. An investigation will be made and a hearing held, the Mayor explained. While the Council is investigating the requested rate adjustment, the company plans to lodge a campaign of public information by distributing circulars on cars and buses and using newspaper advertising to tell why the increase is needed.

The company introduces its petition with the explanation that within a short time the three-year construction program, outlined in an agreement between the company and a committee of citizens of Houston, will have been completed. The company obligated itself to spend $1,500,000 within three years on extensions. Other improvements not included in the agreement have been carried out by the company and the total expenditures to date have been $1,650,000. The company now claims that $1,000,000 is needed to keep pace with the growth of Houston and presents the problem of from what source the $1,000,000 of new money can be secured.

With a record of earning only $4,905 with which to pay interest on the $3,627,358 of new money invested during the past thirteen years, it was easy to understand why investors do not want to purchase additional securities of the company. According to the petition the people of Houston have purchased securities liberally, believing, as did the company, in the future of public transportation and the fairness of the citizens and city authorities to permit the company to earn a reasonable return on money so invested. While the interest has been paid on the securities it has come as a sacrifice from the original security holders, and if further securities should be offered and sold the interest paid on them would in turn come as a sacrifice from the present holders of securities located in Houston and elsewhere. Under the circumstances, the company would not be justified in asking people to invest further in the company's securities and could not expect them to do so.

The difficulties through which the company has passed since the outbreak of the European war were enumerated in a brief historical summary included in the petition. Mention was made of the operation of jitneys which depleted the revenues of the company, the expansive improvement program and the substantial addition to its investment. The relief offered through various means would have proved sufficient to keep the company in good financial condition, except for further depletion of the revenues by diversion of traffic from its cars to privately owned automobiles. The effect of the ownership and use of private cars was shown by the number of revenue passengers on the Houston car lines since 1920 and Harris County's auto registration during that same period. The auto registration for the year ended Dec. 31, 1920, was 22,032, and for 1926, 60,922. The number of revenue passengers in 1920 was 35,222,621 and in 1926 42,082,233. Elimination of the jitneys helped to increase the number of passengers on the car lines from 1923 to 1926. To regain by an increase in fare from present car riders the revenue lost through automobile development would mean an increase in the present fare of more than 3 cents per ride.

Reference was made in the petition to the efforts made to facilitate riding—the means to make the service more attractive, the advertising and general merchandising methods and the investment in buses being proposed to that end. The bus operation, however, has been unprofitable, the amount earned on the investment being less than 1 per cent. However, the petition states the net result is more satisfactory than the investment in car lines would have been to serve the same territory.

The service now needed cannot be provided until new equipment is purchased. Plans and specifications for new cars of modern design are now in the hands of the car builders awaiting orders to begin work. The additional revenue needed for the purposes above enumerated plus added taxes to be paid to the city and state on gross earnings is equivalent to an additional fare of approximately 1½ cents for each passenger now carried.

A schedule of rates should be promulgated which will permit those who use the service regularly to pay a fare considerably less than those who use it occasionally. The wholesale rate would be made available by the purchase of a weekly ticket sold by the trainman, which when presented to the operator would entitle the bearer to ride for a 5-cent fare, the ticket to be transferrable and made available for use by any member of the family, or any one else who may present it. Under the plan of a wholesale rate or sliding scale of fares the additional revenue needed by the company would be paid very largely by those who use the service only occasionally. The infrequent rider, who uses the automobile except when it is not available, certainly should not object to paying a cash rate not to exceed 10 cents, particularly if tokens were sold at a liberal discount.

In conclusion the petitioner stated:

> In asking for this adjustment, it is not our purpose to secure a rate which will produce any more revenue than is necessary for the company to put its finances in condition to maintain proper service and continue as a factor in the development of the city. There are those who will, of course, hold views different from the conclusions we have reached, and to them or any one else we desire to extend an invitation to ask for or call to secure any further information necessary for thorough understanding of the matters herein discussed.

Beaver Valley Honors Twenty-five-Year Men

In New Brighton, Pa., there were reunion and rejoicing recently in celebrating the affiliation of thirteen employees with the company for 25 years or more. A feature in this connection has been the organization of the Twenty-Year Club, in which, in addition to the 25-year men, will be included five more men who will reach the 25 years of service mark during the current year.

A banquet was held at the Pittsburgh Athletic Association Club to permit A. W. Robertson, the president of the Philadelphia Company, and Vice-President Thomas F. Fitzgerald, former General Manager W. H. Boyce and Personal Director W. G. Marshall to be present. The trip was made by Beaver Valley motor coaches and was one of the high spots of the occasion, which later reached the point of solemnity when the officers of the company, in their addresses, referred to the loyalty of the group of men and pictured the happenings of joy and sorrow in the 25-year period which they had served their company and the public.

Clinton D. Smith, general manager, presided at the banquet and presented each of the men to the officials of the parent company. In doing this he briefly sketched events in the life of each, saying: "I find inspiration and keen pride in reviewing the service of these men and their contribution toward the prestige, stability and success of our company."

In token of the service rendered and the continuity of it, General Manager Smith presented a gold watch charm to each of the thirteen men. The face of this charm bore a reproduction of the service with the figures "25 years," while the back bore the name of the employee and the date he began work. A. W. Robertson, president, and Thomas Fitzgerald, vice-president, both made grateful reference to the long term of employment and expressed a bright future for the property in the group represented.

Mr. Boyce, the former general manager, referred to his personal contact and told some of the experiences during the early days of the local lines when track, cars and equipment were not so efficient as they are today.

Of the thirteen men, two have been pensioned and eleven are still in active service with the Beaver Valley Traction Company. They are J. R. Marshall, superintendent of transportation; H. J. Meyer, superintendent of equipment; W. F. Allshouse, track supervisor; I. J. French and David Hall, pensioned employees; W. J. Moffett, P. F. Householder, C. P. Hayward, A. E. Price, H. McMillen, John Myers, William Myers and Robert J. McClymonds.

During 1927 the five men who will reach the 25 years of service mark are M. D. Ayers, W. T. Byers, James Davidson, James Graham, D. Lee Noss and Alex Webster. This will make a total of seventeen men who have been with the company 25 years, practically 10 per cent of the total number employed locally. The Twenty-Year Club will perpetuate for all time the tribute due those who have served and continue to serve faithfully a community of people.

Kansas City Grant Ready

The proposed 30-year franchise for the Kansas City Public Service Company, the successor to the Kansas City Railways, was introduced in the Council on March 3 at a special meeting called for that purpose. It was referred, without discussion, to the Council as a committee of the whole for public hearings. Attached to the ordinance was a report of the special committee in whose name the measure was introduced. The report set forth the leading provisions of the proposed grant and unanimously recommended its adoption.

Mr. Gossett, the chairman of the committee, said the ordinance was not introduced at a special meeting in an attempt to hasten matters; that it would take its usual course through the Council, and that public hearings would be had as long as necessary. He said it was the desire of the committee that the ordinance come up for final action on March 21. Should it be passed on that date it would become effective March 31. The company would have twenty days in which to accept it. The grant not being for more than 30 years, the action of the Council is final, under a provision of the charter, and will not have to be submitted to a popular vote.

The franchise committee has been at work since early in November, following the adverse referendum. On Dec. 11 the committee submitted to the Council its recommendations for the basis of the ordinance. Those the Council adopted unanimously on Dec. 20, reserving the right to withdraw its approval if the suggestions were not generally followed.

Will Appeal for Eight Cents in St. Louis

Receiver Rolla Wells of the United Railways, St. Louis, Mo., is preparing to appeal to the United States Supreme Court in an effort to regain the 8-cent fare or two tokens for 15 cents rate which was temporarily in effect under a federal court injunction from Feb. 7 to March 1. Thomas E. Francis, counsel for Receiver Rolla Wells, has already notified City Counselor Muench that an appeal to the highest court would be made. The city will vigorously resist the petition. A special court composed of three federal judges sitting at Kansas City refused to make the temporary fare permanent and ruled that the company was not entitled to the raise, but should await action by the Missouri Public Service Commission, before which an application for the 8-cent fare has been pending since June 7, last.

Delay in Brooks-Coleman Act

Proposed repeal of the Brooks-Coleman act of 1921 placing valuation of electric railway properties and regulation of rates in charge of the Minnesota Railroad and Warehouse Commission seems lost at the present biennial session of the Legislature in St. Paul. The Senate adopted a report of the general legislation committee for indefinite postponement, 41 to 23. While the matter is still in the House it is not expected to come up. Five Minneapolis Senators voted for the report against three opposing. The bill was introduced by Senators Henry Morin of Duluth and Charles Hausler of St. Paul, both cities opposing the present law. The Senators who opposed the change hold that rate making should be in the jurisdiction of a disinterested body, such as the state commission, and that otherwise the law does not take away from cities the control of electric railways. The report of the Senators followed several public hearings in the Capitol.

Progress in Campaign to Reclaim Michigan Road

After several months of solicitation for stock subscriptions, residents in the villages and communities along the abandoned Grand Rapids, Holland & Chicago Railway at a mass meeting on March 8, in Grandville, Mich., voted to purchase that part of the defunct road between Jenison and Grand Rapids. Authority to purchase was given by the campaign committee of the United Suburban Railway, as the new company will be known. According to Harold T. Slaght, chairman of the finance committee of the new company, the purchase price as arranged by his committee and representatives of the Heyman-Michaels Company, Chicago, which purchased the line at receiver's sale, is $30,000. The finance committee was also authorized to purchase and string new trolley wire at a cost of $7,500 and to purchase cars. The committee started on March 9 to complete the negotiations with the Michigan Railway for use of the tracks from the west city limits of Grand Rapids to the downtown station of the latter company. This agreement will be made on a car-mile basis which is considered favorable to economy in operation.

It was estimated that $52,250 would be required for the United Suburban Railway to begin operation. This would include the purchase price, the expense of the trolley wire, incorporation, insurance and the fund for operation. Reports at the mass meeting showed that $45,210 had been subscribed, leaving a balance of $7,040 to be raised before running of cars can be begun.

A call was authorized for a general meeting of the stockholders to be held in Grandville on March 21, to elect directors for one year. In the meantime members of the finance committee of the proposed company will meet with representatives of the Consumers Power Company, which owns the right-of-way, to arrange to have the new interurban lease the right-of-way on favorable terms.

Following a survey, Chairman Slaght said if the new line could carry as many passengers as had been carried by the old line it would make a profit. One big factor, he said, would help the new company. That was the possible elimination of personal taxes, as the line would be a community affair.

Leaders in the new company said there was a possibility of beginning service within the next 60 days. The line, double track, will be 8.3 miles in length. It will serve about 20,000 people in Burlingame, Beverly, Wyoming Park, and other sections.

Co-operator Greets Operator in Philadelphia

The bonds of a new friendship between the management of the Philadelphia Rapid Transit Company, Philadelphia, Pa., and its employees were tied on Feb. 25 with the première of the P.R.T. *Co-operator*, acting as agent provocateur. Many employees have felt the need of this community of interests sheet and have suggested some such avenue of communication which might carry a message to the employees rather than to the stockholder and car rider as does *Service Talks*.

Not imposing but impressive is the exterior view of the initial number, with a Mitten moral on labor and profits boxed in its center. Its contents consume fourteen pages which fulfill the purpose of the booklet—an appeal to the employee. Here is an announcement of the company's campaign to win depositors for the Mitten Bank, in which every employee is a stockholder; also a bank statement that would satisfy a Ripley analysis, and portraits, too, of the employer and employee directors—a financial democracy shouting from the pages their faith in this system. And here's a page story of the company's new headquarters and an account of the saving fund transfer, and gossip—Motorman Weiss carries around with him lilies, fearing contamination with Philadelphia passengers. No! they are Ruskin's lilies—Sesame and Lilies.

Unfortunately the *Co-operator* will appear at no definite period, but happily when it does come it will have "something really worth saying." Fellow employees, avid in anticipation of this paper, are invited after a perusal to be critical in their comments, to be sent to 1520 Spruce Street.

Life of Fellow Worker Saved by Lineman of Connecticut Company

John J. Borzillo, a lineman of the Connecticut Company, New Haven, by quick thought and daring action saved the life of a fellow-workman of the Winchester Repeating Arms Company who was untying cables at the top of a 40-ft. pole. The rescue took only ten minutes. Just in time to release the arm of the trapped man, who had caught it under one of the 500,000-circ.mil cables carrying 440 volts, a.c. on the bridge on which he was working, Borzillo jumped from the cage of the trolley line truck where he was removing a wire in order that the bridge might be raised and ran to the man, 200 ft. away. He stopped only a second to strap on his spurs and then climbed the pole, and with his foot placed against one of the crossarms lifted the feeder and pulled out the man's arm.

Winchester men who were working on the bridge job threw a rope to him from the roof of the building opposite. He caught it and tied it about his body and through the "D" rings of his body belt lowered himself and the rescued man to the ground. Two men working on the ground rushed the injured man to the emergency hospital, where he arrived in time to be treated. No serious harm resulted.

Governors' Messages Concluded

The digest of the Governors' messages to the Legislatures which was started in these columns in the issue of Feb. 26 and continued in the issue of March 5 is concluded herewith. The states covered are Pennsylvania, Kansas, Oregon, North Carolina, Iowa and Idaho.

PENNSYLVANIA

According to the message of Gov. John S. Fisher of Pennsylvania, it is the province of government to establish the rules under which the operation of public service companies shall be carried on efficiently, wisely and fairly. He said that in the natural sequence of events utilities developed in advance of governmental regulation. Out of the uncontrolled freedom of the early stages of the business there naturally arose abuses. It was to correct these and prevent their recurrence that instruments for supervision were fashioned by both the nation and the state. Sometimes they were created under strong reactions of popular resentment and were carried to unwise extremes, but in the main their influence has been salutary. Proper regulation, he believes, has proved as beneficial to business as to the public. The Public Service Commission of Pennsylvania was the agency established by the Legislature to deal with public utility problems and should be organized, sustained and equipped to carry out its functions of assuring to the people adequate service at reasonable rates. He believes the construction of the state highway system should be kept moving; while much had been accomplished, much remains to be done. He said that more stringent measures would have to be enacted for the safety of the highways and protection of the people. Uniform traffic regulations were desirable, but in establishing them sight should not be lost of the fact that conditions suitable for one community are not made burdensome for another.

KANSAS

Gov. Ben S. Paulen, in his message to the Legislature, said that the state was confronted by the absolute necessity of better means of transportation. In connection with motor vehicle laws, he called the attention of the Legislature to the uniform motor vehicle code drafted and adopted by the national conference of commissioners on uniform state laws and approved by the American Bar Association. A uniform regulation of motor cars would come sooner or later, he believed, and since the state of Kansas was among the first in the number of cars per capita, it should adopt such regulations as would be for the public interest. On the important question of motor carriers, he believed that legislation should be enacted prescribing the manner in which bus lines operating through a number of taxing districts should be assessed for taxation purposes.

OREGON

The details in connection with the administration of the laws relating to the licensing and regulation of the operation of motor vehicles on the highways of Oregon have now reached such proportions as to necessitate the separation of such duties from the present duties of the Secretary of State. The creation of a separate department of vehicles is desirable. This opinion was expressed by Gov. I. L. Patterson in his address to the Thirty-fourth Legislative Assembly. By vesting the administration department of the motor vehicle laws of the state in an official to be appointed by the Governor control is retained of the important offices that may be appointed, so that in the event that it be desirable at times that they be assigned to other duties necessary in maintaining the peace of the state they may be readily and speedily assigned. He recommended the appeal of that provision of the existing motor vehicle law imposing an additional license fee of 50 per cent on "motor vehicles not common carriers, . . . and used for commercial purposes. . . ."

NORTH CAROLINA

In the interests of safety, Angus W. McLean, Governor, told the General Assembly that the time had arrived when it was necessary to enact a law requiring the registration of persons driving motor vehicles. He would recommend a law which would provide that licenses be issued only after a careful examination as to the character, habits, experience and general fitness of the applicant.

IOWA

The abolition of the valuation department in the office of the Railroad Commission of Iowa was recommended in the inaugural address of John Hamill, Governor. He recommended that it be eliminated, inasmuch as the appraisement of the railroad properties under that department had no actual relation to the fixing of freight rates within the state, and neither was the valuation used in computing rates to be taxed to the railroad companies.

IDAHO

H. C. Baldridge, Governor, in the nineteenth session speech, stressed the advisability of increasing the speed limit of motor vehicles to 25 m.p.h. outside of municipal limits. He recommended and urged the adoption of a uniform motor vehicle registration and certificate of title act, a uniform motor vehicle operators' and chauffeurs' license act, and a uniform act regulating the operation of motor vehicles on highways, this to be in accordance with the report of Herbert Hoover to the second National Conference on Street and Highway Safety.

Traffic Survey of Metropolitan Boston

The City Council of Boston, Mass., has appropriated $25,000 for a comprehensive traffic survey of the metropolitan area under the direction of the Albert Russel Erskine Bureau for Street Traffic Research. The survey is expected to bring order out of the chaos of complex traffic regulations concerning parking, one-way streets, right or left turns, and by its detailed study of traffic movement provide the necessary data for the installation of an efficient system of traffic control. At present Boston's entire signal system consists of one multiple light signal pole operated by an officer from the sidewalk and two multiple light traffic towers operated by an officer from the inside of the towers.

Scientific study will be made of such subjects as causes of congestion, causes of accidents, rules of the road, pedestrian traffic and its protection, organization and operation of traffic police, installation and operation of traffic signals, design and installation of traffic signs and markings, the handling of traffic law violations and parking and garage problems.

The Boston survey is being conducted in co-operation with an advisory board on traffic, appointed by the Mayor, and composed of representatives of city departments, members of the Chamber of Commerce and representatives of all the leading bodies that may be affected by traffic changes to be proposed. It is the fourth metropolitan traffic study made by the Erskine bureau under the direction of Dr. Miller McClintock.

Detroit Men Stimulated to Greater Effort

Gratifying results have followed the intensification during the past few months of the continuous campaign of the Detroit Municipal Railway, Detroit, Mich., in the interests of safety. The total number of accidents reported during January, 1927, was 30 per cent lower than that of January, 1926, and during the first ten days of February only 310 accidents were reported, as against 385 during the corresponding period of the previous month. Should this record be continued during the remainder of February a new low level will have been reached. During this same period one division, operating approximately 20,000 car-miles a day, established the remarkable record of running one entire day without a single accident.

Keen competition has been set up among the eight operating divisions by the presentation of a banner each month to the division showing the greatest reduction in the number of accidents over the preceding month. Then at the end of the year the division that has won the most banners is presented with a beautiful championship pennant. The men of each division are taking a great deal of pride in adorning the walls of their lobbies and recreation rooms with these banners and pennants, hence their zealous effort to avoid accidents.

In addition to this form of competition the trainmen on each division are grouped into teams consisting of twelve men. Each team elects its own captain and in a sportsmanlike manner endeavors to make the best showing on the division in the reduction of accidents.

The number of accidents chargeable to the various teams are charted each day on the bulletin boards at the respective carhouses, thus keeping the teams informed as to the progress during the month. At the end of each month boxes of cigars are distributed to the members that make up the team having the fewest number of accidents on each division.

Summer Course at Harvard for Utility Executives

The Harvard University Summer School, in session from July 5 to Aug. 13, 1927, will include a course on public utility management and economics for public utility executives. Enrolment will be limited to 50 men and application should be made as early as possible to the Harvard Business School, Cambridge, Mass. Information concerning the living arrangements will be sent on request. The tuition is $100. Messrs. Philip Cabot and Deane W. Malott, in charge of the public utilities work in the Harvard Business School, will conduct the course, which is the equivalent of the full winter course offered in that school. Classes will meet daily from 10 to 12 a.m. and from 2 to 3 p.m. At least twenty hours a week preparation outside the classroom will be necessary. The course will require the full time of those enrolled.

Passenger Service Over Houston North Shore Planned

Plans are being made to start passenger service over the Houston North Shore Railway line from Houston to Goose Creek, Tex. This electric railway line, 32.5 miles long, penetrates a territory hitherto without rail facilities. H. K. Johnson, president of the company, reports rails are now laid from Baytown to the Houston city limits. The line represents an outlay of $1,150,000. Application for sale of the property to the Missouri-Pacific Railway is pending, and decision by the Interstate Commerce Commission is expected by April 1. In the meantime passenger service is to be started prior to this date. Four modern interurban cars have been purchased to be put into service, and a schedule of fares based on 85 cents from Houston to Goose Creek, or commuters' tickets for 50 cents, has been announced. A modern electric locomotive capable of drawing 40 loaded cars has also been purchased for service on this line.

Omaha Franchise Election Deferred

The question of granting a new franchise to the Omaha & Council Bluffs Street Railway will not be submitted at the May election in Omaha, Neb. The city attorney filed a number of objections to the draft prepared by the citizens' committee, mostly technical. As it was found impossible to secure an agreement in time to submit the franchise, it has been withdrawn by the citizens' committee, with the permission of the Council.

John Lee Webster, attorney for the company, has long held to the opinion that the company has a perpetual franchise, and he has announced his willingness to try the matter out in court. When the franchise asked by the company and defeated was submitted the company offered to waive the point if an extension were granted. The city voters refused this extension under the terms proposed. The Omaha *Bee* suggests that a judicial determination be secured. If the company has perpetual rights, the Council should know it, and if it has not, "then it cannot weigh them against other concessions in seeking a franchise."

The Guaranty Trust Company, New York, representing the bondholders, recently filed suit in the federal court setting up the claim of a perpetual franchise. Mr. Webster said he would press for an early hearing.

No Segregation for the Present in Albany Case

The Public Service Commission has denied the motion of the city of Albany for an immediate ruling on the question of segregating the Albany zone from the Troy zone when the commission begins the consideration of the application of the United Traction Company for a fare increase. The commission recommended, however, that the communities affected by this application set forth their reasons for or against segregation in the briefs which they will present.

In denying the motion of the city of Albany, the commission stated that the question presented is one which should properly be determined in deciding finally upon the merits of the application made by the railway, and that to decide the question at this time would constitute a prejudgment on the part of the commission of one of the most important questions that will arise in determination of the case.

Chairman Prendergast of the commission announced on March 7 that briefs by the United Traction Company and the various municipalities are to be filed on or before April 1 in the matter of the railway's petition.

Terminal Talk Revived in Watertown

Comparatively little headway has been made to date with the proposal recently presented to the City Council by the Milwaukee Electric Railway & Light Company providing for the expenditure of approximately $100,000 in Watertown for the erection of a modern terminal and train building and the removal of its railway tracks on three streets and part of another. The obstacle which seems to be blocking progress in this improvement program centers around the city's request to have the company share in the cost of the new West Main Street bridge which the city and interurban use to replace the present structure.

In testifying before the Council, Vice-President Jackson of the company said the company did not intend to substitute buses. He suggested that if local conditions required bus service the city should supply it by means of a local operator.

A petition was brought to the attention of the Council signed by 370 people urging that the tracks remain, while 107 persons urge that the tracks be taken up.

Questioned concerning the new terminal, Mr. Jackson declared train buildings would be erected adjacent to the station to permit three interurban cars to load and unload passengers under the roof. All company buses would also use the terminal facilities.

The Story of Baltimore in 1926

Looking back over 1926, the United Railways & Electric Company, Baltimore, Md., has picked some of the things from the routine which it has embodied in a public statement that has been issued. The company says that although the items listed do not present an adequate picture of the task that was faced they suggest the size of the job. The following items are listed:

More than 15 miles of track was entirely reconstructed in 1926, at a cost of about $858,863.

One hundred street cars a month went through the company's paint shop for complete repainting, inside and out.

Twelve new articulated cars were built and put into service, making 34 in all.

10,111,945 more "seat-miles" were furnished. A "seat-mile" is a measure of service—one seat going 1 mile. Or put it this way: street car passengers had seats for 10,111,945 more miles last year than in 1925, which means they had 1,637,173,845 seat-miles, or almost as many seat-miles as Henry Ford has dollars.

225,255,633 revenue passengers were carried, or 1,020,106 more than in 1925.

Of the company's gross revenues of $16,715,709, $10,782,619 went right back into the expense of running the cars.

$1,954,671 more went back into the public treasury in taxes. This was 2⅓ times as much as the stockholders got, which was $818,000.

802,063 more transfer passengers were carried than in 1925.

Of the taxes paid out of carfares, $1,121,000 was park tax for the support of the city's parks.

2,008 public reports and criticisms of service were handled and adjusted as nearly as possible to the satisfaction of the critics.

News Notes

Agreement Made with St. Louis Union.—Mayor Victor J. Miller of St. Louis, Mo., has announced an agreement with the St. Louis street car men's union whereby terms of the service-at-cost franchise now pending before the St. Louis Board of Aldermen will recognize the right of the car workers to unionize and will also restrict the use of one-man cars by the railway. The understanding with Mayor Miller, it is believed, will cause William R. Schneider, attorney for the union and member of the State Legislature, to withdraw the bill he had introduced at Jefferson City for the repeal of the service-at-cost law. It will also result in the railway workers actively supporting the franchise measure when it is presented.

Westchester to Ask State Aid.—The Westchester County Board of Supervisors has voted to ask State Senators and Assemblymen from Westchester to support the proposed legislation which will refer the passenger and commuter traffic problem in New York City and suburban areas to the Port of New York Authority. A report will be made to the Legislature of New York State and of New Jersey. The recommendations will not carry any weight until approved by voters of these sections.

Another Railway After Coffin Award.—The Virginia Electric & Power Company, Richmond, Va., will be a competitor in the national contest for the 1927 Charles A. Coffin award. In seeking this honor the company will emphasize particularly more riders and more revenue; a friendly public fostered by a co-operative spirit; lower costs and increased reliability of service; increased safety for riders; increased co-operation between the management and employees, and financial accomplishments by way of improved investment worth of securities.

Fares Lowered.—The Union Traction Company, Nashville, Tenn., has reduced the fare from Nashville to Gallatin, Tenn., from 92 cents to 75 cents for a single trip. A round-trip rate of $1.25 has been established.

Would Establish Ten-Cent Rate.—The New York State Railways, in a supplemental petition filed with the Public Service Commission, asks permission to establish a new rate of fare of 10 cents between Oneida and Kenwood, instead of the present 8-cent fare, without any reduced rate through the medium of tickets, but with the privilege of a round-trip fare of 15 cents. The petition originally filed asked that the railway be permitted in the city of Oneida to sell three tickets for 25 cents with a cash fare of 10 cents, in place of the present 7-cent fare. A hearing will follow.

Reports for Traffic Study.—Norman D. Wilson, of Wilson, Bunnell & Borgstrom, consulting engineers, Toronto, Ont., is again in Brazil, South America, for the Brazilian Traction, Light & Power Company, Ltd., which controls the traction services in Rio de Janeiro and São Paulo. In 1925 Mr. Wilson reported to the company on the transit and traffic situations in these two cities. It is in connection with his recommendations for a revised franchise and the construction by the city of a short section of surface subway to relieve the traffic difficulties in the Triangle in São Paulo that that city has retained James Dalrymple, former general manager of the Glasgow Tramways.

Tokens for Change.—The use of metal disks or tokens, for change only, has been revived on the Rochester lines of the New York State Railways. The tokens will end the difficulties in making change for passengers and conductors alike. If the passenger has the correct fare, 8 cents, no token will be required. The disks are for use only when the passenger has not the correct fare and he is given a token in lieu of change. The new order does not affect the sale of tickets.

Plan Three-Mile Extension of Service.—Extension of through railway service of the Chicago Surface Lines, Chicago, Ill., for a distance of about 3 miles along Ewing Avenue and Indianapolis Boulevard in South Chicago was ordered on Feb. 16 by the Illinois Commerce Commission. Under present arrangements Chicago Surface Lines cars operate from the downtown Loop district over Cottage Grove and South Chicago Avenues as far as 93d Street only. This extension will give residents of South Chicago a more frequent and more direct service without transfer to downtown Chicago. Except for a new wye at the proposed terminus, no new track will be constructed in connection with the extension of service. Surface Lines cars will be operated over the present tracks of the Hammond, Whiting & East Chicago line, an affiliated company.

Recent Bus Developments

Interstate Service a Subterfuge in This Case

A recent order by the Public Service Commission of Pennsylvania denied the contention of the Highway Motor Coach Company that it does not need a certificate of public convenience from the commission to operate between Harrisburg and other cities and Camden, N. J., because it is doing an interstate business. The commission directed that the company cease operation until it has obtained a certificate.

The Highway Motor Coach Company is a Delaware corporation. Last year it began to carry passengers between Harrisburg and Philadelphia by way of Lebanon, Reading, Pottstown, Norristown, Roxborough, Philadelphia, Camden, thence back to Philadelphia. A month later the company began a similar service between York and Philadelphia. The commission said:

> The extension of the route a short distance in Camden, N. J., is a mere subterfuge or scheme to evade the law. The substance of a transaction is regarded by the law as essential and not the form of the transaction. Attempts made to evade the operation of one law by subterfuge have always been swept aside by courts and commissions. This principle is so well established as to need no citation. The transportation furnished by the respondent under the facts in this case is not interstate within the purview of the decisions of the United States Supreme Court.

Interurban Becomes Iowa's Biggest Bus Operator

The Fort Dodge, Des Moines & Southern Transportation Company, Boone, Iowa, has purchased the Hawkeye Stages, Inc., with headquarters at Des Moines, making the Boone company, which is an auxiliary of the Fort Dodge, Des Moines & Southern Railroad, the largest single bus company of its kind in the State. The Boone company will have 444 miles of additional bus lines and will be operating 30 buses in Iowa more than 125,000 miles each month. C. H. Crooks is president, M. Johnston secretary-treasurer and G. E. Motz manager for the consolidated company. Among the lines will be a continuous one from Oskaloosa to Spencer.

Experiments with New Fageol Twin Coach in Chicago

Trial operation of a new type of motor coach over Diversey Boulevard, Chicago, between Crawford and Laramie Avenues on Feb. 28 was interpreted by residents of that part of the city as an indication that the Chicago Surface Lines is to start motor coach service soon in conjunction with its railway operations. Permission to operate the Diversey Boulevard bus route was granted to the company last November by the Illinois Commerce Commission. The Surface Lines still have 90 days in which to start service.

The new bus, which made the test run over the proposed route last week, was designed and built by the Fageol Twin Coach Company and is being taken on a transcontinental demonstration tour by Frank Fageol, president of the company. It was described and illustrated in the ELECTRIC RAILWAY JOURNAL for Feb. 26, page 381.

Operation of the Diversey Boulevard route and other motor coach lines as extensions to the present railway system is being opposed by the Chicago Motor Coach Company, which has an appeal pending from the order of the commission authorizing the installation of the buses. It is understood, however, that residents along Diversey Boulevard have repeatedly requested the Chicago Surface Lines to provide this service.

Ohio Court Frowns Upon Competitive Service

Bus lines in Ohio have lost a hard fight with the Pennsylvania Railroad in an effort to gain through service linking Columbus, Cincinnati and Cleveland. But according to the decision of the State Supreme Court bus transportation is a means of transportation auxiliary to the existing railway routes when such service is competitive and is not really needed. Nine cases were appealed from the Public Utilities Commission, and the higher court declared that neither the commission nor the bus companies running these shorter lines acted discreetly in transferring certificates of operation assigned to them to the Buckeye Company, which has vested power of the consolidated lines. The railroad charged the service company with "an intent deliberately to compete with their system to its prejudice." The transfers have thus been nullified and the cases referred back to the commission with the following interpretation of the law:

> An application to amend the tariff and schedule of one or each of two certified motor transportation routes, authorized to be separated as separate routes, so as to convert the service of such routes from local service between their respective terminals to a through service between the outside terminal of the two routes, is in effect an application for a new route, and must be made under Section 614-91, General Code, and publication must be made and notices served as provided in that section. And before an order can issue granting such service, the Public Utilities Commission must find that the public convenience and necessity require it.

Bills asking for more liberal treatment of operators who seek bus operating rights are still under consideration by the Ohio General Assembly.

Suit Involving Purple Swan Dismissed

The suit of the Seiberling Rubber Company, Akron, Ohio, against the Purple Swan Safety Coach Lines, Inc., for rental due on tires used by the bus company was dismissed by Circuit Judge Moses M. Hartmann of St. Louis, Mo., on Feb. 28 upon the filing of a stipulation by counsel that the dispute had been adjusted. Some of the Purple Swan lines were operated in competition with the Blue Goose line run by the East St. Louis & Suburban Railway. The stipulation indicates that the bus company paid $9,500 in cash and executed demand notes for $7,142 in favor of the Seiberling company in the settlement of the claim.

When the Seiberling company brought its action on Dec. 27, last, Judge Hartmann appointed a temporary receiver for the bus lines, but the receivership was terminated within three days when the Purple Swan Company filed a bond with the court to protect the plaintiff should the court determine that the coach lines owed the amounts claimed.

Coach Losses Concern Cincinnati

An Outline of President Draper's Proposal to the City Administration in Regard to Bus Losses—Railway Has No Monopoly of This Class of Service

IN A FORMAL report to E. D. Gilman, director of the Department of Public Utilities of the city of Cincinnati, Walter A. Draper, president of the Cincinnati Street Railway, has outlined a procedure for the reduction of losses on the operation of the motor coaches of his company. This operation has shown deficits averaging $14,000 each month over the nine months of its life. As losses have been absorbed in the profits of the street cars, a seemingly unfair situation exists.

The Cincinnati Street Railway does not have a monopoly in providing municipal transportation in Cincinnati. Independent bus lines have secured short routes through thickly populated sections of the city already served by railway lines. On the other hand, the railway, which was delayed in entering the motor coach field by extended franchise negotiations, operates the runs to remote suburbs and the crosstown lines. In several instances the railway established routes where independent lines had failed.

Of the three classes of motor coach service rendered by the railway, namely, lines radiating from the center of the city, crosstown lines and feeder lines, the first comes nearest to paying its way, while there is less real need for it than the two other classes of service.

Mr. Draper answers the question, Why the motor coach operation of his company loses money when independent companies apparently make a profit, as follows:

> It can easily be seen that if independent lines do make a profit it is because, being free to choose at the beginning, the operators of these lines selected routes where the business would pay best. These routes were mainly along existing lines of travel and were and are reasonably short routes. Having the street cars at hand to take care of the rush-hour riding morning and evening, the independents have to provide very little if any additional service, and it is this rush-hour service, requiring investment and the maintenance of equipment which is used for so short a time, that is the most costly to give. The independent lines, moreover, do not issue transfers.
>
> The motor coach lines of the railway were put on where service was needed or where it was thought motor coaches could supply a different class of service. Those of our lines that follow the same routes as street cars are, with one exception, long lines that run express service designed to accommodate the long rider, which again is the more costly service. The other lines either connect parts of the city and other intersecting car and coach lines or supply remote sections with a form of feeder service.

The next logical question, Why not discontinue the service, is answered by Mr. Draper:

> The answer to this question is found largely in the answer to the other question, that the major parts of the service given by this company was put on because it was hoped it might serve a useful purpose and the same thing that makes some of it lose money; that is, remoteness of territory served, is in itself the reason why the service is needed. Giving a service that is not duplicative or competitive, these lines, therefore, should not be discontinued merely because they lose money. It is the measure of the loss that should govern. This principle has been recognized as sound by state law, which provides that service shall be extended or continued by a public utility even though it be given at a loss, providing this loss is not great enough to affect the results of the entire operation of the utility to the extent that there will not be a reasonable return on the investment and that there will not be an impairment of the service as a whole. The test of profitableness alone should not be applied to determine whether the service on the two cross-town lines of the company or the Mount Airy (feeder) line should be discontinued. The test of individual profitableness, if applied to some of the existing rail lines, would require their discontinuance, manifestly an absurdity. The Mount Airy line gives service to a part of Cincinnati that has no other public transportation facilities. It was begun at the request of the city after the independent operator had found it unprofitable and discontinued operations, but the loss from this line is not so great but that the system as a whole can afford to carry it.
>
> It certainly must be clear that there is something fundamentally wrong if independent operators can select the profitable routes and this company must operate the unprofitable routes, with the consequence that the rest of the system must stand the losses. The only conclusion is that unified operation is the logical and economical basis for a city-wide public transportation system.

Mr. Draper's remedies do not include discontinuance of any lines at this time. The changes he suggests are:

> 1. Bring the fare limit on two of the routes which run from the city to distant suburbs closer to the city, charging 10 cents to the nearest point and 5 cents additional to any point beyond. Also reduce fare on outer end of these routes to attract riding for short distances in the outer zone.
> 2. Change the route of one line, running it through a more thickly populated section.
> 3. Discontinue express service except during rush hours on one other poor paying route so that a full load may be assured. This gives the opportunity of picking up passengers all the way into the city.
> 4. If these first three steps do not lessen losses sufficiently after a reasonable trial, alter the transfer privilege; either charge 5 cents for transfers except to cross-town lines, or eliminate them entirely.
> 5. Reduce the amount charged to depreciation after the end of the first year.

Mr. Draper concludes that after trying these measures there would still be left the expedient of increasing all motor coach fares. His idea is that if after the experiment were made that has been outlined such a step were found necessary, the traveling public could certainly find no fault with such a move and it would be in line with the tendency observed in other cities toward a higher class or de luxe service on the motor coach, with a corresponding higher rate of fare. Further Mr. Draper said:

> Finally, in case it is found necessary, consideration should be given to the discontinuance of the poorest paying line or lines. While I would regret the necessity of discontinuing any line, it might have to be done in fairness to the rest of the system, and the motor coaches now operating on such discontinued line or lines could better be used for additional service elsewhere, especially on the two cross-town lines during the morning and evening rush hours.
>
> I am aware that the trial of these various steps will consume time, but I am not yet willing to say that motor coach service in Cincinnati has cost the transportation system as a whole so much as to cause us to become panicky or to be driven to hasty action. It is true that the motor coach is not as popular, at least in Cincinnati, as it once was, and the necessity of protecting the existing rail car system for the great mass of people is apparent, but there is a place in a unified transportation system for all forms of transportation that can demonstrate their lasting qualities. Being charged with the responsibility and obligation of providing such a unified system, we cannot neglect to adopt any reasonable form of transportation that the public desires and is willing to pay for.

Bus Experiment in Residential District.—Further expansion of the bus system of the Rochester, N. Y., lines of the New York State Railways was marked March 7 with the opening of service on an experimental line in Ridgeway Avenue, residential north side section. Railway Commissioner Charles R. Barnes announced the buses would operate only during the rush hours until the traffic showed that patronage would be sufficient to warrant full time service. The service was installed on the appeal of residents.

Hearing on Proposed Specifications Applying to Buses.—The street transportation department of the Board of Public Utility Commissioners of New Jersey has submitted to the board proposed specifications applying to buses of the "city type, single-deck" and "parlor car type," which it is recommended shall take the place of the specifications adopted by the board on Dec. 29, 1924. The board will hold a hearing on the matter in Newark, N. J., on March 23, 1927, upon the question whether the specifications so submitted shall be adopted and fixed as just and reasonable regulations to be observed and followed by the operators of buses of these types.

Milwaukee Railway Opposes New Operators.—Competition between the Milwaukee Electric Railway & Light Company and the American Coach lines for business on the North Milwaukee and the Wauwatosa routes and the intercity route to Green Bay advanced a step when the American line announced that fares would be reduced ranging from 16⅔ per cent on city and suburban lines and 20 per cent on intercity routes. Metal tokens will be introduced so that passengers on the North Milwaukee and the Wauwatosa routes can purchase twelve 10-cent tokens, eight 15-cent tokens and six 20-cent tokens for $1. This makes a reduction of 16⅔ per cent on these fares when tokens are used. On the route between Green Bay and Milwaukee the revised fare will hereafter be $3.50 instead of $4.25. Fares to intermediate points will be similarly reduced. The Milwaukee Electric Railway & Light Company complained on the ground that this area was adequately served by its own facilities.

Financial and Corporate

Receivership Action Likely for Auburn & Syracuse Railroad

Receivership proceedings are anticipated in the case of the Auburn & Syracuse Electric Railroad, Syracuse, N. Y., which operates in Syracuse and also a suburban line connecting Auburn and Syracuse. A statement by the company said:

> Having defaulted interest due April 1 and Oct. 1, 1926, a bondholders' protective committee was formed. Within a short time the Equitable Trust Company, New York City, which is trustee under the mortgage, will probably seek foreclosure. The natural conclusion of that will be the asking for the appointment of a receiver. Figures show the continual loss to be almost entirely due to use of privately owned automobiles.

The outstanding mortgage bonds of the company amount to $1,752,000 with annual interest charges of $87,600. The losses increased from $16,031.71 in 1924 to $87,684.34 in 1926.

Increase in Passengers Carried in Winnipeg

The Winnipeg Electric Company, Winnipeg, Man., carried 57,985,144 revenue passengers in 1926. This represented a 5 per cent increase over 1925. The year 1920 established a record for the company and each succeeding year up to 1925 showed a decrease from the preceding year. The following table shows the trend:

1920	65,248,840
1921	61,515,325
1922	60,399,419
1923	58,253,356
1924	55,077,901
1925	55,096,058
1926	57,985,144

Texas Tax Relief Bill Before Governor for Signature

Repeal of the gross receipts tax on interurbans and other electric railways in Texas was put up to the Governor on March 2 when the Senate finally passed the Kemble House bill. Senator Witt of McLennan, sponsoring the measure, declared that the Texas Electric Railway had not paid dividends on preferred stock in twelve months, despite the fact that it is the second largest taxpayer in McLennan County. He urged that repealing the gross receipts tax would leave the school, road and other taxes and place the electric railways on the same plane with other industries.

Engineers Public Service Reports Good Year

Large increases in consolidated gross and net earnings are shown by the Engineers Public Service Company, New York, N. Y., in its annual report for 1926, issued recently to stockholders. Gross earnings were $26,627,687, an increase of $3,518,750 over the previous year, and the balance available for reserves and the 778,938 outstanding shares of Engineers common stock increased 25.9 per cent to $3,183,879. The report gives several detail analyses, including capitalization totaling $4.92 per $1 of gross, maintenance expenditures amounting to 9 per cent of gross and reserves and surplus equaling 72 per cent of annual gross earnings. The company reports, in addition to the acquisition of the Baton Rouge Electric Company, net increases in plant of its subsidiaries totaling $15,077,000 and the reinvestment of $3,391,455 of earnings in the properties.

The Engineers Public Service Company controls subsidiaries operated under executive management of Stone & Webster. The subsidiaries serve a population of 1,176,100. The increased earnings of the El Paso, Savannah and Key West properties reflect the healthy growth of industry in the territories served. The total number of stockholders is 8,800, an increase of 35 per cent in the last ten months.

Cincinnati Has Good Year

Substantial Increase in Passengers Handled—Progress Made in Rehabilitation of Property—President Draper's Remarks Abstracted at Length

TAKING everything into consideration, the results of the first year's operation of the Cincinnati Street Railway, Cincinnati, Ohio, since that company resumed control on Nov. 1, 1925, are not disappointing. This was the substance of the opening remarks of Walter A. Draper, president, at the recent annual meeting of the stockholders. He said the year had been one of readjustment and rehabilitation after the several years of negotiations between the city and the companies, during which time it was impossible for the then operating company to do many of the things desirable and needful in the interest of the public and stockholders. The budget filed with the city of Cincinnati on Dec. 1, 1925, covering estimated results of operations for the year 1926, indicated a deficiency for the year of $72,848, without including any estimate for the operation of the motor coaches, which were at that time not a part of the company's business. The actual results for the year 1926 show a surplus of $14,064 above all requirements, including dividends on stock and interest on notes, despite losses from motor coaches, and despite the much larger operating charge for track reconstruction than was anticipated when the budget was filed.

EARNINGS OF CINCINNATI STREET RAILWAY

	1926	Jan. 1–Oct. 31, 1925	Nov. 1–Dec. 31, 1925	Total Year 1925
Railway operating revenue	$8,102,517	$7,558,322	$1,242,269	$8,800,592
Railway operating expenses	5,846,221	4,469,590	847,858	5,317,448
Net operating revenue	$2,256,295	$3,088,732	$394,411	$3,483,143
Taxes assignable to railway operations	708,831	625,290	123,369	748,660
Gross income	$1,547,463	$2,463,441	$271,042	$2,734,483
Rentals	25,150	1,030,232	16,675	1,046,908
Balance	$1,522,313	$1,433,208	$254,366	$1,687,575
Interest and sinking fund on bonds and notes	332,885	585,305	58,941	644,246
Surplus	$1,189,428	$847,903	$195,425	$1,043,329
Deficiencies from 1924 allowed to be earned and paid	....	521,905	....	521,905
Balance	$1,189,428	$325,997	$195,425	$521,423
Allowance for return on capital	1,175,364	347,043	188,652	535,695
Balance	$14,064	*$21,045	$6,773	*$14,272
Franchise tax	....	296,989	....	296,989
Deficiency or surplus	$14,064	*$318,034	$6,773	*$311,261

*Denotes deficiencies.

The essential feature of the present operating plan is that if the revenues are sufficient to pay all requirements, including operating costs, taxes and return on capital, and still produce a balance the city has the right, through its control of operations, to determine how this balance shall be applied, namely, to bring the property to an improved operating condition, to increase the service or to add to the fare control fund, so as to bring about a reduction in the rate of fare when that fund is increased from the initial amount of $400,000 to $600,000. Similarly, if necessary expenditures for maintenance, operation, taxes and return on capital exceed the revenues, the deficit must be made good out of the fare control fund until it is reduced to $200,000, when fares automatically increase. Into this fare control fund balances were paid from each month's operation for the period from Nov. 1, 1925, to Dec. 31, 1926, with the exception of July and August, when payments out of the fund were required to be made to meet deficits. The net amount added to the fund was $6,774 for the last two months of 1925, and $14,064 for the twelve months of 1926, or a total of $20,837.

Mr. Draper said that in comparing the results of operation for the year 1926 with the preceding year it was necessary to have in mind that a 10-cent fare was in effect on cars for the first ten months of 1925, as against the 8⅓-cent ticket rate and 10-cent cash rate in effect for the last two months of 1925 and the twelve months of 1926; that motor coach operation began in April, 1926, chiefly on a 10-cent fare, and that the different corporate and financial set-up in effect up to Nov. 1, 1925, required larger rentals, interest, sinking fund and return on capital. Instead of the large rental figure of 1925, which this company received from the lessee at the rate of 6 per cent on its stock, there was the return on capital in 1926 at the rate of 5 per cent, and the smaller rental that was paid for the first three months of 1926 to the former Cincinnati & Hamilton Traction Company. The large balance for the twelve months of 1925 was required and was available for the payment of past deficiencies created in previous years when the receipts from fares were not sufficient to meet requirements, including the former city franchise tax.

RECORD OF PASSENGERS CARRIED IN CINCINNATI

	1926	1925	1924	1923	1922	1921
Revenue Passengers:						
Cars	89,493,159	90,629,875	100,839,343	108,625,599	107,528,666	106,527,759
Coaches	4,104,586	....	....	....	....	....
Total revenue passengers	93,597,745	90,629,875	100,839,343	108,625,599	107,528,666	106,527,759
Transfer Passengers:						
Cars	29,480,811	30,832,130	32,706,502	34,066,858	34,765,044	34,904,917
Coaches	768,711	....	....	....	....	....
Free Passengers:						
Cars	1,465,811	1,309,845	1,319,318	1,292,290	1,399,018	1,527,297
Total, all passengers	125,313,068	122,771,850	134,865,163	143,984,747	143,692,728	142,959,973

The tendency toward a decrease in passengers carried on cars, which became quite marked in the spring of 1925 and was checked in the fall of that year, has now been overcome and, while the total number of passengers carried in 1926 was fewer than the total in 1925, the latter months of the year show a considerable increase over the similar month of the year preceding. This tendency toward an increase in passengers riding the cars is in the face of an increase in the number of automobiles in Cincinnati and the development of better roads.

On the subject of bus operation, he said that the company now had in daily service 62 motor coaches on ten lines. Four of these lines operated from outlying sections to the heart of the city, running chiefly express where paralleling car lines; two were crosstown lines, connecting up many radiating rail and motor coach lines, and three were feeder lines. He said that it was scarcely to be expected that they could be continued at as great a loss as had been experienced. As the rate of fare on motor coaches was fixed and not dedendent upon their cost of operation, and as the deficit from their operation must be assumed by the railway, they thus contributed to the cost of carrying passengers on street cars, and it was possible that a continued or an increasing loss, he claimed, from operating motor coaches might eventually result in an increase in the fare on cars. On the other hand, he claimed, there should not be a too hasty condemnation of buses because the lines did not all show a profit. Some that were losing were rendering a service that parts of the city needed. He referred to the two crosstown motor coach lines rendering a distinct service for which rail service might otherwise be required at a greater cost to that particular territory than the present coach lines. He said that it was apparent that the public desired motor coach service not instead of but supplementary and in some cases in addition to rail lines. Independent motor coach operations which cut into the previous operating company's revenues so sharply during the year 1925 did not offer at this time the menace that they formerly did.

He answered the question of why motor coach service of the company was operated at a loss, while at least some of the independent lines claimed to show a profit by saying that the independents at the start, being unregulated, picked choice routes, generally short ones, in thickly settled sections and in most part on the same streets with existing rail lines where they were assured of loads. The routes operated by the company, he stated, include several to remote and thinly settled sections that no independent could be induced to serve. It was recognized, he said, that a unified and co-ordinated city transportation system was the most logical and satisfactory plan for serving the public. It was clear that if the profitable motor coach routes operated independently were a part of the whole transportation system they would tend to offset the loss from the needed but unprofitable lines.

The total amount expended for replacement and renewal of track and overhead construction in 1926, in addition to ordinary maintenance and repairs, was $523,367. Of this amount $451,994 was provided by the special depreciation reserve fund, $36,373 was paid for out of receipts and charged directly to operating expenses during the year and $35,000 was paid with funds borrowed for the purpose, which will be charged out and repaid at a later date. The purchase of new equipment had been deferred until the track over which it should operate could be put in better condition. Work had been done, however, on improving the condition of existing rolling stock and increasing the degree of comfort and convenience. Even a larger program for 1927 has been agreed upon after conferences with the chairman of the highways committee of Council and the city manager, amounting to nearly 140,000 ft., or approximately 26 miles of single track. Additions and betterments to the property of the company from Nov. 1, 1925, to Dec. 31, 1926, cost $970,299. Similar expenditures in 1927 will not exceed $2,000,000.

Mr. Draper referred to the rapid transit lines as a problem confronting the city as a whole; its ultimate disposition was the question. Surveys and studies already made clearly indicated that the line could not and should not be operated except as a part of a unified city-wide system. The immediate hope for the line lay in the possibility of its taking enough traffic on its rails to reduce the service required on the surface rails and to relieve traffic on congested streets to warrant its construction and operation. The future hope for the line lay in the fact that it would doubtless improve the value of the territory through which it ran, a large part of which had now been little developed.

He referred to the valuation of the property and the long-drawn out negotiations, which finally resulted in an agreement with the city fixing the capital value on Nov. 1, 1925, at $27,000,000, plus $1,000,000 for the Mill Creek Valley lines.

He said that the recognition of the mutuality of interests of the company and city, or of the car rider and the taxpayer, under the present plan of city control of the transportation system was clearly appreciated by the city administration and was evidenced by the co-operative efforts of city and company to facilitate this important work; the new year had been entered upon with confidence and a sincere effort was being made by the officials of the company to carry to the public of Cincinnati the message that the company was endeavoring to live up to its responsibility for providing public city transportation service of satisfactory character. According to him, it could be safely said without prejudice there were evidences of progress in Cincinnati that not only would be advantageous to all enterprises, but would also require the furnishing of increasing facilities by the company.

Suburban Line Does Well

Net Income of Chicago & West Towns Railway Has Practically Doubled Since 1920

The Chicago & West Towns Railway, Oak Park, Ill., has, during the last seven years, established its ability to show good earnings and has widened considerably the margin by which interest charges on its bonded indebtedness have been earned. Both gross earnings and the net income available for interest on funded debt have increased without exception in each year since 1920, the net having practically doubled in that time, rising from $177,331 in 1920 to $349,269 in the year just ended.

A comparison of the gross earnings, the net income and the bond interest charges for each year of the last seven follows:

Yr. Ended Dec. 31	Gross Earnings	Net Income Available Bond Int.	Bond Int.
1926	$1,441,083	$349,269	$105,000
1925	1,348,902	317,563	105,000
1924	1,273,702	287,546	91,961
1923	1,208,218	274,032	80,500
1922	1,132,427	242,683	69,250
1921	1,108,618	222,491	68,000
1920	1,000,096	177,331	62,333

Net income as available for bond interest is before provision for amortization of bonds or for depreciation.

Present interest charges on the funded debt have been covered on the average 2.55 times in the seven-year period from 1920 to 1926. In 1925 these charges were covered 3.02 times and in 1926, 3.33 times. The actual amounts paid as bond interest prior to 1924 are not significant in calculating the average number of times charges were earned, as from 1922 to 1924 the full amount of bonds now outstanding had not been sold, and prior to 1922 an issue with a lower rate of interest was in the hands of the public.

Capitalization of the Chicago & West Towns Railway consists of $1,500,000 of first mortgage 7 per cent bonds due on July 1, 1932; $1,000,000 of 6 per cent cumulative first preferred stock; $210,000 of 8 per cent cumulative second preferred, and $1,000,000 of common stock. The financial strength of the company is further indicated by the fact that dividends have been regularly paid on both issues of the preferred stock since its issuance. Dividends have been paid on the common stock at the rate of 6 per cent per annum since Jan. 1, 1926.

The first 7s of 1932 are a direct first and only mortgage on the entire property of the company. Additional bonds may be issued to the extent of 75 per cent of the cost of new construction, if earnings for the twelve preceding months have been equal to twice the interest requirements on the total bonds issued and to be issued.

The Dec. 31, 1926, balance sheet showed a property account totaling $4,528,340, compared with $4,347,447 at the 1925 year end, the fixed assets at the close of 1926 being equal to slightly more than $3,000 for each $1,000 bond outstanding. Against the property account there is a depreciation reserve of $672,160, additions to this reserve averaging about $60,000 annually. Working capital position at the 1926 year end was not particularly favorable, current assets totaling $106,309 with current liabilities, which included the reserve for taxes of $67,681, amounting to $124,772. Weakening of the working capital position during the year is accounted for by additions to the property account. The company is entitled to issue bonds to reimburse its treasury for the expenditures to property account. The amount that may be issued under the terms of the trust deed for these expenditures as of Dec. 31, 1926, is $350,000.

The Chicago & West Towns Railway serves a suburban territory lying directly to the west and southwest of Chicago which has experienced a particularly rapid growth during the last five years. A total of 73 miles of electric railway lines are operated in the villages of Oak Park, River Forest, Maywood, Cicero, La Grange, Forest Park, Lyons, Berwyn, Proviso, Riverside, Clyde, Hawthorne and others. The greater part of the power requirements are purchased from the Sanitary District of Chicago, two generating stations being maintained, however, as standby stations. Franchises in the communities served are of varying lengths, and with one exception, i.e. the village of Forest Park, franchises extend beyond the maturity date of the bonds.

Would Sell Railway.—Mayor William E. Westbrook of Ogdensburg, N. Y., has announced that he will sell the rolling stock and property of the Ogdenburg Street Railway at public auction because of delinquent payments on paving assessments. The company has made no formal announcement of its plans except for a statement declaring it has until 1935 to pay the assessments under the law. It is understood, however, that steps will be taken to prevent the sale.

Dividend Payment Reduced by Twin City.—Directors of the Twin Cities Rapid Transit, Minneapolis, Minn., have declared a quarterly dividend of $1 per share on the common stock, payable April 1 to holders of record March 15. In 1926 the company paid four quarterly dividends, each of 1¼ per cent.

New Board Member Elected.—At the annual meeting of the directors of the Columbus Railway, Power & Light Company, held in Columbus, Ohio, recently, John S. Brookes was elected to the board. He replaces John Kelly of Columbus.

Denver Tramway Reduces Debt.—The funded debt of the Denver Tramway, Denver, Col., is to be reduced through refinancing. The first mortgage 6 per cent gold bonds and the first mortgage improvement 6 per cent gold bonds, due on April 1, totaling $2,598,000, will be acquired by the company from the holders, and are to be extended to Oct. 1, 1933. The bonds are to be deposited as collateral for a new issue of $1,750,000 Denver Tramway 6 per cent first underlying mortgage collateral trust sinking fund gold notes, maturing on Oct. 1, 1933.

Interurban May Discontinue.—Officials of the Pennsylvia-Ohio Electric Company are considering plans to terminate interurban railway service between Niles and Mineral Ridge, near Youngstown, Ohio. The company has continued service for some time at a loss, but officials consider it an imposition to be asked to share the cost of a new bridge in Niles over which the lines must run. R. N. Graham, manager of railways, so declared at a conference with Councilmen at Niles. Residents at Mineral Ridge say this is the only way hundreds of workingmen have of reaching their places of business.

Denies Abandonment Approval.—The Public Service Commission on March 8 denied the application of the Hudson Valley Railway, Glens Falls, N. Y., to abandon its lines between Lake George and Warrensburg and between Thomson and Greenwich. The commission in its summation of the case said the petitioner had not made a clear and satisfactory argument as to its financial inability to carry on successfully the operation of the Greenwich branch and that there existed a real public demand for the continuation of that branch. Also that there was a public need for the service in Warrensburg and that the Lake George-Warrensburg branch financial loss was not satisfactorily proved.

Acquisition Offsets Loss from Abandonment.—The Illinois Northern Utilities Company for the year ended Dec. 31, 1926, reports a net income of $828,739 after interest, amortization, taxes, retirement reserves and all other charges, equal after dividends on the preferred and junior preferred stock to $12 a share on $4,535,000 of common stock. This compares with a net income of $655,731, or $8.41 a share, on $4,885,000 common stock in 1925. During the year recently ended the company reacquired $700,000 of its common stock from the Middle West Utilities Company to offset the property loss resulting from the abandonment of the Sterling, Dixon & Eastern Railway. This enabled the company to take out of its fixed capital account the investment carried in the Sterling, Dixon & Eastern property, according to Martin J. Insull, president. The company had 4,458 stockholders at the end of 1926.

Two New Directors Elected.—George G. Shaw and P. H. Worman were elected directors of the City Railway, Dayton, Ohio, at the meeting of the stockholders on Feb. 10.

Carhouse Property Sold.—The carhouse property of the Alabama Traction Company at Decatur, Ala., has been acquired by the Cooper-Wells Company, operating the hoisery mill. The property lies adjacent to the hosiery mill and provides ample space for whatever expansion may be necessary in the future. The property was first acquired by the city of Decatur, which, ratifying the action of the Albany Council, took it over in settlement of claims against the railway.

Increase in Capital Value Asked in Youngstown. — Request that capital value of the Youngstown Municipal Railway, Youngstown, Ohio, be increased $55,953 is pending in the City Council. The increase, according to Harry Engle, street railway commissioner, is for improvements installed at the Mahoning Avenue garage, where the company's city buses are housed and kept in running condition. Of this amount $25,679 is for the installation of five 20,500-gal. gasoline tanks and one 20,500-gal. oil tank. The rest, $30,273, was used to purchase and install modern machine shop equipment.

Merger of Reorganized Roads Arranged.—Announcement has been made of the merging of Ohio and Indiana corporations under the single title of the Fort Wayne, Van Wert & Lima Traction Company. Officers and members of the board of directors are: Henry C. Paul, president; Frank H. Cutshall, treasurer, and James W. Barrett, secretary, all of Fort Wayne, Ind.; J. C. Neff, Philadelphia, and D. P. Abercrombie, Boston. The merged company is the successor after reorganization of properties previously existing.

Eight Parts of Line to Be Abandoned.—The Public Service Commission approved declarations of abandonment by the Empire State Railroad Corporation of eight parts of its line in Oswego, N. Y. The city is planning to give consents for the operation of bus lines to provide transportation service in the city. Evidence showed a gradual decline in patronage of the Oswego line within the past five years, the losses in gross revenues after payment of operating expenses being, in 1926, $24,423, in 1925, $18,786, and in 1924, $10,628. It was further shown that after paying operating expenses, taxes and interest, the railroad had a deficit of $59,968 in 1926 Revenue passengers on the Oswego City lines declined from 1,223,368 in 1923 to 947,620 in 1926.

Book Reviews

Main Street and Wall Street

By William Z. Ripley, Boston, Mass.: Little, Brown & Company. 353 pages. Price $2.50.

Books are seldom what the blurbs on their jackets purport them to be. In this case, however, Professor Ripley has in some of his caustic comments quite lived up to the claim made for it that his book is a startling exposé of present-day financial methods. Of one entrancing picture drawn of the banker's function in industry he said:

"This busy 'organization capital' bee, 'with honeyed thigh,' in Milton's words, buzzes from one flowery situation to another, extracting the precious nectar of control and just incidentally powdering the public with the preferred pollen."

As for Professor Ripley, he appears to be no dispenser of pollen at all, either preferred or common. One of the things at which this gallant Knight who has essayed the task of self-appointed censor does tilt, is the issuance of no-par stock, which he says cuts the ground from under any attempt to correlate closely the amount of the investment and a stated par value for the securities. He does admit, however, that, like most things on earth, human beings particularly, no-par stock is not altogether bad. According to the penetrating professor, the issuance of securities in this form does embody a useful principle, just as to him Coca-Cola sounded refreshing until he delved into the company's financial structure. He is not apparently against all holding corporations. He says even the holding company may benefit from a proper amount of articulation, but that such company need not be a vaudeville contortionist for all that.

And so the comment runs through the more than 350 pages, made up among other things of reprints of his articles "Stop, Look and Listen!" and "More Light!—and Power Too," both of which were the subject of comment in the ELECTRIC RAILWAY JOURNAL at the time of their appearance in the *Atlantic Monthly*. The chapter "More Light—and Power Too" is directed at the light and power industry, but some of his strictures apply equally well to cases in the railway field. It should not be assumed that all he says is condemnatory. That is not the fact. The professor sees many things that, in his opinion, need correcting and many tendencies appear to him to be fraught with danger, but he also sees any number of practices that are worthy of emulation.

Some of the matters upon which he touches are the complicated holding company structures, the lack of uniformity in legislation covering incorporation, the disposition of some holding companies to venture into far-off fields, the possible abuse of banker control, the frailties of some customer-ownership plans, the iniquity of recent sales of some properties at prices that might be regarded as inordinate, the inadequacy of some depreciation reserves, and kindred subjects.

Many of the points the professor raises have been raised before, and nowhere more than in the industry itself are some of the problems receiving more careful attention. The matter of simplification of corporate structure is now before the industry as a burning issue. During the war many expedients were called into play in order to preserve the *status quo*, or to preserve it as nearly as possible. Now that this emergency has passed, voluntary readjustment and simplification of corporate structure are taking place on an extended scale. Even the professor is cognizant of this tendency, for he himself cites several instances of it.

As for customer ownership, all the evils are inherent in it which the professor names. Utilities are cognizant of them. The report of the public service securities committee of the Investment Bankers' Association presented at the annual convention, Oct. 11 to 15, 1926, shows the extent to which some of the other subjects mentioned by the professor are receiving the serious attention of the investment bankers. All this is not said with the idea of mitigating the criticisms contained in this chapter. No industry should be so squeamish about its doings as not to accept with good grace suggestions from a source so well informed.

In concluding his preface the professor pays his respects to a host of persons to whom he is indebted, and then says that the only possible reparation will be that, despite its manifest shortcomings, the volume shall stimulate discussion and inquiry. And then, apparently as an afterthought, this professor, who himself is a master of cajolery, mordant humor, invective, just plain foolery and much common sense, adds: "That it may bring forth fruit in due season is my most earnest wish." He has certainly lived to see that wish fulfilled, and to find himself the recipient of a considerable quantity of fruit, some of it overripe, if it wasn't actually putrid.

Electric Power Stations

By L. W. W. Morrow, managing editor *Electrical World*. New York: McGraw-Hill Book Company. 326 pages. Price $4.

This work is a sound discussion of the fundamental principles of production, transmission and distribution of electrical energy on a large scale in an economical manner. The book covers such topics as plant sites and their layout, coal oil and gas—their use in electric power stations, steam, auxiliary energy supply, boiler room, turbines, electrical equipment and switching. Throughout the book emphasis is placed on principles underlying the selection of proper equipment for specific conditions and on the methods of utilizing this equipment to best advantage.

Primer of Simplified Practices

By United States Department of Commerce.

Growing out of a concerted movement on the part of producers, distributors and consumers in co-operation with the Department of Commerce a primer of simplified practices in production has just been issued. The primary object of the book is to eliminate needless variety in sizes, dimensions and types of commonplace articles to the end that production cost may be decreased while the utility and efficiency of production are enhanced.

Higher returns to the worker, savings to the consumer, greater productivity, enlarged general purchasing power and more intelligent use of our natural resources, resulting in benefits to the entire nation, are cited as some of the advantages to be gained through simplified practice.

This simple and effective method of attacking waste differs from standardization in that it tends only to the elimination of odd sizes of products in small demand. It does not interfere with fashions or styles.

The co-operative trend of the times shows that there are many features in a large proportion of commonplace articles in which attempted individuality is superficial and useless, and stands in the way of their broader use. "For instance," the primer says, "twenty years ago there were 180 different sizes and styles of electric lamp bases. The common base which is used today has been a factor in increasing the use of electricity for lighting purposes, yet there are other features of the electric lamp which retain their individuality."

The history of the simplification movement is a record of constant abandonment of the fallacy that widely diverse or "odd sizes" tend to secure competitive advantages. The passing of this misconception had led to a point where today industries as a whole are very generally competing with other industries through simplification to broaden markets and induce the widest possible consumption of their products.

Under the procedure of the Division of Simplified Practice, each simplified practice recommendation must be accepted by producers, distributors and consumers representing 80 per cent of the annual volume of the industry, it being believed that only such a proportion of acceptance will insure general application and adoption. The division has no police power to enforce simplified practice recommendations nor does it desire any. The government offers its services merely as an effective agency in bringing together business groups on a neutral ground. The final recommendations as to the elimination of sizes, styles and types of articles is the job of the industry itself and the adherence to such recommendations is left entirely to the business group interested. A representative standing committee is appointed at the general conference to serve as a liaison between the Department of Commerce and the industry, and upon which devolves the duties of promoting and supporting findings of the conferees, as well as conducting annual resurveys to ascertain the degree of adherence and convene to effect revisions, or reaffirmations.

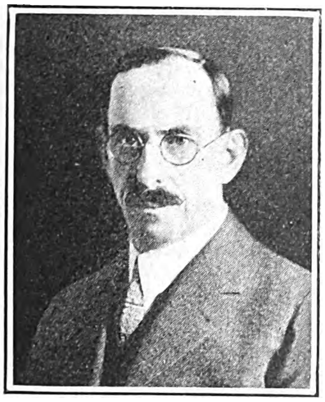
Personal Items

Changes on Interstate

Advancement of Officials, Announced Recently, Has Gone Into Effect—Mr. Van Arsdel Succeeds Mr. Reid

Important changes in the personnel of the Interstate Public Service Company, Indianapolis, Ind., were announced recently by Harry Reid at a dinner given at the Columbia Club in his behalf by his associates in the Indianapolis office of the company.

As stated previously in the ELECTRIC RAILWAY JOURNAL, Mr. Reid has been named president of the National Electric Power Company, New York City. He has been giving most of his time to his new position for some time and stated that at the annual meeting of the stockholders of the Interstate on March 7 the following changes in the personnel of the Interstate would be made:



E. Van Arsdel

E. Van Arsdel, who has been vice-president of the Interstate for eight years, will become president.

I. L. Oppenheimer, who has been with the Interstate for six years, as assistant to Vice-President Van Arsdel, will become vice-president in charge of the operation of the electric, gas and water properties.

L. M. Brown, who has been general manager of the railway of the Interstate between Indianapolis and Louisville for several years, will become vice-president in charge of all railway operations for the company.

W. Marshall Dale, who came to the Interstate about two years ago from the Kentucky Utilities Company, will become vice-president and treasurer in charge of the finances.

A. D. Jones will become vice-president and auditor in charge of the accounting and stores.

G. J. Oglebay, who has been manager of the Bedford district for several years, will become assistant to Vice-President Oppenheimer, in charge of the gas, electric light and water properties.

While the sentiment expressed at the dinner indicated much regret at Mr. Reid's departure from Indianapolis, it also was evident that his associates feel great pleasure in his elevation to the management of a property of such large scope as the National Electric Power Company, one of the large units of the Insull organization operating gas, electric, water and railway properties in twelve states. Mr. Reid has succeeded Albert Emanuel of New York as president of the National Electric Power Company, Samuel Insull succeeds Victor Emanuel as chairman of the company.

Mr. Reid went to the Interstate in January, 1917. He was elected president and general manager within a short time thereafter and under his direction the Interstate has grown, not only as one of the largest utilities in Indiana, but in the good graces and good will of the people in the many communities it serves.

Mr. Van Arsdel is well known and highly esteemed by the men and women with whom he has been associated in the company. He is a native of Kentucky and went to Indianapolis in March, 1917. He was operating manager of the Interstate for a year, following which he became its vice-president. He was vice-president of the Kentucky Utilities Company at the time of his appointment as a member of the Interstate organization. Mr. Van Arsdel was with Mr. Reid at Louisville for five years in the operation of the Kentucky Utilities Company properties.

At the dinner at which the changes in personnel were announced Mr. Van Arsdel, on behalf of the employees and executives in the Indianapolis office, presented to Mr. Reid a beautiful center piece of Kirk silver and two beautiful silver candlesticks of the same design. Mr. Reid's associates also presented to him a marble desk set inlaid with gold.

As for the other employees Mr. Rockefeller has been transferred from the Connersville district to the Bedford district as local manager. For the past three years he has been manager of the Connersville district and prior to this he was located at Aurora for a period of nine years in the same capacity.

Fifteen years service with one organization is Mr. Oglebay's record. During the past eight years he has been located at Bedford, Ind., in the capacity of local district manager. Effective on Feb. 1, he joined the Indianapolis organization as assistant in the operation of electric, gas and water utilities.

Mr. Large will succeed Mr. Rockefeller as district manager at Connersville, Ind. Prior to this transfer, he was district superintendent at Oakland City, Ind., and he has been associated with the Interstate for a period of three years.

W. R. Power Heads Kentucky Association

W. R. Power, general manager of the Ohio Valley Electric Railway, Huntington, W. Va., was elected president of the Kentucky Association of Public Utilities at its meeting in Louisville on Feb. 18-19.

Early in his career Mr. Power went with the General Electric Company, Schenectady, in the testing department. In the fall of 1903 he joined the American Railways on the Chicago & Joliet Electric Railway property at Joliet, Ill. A year later he was transferred to one of its Pennsylvania properties and in 1912 was transferred to Huntington, W. Va., on another property of the same company. Five years later Mr. Power was made general manager of the Consolidated Light, Heat & Power Company and affiliated companies in that district, consisting of the railway and lighting companies at Ashland, Ky., and Ironton, Ohio. The holding company was taken over three years ago by the American Gas & Electric Company and is now known as the Appalachian Electric Power Company, Huntington district.

W. R. Power

It was with P. H. Chase, chief electrical engineer for the American Railways, that Mr. Power demonstrated in 1921 the possibility of inspecting high-tension lines by airplane. The demonstration was made in a new Curtis "Oriole" with Bob Shank, a local aviator at Huntington, as pilot. A distance of 25 miles and return was covered in the flight. The line inspected was being constructed by the Virginia Power Company from Cabin Creek, in Kanawha County, to Huntington. It was said in the April 9, 1921, issue of ELECTRIC RAILWAY JOURNAL that both Mr. Chase and Mr. Power had found the plan workable.

Mr. Power was reared in Kansas. His education included special courses at the University of Illinois.

Glasgow Tramway Appointments

Following on the appointment of Lachlan McKinnon to be general manager of Glasgow Corporation Tramways, Glasgow, Scotland, in succession to James Dalrymple, retired, the tramways committee has approved the following recommendations submitted by the general manager: James N. Wilson, secretary and treasurer of the department, to be deputy general manager; Robert F. Smith, accountant, to be traffic superintendent; and G. W. Alexander, principal assistant to Mr. Smith, to be accountant for the railway department.

All of the officers so named have for many years been in the service of the corporation. Mr. Wilson will continue to hold the office of secretary and treasurer.

North Shore Line Appoints New Officers

Reorganization of the transportation department and changes in divisional limits of the Chicago, North Shore & Milwaukee Railroad to facilitate train operation were made known recently with the announcement of ten new appointments by General Manager John F. Egolf. All of the new appointees are under the supervision of J. W. Simons, general superintendent of transportation.

Chester K. Thomas, director of service improvement, has been named division superintendent of the Main Line Division, in charge of all train operation between Harvard Street, Chicago, and Austin Avenue, Milwaukee, including the Mundelein-Lake Bluff service.

William Burke has been appointed superintendent of the Milwaukee Division, with supervision of all traffic operating between Austin Avenue and Sixth and Clybourn Streets, Milwaukee.

Charles Cawley and John J. Dee have been named superintendent and assistant superintendent, respectively, of the Chicago Division, between 61st Street and Harvard Street, in the city of Chicago.

George C. Kenry is appointed superintendent in charge of all train and motor coach operation in the city of Waukegan and on the Shore Line Division between North Chicago Junction and Waukegan.

George Bernard has been appointed conductor instructor.

D. A. Miner has been named motorman instructor with supervision over all divisions. In addition thereto he assumes the duties of trainmaster.

George Merriman, S. M. Carrell and William Ives are appointed trainmasters with supervision over train operation of the Chicago, North Shore & Milwaukee Railroad between Chicago and Milwaukee, and Lake Bluff and Mundelein.

Jasper C. Johnson, formerly superintendent of operations of the main line division of the Shore Line Motor Coach Company, has been appointed assistant general manager. Mr. Johnson's headquarters will be at Michigan City, Ind.

F. M. Plake of the valuation engineering force of the Missouri Public Service Commission has been named chief valuation engineer to succeed James L. Harrop, resigned. Mr. Plake has been with the commission for four years. Prior to that time he served with the Interstate Commerce Commission.

Obituary

Dudley Farrand

Dudley Farrand, identified with the electric light and power industry for many years and vice-president of the Public Service Corporation of New Jersey, died on March 3 at Fair Haven, N. J., in his 59th year. He started his career as a clerk with the Newark Electric Light & Power Company and after two years of service he was made assistant secretary. He was next made assistant manager and subsequently he was placed in charge of design and construction. After an association with the People's Light & Power Company, during which he was assistant general manager and general manager, he became general manager of the United Electric Company of New Jersey, and four years later he obtained a similar position with the electric department of the Public Service Corporation of New Jersey.

On the formation of the Public Service Electric Company in 1910 to take over all the electric properties of the Public Service Corporation Mr. Farrand was appointed its general manager. Five years later he was made its vice-president and general manager, assuming in addition the duties of assistant to the president in 1917. Mr. Farrand was president of the National Electric Light Association in 1907 and the following year was appointed by President Roosevelt as technical adviser representing the electrical interests to the National Conservation Commission.

George J. Baldwin

George J. Baldwin died at the Johns Hopkins Hospital, Baltimore, Md., from pneumonia, on March 5. No truer eulogy can be written for this great organizer of public utilities throughout the South than to say he spent the major part of his 70 years in serving the interests of philanthropy and in helping to create power in industrial life. Mr. Baldwin, a partner in Stone & Webster since 1898, under which company these organizations were formed, had also been vice-president and general manager since 1916 of the American International Corporation, founded during that same year to extend and cement the foreign financial and commercial relations of the United States.

Upon graduating from the Massachusetts Institute of Technology in 1887, his activities increased and progressed first from chemist at the Woodstock Iron Company, Anniston, Ala., to superintendent of the Bradley Gold Mine Company of Nacoochee, Ga. He resigned from the mine company after a year of service to join the Baldwin Company, cotton factors and dealers in fertilizers. In 1886 he founded the Baldwin Fertilizer Company, of which he was president until 1894. As a member of the firm of Stone & Webster, with which he aligned himself four years later, he organized the following companies, being at one time or another president of all of them: Savannah Electric Company, Jacksonville Traction Company, Key West Electric Company and Pensacola Electric Company. Mr. Baldwin at one time also was first vice-president of the Pacific Mail Steamship Company and acted as chairman of the New York Shipbuilding Corporation.

James W. Samuel

James W. Samuel, former assistant treasurer of the United Railways, St. Louis, Mo., died in his home in that city on Feb. 17, following a long period of ill health. He had been relieved of his duties as assistant secretary and treasurer of the company by Receiver Rollo Wells in 1920. At that time Mr. Samuel, 40 years old, had been in the employ of the railway for about 25 years. He started as a clerk and occupied in turn many important positions with the company. For many years he was chief clerk in the office of the treasurer and in 1916 was elected to the office of assistant treasurer and secretary.

In filling that position he supervised the counting and banking of all money taken in on the cars, issued and registered the capital stock of the company, collected bills and looked after the rental of buildings. He also kept records of all insurance policies of the company. At the age of 16 he served as general utility boy in the employ of the old Lindell Railway. This was in August, 1895. When the Lindell was consolidated with the other systems of St. Louis Mr. Adkins, former treasurer of the old Lindell lines, became secretary and treasurer of the United Railways. Mr. Samuel continued then in Mr. Adkins' office. Mr. Samuel was 48 years old.

John Stopp, for several years general shop foreman at the carhouse of the Tri-City Railway, Rock Island, Ill., died recently. He started service with the Tri-City property 35 years ago as a motorman. Mr. Stopp was 58 years old.

Joe C. Thompson, secretary and assistant treasurer of the Texas Power & Light Company, Dallas, Tex., died at Dallas on Feb. 28. Mr. Thompson was also tax commissioner for the Texas Power & Light Company, Dallas Power & Light Company, Dallas Railway & Terminal Company and the Texas Electric Railway, Inc. He had been connected with these companies since 1913 and had lived in Dallas for 25 years. Mr. Thompson was 52 years of age.

John R. McGinley, an organizer of the Philadelphia Company, of which he was vice-president and general manager for many years, died in New York City recently. Mr. McGinley, a prominent figure in the industrial world, was an early associate of George Westinghouse, with whom he formed the Westinghouse Electric & Manufacturing Company, and with whom he was associated for many years in the Westinghouse Air Brake Company. He was actively identified with many industrial and financial institutions of Pittsburgh and elsewhere, among them the Fidelity Title & Trust Company, the Duff Manufacturing Company, Chicago Pneumatic Tool Company, Union Switch & Signal Company and the R. D. Nuttall Company.

Coffin Awards Made to General Electric Employees

Twenty-seven employees of the General Electric Company were awarded Charles A. Coffin Foundation certificates of merit for their outstanding services toward the increase of the company's efficiency or progress in the electrical art during 1926. The awards were made March 4. With each certificate went four shares of General Electric common stock. One-third of the twenty-seven awards were to workmen, two to foremen, eight to engineers, five to commercial men and three to administrative employees.

The Charles A. Coffin Foundation, which makes the awards, was created by the General Electric Company in 1922 in recognition of the services to the electrical industry of the late Charles A. Coffin, first president of the company, who died last summer. The awards of the foundation include, in addition to those to General Electric employees, yearly prizes in the electric railway and power fields and a number of annual fellowships in American universities.

Work Begun on Twin City's New Noiseless Cars

Construction has begun in the St. Paul shops of the Twin City Rapid Transit Company, Minneapolis, Minn., of 25 noiseless cars provided for in the company's 1927 budget, which has been accepted by the Minneapolis City Council. These are to weigh 1,000 lb. more than the trial cars that have been in service two or more years, providing for more structural strength, but 10,000 lb. less than the standard car in use. The cars will cost $155,000, of which 60 per cent will be charged to the Minneapolis division and the rest to the St. Paul City Railway. Aluminum is utilized considerably in the structure of the cars. With the use of a new type of wheels and brakes and through other features the car noise is reduced to a minimum, from the viewpoint of modern engineering.

Chicago, Aurora & Elgin Railroad to Build New Terminal

Plans for the construction of a new passenger terminal at Aurora, Ill., have been announced by the Chicago, Aurora & Elgin Railroad. Acquisition of a new right-of-way extending several blocks along the Fox River and of an entire business block at Broadway and New York Street has been completed by the company and construction of a $60,000 terminal station will be begun at once. Extension of the city's principal business district one block south along Broadway is expected to result from the railroad's undertaking.

In all, more than 10 acres of land has been purchased by the company and the total cost, including terminal construction, is said to be approximately $1,000,000. The new terminal and new right-of-way will make it possible for the Aurora-Elgin line to discharge passengers in the heart of Aurora without running its trains over the street car tracks of the Aurora, Elgin & Fox River Electric Company on Broadway as at present.

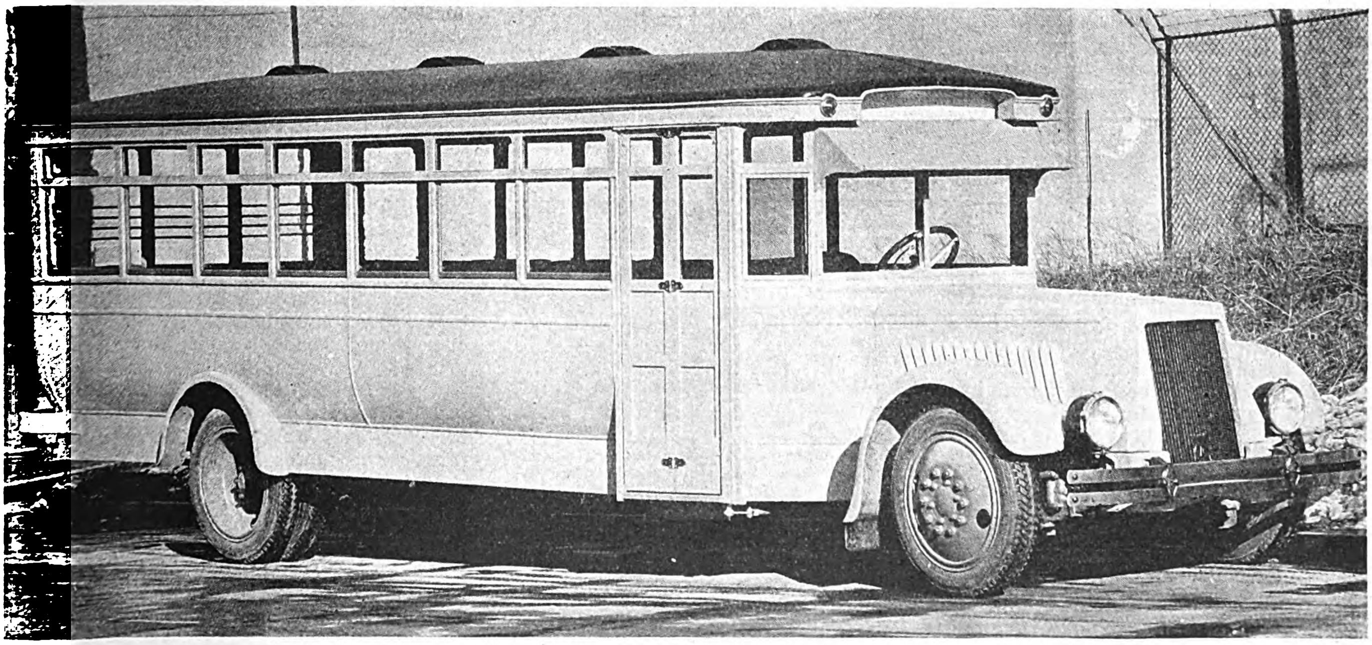
The Aurora terminal is part of a comprehensive plan of improvement started by the railroad since its purchase by Samuel Insull and associates early in 1926. A new $250,000 terminal is now under construction at Wells Street, Chicago, and extensive improvements are being made in the roadbed and rolling stock.

Some Details of New Jersey Company's New Macks

Additional facts are available about the 77 Mack buses recently ordered from Mack Trucks, Inc., for use on the lines of the Public Service Transportation Company, Newark, N. J., and twenty by the Capitol District Transportation Company (United Traction Company), Albany, N. Y. Thirty-seven of the buses ordered by the Public Service Corporation are gas-electric drive, as are the twenty ordered by the Capitol District Company. Forty ordered by the Public Service are mechanical drive Macks. All buses are of the six-cylinder type as shown in the accompanying illustration. The Public Service Company also purchased at the same time 70 four-cylinder, gas-electric drive Macks, bringing the total order up to 147 buses.

The six-cylinder Macks are equipped with genuine leather-upholstered seats, and have a capacity of 29 passengers, sitting. The engine, radiator, gasoline tank, steering wheel, transmission and entire chassis are mounted on blocks of live rubber under compression. This system of rubber suspension is known as rubber shock insulation, as these rubber blocks damp out vibration so that an increase in bus life and passenger comfort is obtained.

In the gas-electric drive buses, an electric generator is connected with the gasoline engine, and then through a control box with an electric motor. Only one electric motor is used and this is connected directly to the standard Mack driveshaft. It is claimed that the single motor drive eliminates several hundred pounds weight,



Mack Six-Cylinder Gas-Electric Bus of the Type Ordered for Use in Newark, N. J., and Albany, N. Y.

extra maintenance and extra cost which must be calculated in gas-electric drive buses using two motors. Speed in the gas-electric drive bus is controlled by acceleration of the gasoline engine.

Bertin Heads Galena Signal Oil

M. J. A. Bertin was recently elected president of the Galena Signal Oil Company, following his election as a director during the annual meeting of the company. Mr. Bertin succeeds L. G. Drake, who resigned as president and director. F. A. Burgess is another director elected at the annual meeting, succeeding C. W. Hochette. At a subsequent meeting of the directorate J. French Miller was named as treasurer, in place of William P. Westcott.

Triplex Car Studied for Use in Montreal

It is understood that the order for the new cars and trailers for the Montreal Tramways, Montreal, Que., will not be placed until a decision on the desirability of the new type of triplex car has been ascertained.

For the present, according to the Montreal Tramways Commission, no more one-man cars are in prospect. The original 50 placed in operation were designed to give more adequate service on certain routes, and not with the idea that future equipment would be entirely of this model.

Inquiry has been made as to whether consideration has been given to double-deckers for Montreal. The matter has not been studied to the bottom, but the responsible operating officials at Montreal are said not to be much impressed with such a model for employment in a climate where, in winter, ventilation is of paramount importance.

As indicated in the ELECTRIC RAILWAY JOURNAL for Feb. 26, page 403, the order at Montreal is for 50 cars.

The Westinghouse Advertising Policy

Much misunderstanding has developed over the recent newspaper stories concerning the announcement on the part of the Westinghouse Electric & Manufacturing Company to use daily newspaper advertising. Certain newspapers used the news story that was sent out in such a way as to make it appear that no other media might be used.

The Westinghouse company is giving up all general magazine advertising, feeling that it can handle institutional advertising and certain product advertising through concentration in localities as conditions demand. The newspaper space will not be used for highly technical apparatus, but primarily for apparatus that is sold through dealers and jobbers. For instance, it might run a campaign on street lighting in a certain city where it was known that thought is being given to a new street lighting system. It was felt that such a situation is primarily of local interest, and that in this, as in many phases of the company's general advertising, newspapers furnish a more effective medium than do general magazines.

An article in the March 10 issue of *Printers' Ink* by J. C. McQuiston, director of publicity of the Westinghouse company, clarifies the situation. In it he makes this statement: "The technical and trade press advertising in our opinion is absolutely as essential to our welfare in the future as it has been in the past."

Track and Line

Miami, Fla.—Application was made recently for the extension of railway service to Cocoanut Grove by W. T. Price in behalf of the residents of the territory involved. The plan contemplates a spur line from the Coral Gables Rapid Transit route. The estimated cost was placed at approximately $166,000 for 3.4 miles of track.

Connecticut Company, through N. J. Scott, manager of the Hartford division, has announced plans for new track construction and changes on the Rockville, Hartford & Stafford Springs line. The track department will install a switch at the Burke Farm, Rockville, another at Tolland Avenue, and will replace the switch at Ogden's Corner. These improvements will permit cars to make the trip between Tolland Avenue, Rockville, and Hartford in about one hour and fifteen minutes.

Shops and Buildings

Department of Street Railways, Detroit, Mich., has a program under way which contemplates the sale of some of its carhouse property and the erection of buildings elsewhere. Legal objections having been overcome, the street railway commissioners have empowered the department of street railways to readvertise for bids on its property on Woodward Avenue across from the Highland Park plant at the Ford Motor Company. The property, no longer needed for carhouses, has a frontage of 125 ft. on Woodward Avenue and is 517 ft. deep. At the time it was previously offered for sale, a bid of $525,000 was received. The sale was halted when it was discovered that the charter requires a vote of the people to dispose of real estate involving more than 10 cents per capita of population. Since then the charter has been amended to read 30 cents. The City Council has voted to approve the expenditure by the department of street railways of $280,000 for 20 acres of land on Coolidge Highway near Grand River Avenue, as a carhouse site.

Metal, Coal and Material Prices

Metals—New York	Mar. 8, 1927
Copper, electrolytic, cents per lb	13.15
Copper wire, cents per lb	15.25
Lead, cents per lb	7.65
Zinc, cents per lb	7.10
Tin, Straits, cents per lb	70.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.35
Somerset mine run, Boston, net tons	1.975
Pittsburgh mine run, Pittsburgh, net tons	1.85
Franklin, Ill., screenings, Chicago, net tons	2.625
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.70
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.77

Trade Notes

John Alden Plimpton was appointed Western manager of the Pennsylvania Crusher Company, Philadelphia, Pa., effective Feb. 1. Mr. Plimpton's office will be in Chicago. He succeeds B. S. Darling, who has undertaken association work. Mr. Plimpton is a graduate of the Massachusetts Institute of Technology, and prior to his promotion was sales engineer at the company's Pittsburgh office.

Wiswell Improved Railroad Crossing Company, Chicago, Ill., reports the election of the following gentlemen as officers and directors of the company. The personnel was elected at the annual meeting held on Jan. 26. Officers: C. T. Wiswell, president; T. G. Murray, vice-president and chairman of board; C. P. Jaeger, secretary and treasurer; L. C. Larson, sales manager. Directors: T. G. Murray, president Association of Commerce and Merchants, Madison, Wis.; Charles O'Neill, vice-president Bank of Wisconsin, Madison, Wis.; H. V. Tennant, consulting engineer, Portage, Wis.; G. T. Wiswell, civil engineer, Chicago, Ill.; J. A. Lorimer, merchant, Chicago, Ill.; C. P. Jaeger, business man, Madison, Wis., and W. E. Hanson, construction engineer, Chicago, Ill.

New Advertising Literature

Chausse Oil Burner Company, Elkhart, Ind., is issuing catalog No. 11 descriptive of the Chausse portable asphalt plant and other equipment for repairing asphalt pavements. The catalog is well illustrated and in addition to covering details of the portable plant has information and cuts descriptive of the Chausse railway switch heater.

Ohio Brass Company, Mansfield, Ohio, has issued an attractive map of the United States which is after the general design of "Ye Olde" mariner's chart. Within the borders of each state is shown a cut or design of some product of the company that is of outstanding significance to the specific territory.

Amtorg Trading Corporation has just issued an elaborate commercial compendium of the United States, containing 1,076 pages with 2,800 illustrations. The "Catalog of American Industry and Trade," as it is styled, is printed in Russian and is especially designed to place American business before every business and trade executive in the Soviet union. Six hundred and forty-three pages of American advertising contain the insertions of 382 manufacturers of 30 states of the Union and of Canada. The catalog is handsomely bound and, in addition to presenting the claim and operations of the American industries, has interesting articles, contributed by noted engineers and business men. An economic survey of the United States is included.

Annual Maintenance and Construction Number

Maintenance from the Car Rider's Viewpoint

WHAT concern of the car rider is the maintenance practice of his street car line? What does he care about the workings of the motors, the trolley, the track? Why worry whether the car that carries him is a light-weight type or a heavy one? Certainly if the rider pays any particular attention to these things he is different from the average man. But when he decides whether to ride the street cars or to buy a new flivver, he considers, even without realizing it, that perhaps the cars are habitually dirty; that there have been frequent delays because of road failures; that the flat wheels have left him tired at the end of a half-hour ride; that the lights flicker so that he cannot read the evening paper. Perhaps his wife tore a new dress because a nail protruded from the car seat, or a spot of oil from a door engine dropped on his new fedora as he left the car on the way to the theater. These are the possibilities to indicate how the car rider is affected by the maintenance of the system.

Let the maintenance man put himself in the position of the man who is to be attracted or repelled. Let him determine if he would ride the cars if he had to pay fare. Then have him go back to his job and try to put his part of the system in such good condition that the average citizen will be pleased to become a regular rider. That is maintenance from the car rider's viewpoint.

Well-maintained rolling stock reflects the company's own estimate of itself.

Smooth, Quiet Operation Results from Good Workmanship

EVERY ONE realizes that quiet running cars are needed and that a high standard of maintenance is necessary to do away with excessive noise. Campaigns for noise reduction are producing good results, and the various maintenance departments show an alertness and eagerness along this line never before manifested.

Better maintenance will permit smoother operation and make it easier to maintain schedules. An open-circuited resistor or a governor out of adjustment may cause jerky acceleration and annoying stops. The passenger usually blames the operator for this, but the real reason is poor maintenance.

The men responsible for the condition of electric railway equipment are really the foundation that must support any campaign for improved equipment. Success in attracting riders and keeping them satisfied depends on the efficiency of the maintenance departments. All other sales effort and publicity to produce increased patronage will fail if cars are dirty and ill-kept, if the track is rough and out of alignment, or if trolley wire breaks and wheels off the wire cause annoying interruptions to service.

Avoid the folly of the broken trolley—inspect the overhead before it gets under foot.

Care Is Important for the Electrical System

NO PART of an electric railway is more vital than the electrical system. Practically 100 per cent service is an absolute essential. Other parts may fail, causing local delays or inconvenience, but breakdown of the electrical system may easily affect a large territory, so that extraordinary efforts should be and are constantly made to prevent failure.

The generation of power is no longer a matter of direct concern to many railways. Its purchase, frequently from large interconnected systems of such diverse territory that failure of the primary source of power is infrequent, is supplanting generation for railway purposes alone. Increased reliability in the substation has been secured by improvements in conversion equipment, particularly for use on 60-cycle systems, while the tendency toward simplification and increased efficiency by use of the mercury arc rectifier is receiving careful consideration.

Development of automatic protective apparatus for use in the substation and on the line has not only reduced the time required for the isolation of overloaded or defective sections and decreased the probability of interruption of other than the affected circuit, but has provided for the automatic restoration of service at the instant that conditions become normal. Remote supervisory control has made it possible for the load dispatcher at a central point to keep in continuous touch with the entire system and to perform necessary switching operations in distant unattended stations with greater facility and certainty than was formerly possible with operators at each place.

The transmission, distribution and trolley contact lines have also received consideration. Insulating materials are constantly being improved, and the results of intensive research are being applied to the insulation of cables for high voltages. The trolley wire material, its manufacture and use are all being carefully studied in the desire to secure a more perfect electrical system.

Unfortunately not all electric railways have modern equipment throughout, though the electrical system may include some or all of the features previously mentioned. In all cases, however, there are two requisites for satisfactory service, namely, thorough inspection and judicious maintenance. Good construction alone is not enough. There must be periodic and thorough inspection to eliminate possible sources of delay before a breakdown actually occurs. In many instances inspection must be supplemented by tests, to determine conditions accurately. The frequency with which inspection and tests are necessary varies for different parts of the system. Some require daily attention, others need it less frequently; but regularity is essential.

Incoming material should be closely watched so that its acceptability and quality are known before installation. The scrap pile cannot be overlooked for ideas, as an inspection of worn-out parts often points the way to improvements.

The importance of thorough inspection combined with judicious maintenance cannot be overestimated. Worn materials must be replaced before failure, but economy dictates the necessity of getting all possible wear before replacement. To secure a proper balance between these two conflicting requirements makes necessary the use of good judgment all along the line, by the superintendent, by the inspector and by the foreman and workmen directly responsible for the maintenance of the system.

The repair job that is "cheap" is not the least expensive in the long run.

Preventive Maintenance Is Better than Repairs After Failure

MAINTENANCE of the highest type includes cars well painted, which are kept immaculately clean, with no loose parts to cause disagreeable noises, and lubricated so that smooth running results. For a short period such maintenance will cost more per car-mile than slipshod work, but in the long run, considering both maintenance and depreciation of the equipment, it will be the cheaper. From the revenue viewpoint the better maintained car certainly will attract more riders and the increased earning power will more than pay for the high standard of maintenance.

Most car maintenance work can be classified under five general headings. These are (1) work needed to keep the car clean, attractive and noiseless; (2) inspection and adjustment; (3) repairs and replacements of worn parts to anticipate and forestall failure; (4) repair of failures; (5) repairs to equipment damaged in operation.

The far-reaching influence of the first class of maintenance, that necessary to keep the equipment attractive, is often overlooked. Many master mechanics know that when it appears advisable to reduce maintenance expense, this class of work is the first one in the budget to be cut, as officials consider that the cars will still operate satisfactorily even though their appearance is not of the high class desired.

The items of car cleaning, painting and lubrication represent a relatively small part of maintenance costs and the savings from neglecting any of these will be comparatively small. It certainly does not pay to cut down expenditures for these three items. In analyzing average figures for several large railway systems, it was found that car cleaning constitutes approximately 15 per cent of the total maintenance cost. Car painting, done on a yearly basis, was approximately 12 per cent of the total and the cost of both labor and material for lubrication was less than 3 per cent of the total. The systems included in the analysis pride themselves particularly on having attractive cars, but still the total expenditure for the three items enumerated is less than one-third of total maintenance cost.

Why give the passenger a soft seat and trust him to a rough motorman?

Cutting Costs at the Source

NO PROGRAM of maintenance-cost reduction can be fully or even largely successful unless the co-operation of the working force can be secured. This co-operation is necessary for conservation of materials, and even more for conservation of time. It involves two elements; desire to keep down maintenance costs, and knowledge of the equipment and its use far beyond the range of the particular job. It appears therefore that here is a problem of management which for its solution involves education. First comes education in loyalty and co-operation; on this a superstructure of information can be reared.

Maintenance costs can be most effectively minimized by careful, that is, intelligent, handling of equipment. This is especially needed, for example, with the modern, light-weight, ventilated motor. A manufacturer's expert, called in for consultation in connection with an epidemic of motor failures, soon correctly diagnosed the trouble as due to frequent and unnecessary reversal of motors in braking. A campaign of education stopped the trouble. Similarly, motormen sometimes "fan" the control so as to "inch the car along" when following another car or other vehicle.

These illustrations suggest but one of many ways in which maintenance can be made to approach the irreducible minimum, that is the amount which is involved in unpreventable wear-and-tear. Then in the actual maintenance work there are other opportunities. First, because most obvious, is elimination of waste in the use of materials. Reclamation of worn equipment and other parts is responsible for large economies and has still further possibilities; always, however, understanding that repair work can be carried too far. To a limited extent also there is actual loss or misuse of material; this can be obviated with a little care.

Important as materials conservation is, however, time conservation is still more important. Labor loss is the more subtle, more difficult to discern and measure—and yet labor is the largest part of maintenance cost. Good supervision will control this loss to some extent, but without the will to save and knowledge of how to do it the worker will waste time, inadvertently or otherwise.

No magic formula can be invoked. But an overwhelming majority of electric railway workers want to help the management cut maintenance costs. They positively will welcome information and suggestions. They want to be taken into partnership in performing this task of management. Much can be done along the line of education through departmental conferences, and where a railway has a comprehensive educational and training program in operation, cutting maintenance costs may well be one objective in laying out the courses. Competition is also an incentive; such, for example, as is furnished by the increasingly popular interchange of maintenance cost data among properties. The first requisite in all of this, however, is a conviction on the part of somebody that the worker is the ultimate source of considerable maintenance cost, hence offers an opportunity for stopping certain leaks at their source.

Paint your rolling stock or you won't need any rolling stock to paint.

Paint Artistically If Possible, but Paint Anyway!

SIR JOSHUA REYNOLDS' famous remark to one of his questioners that he mixed his paint with brains is one that the electric railways may well ponder. Many of them are doing this very thing, but some of them are not. Ordinary pigments include, among others, umbers, siennas, ochres, chromes, Venetian red, Indian red, Prussian blue, and Vandyke brown, but it is the combination of colors that counts. Thus it may seem a long jump from Pliny explaining the term "catagrapha" and Epictetus decorating a vase to the modern car painter, but to both of them the vehicle is still the liquid in which the particles of the base are held in suspension. Age may stale only slightly the infinite variety of the subject of the master, but age and abrasions do detract from the work of the master car painter. The true artist may wince at a combination of yellow and bright red, but these colors make for visibility.

The slatternly-looking vehicle certainly has no place in the present scheme of things. And in eradicating it, paint can be made to play an important part. This is so because the modern methods of painting have made it possible. Isn't it significant that on one railway system the cost of repainting a double-truck car at the present time is $69 with labor at 58 cents an hour —a cost considerably lower than that of 1913, although labor and materials doubled in cost meanwhile? Isn't it also significant that on another system, by improved methods, the number of revenue cars painted annually has been increased from 34 per cent of the total operated in 1920 to 82 per cent in 1925, while the man-hours required for painting a 40-ft. double-truck car have been cut from 340 in 1920, with hand labor, to 90.9 in 1925 with spray and hand labor?

The answer, it seems, is not in the economy itself, but in the opportunity which that economy affords for more work of the same kind to be done at the same gross expenditure. But no matter what the cost, it is the color combination that counts. And there again the advice of Sir Joshua holds good. The tangerine that would do in one place might not do at all in another. Of course, the taste of the public cannot be trusted implicitly, but the railways in Atlanta and Kansas City appear to have fared well by permitting their public to express its ideas about the matter. The members of an art institute might not approve of looking upon traffic, made up for a goodly part of street cars, when they are bright red. This would seem to be just as well. The flaming interurban that can be heard a mile away, to put the matter in the vernacular, may be all right when isolated, as it usually is, but a multitude of such cars on a city system would be more than sensitive souls could endure. A maroon that is permitted to become a screaming scarlet would probably not receive acclaim at the hands of the art critics. It is all a matter of taste, durability and cost, and not the least important of these is the esthetic side of the matter. Of that it might be said *fiat lux.*

Interurban Stations Often a Poor Advertisement

WHAT a dismal picture some interurban stations present! A two-by-four shack, open on one side; a dirt floor and rotting sills that struggle to keep the cinder ballast from washing away. Look at the walls. They are the victims of every pocket-knife owner, and what is far worse, those traveling Michelangelos with a flair for the obscene and lewd. Often they are the last resting place for the dodger of a Fourth of July excursion which raises the ire of the commuter when snow is a foot or two deep outside.

Turn the mental film and view a terminal station of the average interurban. Often it is a reconstructed building. It is poorly lighted, furnished with hard benches, its toilets are unsanitary, cuspidors of the iron age adorn its smoking rooms, it is cleaned with a lick and a promise. It is cold in winter and hot in summer. It is a sardonic joke on the company's publicity claims.

Yet the wayside station and the terminal building are the gateways to the utility—the portals to service, that no matter how well advertised or maintained, suffers immeasurably by their unkempt appearance. Poorly maintained way stations are often the point of the wedge for community antagonism. They are monuments of indifference to what the public considers essential to its comfort. Ten minutes in a leaky, unkempt way station has bred many a bitter enemy.

There is a certain likeness between an attractive street car running on bad track and a Rolls-Royce running on a flat.

Many Station Improvements Can Be Made at Little Cost

ON THE other hand, let's square off and look at the whole problem of the possibilities available for interurban station improvement in the light of a few simple maintenance kinks. That the way structure be adequately protected and habitable in all kinds of weather is the first consideration. This and cleanliness can be easily effected by rigid inspection by the track foremen. Next comes a neatly ballasted platform, a little whitewash on the sills, renewal of old sills with ties or bridge timber that ordinarily would be burned or piled in the storage yard. Add a few buckets of paint. Then offer a small prize and half the problem has been solved.

Next it may be observed that flower seeds are cheap and vine seeds are cheaper. A flower box with a few hardy plants or a vine is living publicity of the best sort. Or better still, a small flower plot arranged in an emblematic fashion with a slogan of the road, spelled with flowers. Fix to the wall a neat publicity board, the messages on which are frequently changed, and then by reason of the new ensemble sit back and watch how the wind shifts. No station is so isolated but some adaptation of this scheme is not practical. More often the rule than the exception, the community that is served will furnish the protective measures and, more than likely, some of the maintenance effort necessary to make the portal a show place. With such a decorative setting the station becomes not only the portal to the company's service but a gateway to the community of which every citizen will be proud. Make these silent sentinels monuments to the progressive principles of the industry. Silence is golden if the gold is there.

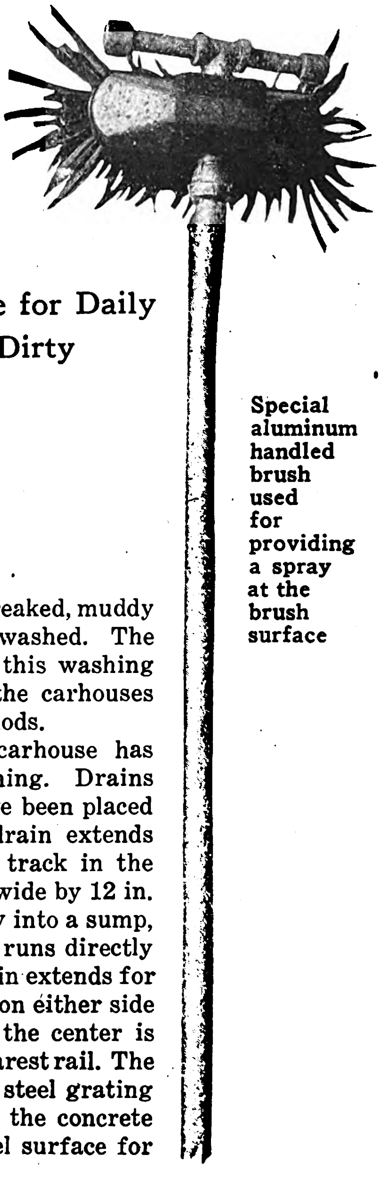
Clean Cars

Hold Patronage

Methods of the Third Avenue Railway, New York City, Provide for Daily Washing of Car Exteriors When These Become Spotted or Dirty from Traffic or Weather Conditions

By J. S. McWhirter
Superintendent of Equipment Third Avenue Railway System, New York, N. Y.



Special aluminum handled brush used for providing a spray at the brush surface

SPECIAL provision has been made so that cars can be cleaned frequently on the lines of the Third Avenue Railway System, New York City, in order to keep the company's rolling stock in the most attractive condition possible and also to prevent deterioration. Much of the track of this company is under elevated railway structures, where, during rainstorms or in the winter, there is dripping from the structure onto the cars. Even when there is no actual rain the windows and sides of the cars get a muddy appearance which is most undesirable. Also, during the summer considerable dirt and iron rust from the structure fall to the roofs of passing cars. Whenever there is a rainstorm, this washes from the roof down on the sides and the windows and produces a streaked appearance.

In order to provide for frequent cleaning, each carhouse has been equipped with a washing system. Cars are washed daily if conditions warrant. When there is a rainstorm or when cars begin returning to the carhouse dirty or with a streaked, muddy appearance all cars are washed. The usual practice is to do this washing as the cars return to the carhouses after the peak-load periods.

One track at each carhouse has been equipped for washing. Drains and a concrete floor have been placed in this section. The drain extends along each side of the track in the form of a trough 10 in. wide by 12 in. deep and sloped to empty into a sump, from which a 3-in. pipe runs directly into the sewer. The drain extends for a length of about 50 ft. on either side of the wash track and the center is about 2 ft. outside the nearest rail. The drain is covered with a steel grating whose top is flush with the concrete floor, thus giving a level surface for

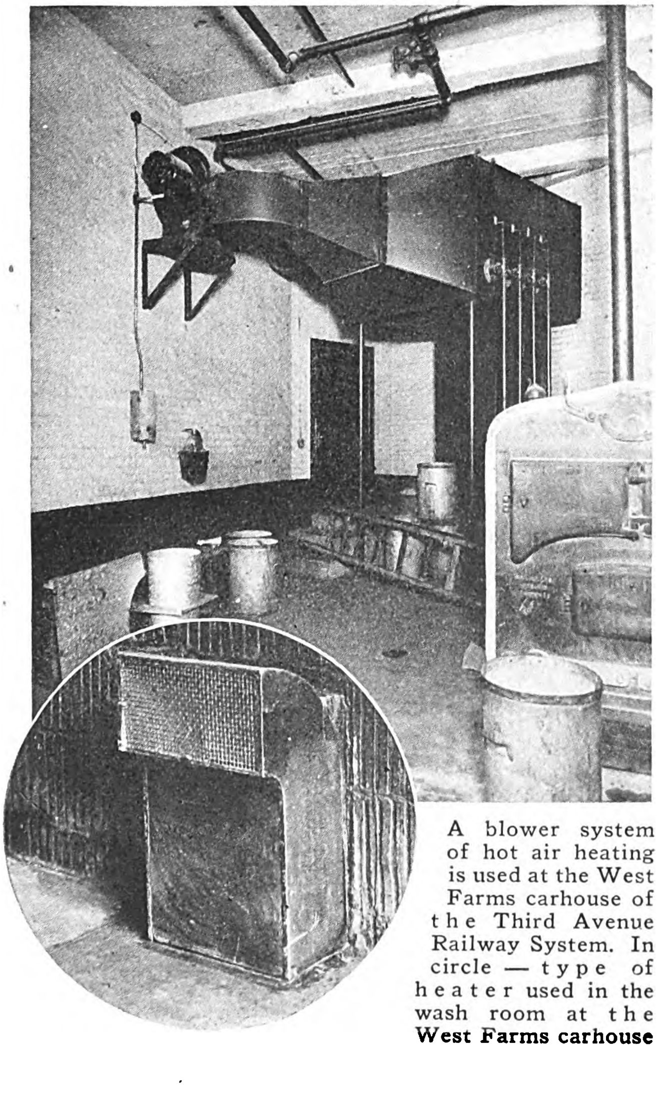
Construction used for special aluminum handled brush

the men who do the washing as well as making the floor look neat.

At each location are four hose connections to the city water system so that four men can work at the same time. In an accompanying illustration, which shows the washing track at the West Farms carhouse, two of the water connections are alongside the shop wall, since the wash track is the first from the wall. The other two water connections, which come between tracks, are in the floor. These have removable covers for making the hose connection which can be replaced with the hose passing through a hole in the cover. Each hose has a length of 50 ft. so that all parts of the outside of the car can be reached readily. Ordinarily with four men a 43-ft. city car can be washed in 1¼ minutes. Where cars do not come in at such a rapid rate two men can do the washing in about 2½ minutes per car.



A blower system of hot air heating is used at the West Farms carhouse of the Third Avenue Railway System. In circle — type of heater used in the wash room at the West Farms carhouse

A convenient brush for the washing is used which has a special construction with a pipe connection over the top to provide a spray of water at city pressure. The brush handle is made of ¾-in. aluminum pipe and is 42 in. long. The lower end is provided with an aluminum union and a nipple for attachment of the hose. The upper end passes through the brush and then has a T-shaped connection of ⅜-in. aluminum pipe 10 in. long just at the upper face of the brush, with a row of $\frac{1}{16}$-in. holes spaced ⅝ in. apart along the side next to the brush. The water is forced out of these holes with considerable pressure and passes along the front side and into the brush. The spray of water itself is very effective for removing dirt and the rubbing of the brush, which also keeps filled with water, will remove any hard particles. The brush used is a No. H-701, manufactured by the Whiting Adams Company, New York, N. Y. An accompanying drawing shows the method of fastening the brush to the handle and the provisions for spraying the water and attaching the hose. The aluminum pipe is very light and lessens the fatigue of the workmen.

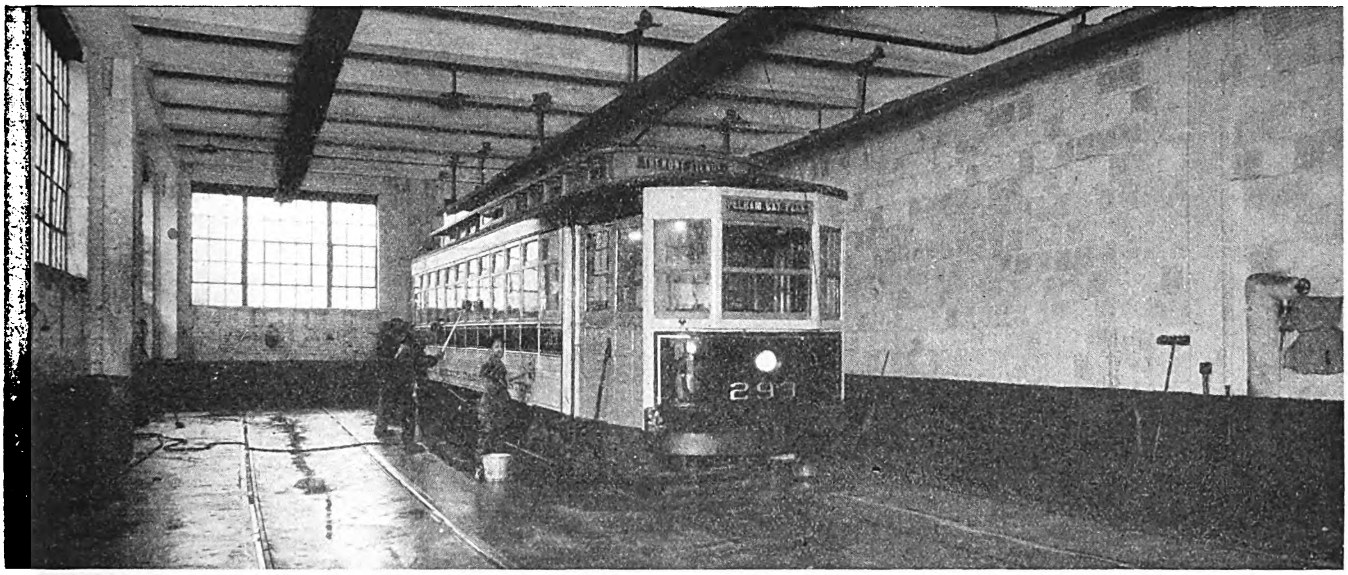
With four men washing a car, two start at one vestibule corner and work in opposite directions. The other two start at the diagonally opposite corner and work toward the first two. Each man wears a rubber coat, boots, hat and gloves.

All parts of cars in service are cleaned thoroughly and are scrubbed once each month. The wash room at the West Farms carhouse, which is typical, is provided with three tracks and is 30 ft. wide by about 60 ft. long. The floors are of concrete and are sloped to sumps for drainage, so that the water runs directly into the sewer.

To provide for efficient washing of cars during cold weather, the wash room is heated by a blower system. Air is heated over steam pipes in the boiler room and then blown through ducts. A 16-in. diameter pipe runs from the blower underground and from this risers are provided, each 10 in. x 20 in. The washing room has four outlets. The equipment and methods used are shown in accompanying illustrations.

For the general monthly cleaning the five men assigned to the work at the West Farms carhouse average thirteen or fourteen cars daily. One works inside rubbing off moldings, etc., with cheesecloth, one cleans the vestibules, two scrub and wash the outsides and one uses a squeegee, after rinsing. The brushes with the special aluminum handle and attachment for spraying the water are used advantageously in this general cleaning.

In cleaning the outside of the car all parts are first wet down by means of the aluminum handled brush. Little rubbing is done, as the water is simply sprayed on, the pressure as it comes out of the small openings being sufficient so that all parts of the car can be reached readily. After the exterior has been wet down a soap solution is applied. This solution is made up in advance and is kept in a barrel in one corner of the



General view of the wash room at the West Farms carhouse of the Third Avenue System

wash room. A 14-qt. pail of Amberzo vegetable soap, made by the Hildreth Varnish Company, New York City, is dissolved in a barrel of water. A pint of this solution is used to each 14-qt. pail of water for use on the car bodies. The soap solution is applied to the car body by round car washing brushes with handles of different lengths for reaching various parts conveniently. All of the brushes used are purchased from Whiting Adams, New York City.

Following the application of the soap suds, the exterior is scrubbed thoroughly with a flat floor scrubbing brush for large surfaces and a furniture rubbing brush to fit into the various corners and around moldings, window openings, etc. After the scrubbing, the rinsing is done with the aluminum handled brush, with considerable rubbing to make certain that all soap is removed. An ordinary type of squeegee, such as is commonly used for window washing, completes the outside washing program and prevents streaks while drying. After this the ventilator sash and side windows are wiped carefully with cheesecloth.

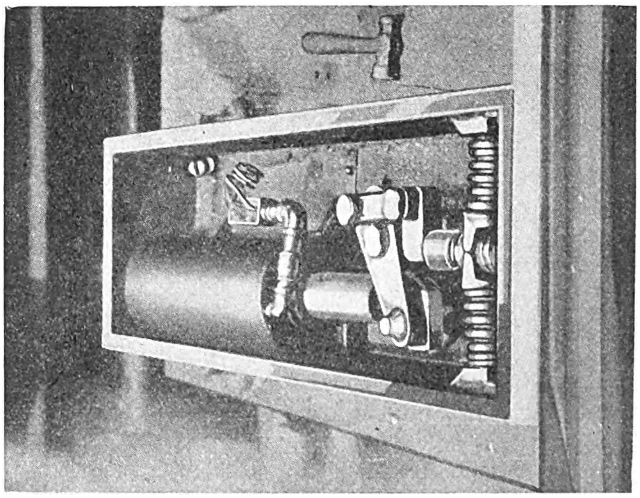
While the exterior of the car is being washed, men are busy inside. Platforms, vestibules, stanchions and similar parts are given the same scrubbing and washing as the exterior. Roofs are also given the same regular scrubbing. For washing the insides of windows of the car body a counter brush is used with plain water. No soap is used inside the car. Moldings, lamps, seats and other interior fittings are wiped with dry cheesecloth. It should be mentioned that cane seats are removed and scrubbed at the time the car goes through the shop on its regular painting schedule, and so the only attention given them during the monthly cleaning is to wipe off carefully and make certain that there is no oil or other material on them which might damage the passengers' clothing and so result in damage suits afterward. The flooring inside the car is flushed out with a hose. In all the interior washing particular care is exercised to make certain that water is not slopped or directed so as to reach any of the electrical apparatus.

This same general plan of washing is carried out at the ten carhouses of the Third Avenue system. The number of men at each varies, due to the differing numbers of cars maintained.

Knoxville Installs Electric Switch of New Type

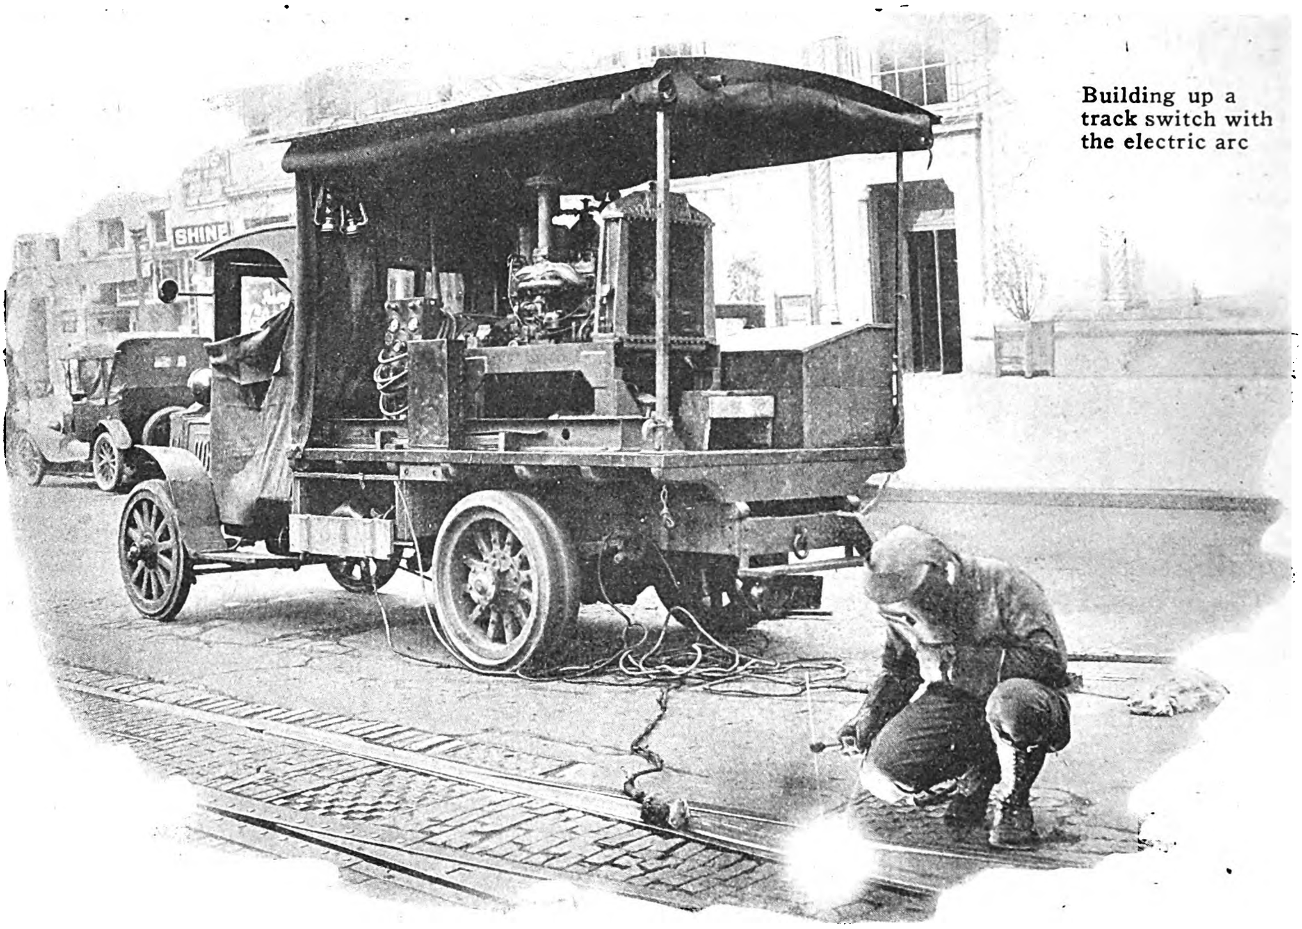
RECENTLY a new electrically operated track switch designed and patented by Charles A. Walker, electrical superintendent, Knoxville Power & Light Company, Knoxville, Tenn., was placed in service in that city. The first unit was constructed in the shops of the company.

As outlined in the patent application, the points of superiority claimed are that the electrical mechanism is contained within the non-magnetic casing, which can be filled with oil. The equipment thus inclosed is placed below the street surface in the usual manner, and the operating levers are connected directly with the switch point.



Mechanism of a new type of electric track switch developed in Nashville, Tenn.

It is claimed that the non-magnetic casing will be non-corrosive as well and the oil filling will prevent trouble due to moisture, either from leakage or from sweating. Suitable connections are made by which the wires are taken from the underground box by conduit to the side of the street, where connection is made with the trolley contacts in a conventional manner.



Building up a track switch with the electric arc

Welding Track Without Car Delays

Tracks May Be Kept in First-Class Condition by Welding with a Moderate Expenditure of Maintenance Funds — This Also Permits Effective Emergency Repairs to Be Made Speedily and Obviates Delays

By Edwin P. Goucher

Engineer of Way and Structures Capital Traction Company, Washington, D. C.

MAINTENANCE and construction work on the lines of the Capital Traction Company, Washington, D. C., is not allowed to interfere with the operation of the cars. Of course at times a delay of two or three minutes cannot be avoided, but a delay of four or five minutes means an investigation and possibly a reprimand to the guilty party. Cars are never rerouted in order to carry on construction work. Rerouting causes annoyance to passengers and perhaps requires a longer time for them to reach their destination. The installation of new track is done at night, after the last scheduled car has passed, and the track must be ready for the first regular car in the morning. If owl service is operated on the line in question the owl car is run in both directions on the adjacent track.

In this age of efficiency and economy it would be difficult to visualize what would result from a complete cessation of all practices and means of welding. This art as applied with present-day methods undoubtedly is saving millions of dollars annually in the maintenance costs for the electric railway industry alone. Not many years ago when a frog became badly worn, or a rail head broke, there was nothing else to do but buy a new frog or cut in a new piece of rail. Present-day welding methods have changed all this. On most properties a frog or switch, before being scrapped and replaced, has been built up with the arc at least once and possibly two or three times.

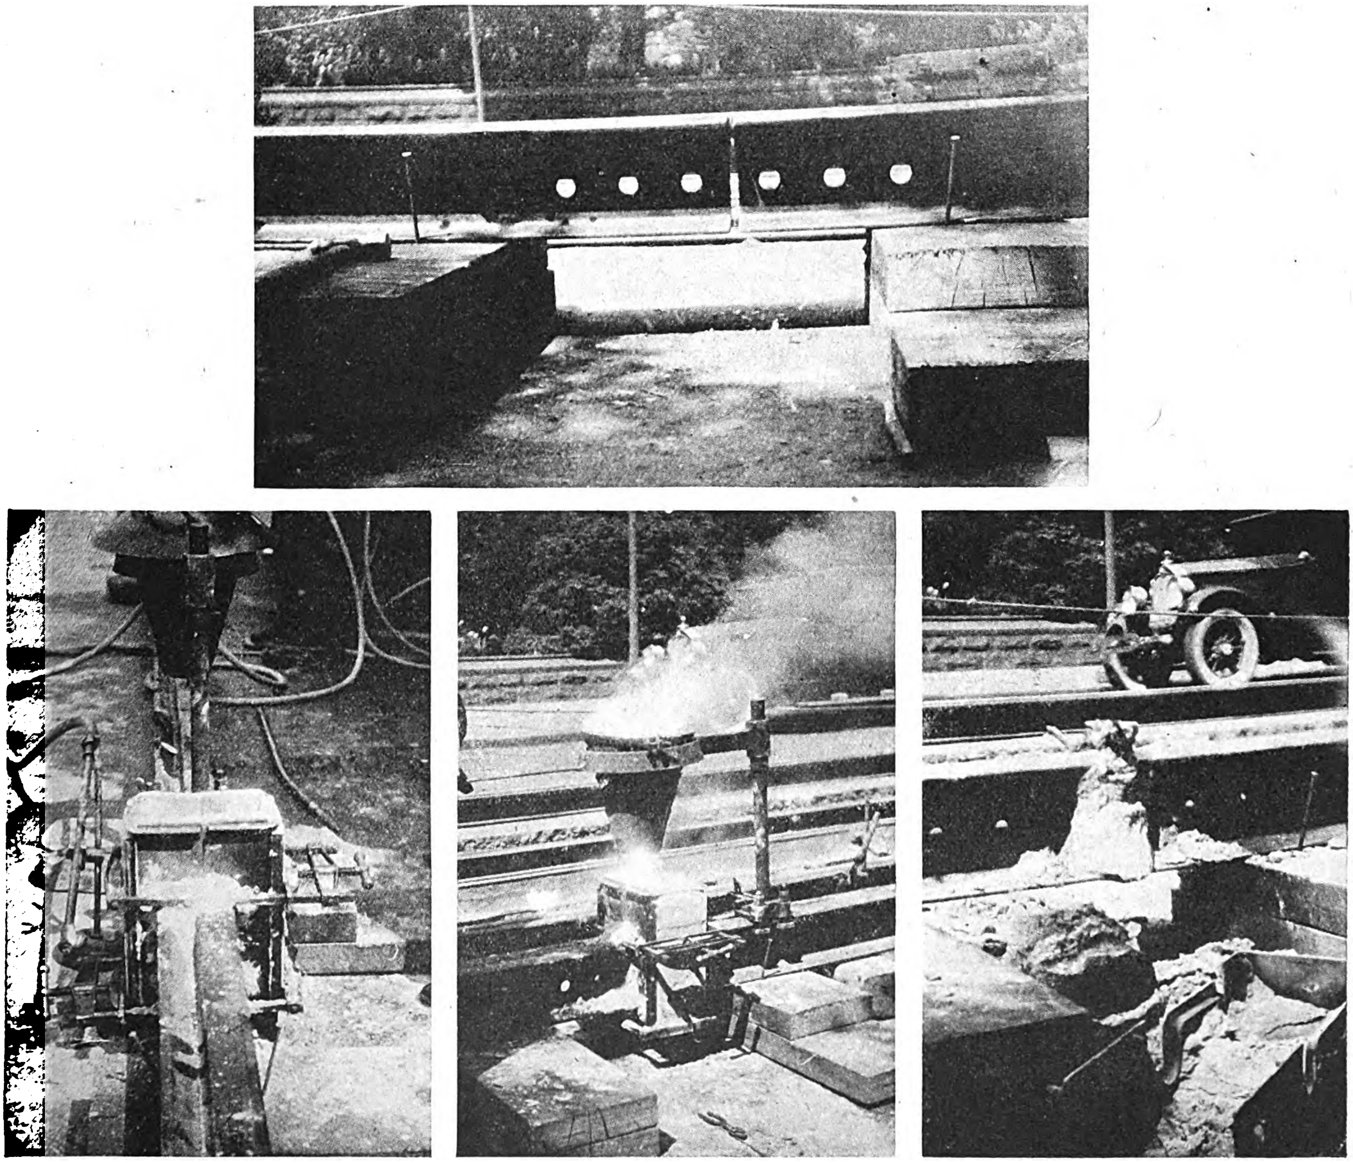
The Capital Traction Company is a firm believer in the value of welding as a means of reducing operating costs and making emergency repairs to obviate service delays. Three welders are kept busy practically the entire year building up worn frogs, cupped joints, worn guard rails and other miscellaneous work. Practically all of the tracks in the city of Washington are of the underground conduit type. Special work costs from six to ten times as much as similar layouts for the regular surface construction, so any one familiar with the savings effected by making welding repairs on surface track special work may readily understand that this amount must be very much greater when the repairs are made on the conduit type of track. The saving alone in interest on investments probably more than carries all the costs of the welding equipment and labor expended in making these repairs.

As an example, there is a double-track crossing on the lines of the Capital Traction Company that will be renewed complete this year. This crossing was scheduled for renewal in 1925, but by means of electric arc welding it was possible to hold it over until 1927. This job will cost installed about $21,000 and the interest for that amount for two years at 6 per cent is about $2,500.

The ever-increasing need for labor and time-saving equipment has resulted in the development of many new machines for various classes of work, and in my opinion one of the most important is the welding outfit mounted on an automobile truck. The old way of towing or hauling the welding machine to the job and back again, leaving the operator and his helper to shift for themselves during the day, is fast becoming a thing of the past. The time wasted while the machine is moved from place to place by the men is too costly, not to say anything about the lost time occasioned while waiting for a truck to move the outfit a mile or two to another job.

Broken rail heads, frogs, etc., are discovered usually by some one in the construction or maintenance forces, but quite often a trainman will report this condition before any one else has noticed it, possibly shortly after the break occurred. Repairs are made immediately if the nature of the break is at all apt to cause a delay to the cars. If of a minor nature, a welder is usually allowed to finish the job on which he is working before leaving for the other location.

Metallic arc welding is used for this class of work on our lines. For ordinary cupped rails, worn guards and manganese plates a high carbon rod is used. Where the break requires a large deposit of metal, such as a broken rail head, a low carbon rod is used to build up the metal to within about ⅜ in. of the running surface and the harder rod is used to complete the weld. We find this method superior to the use of the high carbon rod throughout the weld, and of course the low carbon rod is not suitable for use where it will be subjected to wear.



Several rail lengths are thermit welded at the side of the track and then are installed as one piece

At top—Rails set up ready for mold boxes.
At left—Mold boxes in position ready for welding 122-lb. A.E.R.E.A. 7-in. trilby rail.
In center—Thermit reaction taking place.
At right—Weld after removal of mold boxes and before it is cleaned up.

The Capital Traction Company has now standardized on thermit joints for new construction. While this method of welding presents no serious difficulty on the average property, to those of us operating the conduit system it is quite a problem. We cannot install portable crossovers wherever we wish and divert traffic to one track, nor can we lay temporary track on which to operate cars.

First and foremost in the minds of all Capital Traction employees is the understanding that the cars must not be delayed. Our livelihood depends on the cars and avoidable delays are inexcusable. We have effectually solved the thermit welding problem by welding four to six rails together outside the track, installing them as one piece and welding the intermediate joints at night between 1 a.m. and 5 a.m. This adds materially to the cost per joint as compared to other methods, but we feel that the increased value of the thermit joint is worth the difference. Thermit is also used in the construction of frogs, crossings, repairing broken switch and frog arms and in making compromise joints.

Cutting, brazing and welding with the oxyacetylene torch is now another large factor in track maintenance. This is probably more true of conduit track maintenance than of surface track, due to the increased use of iron and steel in the conduit type of construction. Each of the Capital Traction welders has a complete gas cutting and welding outfit in addition to the regular arc welding equipment. Frequently the combined use of these two methods results in a considerable saving in time.

When present-day traffic conditions are taken into consideration, the wonder is that any trackwork can be repaired or reconstructed without great expense for labor. This would undoubtedly be the case were the hand methods of past years still in use. But labor-saving tools have been developed and are being used to such an extent that instead of an increase, there actually has been a reduction of about 40 per cent in labor hours expended per foot of track on reconstruction work. The decrease of 40 per cent has been the experience of this company, and when this percentage is applied to present labor rates, we can see an actual saving in labor alone of more than $20,000 per mile of conduit track reconstruction, as compared with similar work before we had labor-saving equipment.

While welding equipment cannot be credited with a substantial part of this saving, it nevertheless plays a very important part in the upkeep and maintenance of the road, and in my opinion is probably responsible for as great a saving in that particular field as are our air compressors, derricks, etc., when used on construction work.

Dynamometers Regulate Tension of Trolley Wire

ON THE Boston Elevated System about 50 per cent of the trolley-wire breaks are due to fatigue, or crystallization. These are caused by the moving up and down of the wire at points of attachment and by vibrations set up in the wire by passing trolley wheels.

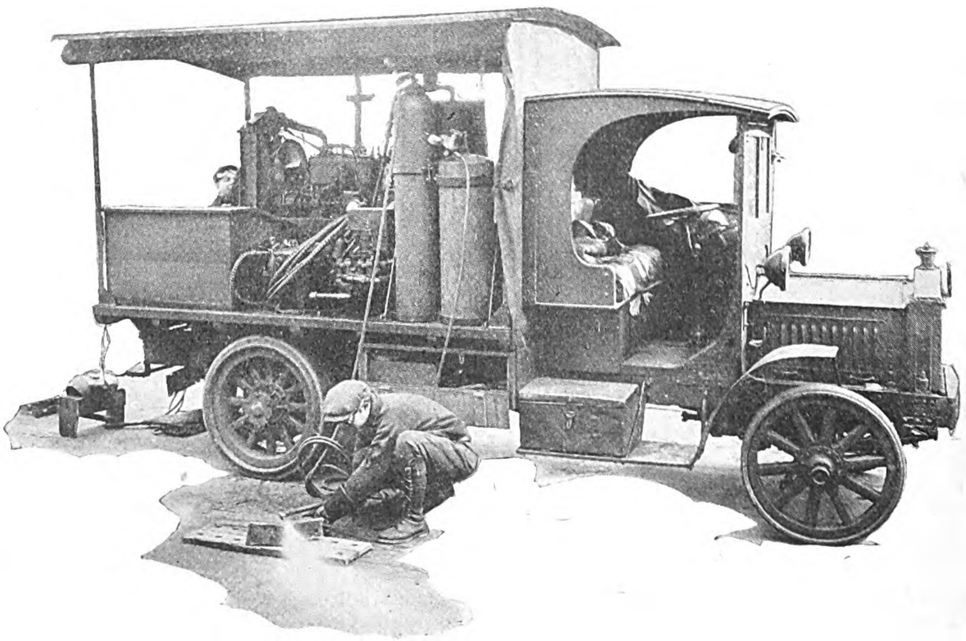
Many more of this class of breaks occur during the months of high temperature than during the low temperature months. For example, in June, July and August, 1926, there were 38 breaks of this nature, and in January, February and December there were nineteen breaks. In winter the wire is tight, due to contraction, and in the summer it is slack, due to expansion. This indicates that the tightness of the trolley wire has much to do with the development of crystallization.

Last September dynamometers were furnished each line maintenance crew, and the trolley wires are now pulled to tensions according to temperature, as follows:

At 0 deg.	2,100 lb.
At 30 deg.	1,800 lb.
At 60 deg.	1,500 lb.
At 90 deg.	1,200 lb.
At 120 deg.	900 lb.

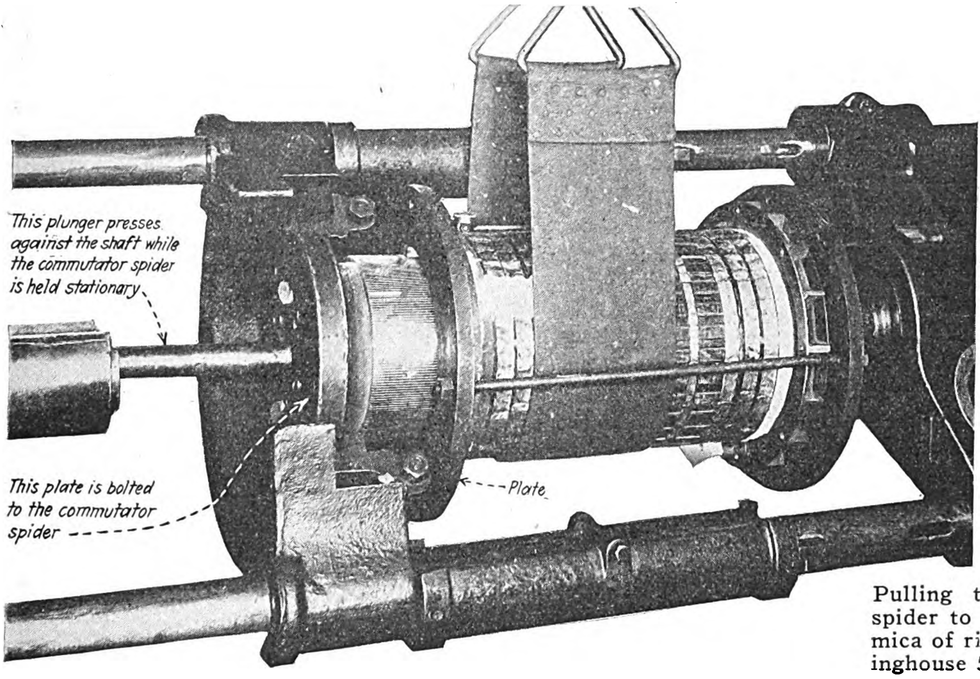
Wire pulled to these tensions will have at zero temperature approximately 3 in. of sag in a 100-ft. section and 7¾ in. sag at 120 deg.

Previous to the use of these instruments the trolley wire was pulled until the men considered it tight, the wire being pulled to the same degree of tightness in winter as in summer, hence wire installed during cold weather was very slack in summer.



Cutting with the oxyacetylene torch produces savings in track maintenance

Preventing Flashovers
Is an Important Part of
Commutator Maintenance*



This plunger presses against the shaft while the commutator spider is held stationary
This plate is bolted to the commutator spider
Plate

Pulling the commutator spider to repair the front mica of ring of the Westinghouse 557-R1 armature

Shellacking Mica V-Rings at Frequent Intervals Produces a Hard, Glossy Coating to Which Dirt and Carbon Dust Will Not Adhere Readily—Creepage Currents Are Decreased with Reduction in Flashovers

By Jesse M. Zimmerman
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company,
East Pittsburgh, Pa.

FLASHING over of the current from the commutator bars of railway motor armatures to the front metal V-ring is due largely to the presence of oil and moisture on the insulation. This tends to collect dirt and carbon dust, which mixture acts as a good conductor for creepage currents. Each flashover consumes part of the bond in the insulation as well as carbonizing the oil which may exist in or on the mica V-ring. This will permit an increase in flow of creepage current between the bars which eventually will become a small arc. When this occurs it soon will decrease the dielectric strength of the ring and at some future time ground the commutator.

As "an ounce of prevention is worth a pound of cure," the prevention of grounded commutators and the flow of creepage current on the front mica V-ring is quite as important as methods of repairing grounds. It is good practice to make the surface of the mica V-ring as smooth as possible, so that the dirt and carbon dust will not adhere readily to it.

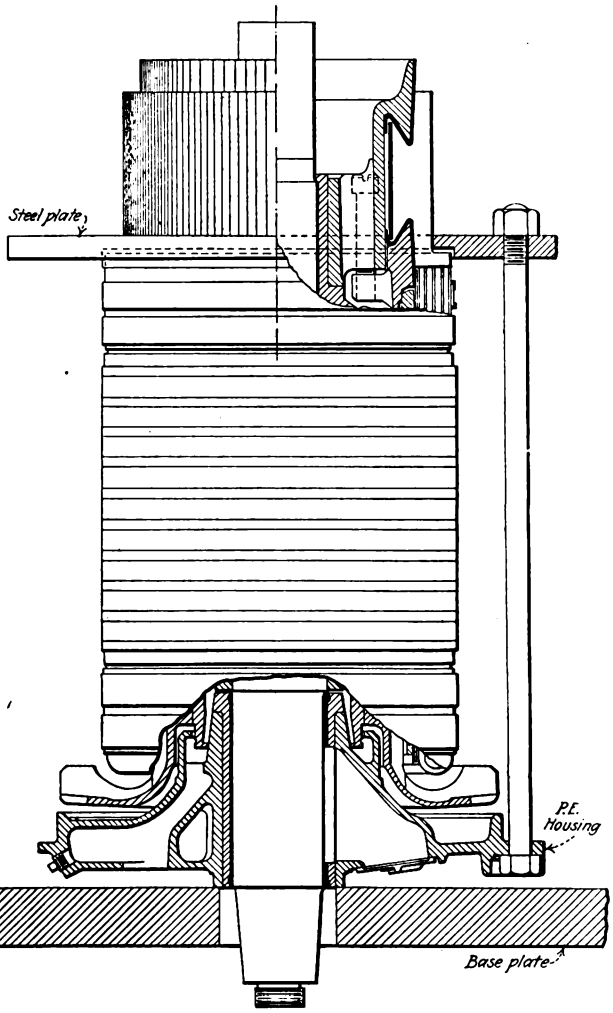
REPAIRING PITTED BARS

If the front ends of the copper bars are badly pitted they should be machined so that the mica is flush with the copper. It will do no harm to take 1/16 in. from the bars. The front edge of the commutator face should not come to a sharp corner, but should be rounded off so that it will have a radius of at least 3/16 in. to 1/4 in. A sharp corner increases the number of flashovers because the electrical potential tends to build up on sharp edges. When an unbalanced voltage condition occurs in the operation of the motor a flashover from the sharp edge of the commutator face to some metal part of the motor will result. This flashover always leaves a pitted place on this part of the commutator.

---

*This is the seventh of a series of articles on commutators for railway motors. The others were: Choosing Materials for Railway Motor Commutators, published Aug. 21, 1926; Important Considerations in Replacing Commutator Bars, published Oct. 23, 1926; Accurate Machining of the V's of Assembled Commutators Is Essential, published Nov. 20, 1926; Mica V-Rings and Bushings Have Important Functions in Commutators, published Dec. 18, 1926; Methods and Equipment for Efficient Assembling of Commutators, published Jan. 15, 1927, and Soldering of Railway Motor Commutators, published Feb. 19, 1927.

The mica V-ring should be cleaned carefully with sandpaper, making sure that no dirt remains on the mica in the corner next to the commutator bars. Dirt should also be removed from the groove between the front end of the mica V-ring and the metal V-ring.



Fixture for holding bars in position when removing the commutator spider. This is for use with armatures similar to Westinghouse 557-R1 and 587-D5

The front mica V-ring should be brushed, also, with a coat of heavy pure orange shellac and a smooth layer of soft four-ply twine wound on closely, pulling the ends through with a loop to fasten. It is best to place the mica V-ring protection on the commutator before the armature has been dipped and is ready to be placed in the baking oven. This will permit the protection to be baked at the same time. The essential feature is that the V-ring protection be thoroughly hardened before the armature is placed in operation.

This twine should be covered with three coats of shellac, ironing each coat in thoroughly with a hot iron. The first coat should be very thin so that it will penetrate the twine thoroughly. After the shellac has become hard it should be covered with a coat of black glossy baking varnish and baked thoroughly. This will leave a hard, glossy surface which can easily be kept free from dirt, moisture, oil and carbon dust. After hardening of the third coat of shellac some operators use one or more coats of commutator compound. This should cover the front ends of the bars, making a fillet of large radius between them and the mica V-ring and filling the groove between the front end of the mica V-ring and the metal V-ring. A commutator compound should resist oil and moisture as well as withstand flashovers. Some operators have found a satisfactory composition to be plaster of paris, dextrine and shellac, applied directly on the mica V-ring. However, a compound made of an iron oxide preparation gives better results.

In some shops it may not be convenient to bake the armature when applying mica V-ring protection. A good grade of air drying varnish should then be used instead of a baking varnish. The average commutator compound on the market will harden in four or five hours without being baked.

At every regular motor inspection period the mica V-ring protection should be cleaned. This can be done by wiping with a cloth dampened with gasoline. If this is carried out grounded commutators will be decreased.

METHODS OF REMOVING GROUNDS

Commutator grounds are more frequent in the front V than in the rear V. Sometimes it may be necessary only to remove the front mica V-ring, while at other times the commutator may be burned so badly that one or more bars will have to be replaced and the front metal V-ring repaired. Any holes burned in the metal V-ring should be built up by welding and finishing so that the mica ring will have a uniform seat.

Where the front metal is detachable the work of repairing the ground without disturbing the armature winding is very simple. Repair of commutators having the detachable metal V-ring in the rear is slightly more complicated. To replace the front mica V-ring in this type of commutator the commutator spider must be removed. At a glance one would think it necessary to remove the armature leads from the commutator to remove the complete commutator. With an inexpensive fixture this can be done without disturbing the commutator bars or the armature winding, as shown in an accompanying illustration.

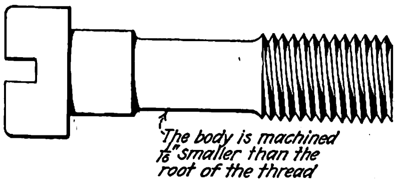
A steel plate is made which fits against the front end of the assembled segments. It should have an offset so that the brush face of the commutator segments will hold it in a central position. The plate should have holes the same in number and size and on the same bolt circle as the pinion end housing.

To hold the commutator bars several turns of steel banding wire should be wrapped on a paper in the groove in front of the neck and be soldered in one spot. The pinion end housing can then be assembled on the armature shaft and the armature placed in an upright position. With the steel plate on the front end of the assembled segments bolted to the pinion end housings by means of long bolts, the commutator bolts can be removed and the commutator spider pressed out in a suitable press.

With this fixture it is possible to hold the commutator bars against the rear V-ring, thereby keeping them in position, while taking out the commutator spider. If several commutator bars are to be renewed the armature should be placed in an upright position after the commutator spider has been pulled before the banding wire is cut and the fixture removed. Should it be necessary only to replace the mica V-ring the fixture and banding wire should not be removed.

When several of the bars are burned badly they should be replaced. A simple method of preparing new bars is to remove the damaged bars, together with an undamaged adjacent bar for a pattern. By clamping the unfinished bar in a vise with the pattern bar it can be trimmed to approximately the outline of the pattern. If the V's have been rough sawed or punched, the amount of filing may be reduced by taking an extra cut with a hacksaw. A new mica strip should be cut to the same size as the unfinished bar and fastened to the copper with a thin coat of heavy pure orange shellac. By clamping the unfinished bar and the pattern in a vise with a mica strip between them, the V's of the new bar can be filed to the same size as the pattern bar. The radius in the V's can be finished with a small rat-tail file and the bars are ready.

After assembling the new bars in the commutator the fixture should be put back on so as to hold the bars in position while the spider is being replaced. The armature leads should not be put in the slots of the new bars until the commutator has been tightened. Long headless stud bolts with a finished body should be screwed into the rear detachable V-ring before pressing the commutator spider onto the armature spider. These studs will serve as guides, accurately locating the bolt holes. After the commutator spider has been pressed on the armature shaft the studs should be replaced by the regular commutator bolts. Next the alignment of the bars should be checked in order to insure good commutation. It is also essential that the commutator be heated to at least 100 deg. C. before the bolts are drawn tight. This will soften the bond in the mica, permitting it to adjust itself to the irregularities of the metal parts and making it possible to obtain a tight commutator. A higher temperature should not be permitted as the armature coil insulation will deteriorate.



The body is machined 1/16" smaller than the root of the thread

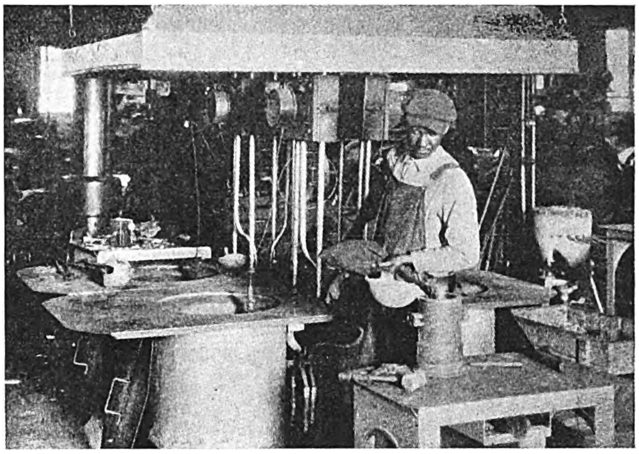
Commutator bolt designed to eliminate breakage

Bolt failures often are due to excessive length. The bolt strikes the bottom of the hole before the commutator is tight. The man tightening the commutator, not knowing of this, subjects the bolt to an excessive strain. To make sure that this does not happen, it is advisable to place the detachable steel V-ring in its final position and draw the commutator bolts tight before the commutator is assembled. This will show whether they are too long.

Breakage of commutator bolts can be decreased by machining the body approximately $\frac{1}{64}$ in. smaller than the root diameter of the threads. If the body of the bolt is larger than the thread root any twisting effect or expansion will occur at the end of the thread, causing a break at this point. If the body of the bolt is smaller the expansion and twisting effect will be distributed over the entire length of the bolt. The seat of the bolt near the head should be sufficiently large to insure a good contact in the detachable steel V-ring.

Electrically Heated Pots in Babbitt Department

SOME months ago the Pittsburgh Railways reorganized its Homewood shop and concentrated all of the maintenance work there, including all the rebabbitting of bearings. After some study it was decided to install four Westinghouse automatic electrically heated babbitt melting pots of 750 lb. capacity each. These pots were grouped as shown in the accompanying illustration. The two in the foreground contain armature bearing metal, the two in the rear metal for the journal babbitt. These pots have sufficient capacity to take care of all the bearings needed daily for the Pittsburgh Railways system, which operates approximately 1,250 passenger cars in addition to its miscellaneous equipment.



Relining an armature bearing in the new babbitting department of the Pittsburgh Railways

The automatic feature is convenient, as the danger of under or over heating metal is eliminated. At 6 o'clock in the morning the shop watchman turns on the current and by the time the men arrive for work at 7:30 the babbitt is at correct temperature for use. The automatic feature keeps it at this temperature until quitting time at night.

Under the system previously used two babbitt rooms were maintained. Gas heating was used and six men were employed solely on bearing work. At present two men take care of this department and have made it what the gentleman in the illustration calls "the show place of the shop," as well as a very efficient section.

Route Numbers for Public Service Cars

ALL cars operating in the Essex Division of Public Service Railway, Newark, N. J., henceforth will carry route numbers in addition to other signs indicating destinations. Cars of the Central line are already equipped and those of other lines will follow.

A sign with numbers in white on a blue background will be placed on the right-hand front corner of the roof of each car, one number facing the front and another the side.

Public Service bus lines have carried route numbers for some time, routes being designated by even numbers. Street car lines will be designated by odd numbers and bus lines and car lines operating in the same territory will as far as possible carry contiguous numbers.

Inspection Methods that Made Possible

100 Per Cent Operation

On Dec. 20, Last Year, the Chicago Surface Lines Operated All of Its Passenger Cars and for Three Days Following This 99.97 Per Cent Were Operated

By T. H. Shaughnessy

Assistant Superintendent of Shops and Equipment Chicago Surface Lines, Chicago, Ill.

OPERATION of 100 per cent of all passenger cars owned by an electric street railway company is considered remarkable, but when this record is established by one of the largest street railway systems it is an achievement—something that did not "just happen," but the result of plans carefully worked out and details followed to the end. Therefore, the task imposed upon the shops and equipment department of the Chicago Surface Lines was by no means a light one. This was referred to briefly in an article in ELECTRIC RAILWAY JOURNAL for Jan. 1, 1927, page 10.

During the late summer and fall months special inspection and attention were given to all parts of the electrical equipment. All main fuse boxes were overhauled and inspected carefully. The terminals were tightened and renewed where necessary, insulating partitions and barriers were cleaned and boxes were given a coat of good insulating paint, inside and out.

Motor junction boxes and terminal boards were cleaned out thoroughly. All terminals, terminal screws and sleeves on the end of motor leads were checked and put in first-class condition. Also the motor leads themselves were thoroughly inspected, broken insulation was repaired and leads were renewed where necessary and repainted.

The rheostats were tested for weak insulation and cleaned. The rods tightened, all leads were examined closely and the terminals were tightened. The wooden supporting sticks were cleaned thoroughly and then repainted. Any that were found charred near the bolts, due to current leakage from defective rheostats, were renewed.

Electric heaters were blown out with air, the supports were tightened, the heater coils checked, terminals tightened and coils or heaters renewed where necessary. Thermostats and thermostat switches were inspected, contacts renewed where necessary and all parts tightened. Heater fuse boxes received a special inspection and all weak or burned fuse clips were renewed.

All air tanks were given a hydrostatic pressure test equal to 1½ times the working pressure. Then they were thoroughly painted and a new strip of canvas, soaked in paint previously, was installed between the tanks and their supporting bands and hangers. The safety valves were tested and governor settings were checked. At the same time all air gages were checked by the method of installing a master air gage in the air line.

All car wiring and motors were tested carefully with instruments. This is the regular practice in our shops at general inspection periods.

Truck and car body inspection and repairs were also given closer attention than usual. Material and supplies were prepared in sufficient quantities to meet all requirements. Corner posts, vestibule posts and other parts were painted and kept in stock, ready for installation when required.

Terminals as well as fuses were given careful attention

At the carhouse foremen's semi-monthly conferences the importance of putting all cars and equipment in the best possible condition was stressed and time and again it was pointed out that it was the duty of every one concerned to believe in himself and in the value and necessity of his work.

With the work in the shops reduced as cars were not taken in for general overhauling, workmen were transferred to the carhouses, to assist in making repairs to cars having damage done to the body, vestibule, etc., with the result that a total of 182 cars were repaired and placed in rush-hour service during the four days preceding Christmas Eve, as shown in the accompanying table.

When it is considered that more than 20 per cent of the cars in use have two-motor equipments and a failure of any kind would put a car out of service the standard of maintenance is self-evident.

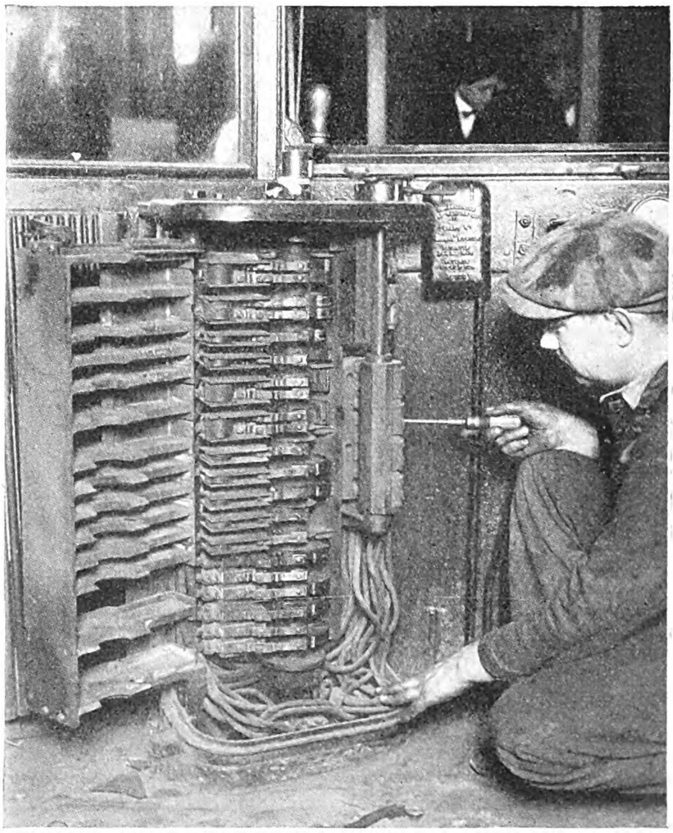
With the 100 new cars delivered during the year and available, the work in connection with overhauling cars was kept up until Dec. 7. No cars were taken into the shops for overhauling after that date. There were in the two shops on Dec. 1 67 cars for overhauling and 54 cars for damages and other repairs, or a total of 121.

On Dec. 7, the last day that cars were taken in for overhauling, there were 55 cars undergoing overhauling and 35 in for damage repairs, a total of 90 cars in

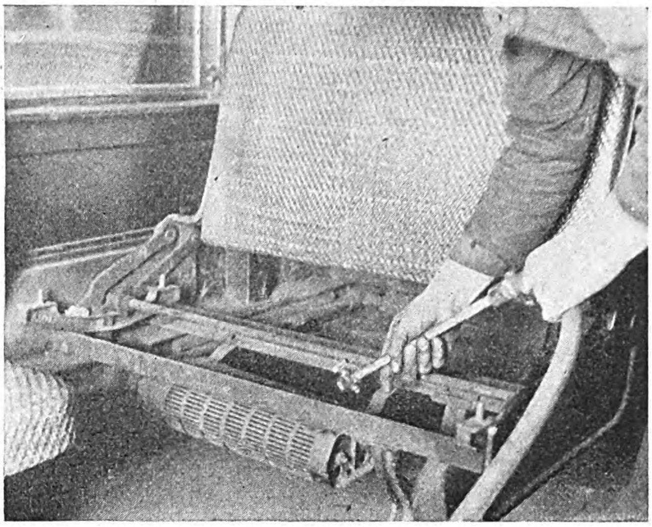
CARS REPAIRED AT CAR STATIONS AND SHOPS AND PLACED IN RUSH-HOUR SERVICE, DEC. 20 TO 23, INCLUSIVE

12-20	12-21	12-22	12-23	Total
47	39	46	50	182

Motor lead junction boxes were inspected carefully and all connectors tightened



All parts of controllers received special attention on inspection



Heaters were blown out with compressed air and all supports, terminals and coils were tightened

the two shops. This total was reduced to zero on Dec. 20 and increased again to one car on Dec. 21, 22 and 23, due to one car being sent in each day with heavy damages, which could not be completed before the rush-hour period.

During the month of November at the sixteen carhouses approximately 25 cars per day were held in for repairs during the rush-hour period, or about 1.5 cars per carhouse. This number was reduced, so that from Dec. 1 to 19 the number of cars held in daily for repairs at carhouses during the rush hour was approximately eleven, or practically 0.7 car per carhouse per day. An accompanying table shows the number of cars available, number of cars operated and number of cars in carhouses and shops from Dec. 1 to 23 inclusive.

CARS AVAILABLE AND OPERATED BY CHICAGO SURFACE LINES DEC. 1 TO DEC. 23, 1926, INCLUSIVE

Date	No. Cars Available	Per Cent	No. Cars Operated	Per Cent	No. of Cars in Carhouses	Per Cent	No. of Cars in Shops	Per Cent
12- 1	3,490	95.9	3,384	93.0	28	0.8	121	3.3
12- 8	3,557	97.7	3.497	96.1	6	0.2	76	2.1
12-15	3,621	99.5	3,589	98.6	2	0.06	16	0.44
12-16	3,619	99.45	3,597	98.8	5	0.14	15	0.41
12-17	3,625	99.61	3,597	98.8	5	0.14	9	0.25
12-20	3,639	100.0	3,639	100.0	0	0	0	0.00
12-21	3,638	99.97	3,638	99.97	0	0	1	0.03
12-22	3,638	99.97	3,638	99.97	0	0	1	0.03
12-23	3,638	99.97	3,638	99.97	0	0	1	0.03

It will be noted from the table that on the four days immediately preceding Christmas Eve there were no cars held in for repairs at any of the carhouses during the rush-hour period. This means that 100 per cent of the cars at the sixteen operating carhouses were available and operated during the rush-hour period on four consecutive days. As far as is known by the writer, this record has never been equaled.

The co-operation of the transportation department with the shops and equipment department in the careful handling and operation of the equipment was of course essential, and it was through a complete understanding and co-ordinating of interests that the exceptional results were accomplished. All operators entered into the work with enthusiasm and by careful handling of mechanical and electrical apparatus failures due to service abuses were reduced materially. The primary objective of the entire organization was to keep cars in service and to avoid delays that would inconvenience passengers.

The high class of maintenance work that formed an essential part of the continuous program for putting car equipment in first class condition through regular overhauling and careful attention to maintenance details provided a substantial foundation for such an undertaking. Many defects were discovered before they actually produced trouble and so the real work of repairs was reduced. Also by providing a supply of spare parts and equipment ahead of time, defective parts could be replaced quickly and the actual work of repairs made during periods when more attention could be given to the work. By providing a maintenance program so as to make all cars available for service during the periods of maximum load an investment in extra equipment to take care of proper service was avoided.

Pittsburgh's Track Repair Organization Permits No Delay to Service

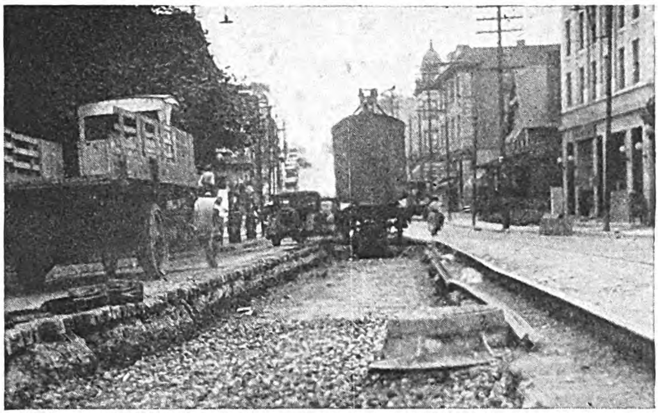
The Construction and Maintenance Sections of the Way and Structures Division Work with the Municipalities Through Which the Company Operates and Meet the Various Schedules of Improvements that Are Undertaken

By O. Williams

Superintendent of Way and Structures Pittsburgh Railways, Pittsburgh, Pa.

UNDER the new organization of the Pittsburgh Railways all maintenance and construction of track is handled by the maintenance of way and structures division of the operating department. This department is headed by a superintendent reporting directly to the general manager. In order to meet the heavy demands for new track and also to keep the present tracks in good, safe operating condition the work is divided between the maintenance and construction sections, each of which is headed by a superintendent reporting to the department head. The maintenance section deals chiefly with the repairs of track and paving and the installation of small jobs of special work needed for renewals. The construction section does the larger renewal and construction jobs, as this department is especially equipped for the purpose with modern labor-saving devices. The personnel of the construction section is made up of a superintendent, three general foremen and ten construction foremen. The number of men employed throughout the season will vary between 150 and 250, depending upon the quantity of work on hand.

The equipment of this department consists of four Thew shovels mounted on standard car wheels, three one-bag concrete mixers, two large 10-in. x 10-in. air compressors, three 6-ton steam rollers, two complete thermit welding outfits, six steel Differential dump cars and many smaller tools, such as pneumatic concrete breakers and tampers. All of this equipment except the steam rollers is operated with direct current taken from the trolley wire. In moving the shovels and concrete mixers from place to place the motive power is supplied by one of the dump cars. The air compressors and welding outfits are mounted on single-truck motor cars and so can move readily from place to place under their own power. The steam rollers are transported on flat cars, generally pulled by a dump car. Supplementing all this equipment is a Universal crane



Preparing new track foundations in West Liberty near Pioneer Street

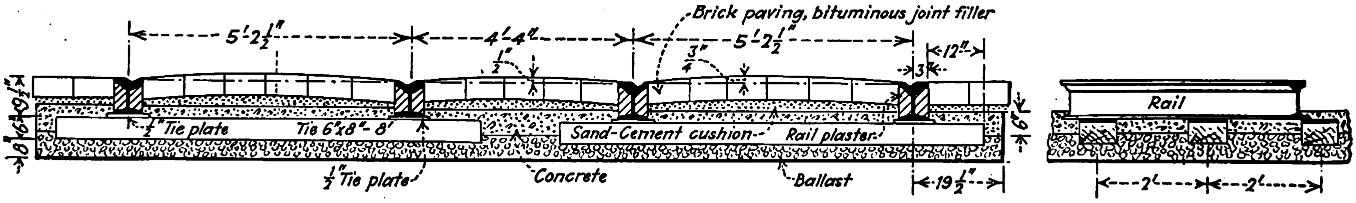
mounted on a 5-ton Mack motor truck and also an electrically operated crane mounted on a double-truck car body. These two cranes are also used whenever needed by the maintenance department in the installation of special work jobs.

In 1924, when the Pittsburgh Railways was removed from the receivership, the agreement entered into with the city of Pittsburgh provided a blanket annual payment of $300,000 in lieu of paving charges, taxes, etc. It states that the work of repaving brought about by track removal or replacement, maintenance of track or car operation shall be done by the railway under the plans and specifications submitted to and approved by the director of public works. In case the mileage of track operated in the city is increased or decreased, either by annexation of contiguous territory or by construction or removal of tracks by the company, then the yearly payments as provided shall be increased or decreased proportionately.

After the signing of this agreement by the city of Pittsburgh the railway immediately presented the same proposition to the various boroughs and townships in which it had tracks upon paved streets. As a result there are now, including the city of Pittsburgh and Allegheny County, 38 municipalities operating under this agreement. Also several agreements are in effect in which the railway company has agreed to install the concrete base and the municipalities to furnish the surface paving. Under the agreements the new track constructed by the railways is determined almost entirely by these municipalities in preparing their repaving schedule.

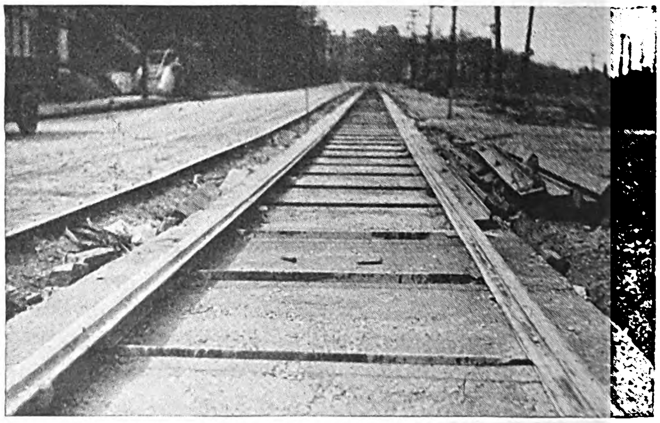
The main problem confronting the construction section was how best to meet these various schedules and improvements of the municipalities, working with them and their contractors in making these changes, and still work efficiently. Due to the wide range of territory served by the Pittsburgh Railways it was determined that the track to be built in the farthest outlying districts would be done by contractors, while the company's forces would operate within the city, or at least within a reasonable radius, in order to facilitate the transporting of equipment from one job to another. The railway next proceeded to prepare a schedule of the starting and finishing dates for certain sections of track on each job, arranged so as to conform with the starting dates used by the municipalities for the paving of the flank. In this way the railway was generally able to build one track and move to the next location while the municipalities' contractor finished the street flank on the first job, after which the railway would return and build the other track, which in turn would be followed by the street flank.

Since the various municipalities had several jobs scheduled to start at approximately the same date, the construction gang was divided into six units of approximately 25 men each. Thus all jobs could be under construction at the same time. In this case two jobs were handled by one general construction foreman, who moved his equipment from one job to another in the order in which they were needed. After certain experiments and slight rearranging of the schedule it was possible to place a shovel on a job, finish a stretch of grading, move to the next job and start grading again with but little lost time. The same procedure was used with the tamping and roller outfits, so that in all there was an almost continuous rotation of equipment. The welding gang necessarily followed closely with the final



Typical cross-section of track construction used by Pittsburgh Railways

Concrete used in track construction on East Street



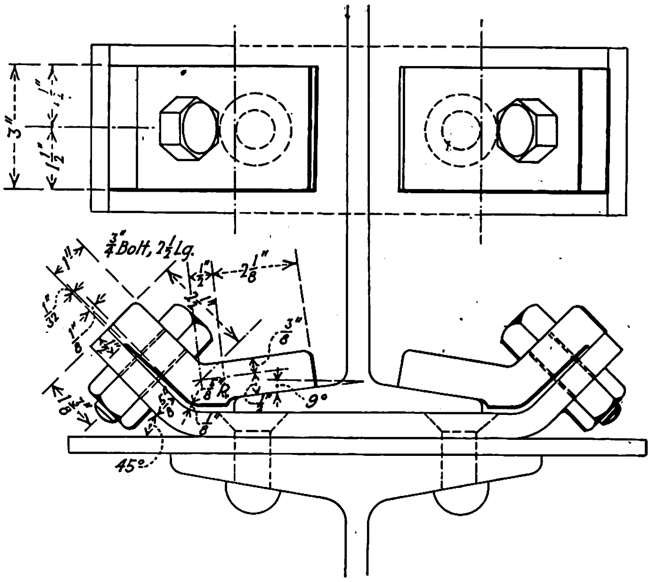
Ballast in place on section of track on McClure Avenue tamping operation on each job, pouring and grinding the necessary thermit welds.

This method created a tendency to improve the efficiency of each of these units by putting them on a competitive basis, as each had to keep up in order to permit moving upon scheduled time to the next job. Doing the work in this manner resulted in an almost uniform speed of about 650 ft. of finished track per week by each gang throughout the construction season. In attaining these results the assistance and co-operation given by the municipalities and contractors was of the greatest importance. Also contributing to the success was the excellent condition of the construction equipment, which had been overhauled thoroughly by the individual operators in the railway shops during the previous winter shutdown.

As is usual with all schedules, many things arose which had not been anticipated. There developed, as the season progressed, certain improvements which were deemed necessary and which necessitated the construction or rebuilding of some track. These were fitted into the schedule as well as possible, and whenever the construction gangs were too busily engaged to take care of the work it was allotted to the maintenance section and carried through in that way.

There were also quite a few jobs which required a little extra attention and in which more than ordinary conditions covering track reconstruction had to be met. A few examples of this will give some idea of this:

In placing the rail across the Ninth Street bridge it was determined to use thermit-welded joints. As this bridge has a steel deck upon which had been fastened clips to receive the rail it was necessary that the rail first be laid on ties, the entire length welded, then dropped into place on the clips and bolted into position. The design of these clips is shown in an accompanying sketch.

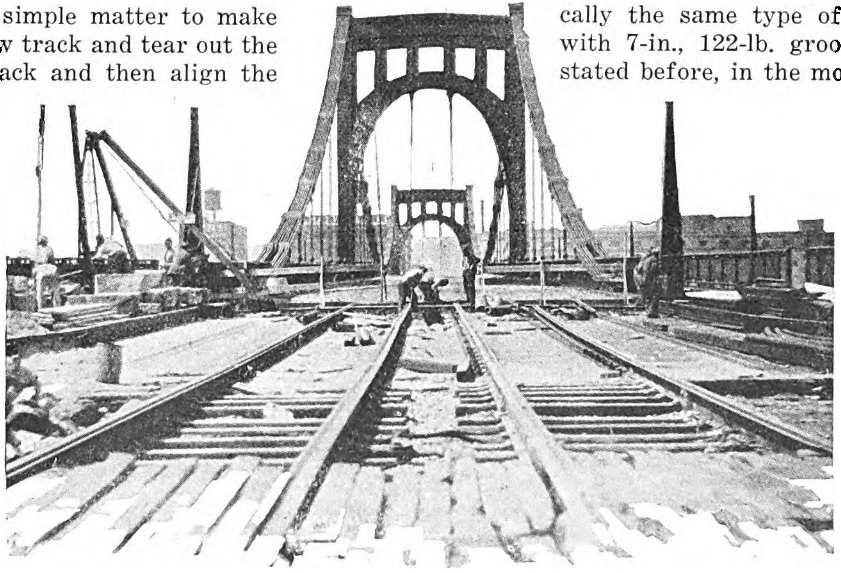


Type of clip used to hold rails on Ninth Street bridge

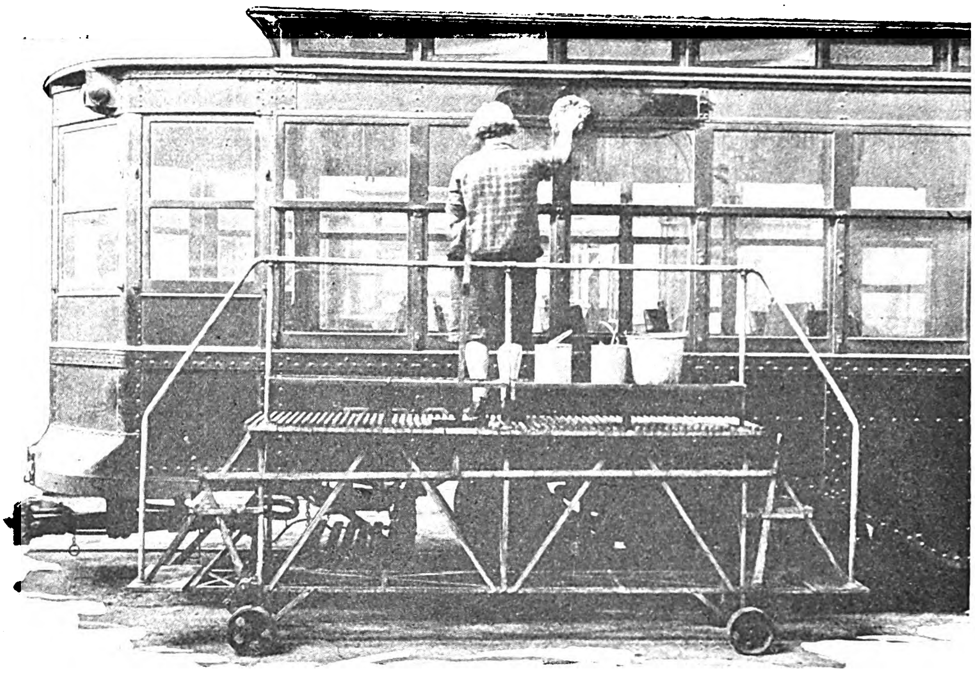
In another instance it was decided to reconstruct only one track in the center of a street where previously there had been two, and also that this should be done without any interference to traffic. This was accomplished by placing temporary crossovers, removing one track, taking out as much of the sub-grade for the new track as possible with a shovel and completing the grade by hand. This, of course, extended somewhat into the second track. The ties were then placed between the ties of the old track and the new rails laid. After this it was a simple matter to make connections to the new track and tear out the section of the old track and then align the new track in its proper location.

In another instance it was necessary, due to county road improvement and the necessary installation of a large special work job at an important intersection, to unite both the maintenance and construction sections. These worked day and night to speed up the installation. With the closing of the Sixth Street bridge it was decided to install an additional loop to assist in rerouting the cars formerly crossing the bridge. Here again the construction section found it necessary to build a track in a heavily congested district on a street where there already was one track which could not be disturbed until the new one and its connections had been completed. This situation was met by first constructing as much of the new track as possible and then during a night in which the cars were rerouted making the necessary connection at each end. At this time also the maintenance section was called in to assist, as extreme speed was necessary.

In summing up the results accomplished by this department it was found that in 1926 approximately 16 miles of single track was built in the city limits of Pittsburgh. The straight track in this total was built of 9-in., 134-lb. grooved girder rail laid on 8 in. of gravel ballast and 6-in. x 8-in. x 8-ft. oak ties. The joints were all made by the thermit-welding process. The special work in most cases consisted of 9-in., 152-lb. grooved rail placed on the same type of construction. Outside of the city of Pittsburgh some 14 miles of single track was built, most of it using practically the same type of construction except with 7-in., 122-lb. grooved girder rail. As stated before, in the more outlying localities the track was built under contract. Of this there was a total of approximately 6½ miles, about 3½ miles of which was built in Glassport Borough, some 2 miles in the city of Washington, Pa., and 1 mile in the city of McKeesport. Thus a total of approximately 30 miles of single track was reconstructed last year on the system.



Reconstructing tracks on the Seventh Street bridge, Pittsburgh



After removal of grease and dirt with pumice stone, the surface is rinsed with warm water applied with a sponge

Frequent Painting Required

for Modern Rolling Stock

Improved Methods Will Reduce Painting Costs so that Railways Can Afford to Paint Oftener—Cars Should Be Painted Once a Year

By A. T. Clark
Superintendent of Rolling Stock and Shops
United Railways & Electric Company, Baltimore, Md.

KEEPING cars attractive requires a carefully worked out system for cleaning and frequent painting. Old-time methods produce a beautiful finish and long life for the paint, but with the present congested city traffic, which soon scratches and mars the surface, frequent painting is most essential. The older systems of painting were expensive and the piano finish which was secured is not needed for a street car. The most essential feature is an attractive appearance of the car as it is viewed from the sidewalk. By adapting methods that will reduce cost and keep the time of painting at a minimum, more frequent painting can be done economically.

Old-time car painting methods followed closely the practices used in fine carriage and coach building and the workmen were, for the most part, recruited from shops that built vehicles of that type. Such a workman had served for many years under an arduous apprenticeship, and only when able to take a carriage or coach and paint, varnish and stripe it completely, doing all the work alone and unaided, was he considered a "coach" painter.

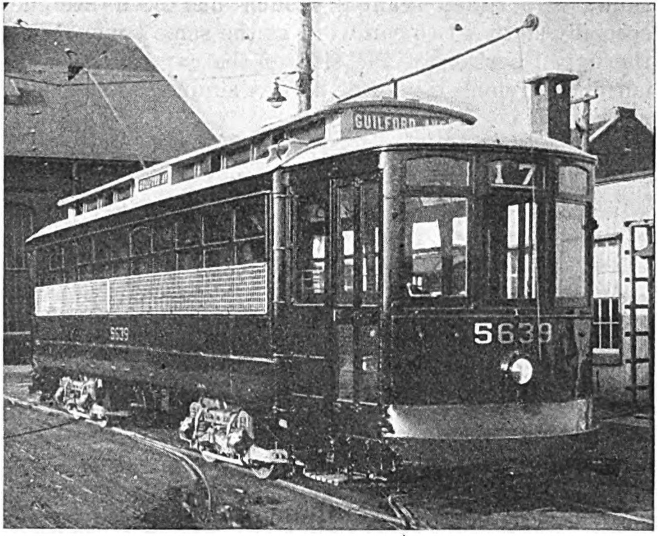
On the United Railways & Electric Company of Baltimore some years ago such a method was standard, and cars as turned out were indeed attractive. An accompanying illustration shows a car painted in that manner. The lower panel was in cream with an orange-yellow broad and fine stripe. The upper panel was painted in dark Tuscan red with an aluminum broad and fine stripe. The broad aluminum stripe was edged in black. The belt rail, corner posts and intermediate posts were in cream color and the letterboard in Tuscan red. The doors and sash were all natural cherry, filled and varnished. The numbering and necessary lettering were aluminum stripe with black edging.

Higher wages increased the cost, and combined with the great length of time the vehicle was in the shop, it was felt necessary to study some means to reduce time and cost. The older method required after the priming coat, which was usually a lead and oil mixture, with the oil percentage large, three or four coats of "rough stuff" or surfacers. Each required about 24 hours for drying. After the last of these coats had stood for 24 hours, a carefully trained painter with a rubbing block and water brought the car surface to a high degree of smoothness. Great skill was required to prevent rubbing more at some points than others, which would produce low places that would show up when the final varnish coats were applied. After this one or two coats of body color were put on, and then the successive coats of varnish, which were also rubbed down, until the final coat, usually of finishing varnish, was applied. The numbers, lettering and decorations were put on after the first coat of rubbing varnish.

Considerable study and experiment showed that a great reduction could be made in the cost of painting cars by substituting the glazing coat of oil and white lead, made of such consistency that it would dry hard and sand smoothly. It was also found that enamel could be substituted for flat color and varnish coats. Exterior surfaces in natural woods, varnished only, while very attractive when new were difficult to keep that way and as a rule soon perished. Today almost universally such surfaces are painted, then varnished, as is the rest of the exterior of the car. Lettering and striping have been eliminated generally, and such as remain are applied in the decalcomania form. As might be expected, with the former high cost of painting, together with a painting period of approximately fourteen days, it was not possible to pass many cars per year through the paint shop. Hence the periods for successive shopping for paint were two to three years. As an average this was too long for best results, and instead of cars being improved in condition, every so often the undercoats were so defective as to require burning off. This added still more cost and time to the car painting. As a result of experience with the practices that we are now pursuing, it has been found that it is quite possible, at a fairly small cost per car, to send the cars to the paint shop every twelve months. Such fairly frequent attention keeps the exterior painted surfaces in an excellent state of preservation.

Of course, there occurs today, as a result of the congestion of vehicles in the crowded streets of our large cities, an unusual amount of damage to exteriors of cars, so that, no matter what care or cost has entered into the preparation of a painting job, the vehicle is liable to damage that will decidedly mar its appearance. It is evident that the least expensive method of painting, giving good appearance, is preferable to a more expensive method giving results of the old-time carriage work.

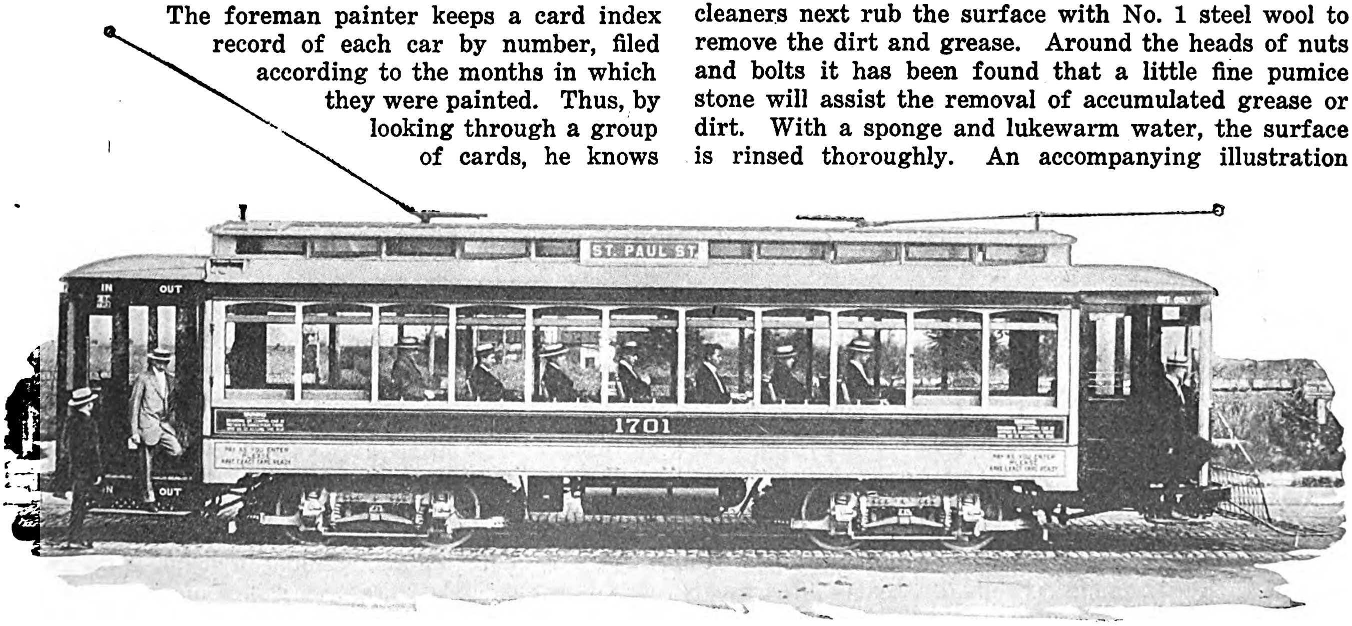
The following methods are now pursued in the painting of cars of the United Railways & Electric Company: The foreman painter keeps a card index record of each car by number, filed according to the months in which they were painted. Thus, by looking through a group of cards, he knows almost instantly those cars which should be sent to the shop for painting. He prepares a list which is turned over to the foreman of the motor and truck shop, who has charge of the transferring crews, and is thus provided with cars to work upon.



Simplified color schemes are the standard practice in Baltimore

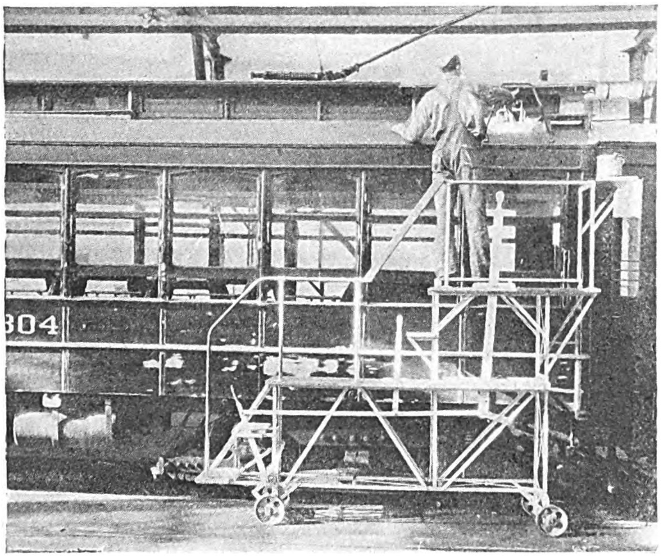
METHOD USED FOR PAINTING A NEW CAR

As the cars are brought to the paint shop they are examined by the carpenter shop representative, who fixes any loose or damaged panels or moldings, and does any other work of this nature required prior to painting. While this is going on the car trimmers remove seats, side-window screens and Hunter signs. In the meantime the roof painters have given the roof a coat of paint. A special type of portable scaffold has been found efficient for the painting of monitor sashes and side roofs. The car is cleaned on the outside, from top to bottom. In order that the car will clean more rapidly a coat of weak acid is placed on as much of the surface as is possible at one time with a 4 or 5-in. wall brush. Then follows a washing with liquid soap made of linseed oil and potash, put on with a brush. The cleaners next rub the surface with No. 1 steel wool to remove the dirt and grease. Around the heads of nuts and bolts it has been found that a little fine pumice stone will assist the removal of accumulated grease or dirt. With a sponge and lukewarm water, the surface is rinsed thoroughly. An accompanying illustration



Old-time painting methods gave much attention to striping and lettering shows a portable scaffold, which has been designed specially so that two can work at the same time. When the upper portion of the side of the car has been finished, the remaining lower half is similarly finished by working from the floor.

As soon as the car has dried thoroughly, all the surfaces which exhibit cracks, nail holes, scars or other imperfections are coated with a lead and oil primer. This is also done on the first day. Any new moldings or panels inserted have been previously painted, so that only in rare instances is new wood encountered. Under a separate heading will be found a description of the painting from the raw wood up. On the second day, the car is given a coat of red enamel, cutting around numbering, lettering, and other decorations. Following the coat of enamel the car is given one coat of finishing varnish on the third day. In some instances, where cars are in good condition, with the surfaces not scratched or marred, it is possible to varnish the car without a coat of red enamel, and this saves one day. After standing for 24 hours the car is ready to receive seats, window screens, Hunter sign curtains, and other trimmings. On the fifth day the car is ready to be returned to service.



A portable scaffold has been found particularly efficient when painting monitor sashes and side roofs

As soon as the exterior has been cleaned (usually the second day) the cleaners begin work on the interior of the car. Here great care is required. The use of acid is eliminated entirely and only upon exceptionally dirty spots is soap used. The work is begun on the ceiling, working down the sides of the car to the floor. The interior cleaning includes underside of hoods and vestibule ends. Accumulations of dirt, paper, etc., under longitudinal seats and such places are removed. After the interior cleaning has been finished, the paint shop foreman or his assistant examines the car and decides whether the interior condition warrants renovation or revarnishing. Should the varnished surfaces appear in good condition a special renovating oil is employed. If, on the other hand, the surfaces appear dull and unattractive, the car is varnished. The interior of the vestibule ends, however, usually receives such hard service that it is found desirable in nearly all cases to repaint the woodwork, using a solid color, imitation mahogany or natural cherry finish. Seat pedestals are bronzed; stanchions, hand brake supports, etc., are then painted or enameled, and finally, on the same day that the car is given a coat of clear varnish, the floors are painted, so that both are drying simultaneously. Before the car is put back into service, all the windows are cleaned carefully and the excess paint is removed with the use of an old razor blade.

PAINTING FROM THE RAW WOOD UP REQUIRES SPECIAL TREATMENT

The practices followed on a car from the raw wood up differ from those already described. To the raw wood is first applied a primer made of two-thirds raw linseed oil and one-third pure whitelead. This is colored pink by the addition of a small amount of Tuscan red. After this has been allowed to stand 48 hours it is sanded with No. 1 sandpaper. Then the second coat of primer made of half linseed oil and half whitelead, which has also been colored, is put on. This second coat is allowed to stand 24 hours and is then sanded with No. 1 sandpaper. The third coat of surfacer consists of one-third linseed oil and two-thirds whitelead, colored as previously described. This third coat, after being allowed to stand, is likewise sanded.

Generally speaking, there has now been provided a good, smooth surface. If, however, a still better surface is desired, a knifing coat of lead with a small amount of oil and turpentine is then used, which, after standing 24 hours, is smoothed down very carefully with No. ½ sandpaper. There is then applied a red undercoating, which is a quick drying, non-sanding surfacer. The next coat is the red body enamel. This is allowed to stand 24 hours and then the numbers, lettering, and other decorations are applied. Following this, the car is given two coats of finishing varnish with 24 hours between for drying.

The result of sending cars to the paint shop every twelve months is that very few cars require such treatment. The burning off of old paint under these conditions is also very rare.

The present paint-shop force includes one foreman, one assistant foreman, one inspector, twenty-two first-class painters, sixteen second-class painters, six third-class painters, three fourth-class painters, one first-class helper, five second-class helpers and twenty women.

ONE HUNDRED CARS A MONTH PAINTED IN BALTIMORE

The total number of passenger cars on the system is approximately 1,200 and with an average output of 100 cars per month it is possible to send every car through the paint shop each twelve months. The paint-shop force also does a great amount of work in painting automobiles, trucks and bus bodies. During 1926 a total of 49 were painted in addition to the cars. Considerable painting is also done by this force of all kinds of signs, also waiting stations and office sections of buildings. A quite extensive rerouting of cars resulted in making changes of more than 1,000 Hunter sign curtains.

Painting records show that the following are fair estimates of cost: To paint the exterior and varnish the interior according to the old methods, including numbering, lettering and striping in vogue at that time, would cost on today's rate of wages and price of materials between $250 and $275 per car. To bring up a car from the raw wood following present-day practice

considerable investigation of this problem, especially along the line of producing a spray gun which will atomize the paint, varnish or lacquer, but will control the spread of the finely-divided particles. So far, the use of spray painting has been confined to the painting of large surfaces, such as walls, partitions of buildings, car body trucks and generally where the fumes would not be of extreme annoyance.

Experiments and tests have also been made with the use of long oil enamels. Generally speaking, these results have not been at all satisfactory because of two conditions. First, there is a longer and uncertain period required for the drying. Instances have occurred where as long a time as five days was needed for a single coat to dry. Secondly, without a coat of varnish over the coat of enamel, great care must be exercised in the kind of cleaners used at terminals. It has been found that such enamels are injured by any acid cleaners.

The company has for its heavy service lines quite a number of front-entrance cars of the Birney safety type and articulated cars arranged for front entrance especially designed by the railway. In order to acquaint the riding public with cars that load at the front, all front-entrance cars are painted in cadmium yellow, the rear-entrance cars using the standard red color.

RECORDS OF PAINTS USED KEPT BY GLASS SAMPLES

The need for records on paints of different kinds is met by providing a small cabinet holding a large number of pieces of glass approximately 3 in. x 5 in. in size on which samples of any new paints are placed, together with an identifying number and a record of who furnished and when. This makes it very easy to check up on the delivery of paint materials as to body and color. Samples are also kept in a similar manner of paints made in the paint shop, with the formula, so that at all times such materials can be reproduced exactly as to color and general consistency.

The liberal use of paint in the paint shop is encouraged with the view of keeping a clean, fresh and attractive appearance. It is believed that such expenditures, although small, have a beneficial effect upon the morale of those working in such surroundings. It also produces an inviting atmosphere to those who, upon occasion, visit this part of the railway system.

Since the war, the greater portion of the car cleaning preparatory to painting on our system is being done by women. This was brought about by the shortage of man-power. Women are also employed in the paint shop to clean windows preparatory to sending the car out for services.

Constant tests of paints, oil and varnishes are being made under supervision of the foreman of the paint shop, usually in the form of test panels. These test panels are prepared carefully under his supervision and a record of the materials and their method of use carefully noted. The test panel is then numbered, dated and placed out for exposure. Removal of test panels is not permitted without instructions from the superintendent and a record is made of the conditions upon removal. Generally speaking, paints are exposed for twelve months, and varnish and similar materials for eighteen months. Color combinations are under constant consideration, with the view of obtaining an attractive color scheme with a cost equal to or less than that existing at present.

Poor Tools May Cause Injury

POOR quality tools, good tools impaired and the improper use of tools account for about 11,000 casualties yearly among railroaders of the United States. A study of "tool accidents" on a single representative railroad has disclosed that 89 per cent of injuries are chargeable to tools. They come under four leading causes: Struck by tools in hands of self or others, 33 per cent; bars slipping, 25 per cent; jacks slipping or falling, 16 per cent; wrenches slipping, 15 per cent; various other causes, 11 per cent.

In one year there were 3,868 compensated accidents recorded in New York State, each caused by the misuse of hand tools, or defects in such tools—proof that safety is of vital importance to the user of tools.

Slight yearly reductions in the annual toll from tools used carelessly indicate a lessening of the general hazards, but the fact that tool accidents are mostly confined to shops, stores, tracks, bridges, and buildings where men work in groups under the close surveillance of their foremen and where safety supervision is easy to provide, makes it evident that a greater improvement is possible with better co-operation between workmen and foremen. Tool accidents will decrease to the extent that supervision and co-operation become effective.

Burred and feathered chisels and sledges, hammers and shovels that are loose on their handles, wrenches with spread or worn jaws and jacks with defective ratchets are an index to the efficiency of those who use them as well as to those who supervise the work in which they are being used.

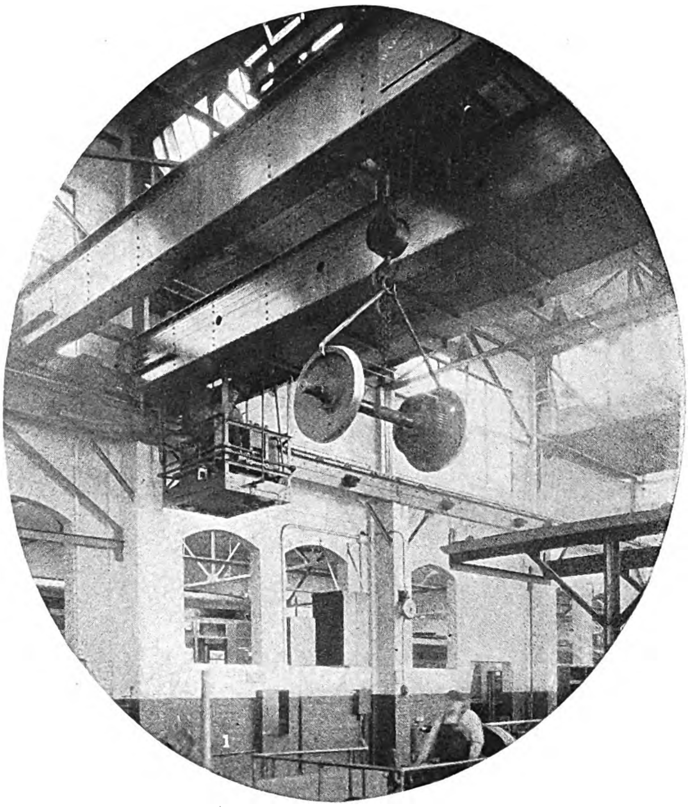
Improper use of tools, even though dangerous, will be discontinued only when foreman and workmen have a mutual understanding that such practices will not be tolerated. To be effective it must be understood by all that the foreman's instructions are to be enforced, and that if necessary the workman who refuses to abide by them will be disciplined.

New Shops of Chicago Rapid Transit Company Will Occupy 15 Acres

TEN separate shop units are planned by the Chicago Rapid Transit Company to be located at Niles Center. They will cover upward of 15 acres and are laid out and connected with each other so as to afford the utmost efficiency in handling cars. When the elevated railroads were operated as four separate companies each road had its own shop and there was no provision for an interchange of equipment. That condition had to be continued as a matter of necessity after the companies were consolidated. When the new shops now under construction are completed they will have a capacity sufficient to care for all the present equipment, and provision is being made for adequate expansion. The present shops will be used for purposes of inspection and minor repairs.

Work on the first unit of the shops is progressing rapidly and it is expected that it will be completed in May. This unit is the paint shop. It will be followed by other units from time to time until all of the shops are completed. The building now under way is 200 ft. by 224 ft. in outside dimensions. The walls are of Old English mission brick with cast stone trimmings. All of the buildings to follow will be of the same design. This will give them an attractive appearance, in keeping with the neighborhood.

Glimpses into the new B.-M.T. Repair Shop



AN ELECTRIC RAILWAY SHOP equipped completely with the latest machine tools and other modern equipment is an inspiration to men responsible for electric car maintenance. Such an example is furnished by the new DeKalb Avenue repair shop of the Brooklyn-Manhattan Transit Corporation.

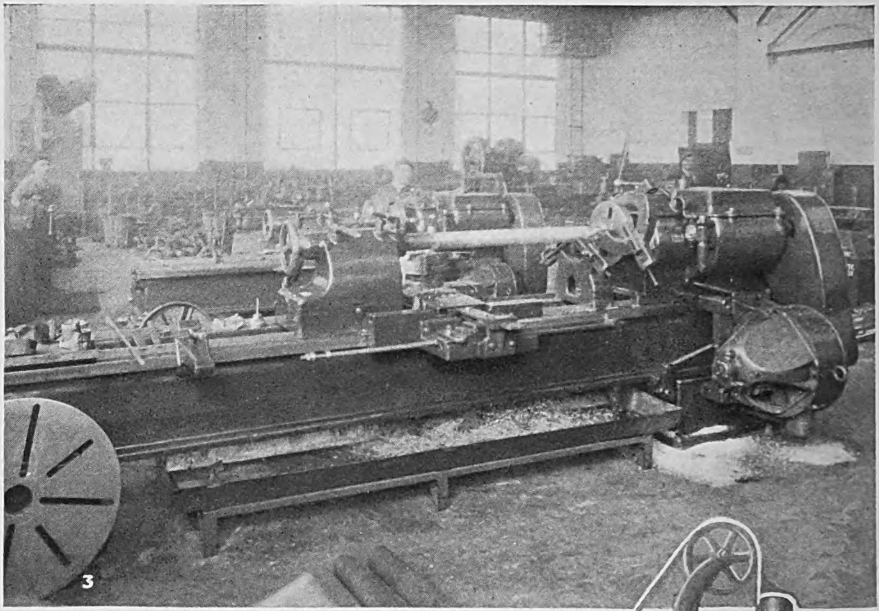
Prior to June, 1926, all maintenance work on surface cars for both the above corporation and the Brooklyn City Railroad was consolidated under one head. The separation of this work for the two companies made it necessary for the Brooklyn-Manhattan Transit Corporation to have increased facilities. The DeKalb Avenue shop was rebuilt and enlarged and the very latest shop equipment that could be obtained was installed.

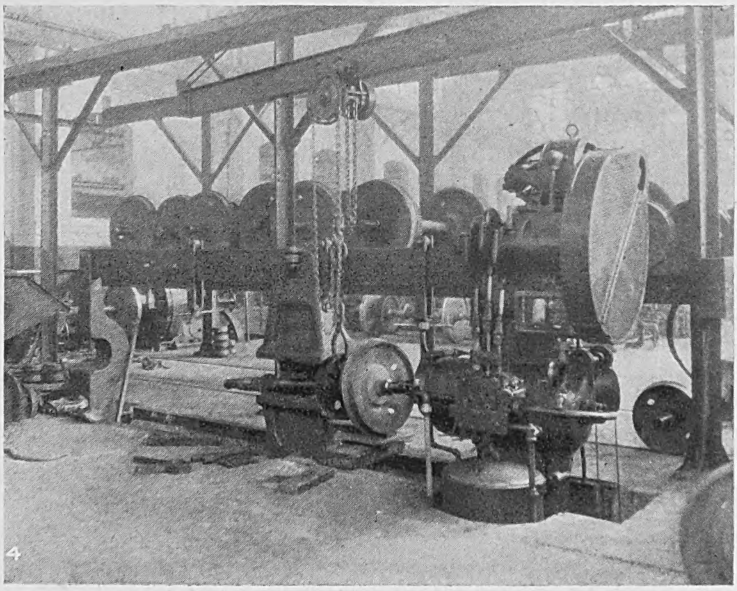
Like other officials of city railway systems, those of the Brooklyn property felt that suitable facilities and shop equipment for maintenance work are essential to safe and reliable car service. Particular attention was given to the selection of machine tools. Experts studied the various machining operations that are necessary for car repairs, improvements were added and several special machines were built by manufacturers to meet the specific class of work. Each machine is provided with individual electric drive. Work and materials can pass through the shop without delay, floor space can be used to the best advantage and any congestion at one machine does not interfere with independent operation of another.

The accompanying illustrations show some of the apparatus of this extensively equipped shop. At the top of this page one of the 10-ton cranes is shown serving the hydraulic wheel press. A general view of the truck overhauling bay with the machine shop at the rear is shown below.

The Wheel and Axle Department *is a busy section*

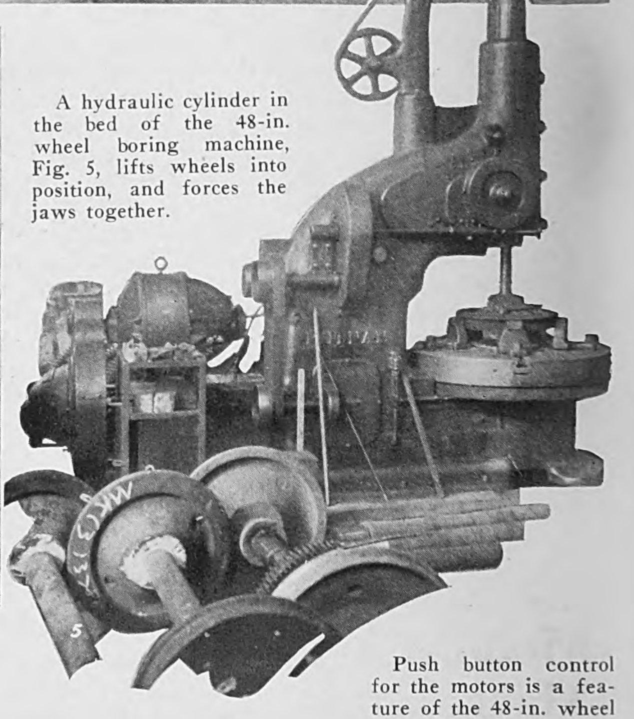
The helical geared ball bearing lathe, Fig. 3, is used almost entirely for turning armature shafts. It is large enough to take the broom shafts of sweeper equipment.



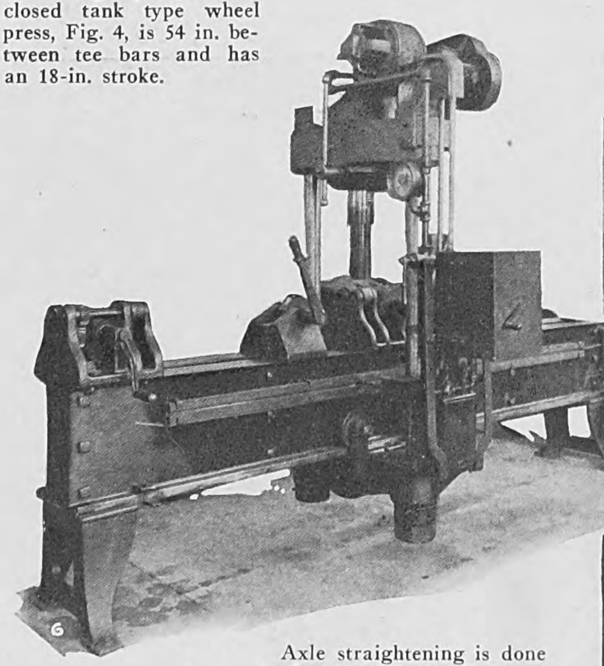


The high-speed, 300-ton closed tank type wheel press, Fig. 4, is 54 in. between tee bars and has an 18-in. stroke.

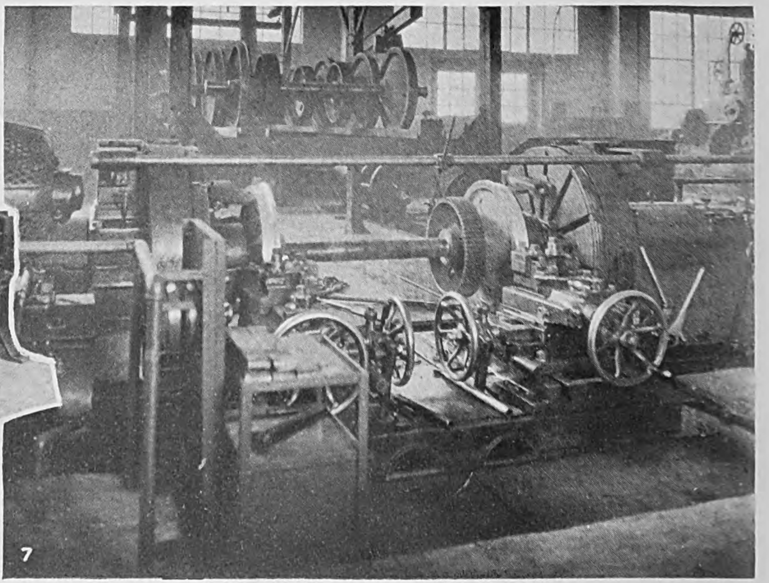
A hydraulic cylinder in the bed of the 48-in. wheel boring machine, Fig. 5, lifts wheels into position, and forces the jaws together.



Push button control for the motors is a feature of the 48-in. wheel lathe, Fig. 7.

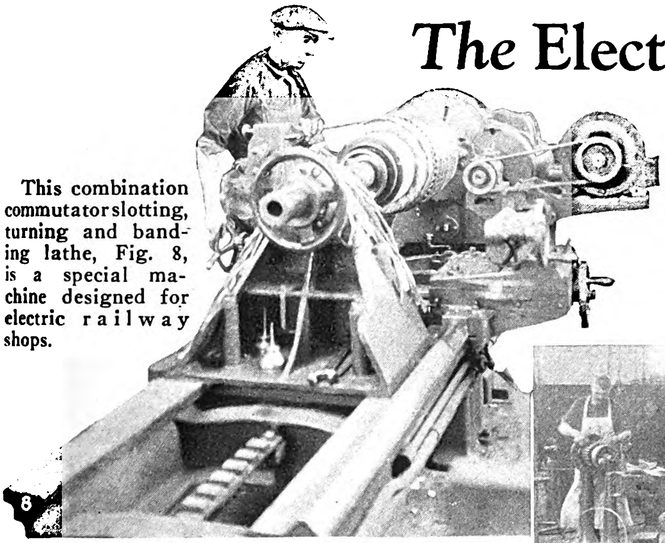


Axle straightening is done in the 125-ton hydraulic press, Fig. 6.

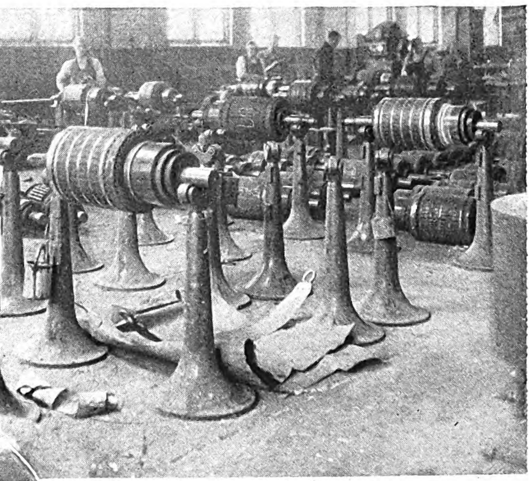


The Electrical Repair Department

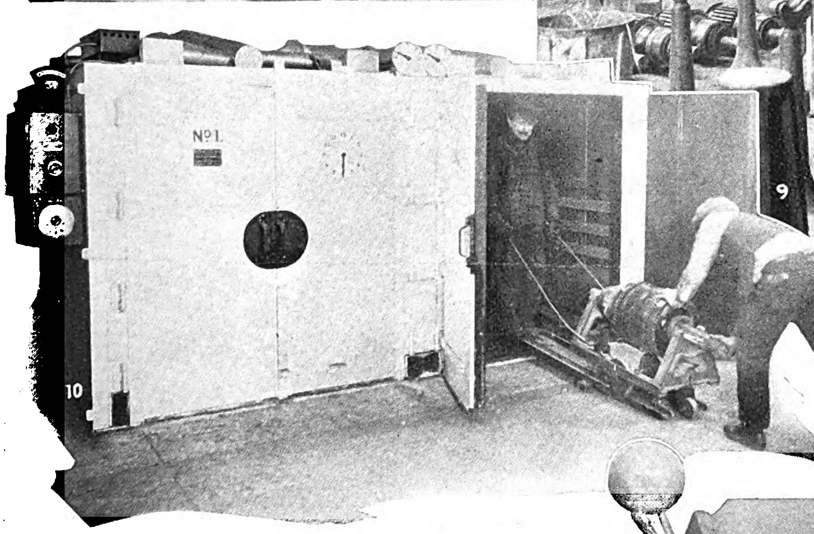
is completely equipped for maintenance of all motor and control apparatus



This combination commutator slotting, turning and banding lathe, Fig. 8, is a special machine designed for electric railway shops.



Conveniently arranged armature stands facilitate work of rewinding, Fig. 9.

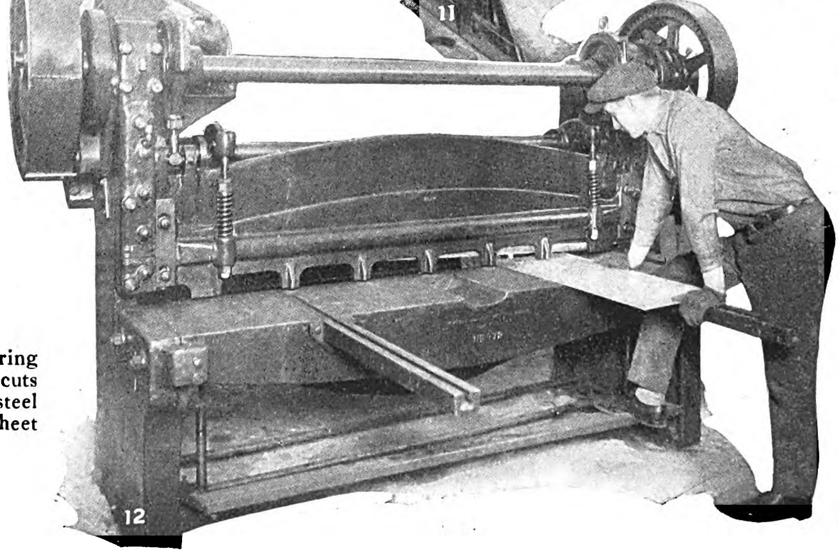


The baking and drying ovens, Fig. 10, have thermostatic heat regulation and clock control for turning off the heat.

Steel car repairs require

Modern Sheet Steel Machines

A hand bending brake shapes sheet steel for splash guards and sand boxes, Fig. 11.

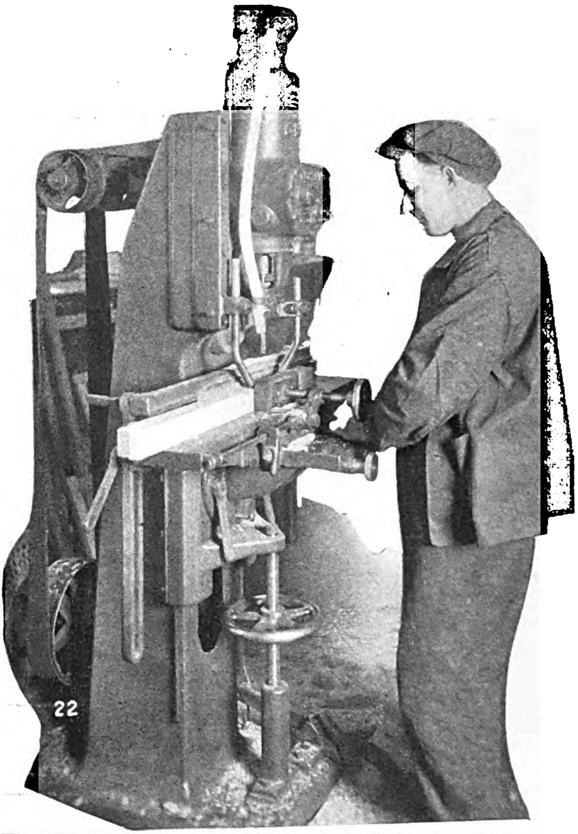


The power squaring shears, Fig. 12, cuts side sheets for steel cars and other sheet metal work.

Modern

Wood-Working Machines

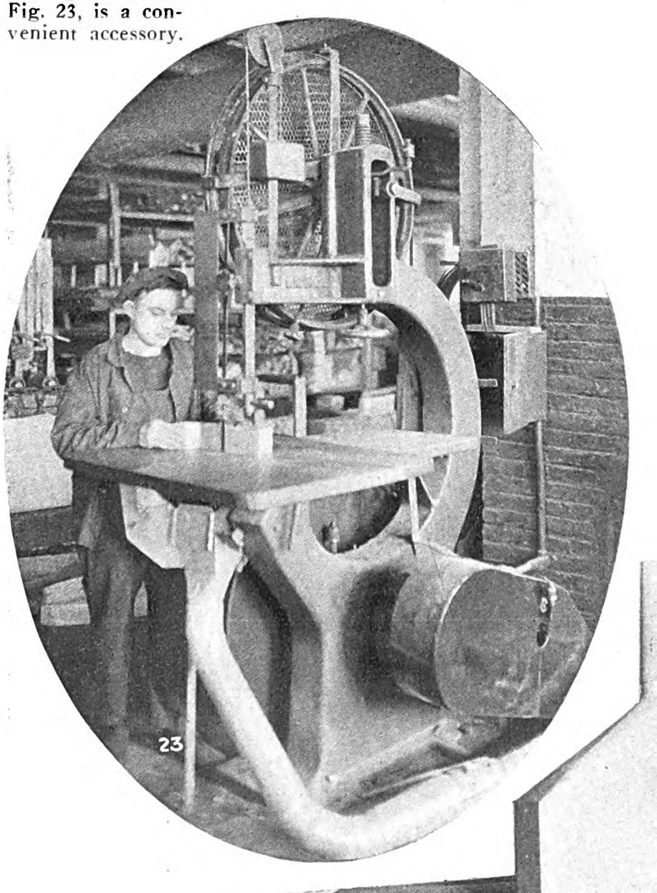
eliminate much hand work



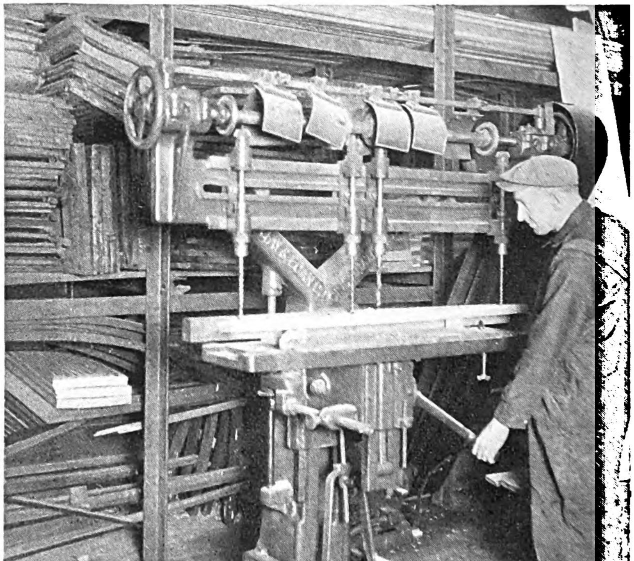
22

Stiles and rails for sash and doors are mortised on this automatic vertical hollow chisel mortiser, Fig. 22. It has a power stroke for the chisel ram.

The 36-in. band, scroll and rip sawing machine, Fig. 23, is a convenient accessory.

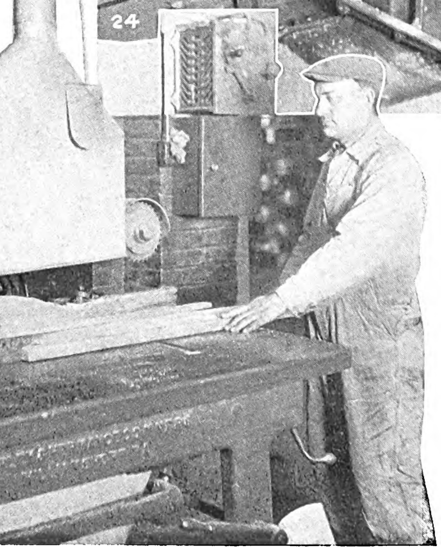


23



24

This four-spindle boring machine, Fig. 24, has a vertical adjustable table.



25

Material is cut quickly into slats and narrow widths on the automatic self-feeding rip saw, Fig. 25.

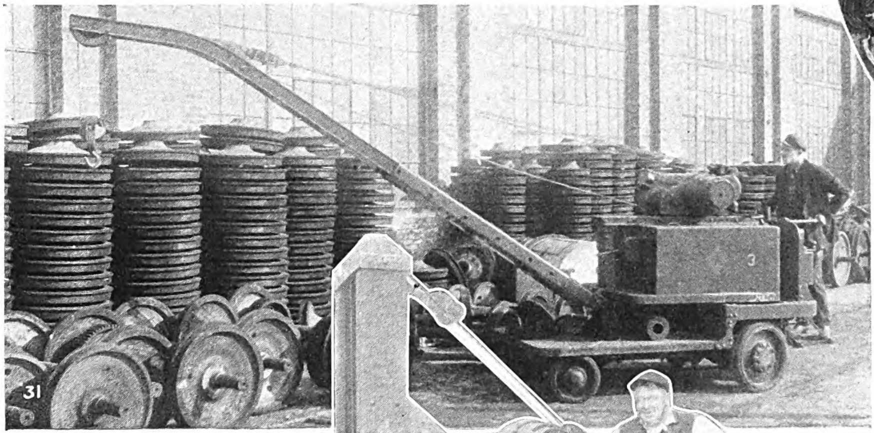
Electric Trucks *are a great convenience for material handling*

A crane truck, Fig. 31, handles heavy parts in the material storage yard.

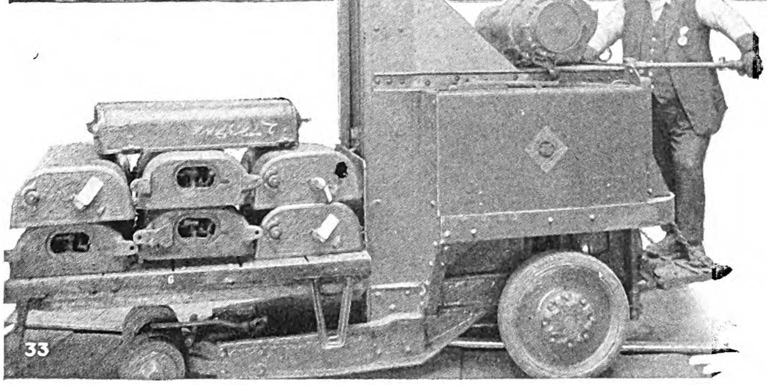
Small material is moved quickly by trucks, Fig. 32, with stationary platforms.

Controllers, compressors and other car equipment can be placed on work benches by one man with the elevating platform truck, Fig. 33.

32



31



33

34

The Tool Room

one of the shop's show places

Cylindrical, internal and surface grinding are done on the universal cutter and grinder, Fig. 34.

Many operations are done economically on the universal milling machine, Fig. 36.

The twist drill grinder, Fig. 35, has a special wheel truing attachment.

Electrical Maintainers Are Not Trouble Men

Successful Maintenance Should Keep Property and Equipment in Such a State of Repair that There Are No Reports of Trouble—Rigid Inspection at Regular Intervals Has Produced Gratifying Results in Chicago

By Dwight L. Smith

Electrical Engineer Chicago Rapid Transit Company, Chicago, Ill.

PROBLEMS in electrical maintenance that require daily solution on the lines of the Chicago Rapid Transit Company are quite different from those of the average city property, but similar procedure and organization can be used by most railways. The route-miles operated total 77 and the single-track miles 217. As most of the track is on elevated structures with third rail and as there are 224 passenger station buildings and an extensive private telephone system maintenance work is quite varied in character.

The electrical department is responsible for all electrical maintenance except that of rolling stock, signals and interlocking. The principal items include the following:

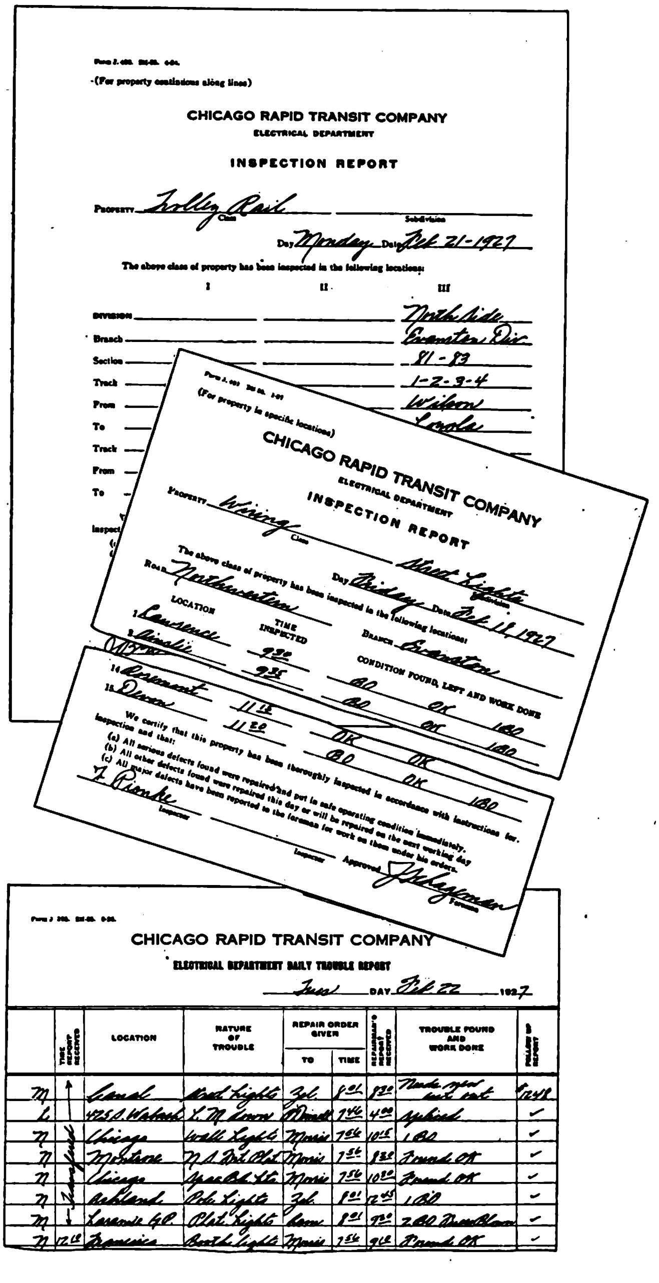
Third rail	200 miles
Overhead trolley	17 miles
Telephone cable	66 miles
Telephone instruments	575
Feeder cable, underground and overhead	286 miles
Street and yard lights	1,010
Electric sign lights	1,560
Station and building lights	27,130
Storage batteries (railroad)	6
Substations (owned by railroad)	5

Despite the magnitude of this task it is accomplished with a force of less than 50 men and the property is not only well maintained but its physical condition is being bettered continually.

Some years ago these maintenance workers were called "trouble men," with the natural result that they believed their work was to take care of only such trouble as was reported. Now the word "trouble" is taboo, the men are known as "maintainers" and their efforts are directed toward keeping property and equipment in such a state of repair that there are no reports of trouble.

A thorough system of inspection is a big factor in approaching this goal. Every item in every location is given a rigid inspection at regular intervals, varying from once a day to annually, based on the type of property and the location. This system is laid down in detail in the inspection manual with which each maintenance foreman is furnished and which he uses as a text book to school his men. In the manual there is a division of the property into classes and groups and the railroad is classified into zones, according to the density of traffic. A definite interval for inspection is assigned for each class and group of property, varying with the zone; for instance, subway lights and signs are inspected daily, third rail in the central zone bi-weekly and bonding in yards annually.

On some classes of inspection, principally those which come at longer intervals, the exact dates are left to the discretion of the foreman to fit in with his work.



(For property continuous along lines)

CHICAGO RAPID TRANSIT COMPANY
ELECTRICAL DEPARTMENT
INSPECTION REPORT

Property Wiring Class Street Lights Division
Day Friday Date Feb 11, 1927

The above class of property has been inspected in the following locations:

Road Northwestern Branch Evanston

LOCATION | TIME INSPECTED | CONDITION FOUND, LEFT AND WORK DONE

1 Lawrence 9 30 B.O.
2 Ainslie 9 35 B.O. OK 1 B.O.
14 Rosemont 11 15 OK OK 1 B.O.
15 Devon 11 20 B.O. OK 1 B.O.

We certify that this property has been thoroughly inspected in accordance with instructions for inspection and that:
(a) All serious defects found were repaired and put in safe operating condition immediately.
(b) All other defects found were repaired this day or will be repaired on the next working day
(c) All major defects have been reported to the foreman for work on them under his orders.

Fig. 1 (at top)—Inspection report used for property along lines

Fig. 2 (in center)—Form used for reporting results of inspection

Fig. 3 (at bottom)—The trouble sheet serves as a permanent record of cases as reported

Otherwise a schedule of dates for each inspection is published periodically in a bulletin, and no deviation from them is permitted. This is notably the case with trolley wire, where inspections must be made at night and where both foremen and inspectors were prone to postpone the date if any reasonable excuse offered. Now no excuse is deemed adequate.

Not only does the manual assign regular periods for inspection but it includes a catechism for each class and group of property. A series of questions indicates what possible faults are to be looked for and the answers tell what is to be done when any of these faults are found.

The inspectors in general do the maintenance work. Small faults found by them are repaired on the spot. Larger faults are reported to the maintenance foreman, who arranges for the necessary men and material for the repair. Faults too large to be taken care of by the maintenance forces are reported by the foreman to the office for inclusion in the construction schedule. The seriousness of any fault discovered determines the celerity with which it is repaired. Emergencies are reported immediately by telephone and the necessary men and material are despatched at once.

Reports of routine inspections are made out by the inspectors, approved by their foreman and forwarded to the office, where they are noted by the electrical superintendent and then recorded. This record shows the dates of inspection of each class and group of property in each location. A frequent check-up serves to show whether inspections are being kept up to the required interval. The forms used in reporting inspections are shown in Figs. 1 and 2.

In line with the policy of prevention is the practice of anticipating possible trouble caused by necessary interference with electrical property by the work of other departments. This information is given through an exchange of work orders, by written and telephone reports and by close liaison between the supervisory forces of the departments. In some cases the interference can be eliminated temporarily while work is going on. A close watch always is kept and inspections are made more frequently than normally.

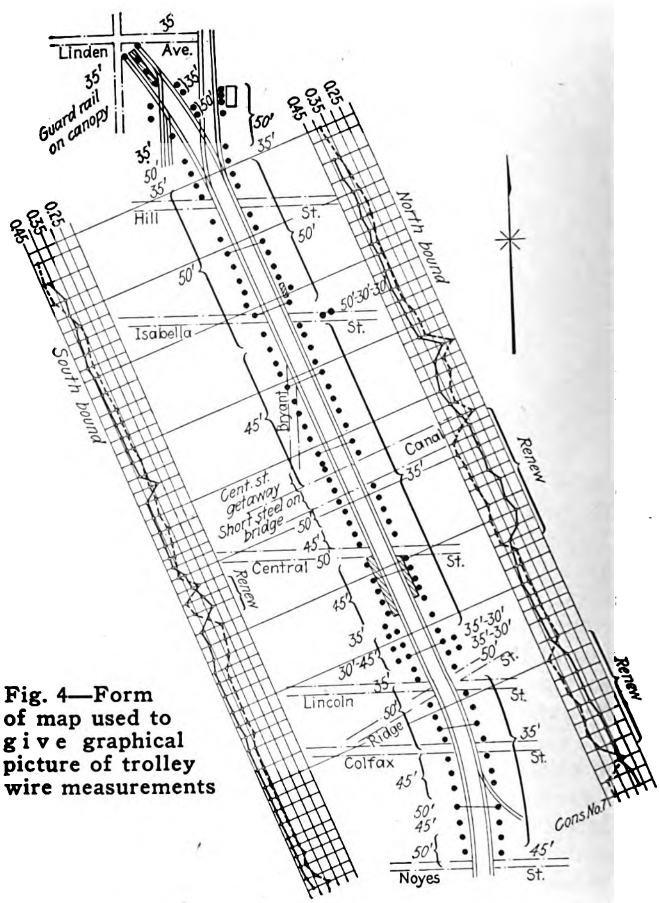

Fig. 4—Form of map used to give graphical picture of trolley wire measurements

Maintenance men are grouped into gangs of from six

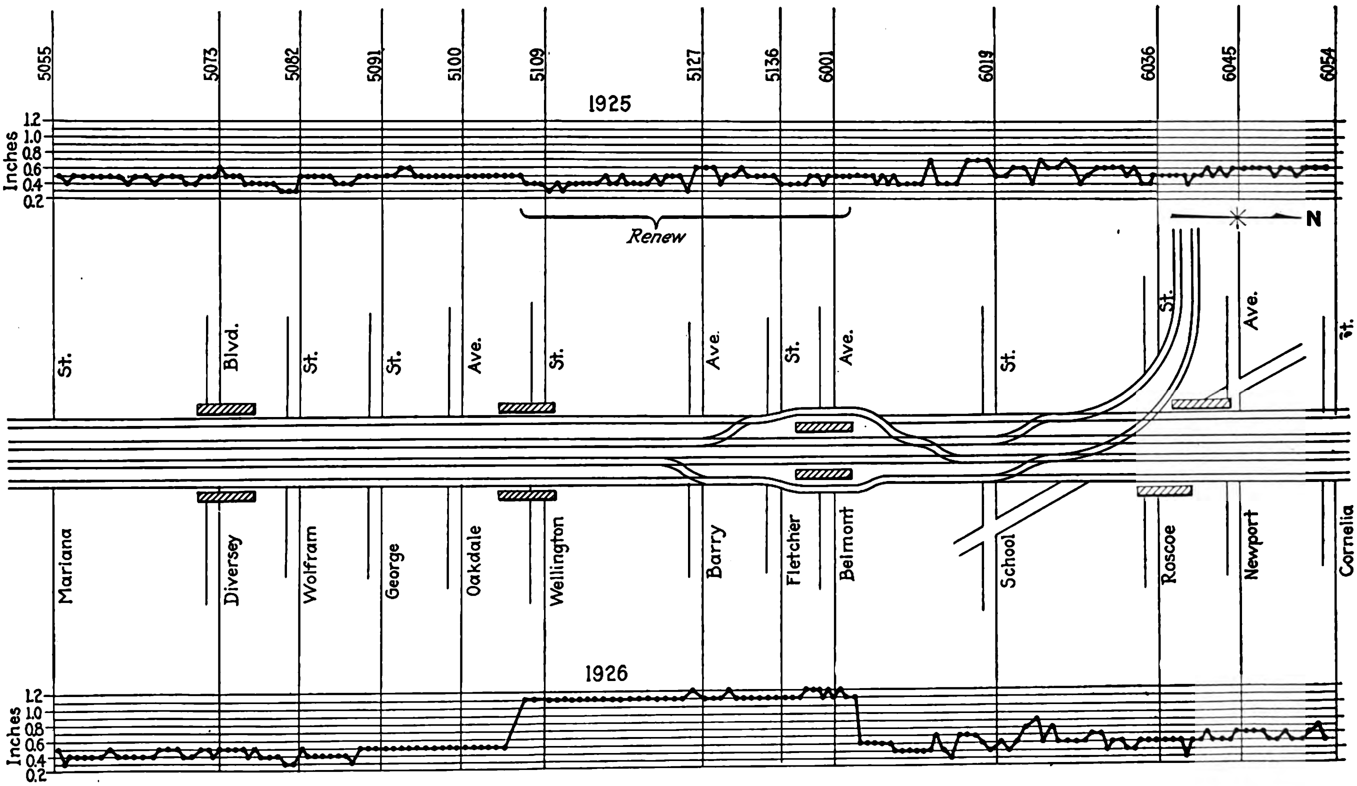

Fig. 5—Map and graphs are used to show third rail measurements

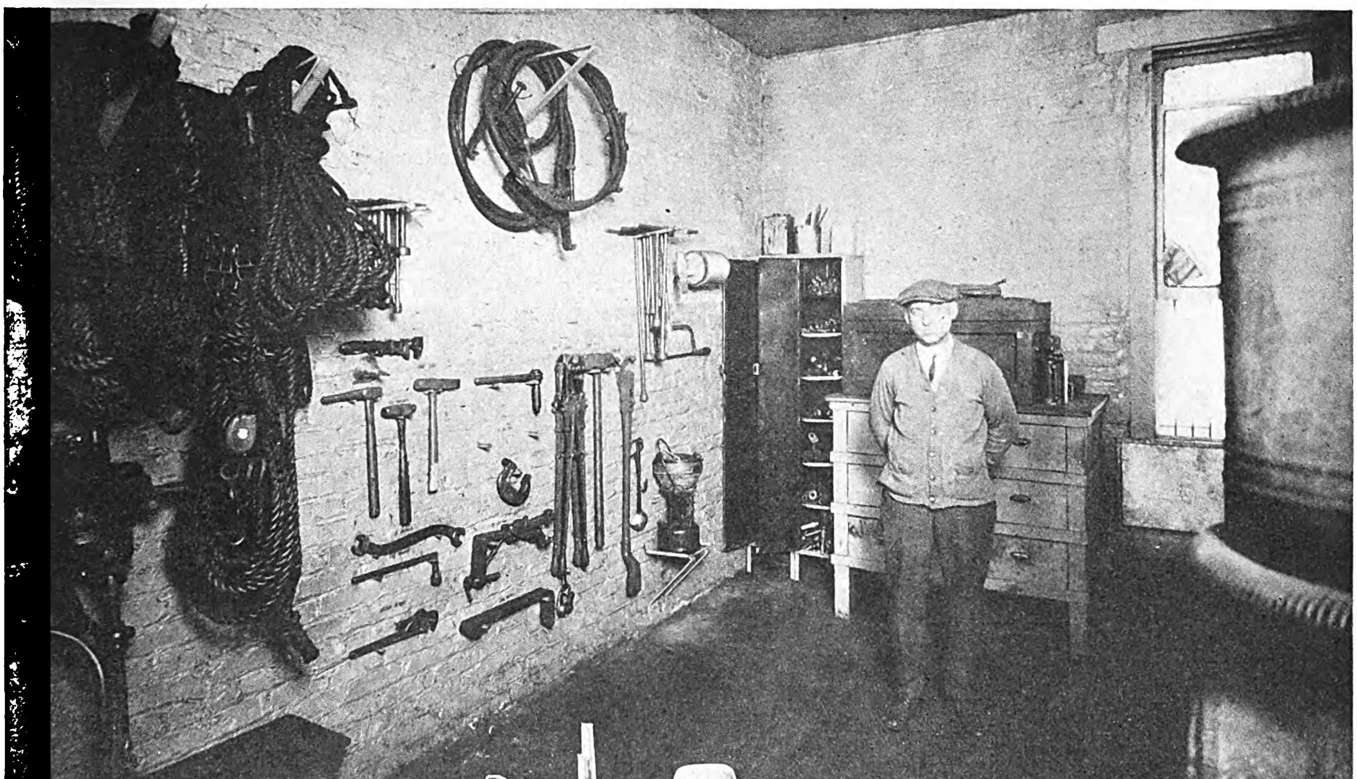
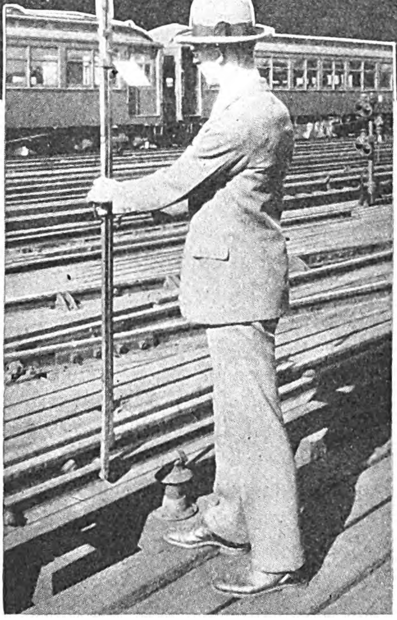


The maintenance shops serve as headquarters for the men—they report and quit work at the shop



The illustration at the left shows method of measuring the thickness of head of the third rail

to eight, each in charge of a foreman. There are five such, one for third rail, one for telephone, one for cable and one for line work, small wire and lighting. These four gangs not only do maintenance but minor items of construction, and work over the entire system. Each has a maintenance shop as its headquarters and as the men work one place today and another tomorrow, they report and quit at their shop. Each shop is equipped with the necessary tools and a working stock of material which is taken out as needed.

The fifth gang includes the maintainers, who are assigned to divisions and branches of the road and who, in general, work singly, but are always on hand in their assigned territory. A large part of the work of these men is replacement of burnt out lamps and taking care of trouble as it is reported, but in spite of this, the term "trouble man" is avoided and they are known as "maintainers." Each of these men has a headquarters at the geographical center of his territory. There he keeps his necessary small tools and stocks of lamps and material, arranged neatly in steel cases. The foreman of this group acts largely as an inspector, spending time with each of his men in turn, checking up their practices and standardizing their methods. He is responsible for keeping their headquarters supplied with the necessary stock of materials, which are ordered from and delivered by the electrical materials man.

The first four gangs mentioned are on duty only during regular working hours. The fifth one not only has a day shift but has a second shift of two men who are on duty up to 1 a.m. with a consolidation of territory. Between 1 a.m. and 8 a.m. the small amount of maintenance necessary other than that regularly scheduled is cared for by men acting in the dual capacity of signal and electrical maintainers.

The costs of maintenance work of each class are kept by the cost clerk on maintenance work orders. These cover twelve-month periods ending Oct. 1 so that the data are ready for use in making the budget for the succeeding calendar year.

The power supervisor acts as work dispatcher and clearing house for all electrical trouble. He can reach by telephone every point on the system. All foremen and maintainers keep him informed as to their whereabouts, all electrical trouble is reported to him and he can reach the proper personnel quickly to cover any emergency. The territorial maintainers are directly under his control at all times, receive from him trouble assignments in their territory and report back on each case and to get their next assignment. A "trouble sheet" kept by the power supervisor serves to record cases as reported, designates assignments and "OKs" with the time that the order is given. This becomes a permanent record kept on file for three years and to which reference is frequently made. This is shown in Fig. 3.

The maintainers on the afternoon trick have a large territory and skillful routing by the power supervisor

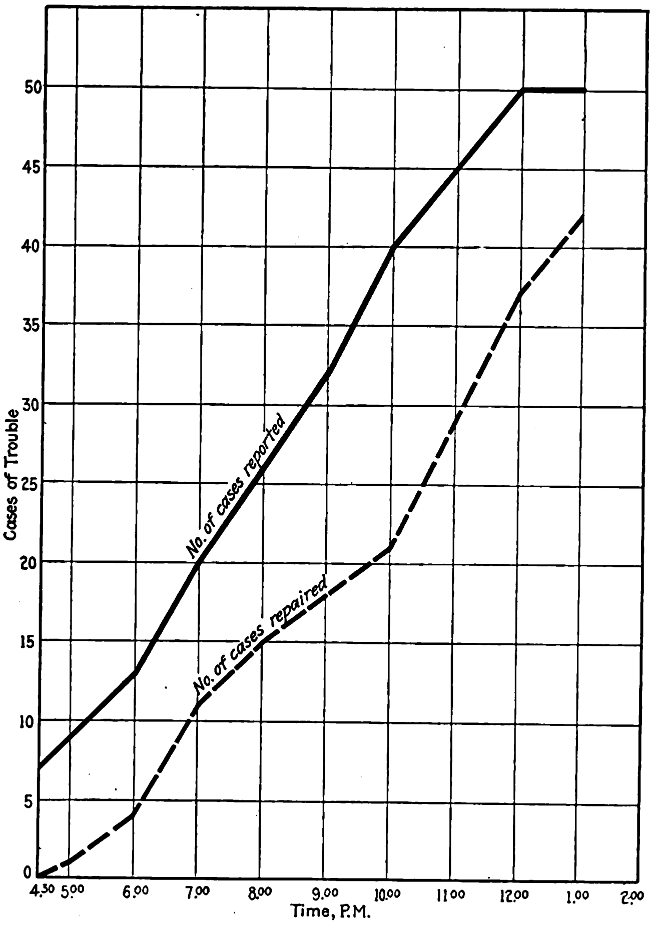


Fig. 6—Graph gives a continuous record of cases reported and repaired

is necessary to enable them to cover all reports. He keeps a graph of the number of defects reported and repaired. Fig. 6 gives such a graph. This is of value to provide a constant picture of how the work is progressing.

Sometimes the territorial maintainer can make only temporary repairs which are safe enough for operation for a few days. When such repairs are made a "follow-up slip" is filled out by the power supervisor and sent to the foreman of the appropriate maintenance gang, which makes the repair permanent.

The Chicago Rapid Transit lines are a consolidation of five properties, each of which originally used a different standard of construction and materials. Since the consolidation universal standards have been laid down to which all new construction and rehabilitation conform. Many of the old parts must still be kept in stock for maintenance, which makes quite a variety of maintenance materials, but standardization is progressing gradually.

Renewals are really wholesale maintenance, but there is a definite point, determined by an economic balance, where smaller repairs should stop and larger renewals begin. In determining this point the first requisite is accurate information; estimation will not do. The service on this road is so severe that in places No. 0000 hard drawn copper trolley wire has a life of only eighteen months. To determine when renewals are necessary and their extent the trolley wire is calipered in each span with a micrometer caliper about every 50,000 wheel passes, the passes being measured by an automatic contactor-operated counter. These measurements are plotted on a map and a study of this record gives the desired information. Fig. 4 shows such a map. Where weak spots are found which do not as yet require renewal they are calipered at more frequent intervals. This plan has enabled the company to keep wire in service until worn to 40 per cent of its original area, without a wire break in 2½ years due to wear.

The useful life of the original installation of third rail is just being reached. The same method has been used to determine the necessity for renewal, the rail head being measured for thickness every rail length and the results similarly plotted. The gage used for this measurement was designed and built by the department. It is arranged so that the operator is insulated from the rail, can place his gage on the rail without stooping and take his reading from a scale at the height of his eyes. A small clipboard attached to the upright holds the sheets on which the readings are recorded. The resulting graph is shown in Fig. 5. This method has resulted in renewals of comparatively short lengths where absolutely needed, rather than the previous practice of renewing long lengths which were estimated to require it, only to find that a part of the rail renewed still had several years of useful life.

Throughout this system of maintenance the keynote is inspection—catch the possible faults before they occur and remedy them. The result has been that delays because of electrical faults are now almost unknown, and that in spite of the continued addition of property the maintenance man-hours are steadily decreasing.

Modern Cars and

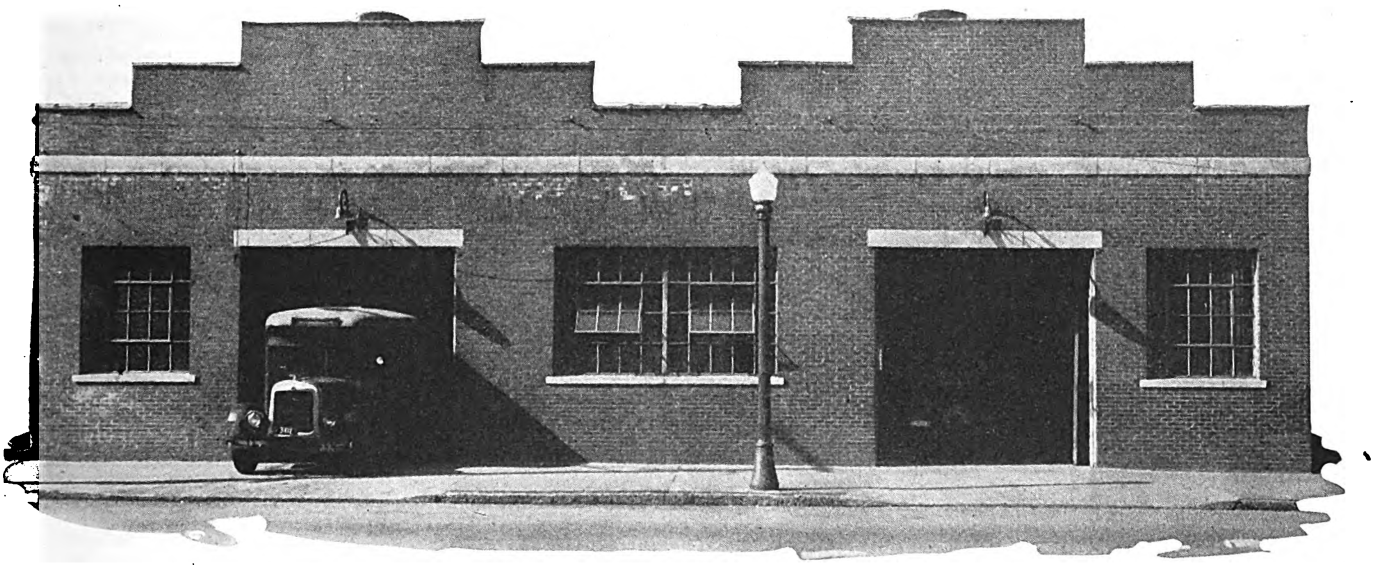
Pneumatic apparatus must be given careful attention,
Regular and systematic care is essential.
Oil and grease will prevent abnormal wear.
Periodic cleaning will assure continuity of service;
Even the door engines should not be neglected.
Require all inspections to be of the highest type.

Men should be instructed in proper care of parts.
All valves must be carefully tested during inspection.
Instead of criticising the design, do the work well;
No apparatus will function right if maintained wrong.
The secret of good operation is good care—
Every nut, bolt and moving part should be examined,
Nothing should be taken for granted.
Analyze failures carefully to prevent a repetition,
Note the cause of each one and correct the cause.
Careless work should not be tolerated,
Even the motormen can help by proper operation.

With every man helping maintenance will be improved.
Insist on regularity of inspections, as
Long overdue inspections invite road delays, so
Let delays decrease and public friendship will increase.

Personal supervision will prove beneficial.
Running apparatus until it fails is poor practice, for
Old or defective parts should be replaced.
Vision of 100% perfect operation can be attained, and
Every management wants successful performance.

Each man will do his share if instructed properly;
Co-operation must exist. To do this
Only capable men should be used on the work and
No inferior material should be used for repairs.
Old methods of drainage are not always suitable.
Much depends on the piping arrangement;
Inspect all piping and apparatus for slow leaks.
Carefully operate all parts before return to service
And if these details are taken care of properly
Long and successful operation will be assured.



Just to the north of the main carhouse and repair shop in Chattanooga is a 70x200-ft. garage recently built by the Tennessee Electric Power Company

Bus and Vehicle Maintenance

Centralized in New Building

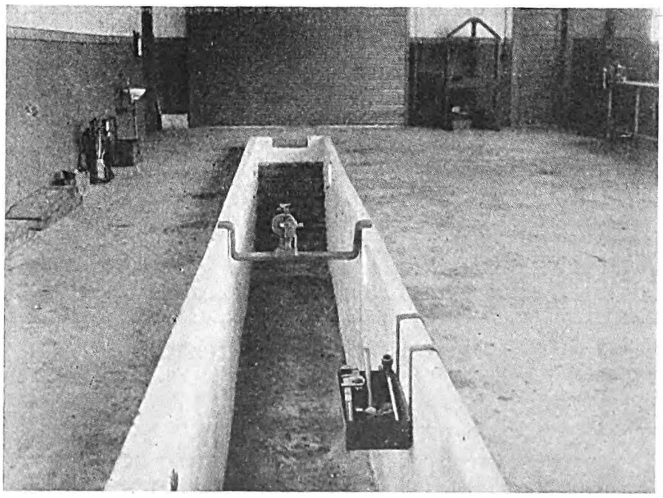
Railway and Power Motor Vehicles of Tennessee Utility Housed in 70x200-Ft. Steel-Tile Structure—Mechanical Costs Kept for Individual Vehicles—Facilities Include Railway Type Pit with Lights Mounted in Side Recesses

By E. D. Reed

Manager Chattanooga District, Tennessee Electric Power Company, Chattanooga, Tenn.

WITH the opening of a new garage early this year and the working out of a system for keeping costs on individual vehicles, the Tennessee Electric Power Company is now well equipped to handle under the one roof all of its 57 motor vehicles. These include five Model Z Yellow buses, 29-passenger capacity, operated from the downtown section to outlying parts of the city of Chattanooga, and 52 trucks and automobiles. The latter include various makes and types—Packards, Buicks, Dodges, Chevrolets and Fords. The trucks are White and Federal. In this list are vehicles used by both railway and power departments, line and emergency cars, as well as official automobiles.

A site for the garage was available immediately to the north of the present trolley carhouses. As shown in the accompanying plan, the garage runs through from Market to Broad Street with two doors on each. This location simplifies the supervision, since J. R. Anderson, superintendent of railways, has jurisdiction over the garage, which is directly in charge of O. E. Nix as foreman. Under him are four day mechanics and two night mechanics with a washer on duty day and night to do oiling and greasing as well. Another employee is a boy whose sole duty is to keep the garage clean. This job we consider rather important. He is supposed to wash down the bottom of the repair pit every day and to clean up immediately any oil or grease that may get on the floor.



A repair shop feature is a 40-ft. pit with openings along the side for electric lights. The rolling steel door leads into the main storage space

No. 1. "In and Out" form for all vehicles; 19 in. across and 11⅝ in. high, printed on white bond paper with blue rules.

No. 2. Monthly costs are tabulated under five headings. The form, which is 13⅞ in. x 11¾ in., is printed the same on front and back.

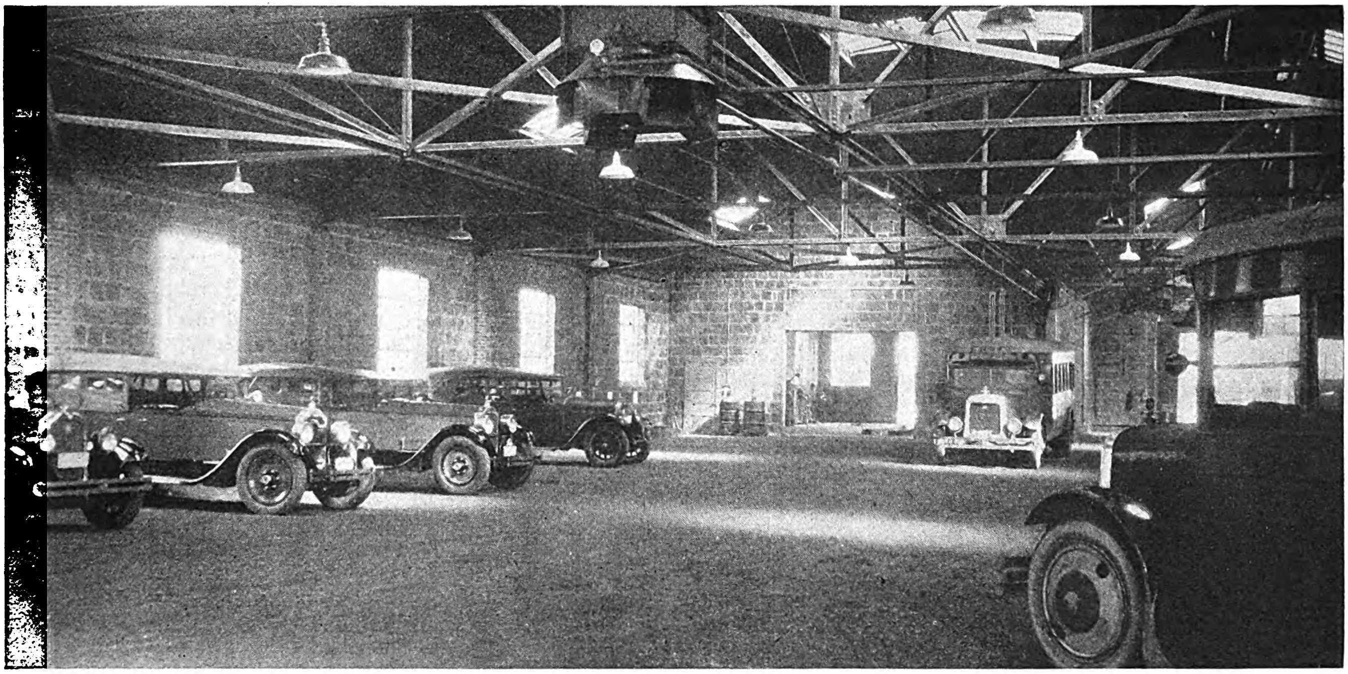
No. 3. On each vehicle being inspected or repaired is this 5½ x 8½-in. white card showing labor and material, the latter listed on the back of the form under Quantity, Kind of Material and Cost.

No. 4. This is a yellow tag, 2⅝ x 5¼ in., marked "Tire On" the back.

No. 5. Is a red tag of same size with "Tire Off" printed on the back.

No. 6. Car numbers are repeated so that two entries can be made daily. The form is on 12⅝ x 14½ in. white stock with blue rules.

No. 7. The tire record contains the life history of each tire as well as its location. This is a 5 x 8-in. card.



Yellow buses and Packard touring cars are some of the equipment that is stored and maintained at Chattanooga. At the rear are tools used in the repair shop

has a steel frame with brick and hollow tile walls, represents an investment of about $45,000, while the garage equipment installed required an investment of at least $1,000 more. Roof and ventilators are of the Roebling steel type and a Wing blower heating system is installed. The roof is mounted on steel trusses with 15-ft. headroom and set on 20-ft. centers.

At the Market Street end there are grouped in one corner an office, stock room, locker room and repair shop as indicated in the plan. These are separated from the storage portion of the garage by 8-in. hollow tile walls carried to the roof. Thus of the total 14,000 sq.ft. of area, a little more than 80 per cent is used for storage, about 11 per cent for the repair shop, and 8 per cent for the other rooms. There is a wash rack in the southwest corner which is separated from the garage by a concrete curb 3 in. high and 4 in. wide along the side. It has a raised portion at the end over which vehicles can be driven.

A useful part of the repair shop is a pit 40 ft. long, built along railway lines. It is 4 ft. deep, and along each edge for its full length is a concrete curb 6 in. high and 4 in. wide. Four 50-cp. Mazda lamps are placed in pockets, two on each side of the pit, as illustrated in the plan and one of the views. Over each bulb is placed a heavy wire guard.

Two useful home-made devices are shown in the picture of the pit. The one spanning the pit is to support the jacks used for lifting the rear end of a bus. It is made of 1-in. x 6-in. steel bar. Its shape is such that it gives the men plenty of room to work. The other device consists of two pieces of strap bent to hook over the edge of the pit so as to support a tool chest or a box for spare parts.

Gasoline is bought from the Standard Oil Company. It is stored in two tanks, each of 560 gal., from which it is pumped direct to the buses or automobiles. Galena oil is used for the company's Yellow buses. It is kept in drums fitted with single-stroke pumps. These vehicles also use Dixon No. 677 differential grease and No. 672 gear grease.

Smaller parts kept in the storeroom are held in a

Two 12-ft. doors are placed at each end of the Chattanooga building, leading to two of the main streets

Berloy Berger all-steel cabinet. Parts most frequently needed for the various vehicles are stored here, although no effort is made to keep many of the heavier parts. Three all-steel work benches 6 ft. long and 30 in. wide have been placed in the repair shop. They are fitted with vises made by the Reed Manufacturing Company.

Several devices have been installed for the more efficient handling of equipment. These include three Chisholm Moore chain hoists, three Weaver garage jacks, three Reese portable jacks and one Weaver High-Lift jack of 4-ton capacity. For routine repairs there are a Black & Decker valve refacer, electric drills, a Russell relining machine, Alemite pressure grease gun, and a 40-ton Weaver gear press. The Monarch 9-in. engine lathe, the Hisey-Wolf double-wheel electric grinder, an acetylene welding outfit and a Marshall constant-potential battery charging outfit have also been found useful.

Two methods are used for keeping track of the company's miscellaneous collection of buses, trucks and automobiles. First, a daily record is kept of the time a vehicle is taken out of the garage, the time it is returned, the miles covered in the period and the driver's name. The form used is reproduced with this article.

Second, a cost record is kept for each vehicle. Totals are entered on a sheet which is used for making the monthly report to the executive officers. There are five divisions of costs, built up as follows: All labor and material are recorded on the card "Automobile Inspection and Repairs," a copy of which is attached to any vehicle which is in the garage for repair work or inspection. The next items, fuel and oil, are taken monthly from the sheet headed "Garage Daily Gasoline and Oil Records," which is filled out each day as any vehicle is supplied.

The system used for the tire costs also permits keeping track of the location of any given tire. When a new tire or one repaired is placed on a vehicle a yellow card, "Tire On," is filled out with the number of the car, the speedometer reading and the tire number. This number is also entered on another card, "Pneumatic Tire Records," kept for each individual tire in use. When the tire is removed a red card, "Tire Off," is filled out with location, speedometer reading and the cause for the change. The information from the red card in turn is transferred to the proper tire record card. Any expense in repairing a tire is noted on this red card and is totaled at the end of the month from the cost record to give the item "Tire Costs."

This garage is considered large enough to take care of our requirements for some time to come. More equipment may be added as additional experience is gained, but the results so far indicate that our engineers have made a wise selection not only in the building construction and facilities but also in the garage equipment.

Combination Salt, Sand and Side Wing Car

By ROBERT HARRIS
Master Mechanic New Brunswick Power Company, St. John, N. B.

KEEPING snow at a reasonable distance from car tracks so that additional roadway space would be available for vehicles following a snowstorm is a necessity in the northern country. To meet the requirement for additional equipment for the purpose the New Brunswick Power Company, St. John, N. B., built a combination car in its shops. The dimensions of the car are given in an accompanying table.

The underframe construction of the car is of steel and wood. The outside sills are ⅜-in. x 4-in. x 4-in., 8.5-lb. angles, laid with the flanges on the outside and the bottom. A 5-in. x 6-in. wood filler is attached to receive the outside sheathing and double floor. The intermediate sills are 1¾-in. x 5-in., 6.5-lb. channels, placed 3 ft. 5 in. on centers and an equal distance from the outside. Provision is made for trapdoors for the inspection and repair of motors. The use of a shallow channel permits a low center of gravity. The channels are notched into the cross sills, which are spaced to suit motor conditions, and the whole framework is tied together with tie rods spaced 3 ft. 4 in. apart. Angles and crown heads are used under vestibules. The side sills, intermediate sills, drawbar sills are all fastened securely to a 6-in. channel bumper 15.5 lb. to the foot.

The sides of the car are built up of 2½-in. x 3-in. ash posts with double cross bracing. Sheathing is used inside and out with ¾-in. tongued and grooved material. This runs perpendicular outside and longitudinal inside. The roof is of the arch type. Windows are provided in the cabs for double-end operation and a window on each side is used when winging back snow.

Metal boxes installed directly over each wheel are fastened securely to the side of the car. These contain approximately 18 cu.ft. of sand to be used for sanding the rails. The sand also acts as ballast for the car while winging back heavy snowfalls. The flow of sand to the rail is controlled by means of hand levers which operate the two forward boxes in the direction that the car is going. The sand flows through slide valves and down metal lined hose to the rail, the amount being regulated by the distance that the lever travels.

In addition to carrying sand, the car is also loaded with from 40 to 50 bags of salt, each bag weighing 160 lb. Individual bags are placed on a table on each side of the car from which the salt is emptied into hoppers. The salt is distributed to the tracks after passing through rollers and a metal pipe.

DIMENSIONS OF COMBINATION SAND, SALT AND SIDE WING CAR OF NEW BRUNSWICK POWER COMPANY

Length over bumpers	25 ft.
Width over drip-boards	6 ft. 8 in.
Height rail to top of trolley board	11 ft. 2 in.
Height (inside) floor to roof boards	7 ft.
Type of truck	Single, 21-E-Brill, reinforced, 7-ft. wheelbase
Wheels	Rolled steel, 33 in. diameter, 5-in. axle, solid gear
Motors	Westinghouse 101-B-2, 15:69 gear ratio

A solid steel side wing is installed on each side of the car. This is constructed of ⅞-in. x 24-in. x 14-ft. material and weighs 1,000 lb. The wings are arranged so that they swing out from the body of the car and they may be set to any desired distance from the rail up to approximately 14 ft. The wings are also provided with interchangeable blades on the bottom that can be raised and lowered to clear certain obstructions.

The total weight of the car is approximately 20 tons. In addition to being used during winter weather, it is proving a valuable piece of equipment for all-year service. To add to its utility it is planned to attach an ice breaker.

Electric Railway Journal Maintenance Data Sheet

This Section Represents a

New Service to Maintenance Readers

of "Electric Railway Journal"

MANY electric railway men have suggested the advisability of publishing the maintenance note material which has appeared in the JOURNAL for many years in a form which would make it more convenient for handy reference. Complying with this desire, a maintenance data sheet section will become a regular feature of future issues of the JOURNAL and will appear in the third issue of each month.

For convenience in indexing the data for reference, each item will bear a departmental heading such as "Rolling Stock," "Line Department," "Track and Way Department," "Buses and Trucks," "Standards," "General Data," "Power and Electrical Department," etc.

If desired, these general headings may be further classified into specific operations or departments. Thus, items headed "Rolling Stock" may be divided into "Machine Shop," "Truck Repairs," "Motor Repairs," "Electrical Repairs," "Sheet Metal Work," "Tool Room," "Carpenter Shop," "Car Body," "Blacksmith Shop" and "Paint Shop." Other general headings may be subdivided similarly.

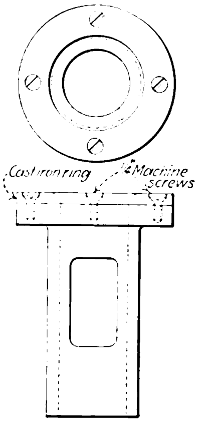
Suggestions are requested from JOURNAL readers as to the character of material that will make this section of greatest value. Maintenance men are urged to take part in the interchange of new ideas. The other fellow wants to know about improved methods of doing a routine maintenance job or a new kink or fixture that saves muscle and labor. By helping him you help yourself. A photograph or sketch with a brief description of the operation or fixture is all that is required. ELECTRIC RAILWAY JOURNAL will pay $5 for each idea published.

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK—ELECTRICAL

Bearing Flanges Reclaimed with Cast-Iron Rings

WORN armature bearing flanges are being reclaimed in the shop of the Washington, Baltimore & Annapolis Electric Railroad at Academy Junction, Md., by the installation of cast-iron rings on the worn surface. Master Mechanic J. A. Mellor believes that at least doubled life of bearings is obtained. The worn flange and the two surfaces of the cast-iron ring are machined and the ring is fastened to the flange by means of four ¼-in. flat-head machine screws countersunk at least 1/16 in. below the outer surface of the ring. When installing these reclaimed bearings a fiber ring is placed between the cast-iron surface and the bearing surface of the oil deflecting ring to keep the metallic wear of these parts at a minimum.



Method of attaching cast-iron ring to worn armature bearing flange used by the W., B. & A.

This practice has been adopted for all types of motors where it is applicable. The rings are being installed when required on all motors as they come through the shop for overhauling.

No trouble has been experienced with these cast-iron rings and it is believed they have effected a large saving in bearing maintenance.

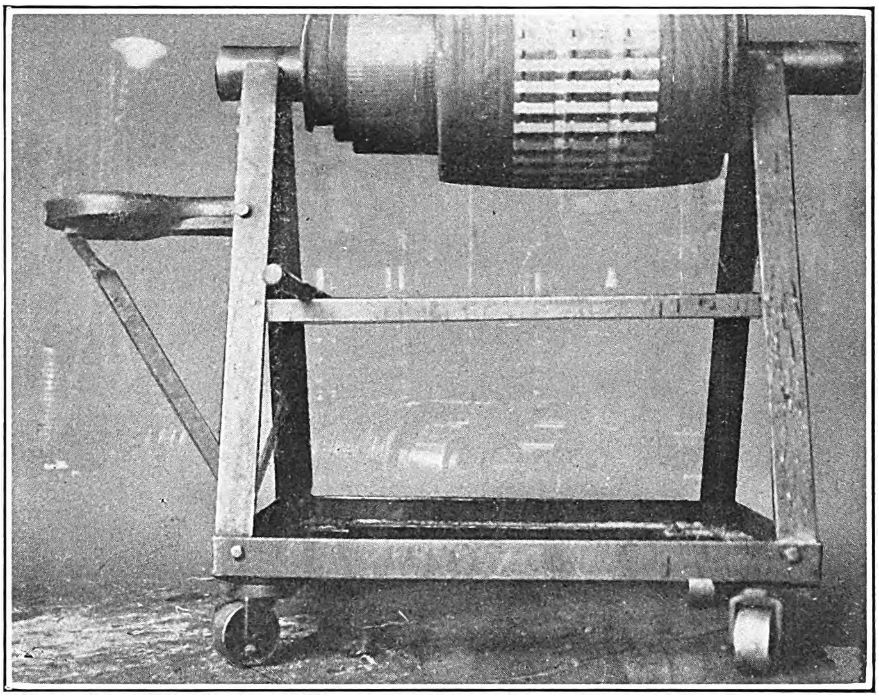
Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK—ELECTRICAL

Portable Armature Winding Truck

PORTABLE armature winding trucks are in use in the armature room of the Wilkes-Barre Railway, Wilkes-Barre, Pa. Each is equipped with a metal shelf and a drop seat. The truck framing is constructed of angles, rigidly bolted together.

The shelf is of sheet steel and is installed between the pedestals the full width of the truck frame. It is very convenient for the reception of the worker's tools and repair material. The wood drop seat is hinged to the pedestal and is found useful when the winder is working upon commutators and connections for commutators. It is claimed that the use of this truck has increased production due to the fact that tools and material are close at hand.



Portable armature winding truck with workman's seat and material shelf

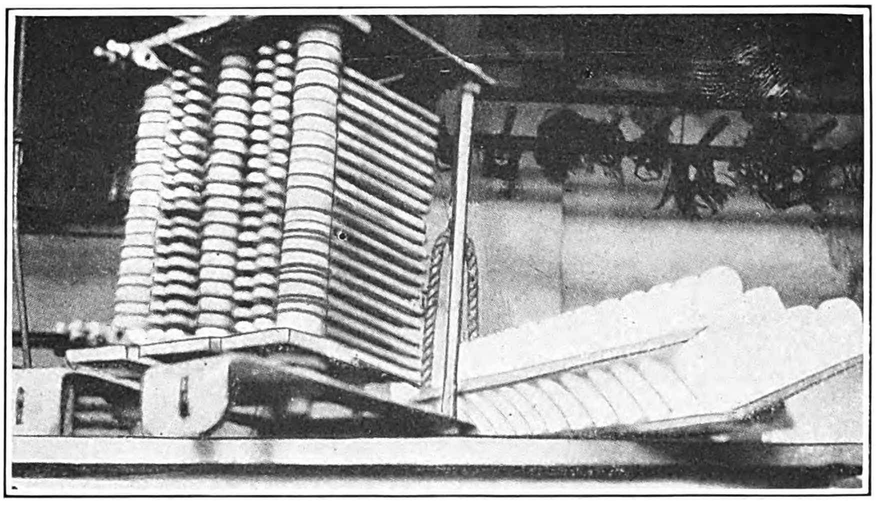
ROLLING STOCK—ELECTRICAL

Fiber Washers Increase Creepage Distance on Resistors

INCREASING the creepage surface on rheostats has been accomplished by the New York Railways through the installation of a 3-in. x 3-in. piece of red fiber on each grid-supporting rod between the last grid and the frame. This has eliminated creepage to the frame due to mud collection.

Breakage of controller air deflector backs has also been eliminated by the substitution of red fiber. This fiber has proved satisfactory under normal operating conditions and is obtained readily.



Red fiber washers increase creepage distance on car resistors

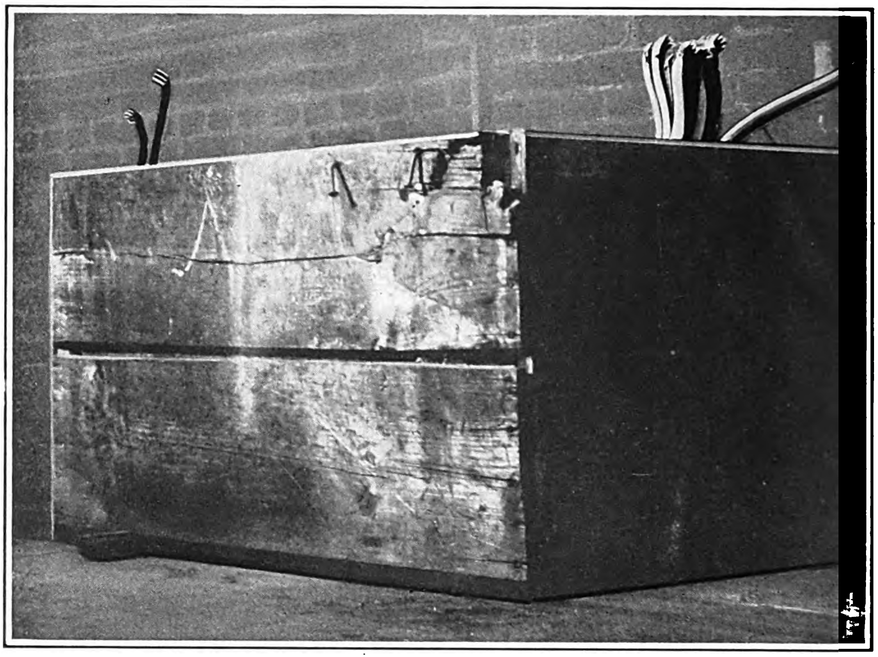
ROLLING STOCK—ELECTRICAL

Armature Coil Insulation Removed by Lye

ARMATURE coils having become inoperative due to deteriorated insulation are being reclaimed in the shop of the Lackawanna & Wyoming Valley Railroad, Scranton, Pa. These coils are immersed in a boiling solution of Red Seal lye and at the expiration of 72 hours the insulation can be readily scraped off. The vat is made of 1½-in. planking and lined with galvanized iron. The solution is heated by means of live steam.

After removal from the lye vat by means of hand hooks they are immediately washed with clean cold water to prevent injury to the workmen. After washing each turn of the coil is thoroughly cleaned, taped and the coil reassembled. It is claimed this process has effected a very material reduction in armature maintenance costs.



Armature coil lye vat

Motor repair stand

Circular steel pieces bolted to the ends of the motor case, and small rollers on the supporting framework, allow the case to be turned to the most convenient position for work.

Rotating Frame Facilitates Motor Repairs

WORK on parts of motor cases that are ordinarily hard to get at has been made much easier by means of a rotating frame used in the Grand Avenue shops of the Connecticut Company, New Haven. This apparatus was designed by J. E. Dooley, master mechanic, and built in the shops. The frame consists of two A shapes held in position by two longitudinal members fastened to the ends by gusset plates, as shown in the accompanying illustration. The ends are continuous 3½-in. x 5½-in. angles bent to the desired shape. Longitudinal members are angles of the same size, but are not continuous. They are arranged to overlap and are bolted together. A series of bolt holes permits the length of the stand to be adjusted according to the size of the motor upon which work is being done.

At each of the upper corners of the end frames is a 4-in. cast-iron wheel. Two circular steel pieces are provided, one bolted fast to each end of the motor case. These circular pieces rest on the small wheels and allow the motor case to be rotated as may be desired.

This arrangement has proved to be a great convenience when field coils are being installed. Instead of being obliged to hold the coil against the top of the motor case, while he is fastening it in place, the shopman now simply turns the case through a half revolution and lays the coil in position on the bottom.

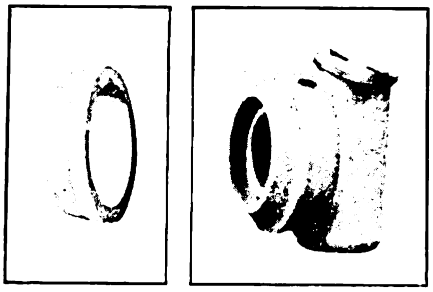
Motor Heads Reclaimed with Steel Rings

STUDY of several methods for reclaiming Westinghouse 101-B motor heads, as compared with the cost of new ones, convinced J. W. Strawbridge, master mechanic of the Williamsport Passenger Railway, Williamsport, Pa., that reclaiming would be the cheapest proposition.

The method adopted was to shrink a cast-steel ring on the worn head. The steel castings are obtained from the foundry of the Lehigh Valley Transit Company, Allentown, Pa., in the rough. They are of such a bore and outside diameter as will suit every condition of worn head, worn housing or a combination of both. The worn head is turned down to a predetermined diameter and the cast-steel ring is bored to such a diameter as to allow for a tight shrinkage fit over the turned-down head. The casting has a flange and is installed on the head with the flange away from the oil well. After being shrunk on it is turned to the desired diameter. Where the field frame as well as the head is worn the frame is bored out to a standard oversize diameter and the head casting ring turned to the proper diameter to obtain a good fit.

This method has resulted in quite a saving being effected in the repair work, and to date not a single ring has come loose in service.



At left, cast-steel ring ready for shrinking on to turned down motor head. At right, motor head ready for service with cast-steel ring shrunk on the machine

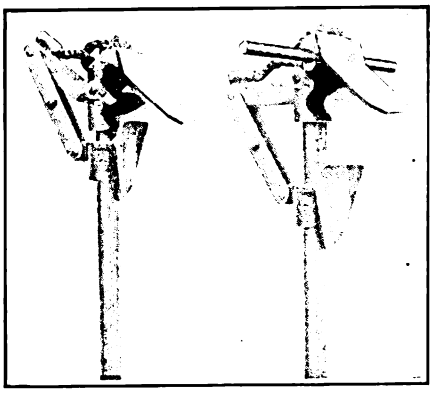
TRACK AND WAY DEPARTMENT

Power Take-off Insures Positive Contact

POWER take-off from the overhead trolley for the operation of portable tools requiring 600-volt energy is made on the Key System Transit Company, Oakland, Cal., by a pole and clamping device, the latter eliminating the possibility of arcing at the wire. The trolley stick, as it is known, is made up in four sections. Three of these are approximately 6 ft. long, while the top one is approximately 18 in. long.

The support for the head in the top section is 1 in. brass tubing, $\frac{1}{16}$ in. thick. Inside of this slides easily another piece of brass tubing. A casting having a boss on one side and a triangular shield of $\frac{1}{8}$-in. copper on the other side is attached to the top of the outer tube. The boss serves as an anchorage for the lever which operates the extreme outer end of the clamping device. The shield, which has a width of 3 in., serves as a guide to the trolley wire when the device is placed in position.



At left, head of power take-off open to receive trolley wire. At right, position when the pole is hooked over the trolley wire

A brass casting on the top of the inner tubing has a groove on the underside and a clamp which presses upward when the head is raised so as to hold the trolley wire in the groove.

The jaws are approximately 3 in. long. A shield of $\frac{1}{8}$-in copper is fastened to the head casting, which, along with the shield on the lower head, guides the trolley wire into the groove. A pair of levers hold the two heads together and actuate the clamp.

When not in use the head drops by its own weight, opening the jaws of the clamp. When the head is hooked over the trolley wire the wire seats itself in the groove and the weight of the pole lifts the head and causes the clamp to close up on the wire. Raising the pole, the weight of the head causes it to drop in the tube, opening the clamping device.

Emergency Magnet Winding Machine

WHERE coils are wound at infrequent intervals, or where a number of small magnet coils have to be wound in a hurry, it may be necessary to provide some sort of shop-made equipment to take care of the work. The accompanying illustrations show how a coil-taping machine was arranged to wind small magnet coils in the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y. In the sketch the tension pegs, numbered 1, 2 and 3, and the tape holder, 4, of the original coil-taping machine were removed from the rotating member, *P*. Three equidistant poles marked *S, S, S* were drilled and tapped in the rotating part of the machine, as indicated. A disk, *K*, was then made of ⅛-in. sheet steel and holes were drilled in this to correspond with the holes *S, S, S*. A ¾-in.-hole was also drilled in the center and the disk was then screwed to the rotating member, *P*, of the taping machine. Studded arbors, of sizes necessary to fit the spools of the magnet to be wound, were provided, and these were bolted to the disk through the center hole. A steady rest was provided for the outside end of these arbors. This steady rest, which was screwed to the bench, was provided with a hinge so that it could be rotated down out of the way while a spool was being inserted over the arbor and to provide for removal of the coil after it was wound. The machine was driven in the usual way by means of a belt. The necessary changes for installation of the disk in no way interfered with the usefulness of the machine for its original purpose.

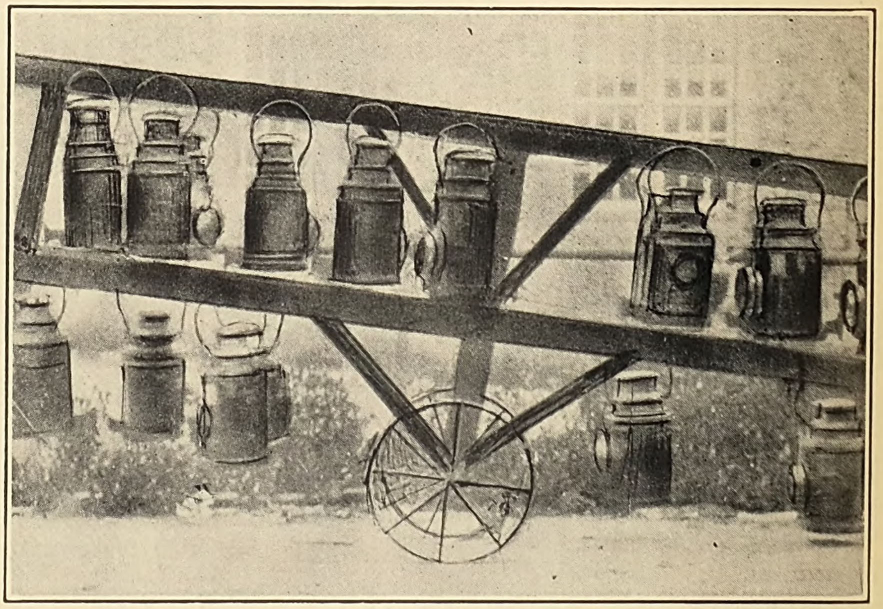
TRACK AND WAY DEPARTMENT

Truck for Transporting Oil Lamps

LABOR of collecting and distributing way department oil lamps has been reduced materially by E. L. Greene, master mechanic York Railways, York, Pa., since the adoption of a manually operated truck designed and built in the company's shops.

This truck consists of a box-shaped skeleton frame 12 ft. long, 18 in. wide and 2 ft. high, with an over-all height of 48 in. above the floor. The frame is built of yellow pine timbers, 2 in. by 3 in., braced with ½-in. x 2-in. flat steel, and is mounted on a pair of 18-in. iron wheels.

Suitable hooks are installed on each of the longitudinal beams for the reception of the lamps. These are so spaced that the lamps can be suspended and moved about without damage to one another.



Portable truck with lamps ready for transportation

The truck weight being well balanced, one man can move it easily. Previously considerable time and labor were required to transport these lamps by hand.

Using the portable truck, the labor has been reduced to such an extent as to permit of one man performing the entire operation.

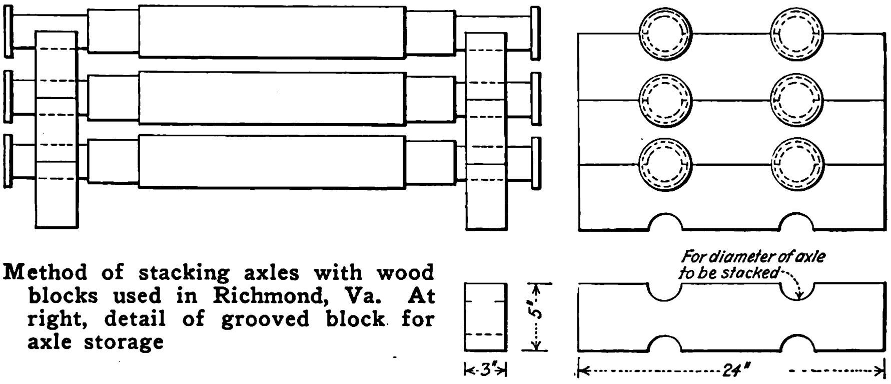
Grooved Wood Blocks for Axle Storage



Method of stacking axles with wood blocks used in Richmond, Va. At right, detail of grooved block for axle storage

DUE to car axles being scattered about the floor the machine shop of the Virginia Electric & Power Company, Richmond, Va., presented a rather untidy appearance until the master mechanic, W. J. Hicks, devised a method for their neat, compact and systematic stacking. This consists of the utilization of oak blocks grooved to conform to the diameter of the axles to be stacked, and placed between each pair of axles at either end. The blocks are 3 in. high, 5 in. wide and 24 in. long.

To permit of easy handling the axles are stacked under lifting facilities. New axles of one size are put in one pile, old axles of the same size to be turned are placed in another, and bent axles of the same size in a third. With this arrangement axles can be removed from the top of the pile and the ones on the bottom will not have to be disturbed, although they can be inspected readily.

This stacking of axles has improved the shop appearance and has provided a means for decreasing the floor space required for the storage of a given number of axles. When not in use these blocks can be stored away in a neat and systematic manner.

ROLLING STOCK—TRUCKS

Handy Type of Car Wheel Buggy

SHOPS are sometimes so crowded that it is impossible to roll wheels after they are mounted and unless some type of crane or hoist is available the transporting of wheels is rather difficult. To meet this condition a handy type of buggy has been devised in the shops of the Grand Rapids Railway, Grand Rapids, Mich. This consists of two central 8-in. diameter wheels connected by a shaft. Arms extend out on either side of this shaft a distance necessary to support a pair of mounted car wheels. Each supporting arm is made of two pieces of steel strap, one piece passing above and the other below the shaft. These are shaped to provide an ample bearing surface and the extreme ends are turned up so that a pair of wheels can be rolled into position and held without danger of slipping off. A pair of wheels mounted on the buggy can be balanced easily and so pushed endwise to any location desired. When the wheels are in a balancing position there is a small clearance for the ends of the supporting straps above the floor.

ROLLING STOCK—TRUCKS

Truck for Handling Car Axles

FOR moving car axles about the shop a handy truck is used by the Interborough Rapid Transit Company of New York.

This truck, which was designed and built in the company's shop, is shown in the accompanying sketch. To lift and move an axle the truck is placed so that the wheels straddle it and the handle, *C*, raised to such a height as will permit the tongs, *A*, to grip the axle slightly beyond the center of gravity. Lowering the handle, *C*, raises one end of the axle from the floor until the hook, *B*, can be slipped under the overbalanced end. By raising handle, *C*, the axle is then lifted clear of the floor so that it can be transported to any desired location.

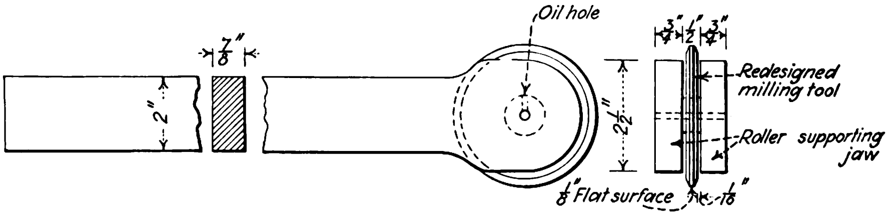
ROLLING STOCK—TRUCKS

Polishing Bearing Surfaces of Axles

POLISHING bearing surfaces of axles is the purpose of a tool which has been designed and constructed in the shop of the Virginia Electric & Power Company, Norfolk, Va., under the supervision of the master mechanic, T. W. Madison. This tool consists of a redesigned 3-in. milling cutter, together with a suitable supporting arm. Finding that a 3-in. milling cutter with a 1-in. arbor hole had served its usefulness as a milling tool, the remnants of the teeth were turned off and the circumference was given a rounding contour except at the top, which was left flat for about ⅛ in. The 1-in. arbor hole was bushed down to ½ in. to provide for the insertion of a ½-in. steel shaft. This bushing is installed with a 1/16-in. projection beyond the side surfaces of the roller to allow sufficient clearance between the side faces and the inside surfaces of its supporting jaw.



Appearance of assembled roller and arm used for polishing purposes

The supporting jaw and arm are made from a 2-in. x 3-in. steel bar, one end being slotted and drilled for the roller and shaft. The bar is tapered down to 2 in. x ⅞ in. about ½ in. from the slotted end, to fit in the tool rest. A ⅛-in. diagonal hole is drilled through the roller bushing for lubrication.

The axle to be polished is run in a lathe at about the same speed as for a finishing cut. The polishing tool installed in the tool rest with the roller forced against the oiled shaft surface produces a high-luster finish.

The results obtained with this polishing tool have been so satisfactory that the usual method of polishing by means of fine files or emery paper has been discarded.

Electric Railway Journal Maintenance Data Sheet

STANDARDS

Standard Dimensions of Journal Bearings

THE American Electric Railway Engineering Association has six standard journal bearings which are arranged to fit the six standard axles of the association. These were adopted as revised in 1926. The accompanying drawing and table give these. Originally the standard journal bearings for the six sizes of journals required six drawings. In order to provide uniformity a change on one usually required similar changes on the others, so that six drawings had to be changed each time. As a number of changes appeared desirable to the 1926 equipment committee, it was considered preferable to reduce the number of drawings and provide a table to show the different dimensions. In arranging this it was found that some of the dimensions were not uniform for various sizes. The use of the single drawing and table made these apparent at once, while when used on several drawings they would not be noticed.

ROLLING STOCK—PAINT SHOP

Lamp Bank for Use in Paint Shop

EXTERIOR illumination of cars undergoing painting in the paint shop of the Lynchburg Traction & Light Company, Lynchburg, Va., has been improved greatly since several lamp banks were installed in convenient locations adjacent to the cars. These lamp banks were designed by Master Mechanic M. M. Cochran and built in the shop. They consist of a base made of dry oak 1½x7x12 in., in the center of which is installed a piece of ¾-in. conduit 48 in. long. About 1 in. from the end of the conduit is installed a piece of ash 1x3x18 in. long and fastened to the ¾-in. conduit by means of a ¾-in heavy pipe strap. This piece of ash acts as a base for the support of the five incandescent lamps and is grooved in the center to permit of the installation of the wires, which enter the conduit through a ⅝-in. hole drilled directly above the base, make their exit from the end of the conduit and drop down to the groove in the lamp supporting base. Compound poured into the pipe about 3 in. up from the base prevents injury to the insulation of the wires from chafing at their entrance to the conduit. A drilled wood plug inserted in the end of the conduit prevents chafing injury to the wires at the point of their exit from the conduit.

ROLLING STOCK—PAINT SHOP

Car Painting in Berlin

THE all-metal cars on the Berlin Street Railway system are painted with both the brush and the spray methods. Particulars of these cars were published in the ELECTRIC RAILWAY JOURNAL for Jan. 29 and Feb. 5. The schedule of application with the brush and spray methods appears in the accompanying tables:

SCHEDULE OF OUTSIDE ENAMEL APPLICATION WITH BRUSH, BERLIN CARS

1. Rub all rust spots with No. 00 sandpaper.
2. Wash the surface of the plate with a cleaner to remove any grease or remaining rust spots.
3. Put on foundation oil paint, white.
4. Putty (or cement) all cracks and screw holes.
5. Put on coat of oil paint, white and yellow.
6. Rub down with No. 00 sandpaper.
7. Put on coat of oil paint, white and yellow.
8. Rub down with No. 00 sandpaper.
9. Put on a coat of enamel, white and yellow.
10. Rub down with oiled paper and pumice.
11. Put on a coat of enamel, white and yellow.
12. Rub down with oiled paper and pumice.
13. Striping and lettering.
14. Apply outside varnish.

Total time required is five working days and the material used is as follows:

Material required:

Oil paint, white	6 kg. or	13.2 lb.
Lead putty	1.5 kg. or	3.3 lb.
Oil paint, yellow	3.5 kg. or	7.7 lb.
Enamel, white	3.0 kg. or	6.6 lb.
Enamel, yellow	3.0 kg. or	6.6 lb.
Enamel, black	0.5 kg. or	1.1 lb.
Outside varnish	2.0 kg. or	4.4 lb.
Rubbing enamel	1.0 kg. or	2.2 lb.
Pure turpentine	1.0 kg. or	2.2 lb.
Cleaning fluid	2.0 kg. or	4.4 lb.

SCHEDULE OF OUTSIDE ENAMEL APPLICATION WITH SPRAY, BERLIN CARS

A number of cars were painted with the spray method. The first four steps were the same as those just given for the brush method. The later steps were as follows:

5. Rub down with sandpaper.
6. Apply one coat of white oil paint to the upper half by spray.
7. Apply one coat of yellow oil paint to the lower half of spray.
7. Apply one coat of white japan enamel by spray.
9. Apply one coat of yellow enamel by spray.
10. Rub down with oiled paper and pumice.
11. Apply one coat of yellow enamel by spray.
12. Rub down with oiled paper and pumice.
13. Striping and lettering.
14. Apply outside varnish by spray.

Total time required three working days.

The temperature of the room should be 25 deg. C. (or 77 deg. F.) if possible. Artificial drying is not necessary.

The material required is as follows:

Foundation oil color, white;		
(white paint)	0.75 kg. or	1.8 lb.
Pure turpentine	0.75 kg. or	1.8 lb.
Lead putty	1.5 kg. or	3.3 lb.
Oil paint, white	1.8 kg. or	4.0 lb.
Oil paint, yellow	4.0 kg. or	8.8 lb.
Japan enamel, white	1.0 kg. or	2.2 lb.
Enamel, yellow	3.5 kg. or	7.7 lb.
Enamel, black	0.5 kg. or	1.1 lb.
Outside varnish	2.5 kg. or	5.5 lb.
Pure turpentine	0.5 kg. or	1.1 lb.
Cleaning fluid	2.0 kg. or	4.4 lb.

Improved Equipment

for Electric Railway Maintenance

RELIABLE, safe and attractive transportation is a prime requisite of any campaign to attract additional riders. To provide this, much depends upon the equipment available for carrying on the various maintenance operations. More modern machine tools are needed in railway repair shops and improved tools for track and line maintenance work will assist materially in reducing delays and provide for the passengers a smooth, noiseless ride.

Some of the latest improved equipment for railway maintenance is described in the following pages. Careful study of them should produce many suggestions as to equipment needed to bring maintenance to a higher standard and carry on repairs efficiently and economically.

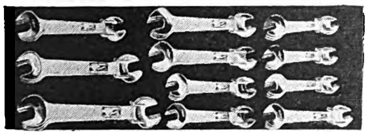
◆

For Repairing Car Body and Overhauling Trucks

Wrench Set No. 311

BONNEY FORGE & TOOL WORKS
Allentown, Pa.

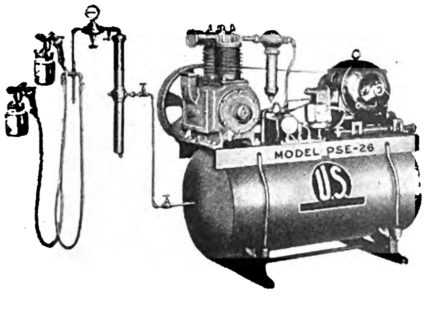
WRENCHES in sets, as shown, are suitable for general repair work. This set, designated as No. 311, consists of three each of the eleven most popular sizes. They are drop forged from vanadium steel, very light and thin but yet strong and well balanced. Thin, pear-shaped jaws permit maximum clearance in close quarters. Each one is guaranteed to strip the thread or break the bolt without damage to the wrench.



Paint Spray Equipment

UNITED STATES AIR COMPRESSOR COMPANY
Cleveland, Ohio

MODEL PSE-26 paint-spraying unit, as shown, is of the twin-cylinder, air-cooled, single-stage type and has sufficient capacity for the continuous operation of two paint guns. It will operate within a tank pressure range of 90 to 125 lb. The reducing valve mounted on the moisture separator permits an air adjustment of from 40 to 90 lb. for painting. The displacement of this unit is 16 cu.ft. of air per minute.

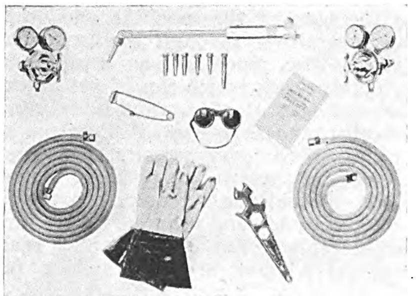


The 60-gal. tank has longitudinal seams, riveted and copper brazed. The compressor is belt-driven by a 3-hp. a.c. or d.c. motor, as desired. The complete unit is 36 in. wide, 52 in. long and 48 in. high. It is shipped with moisture separator, reducing valve, air gage, two paint spray guns with quart cups and two 25-ft. lengths of hose and fittings.

Combination Cutting and Welding Equipment

ALEXANDER MILBURN COMPANY
1416-1428 West Baltimore Street,
Baltimore, Md.

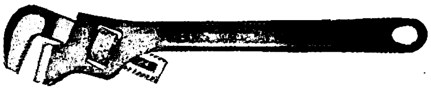
WITH this equipment all operations of welding and cutting can be handled. It is necessary only to change the tips to cut or to weld. The outfit consists of a type N.I. combination torch, 21 in. long; three welding tips, three cutting tips, an oxygen regulator with 3,000-lb. initial pressure gage and 200-lb. delivery pressure gage, acetylene regulator with 500-lb. initial pressure gage and 50-lb. delivery pressure gage, 25 ft. oxygen hose and 25 ft. acetylene hose, both with couplings; a pair of fiber frame goggles, a pair of workman's gloves, friction torch lighter, combination wrench, instruction book and pressure chart. The approximate shipping weight is 45 lb.



Lawson Pipe Wrench

LAWSON MANUFACTURING COMPANY
6505 Carnegie Avenue, Cleveland, Ohio

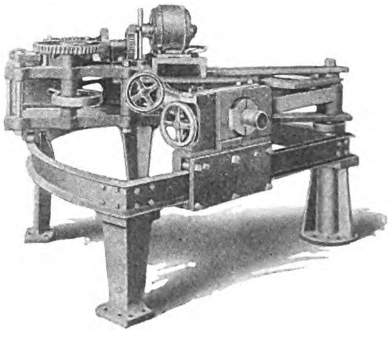
WRENCHES of the type shown are all drop forged from a high grade of steel and have removable jaw housings forged solid with the handle. The jaw teeth are said to be hardened and tempered to give the greatest strength with the least wear. Because it has an angle handle, the Lawson pipe wrench is adaptable to many positions. It has working access to pipes lying close to the floor, wall or ceiling, where it will give ⅛ turn of the pipe. The wrench has exceptional strength in both handle and jaw. Its compact, self-contained and well-balanced design is mechanically correct. The jaws, which are always in an open position ready to grip a pipe, will release instantly when the wrench is to be removed from the pipe. The location of the adjusting nut and the one coil spring used to hold the jaws open permit of one-hand operation. It is made in sizes of 8, 10, 14, 18 and 24 in.



Type E Motor-Operated Pipe-Bending Machine

AMERICAN PIPE BENDING MACHINE COMPANY, INC.
37-39 Pearl Street, Boston, Mass.

BENDING of 1¼-in. to 4-in. cold pipe without having it filled with any substance is the purpose of the machine shown. It is capable of making 1¼-in. to 2-in. pipe bends at the rate of ten to fifteen per hour and 2-in. to 4-in. pipe bends at the rate of five to ten per hour. A 3-hp. motor is fur-

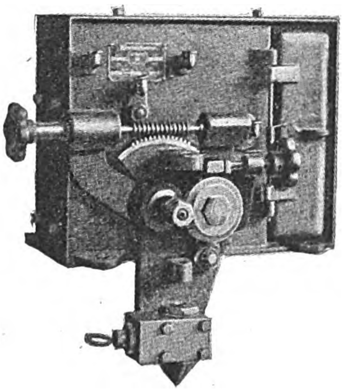


nished with each machine. The complete machine weighs approximately 3,800 lb. and occupies a floor space of 7 ft. 6 in. x 7 ft. 6 in. Suitable bending forms and pipe holders are furnished for the bending of 1¼-in. to 4-in. pipe. Other motor-operated machines in production are the type F standard for bending 3-in. to 6-in. cold pipe and the type F special for bending 3-in. to 5-in. cold pipe. Where hand-operated machines are desirable type F Junior can be furnished for ½-in. bends, type A for ⅜-in. to 1-in. bends, type B special for 1¼-in. to 2-in. bends and the type B Hercules for 3-in. to 4-in. bends. The same construction is incorporated in the hand-operated machines as in the motor-operated machines.

The Auto Arc

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
East Pittsburgh, Pa.

WESTINGHOUSE auto arcs or automatic arc welding heads are designed for production or repair work on repetition operations, by which production can be greatly increased due to the greater welding speed obtainable. They are adaptable to welding axle housings, gear cases, metal pans or boxes, building up worn car wheels, flanges or brake equalizers and any work where a bead of metal is to be laid in a regular path. The machine automatically feeds the welding electrode to the work at the required speed for the job and will maintain a constant arc voltage. The auto arc will strike the arc automatically. The unit is entirely self-contained, no other mechanism being required except the actual work handling machinery designed either to move the auto arc along the seam to be welded or to pass the work under the arc. The machine consists of a housing approximately 18 in. long, 7 in. wide and 14 in. high, in which is contained a control and driving mechanism. The rolls, guides and nozzle through which the electrode is fed to the arc extend from the front of the case.

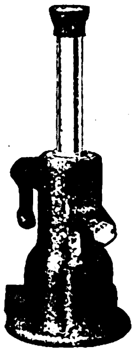


The driving and feed mechanism is regularly supplied for use on 110 volts, 25, 50 or 60 cycles alternating current or 230 volts direct current, as desired. Special machines for other voltages may be obtained. The driving and feed circuit is entirely separate from the arc circuit and is not affected by it. It is claimed that the auto arc will stand up under shop conditions and have practically no maintenance except lubrication and an occasional inspection of the moving parts. Adjustments are possible on the nozzle so that the arc can be directed to the part of the work where the weld is desired.

Petersen "Oiljak"

OIL JACK COMPANY, INC.
15 Park Row, New York City

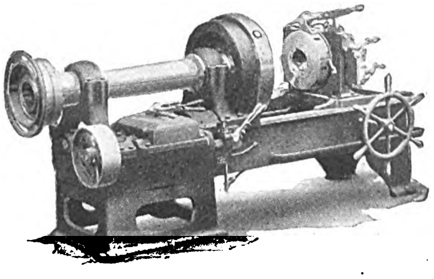
TWO popular models of the "Oiljak," the JB-3 of 3 tons capacity and the JB-10 of 10 tons, are now in full production. Any load within the capacity can be raised with little effort, steadily, smoothly and quickly. Loads can be lowered without jar or shock and can be stopped instantly at any position. An important feature permits of operation of the jacks with short, inch by inch motions of the handle if desired. A full stroke is not necessary, as is the case of most jacks. This makes the jack advantageous for use in cramped quarters. Where danger exists the jack can be operated from a distance by using a longer handle.



No. 4 Peerless Improved Pipe Machine

BIGNALL & KEELER MACHINE WORKS
of the N. O. NELSON MANUFACTURING COMPANY
Edwardsville, Ill.

MODERN machine tool design trends toward elimination of cone pulleys and belts. The pipe threading machine shown is designed along these lines. While using a single driving pulley, a constant belt speed is obtained which can be suited to the heavier work. Eight speeds are obtainable with a constant speed motor by shifting the gears. The motor is bolted to the rear of the machine and power is transmitted through a silent chain drive. The machine has a universal gripping chuck which can be set quickly for any size of pipe, thus adapting it for all-round shop use. A Peerless adjusting mechanism permits adjustment to obtain threads at different gages. A cut-off tool and a reamer provide for the cutting off and reaming of all pipe. Accessibility of all gears and ready removal of dies are outstanding features. A direct-connected oil pump is furnished for lubricating purposes.



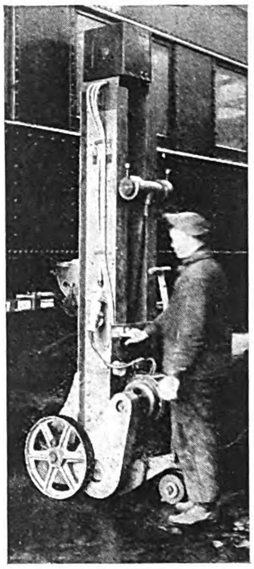
All parts of the machine are accessible for inspection and repairs. It occupies a floor space of 34 in. x 98 in. Each machine is furnished with one set of right-hand dies for threading 1-in., 1¼-in., 1½-in., 2-in., 2½-in., 3-in., 3½-in. and 4-in. pipes.

Portable Car Hoists

WHITING CORPORATION,
Harvey, Ill.

PORTABLE car hoists of this manufacturer embody the same basic principles as the Whiting locomotive and truck hoists now widely used. The car hoist consists of a machined steel screw of ample diameter mounted on a worm gear in a substantial base and housed by a structural frame. The projecting step or support by which the car body is lifted rests on a bronzed nut on the steel screw. The car weight is carried on a hardened and ground alloy steel roller bearing. Power is supplied by an electric motor.

By using two pairs of portable hoists, one pair at each end of the car, the entire car body may be raised off the truck at once. The trucks can then be coupled and handled at one time. All four hoists may be operated as one unit, with the control in one push-button station.

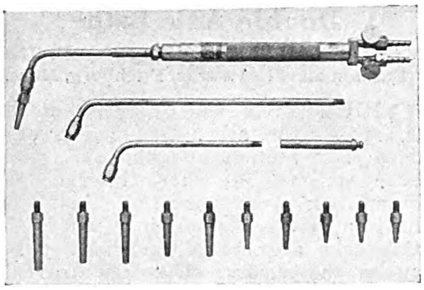


A toggle mechanism lifts the base of the hoist off the ground high enough to put the weight on the wheels, allowing the hoist to be pulled from place to place like a small truck. After being moved into position alongside the car a reverse movement of the toggle lowers the hoist so that its three bearing surfaces rest squarely on the floor. These are spaced to give much greater stability than ordinary jacks. The hoist shown needs no foundation or pit, but may be used on any level floor capable of sustaining the load. No air or water lines are required. Power is used for lowering, so that blocking is not needed under a car, which may be left over the noon hour or night without danger. The hoist will handle cars of any class or size, making unnecessary an assortment of special jacks.

Airco-Davis-Bournonville Style 7700 Welding Torch

AIR REDUCTION SALES COMPANY
342 Madison Avenue, New York, N. Y.

GAS consumption at the rate of one volume of oxygen to one volume of acetylene, which is the ideal for a perfect neutral flame, is said to be practically attained in the style 7700 torch with oxygen of 99.5 per cent purity. The principles of mixing embodied in the design produce a soft, high temperature neutral flame which favors high quality welding with speed and economy. The new torch is approved by the Underwriters Laboratories and is especially well balanced. The possible combination of extension tubes, mixers and tips provides a torch for a full range of welding from sheet metal to heavy forgings or castings.

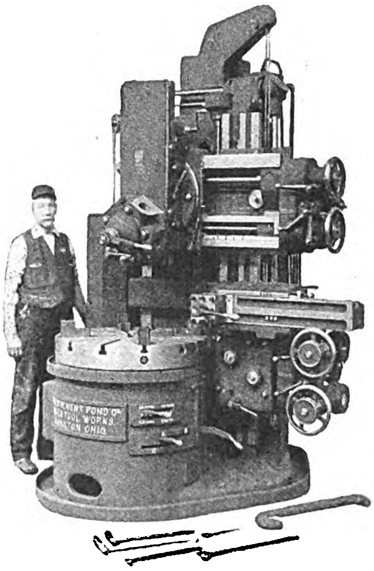


The rear end is a brass forging. The handle is made of seamless knurled brass tubing. The head is of special bronze. Seamless oxygen and acetylene tubes are silver soldered to the head and rear end. Extension tubes 6 in., 9 in., and 16 in. long fit either mixing head. The complete weight of the torch with an 8-10-in. mixer, 9-in. extension tube and with the No. 10 tip is 30 oz.

Side-Head Boring Mill

NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond
Company, Hartford, Conn.

WITH the side head of this boring tool in working position the machine will take work up to 38 in. diameter. A feature is that the side head may be lowered below the table, so that work up to 44 in. diameter can be finished all over with the vertical head. The bed and column are cast integral. The left-hand housing has a flat bearing and the right-hand housing has a three-track bearing with a long narrow guide for the cross rail and side head. The table and chuck are made in one unit mounted directly on the spindle. The three-jaw chuck which is regularly furnished can be operated either universally or independently. The spindle has a taper bearing for absorbing the vertical thrust. Power is delivered to the table through beveled gears and a disk type clutch. The speed change unit is of the selective sliding gear type, with twelve speeds controlled by two levers. The cross rail is elevated and lowered by means of power. The turret slide can be swiveled in either direction to an angle of 30 deg., the swivel being graduated on both sides. This adjustment is made by a worm and worm segment which can be operated from either side. Sixteen positive feed changes are provided. Rapid traverse in all directions and a complete equipment of micrometer dials and observation scales are at the operator's command.



The turret rotates around a cylindrical stud and has bearings equal to the full diameter of the turret. The turret has ten indexing positions so that it can be indexed half way between each of the regular positions. With the turret indexed half way, two tool holders are brought within the field of operation. The side head is mounted directly on the column and there are but two movable joints between the cutting tool and the column. The head extends across the column with a bearing at the center so that all strains are taken on the full width of the column. Rapid power traverse is provided in horizontal and vertical directions for the side head as

◆

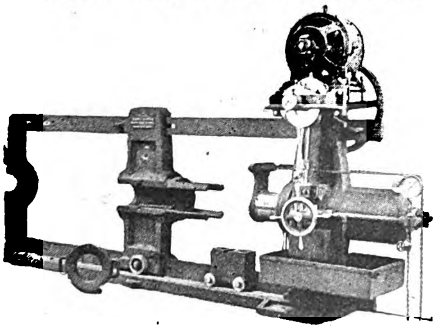
Wheel and Axle Machining

Wheel Press

NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond
Company, Hartford, Conn.

CAR wheel presses of 48-in. size have the cylinder member resistance head and end post mounted on a heavy base plate. The cast-steel cylinder is lined with copper expanded into place and burnished. The piston is packed with cup leather.

The hydraulic pressure for working the ram is obtained from a triple plunger pump. Each plunger has a safety valve. All three plungers may be worked simultaneously or any one or any two may be thrown out, giving a variety of pressures that may be exerted on the piston up to the maximum capacity. The pressure is released by a hand wheel operating a relief valve which permits the water to flow back from the cylinder to the suction tank. A gage indicates the pressure on the ram as well as the total pressure in tons. The resistance head is made of cast steel, supported on rollers running on planed ways on the base. An opening permits the passage of axles. The end post has an opening corresponding to that in the resistance head so that long shafts may be handled. Unless otherwise specified trucks are provided to support the wheels in the press and handle them on and off the axles. These machines can be furnished for either belt or motor drive.



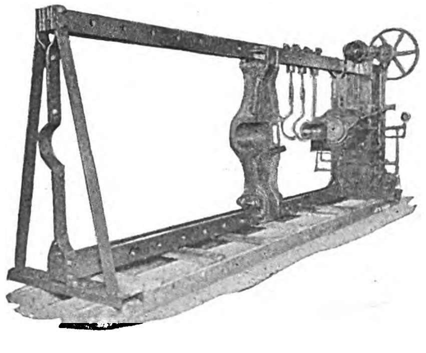
In order to press off wheels from their axles without interfering with the gears a removable attachment with projecting legs can be provided. These legs pass through the holes of the gear wheel and a hinged collar is provided to be placed against the body of the wheel in order to afford a surface against which the wheels can press.

Hydraulic Wheel Press

LOURIE MANUFACTURING COMPANY
Springfield, Ill.

THIS press was designed especially for heavy pressures. Double bars prevent buckling of the press and shaft if the work is not perfectly centered or if more pressure is needed on one side than the other. The crosshead is a steel casting and a steel gate is furnished for the gap. The resistance pins are tool steel. The ram is returned into the cylinder by means of springs. It is hollow, but has a removable disk fitted into the face. The standard equipment furnished includes all hooks, hangers and fittings, as shown in the illustration, as well as a hydraulic gage, safety valve, operating valve and all other necessary valves and fittings. An automatic differential type of pump used operates the ram rapidly under low pressure and slowly under high pressure.

The buttress behind the cylinder is built up of structural I-beams. This permits the use of standard close-grained semi-steel cylinders and pumps. The cylinders are highly polished. Machined cast fillers are placed between the strain bars and the webs of the I-beams. Beams, fillers and strain bars are clamped together by stud bolts.

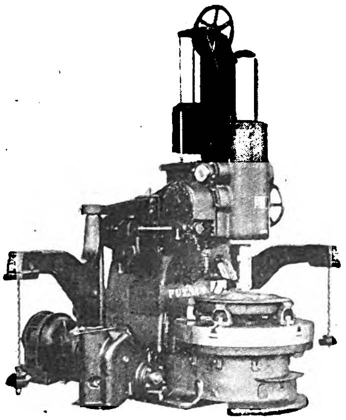


well as the vertical head. Each head has sixteen feeds. Flood lubrication is provided for the spindle bearings, speed change gear unit, the feed gear units and the cross rail elevating mechanism. The machine can be furnished for belt drive through a single pulley or with a motor drive. The floor space required is 81 in. x 93 in. It is made in 36 in. and 44 in. sizes.

48-In. Wheel Boring Machine

MANNING, MAXWELL & MOORE, INC.
Putnam Machine Works, Fitchburg, Mass.

RAPID power traverse in either direction to both the boring and the facing spindles is regularly furnished with this 48-in. wheel-boring machine in addition to the usual power feeds. One lever controls the feed and traverse movements in each case. The chuck can handle wheels from 6½ in. to 42 in. diameter on the tread. The table is driven by a high carbon cast steel bevel gear and a forged nickel steel pinion. The boring spindle is of large diameter and travels in a long bearing. It has ample travel to allow of running the boring bar above the throat of the machine. The boring spindle is equipped with four feeds controlled from the operator's working position. Power traverse to the boring spindle is provided in both directions and is controlled from one lever.



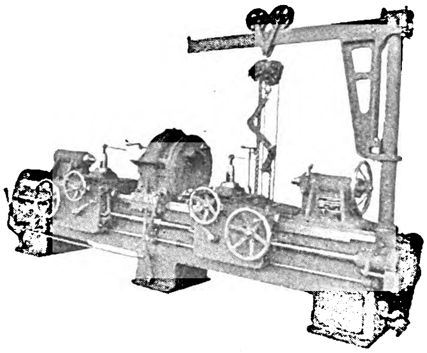
The chuck table has five chuck jaws of hardened steel, conforming in shape to the flange and throat of the wheel tread contour. They are operated universally by a slight motion of one of the three cam studs that are provided so that one will always be convenient to the operator when the table is stopped. If desired, a pneumatic chuck, a hub facing attachment and a pneumatic or mechanical crane can be furnished. The hub facing ram is fitted with a sliding head at its outer end for vertical adjustment of tools. Hubs may be faced while the wheel is being bored.

The drive is through a unit and self-contained gear box giving four speeds in geometrical progression through sliding gears running in oil. If the machine is belt-driven the power is transmitted to the gear box through a constant speed pulley. With electric drive a constant speed motor is geared directly to the gear box. The gear box may be omitted and a three to one variable speed motor geared directly to the table pinion shaft. The machine is started and stopped by starting and stopping the motor.

Double Axle Lathe

MANNING, MAXWELL & MOORE, INC.
Putnam Machine Works, Fitchburg, Mass.

RIGIDITY is said to characterize this axle lathe. The bed is of a deep, box section and the side walls are connected at short intervals by broad box ties. Longitudinal trusses having cast racks, against which the tailstocks are braced, are located between the shears. The legs are cast integral with the bed, one of them being utilized as a tank for the cutting lubricant. The hollow spindle is driven by a herringbone gear and pinion running in a bath of oil, thus affording positive lubrication. The spindle revolves in bronze bearings, one on each side of the main gear. The drive is by means of a double tailed dog which bears against the cast lugs on the equalizing plate. Both tailstocks are adjustable along the bed. Pawls attached to the body engage cast racks in the bed to prevent slipping under a heavy cut. The carriages are guided by V's on the front and rear of the bed and are gibbed on horizontal and vertical surfaces directly in line with the tool thrusts. The feed aprons are of a double wall construction, furnishing a support for all shafts at each end.

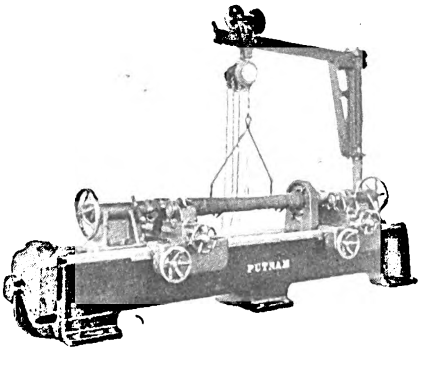


An inclosed feed gear box gives three positive feeds which are changed from the center of the bed. The gears are of hardened steel and run in oil. If desired, a crane can be furnished for lifting the axles in and out of the lathe.

Axle Burnishing Lathe

MANNING, MAXWELL & MOORE, INC.
Putnam Machine Works, Fitchburg, Mass.

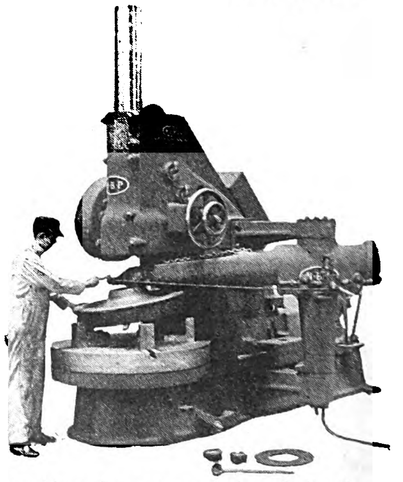
JOURNAL burnishing is the principal function of this machine, which in general consists of two tailstocks and two carriages mounted on a base, each carriage having a front and a rear burnishing tool. Both journals of an axle are burnished at the same time. The bed is of box section. The side walls are connected at short intervals by box ties. The legs are cast integral with the bed. Both tailstocks are adjustable along the bed. Permanent alignment is maintained by means of taper gibs. The two burnishing rolls are brought into contact with the axle by means of a large diameter screw, operating in bronze nuts. The screw is not confined in the carriage endwise, but is free to float, thus the burnishing tools are forced against the axle with equal pressure and no end thrust is taken by the screw or carriage. By setting the burnishing rolls at a slight angle they feed automatically and therefore a feeding mechanism is not required. The aprons contain only the pair of gears and rack pinion for the hand movement of the carriages. A suitable crane can be furnished with this machine. The floor space required with a motor drive and without the crane is 14 ft. 6 in. x 4 ft. 8 in.



48-In. Wheel Borer

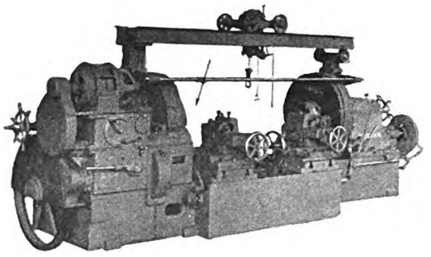
NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond Company, Hartford, Conn.

IN this line of heavy boring machines a self-contained single casting frame makes for rigidity. There are no joints to allow the boring bar to be thrown out of alignment with relation to the table. As soon as the machine is started the wheel is locked rigidly in the self-centering automatic chuck. Stopping and reversing the operation of the table will automatically loosen the wheel from the chuck. All operating levers and handwheels are within easy reach of the operator. Four feeds are available. Changing from a roughing to a finishing feed is accomplished by means of a single lever. There are tapered bushings for both the boring bar and the table spindle. Either a pneumatic or drum type quick-acting crane can be furnished, as desired. The table revolves in a bath of oil on an annular bearing. The bevel driving gear is of semi-steel and the bevel pinion of forged steel. When so ordered, the machine will be equipped with a hub facing attachment. The hub facing bar feeds from the center outlet, so that it can be used at the same time as the boring bar is feeding downward. These machines can be driven by a constant speed motor, an adjustable speed motor, or a belt, as desired.



48-In. Wheel Lathe

MANNING, MAXWELL & MOORE, INC.,
Putnam Machine Works, Fitchburg, Mass.



WHEELS from 24 in. to 44 in. in diameter on the tread can be turned on this lathe. The bed is heavy, deep and of ample width for the swing of the lathe and it is braced with cross and longitudinal ribs. All bearings are bronze bushed. The spindle and faceplate are made as one piece. Twelve radial T-slots are provided so that either three or four driving dogs may be used. The end thrust is taken by thrust washers running in a bath of oil. The faceplates are driven by forged steel pinions mounted on a high carbon steel shaft which is carried in bronze lined capped bearings. Each faceplate is equipped with four adjustable, equalizing driving dogs. The tailstock has a power traverse by individual motor and a friction clutch allows the motor to be started under no load. The tool rests are designed with an adjustment to take care of the minimum and maximum diameter of wheels.

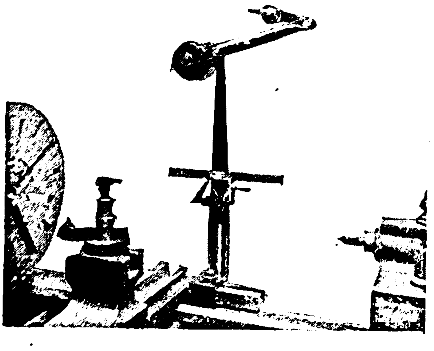
The feeding mechanism gives several impulses per revolution and is practically continuous. The feed ratchets operate in either direction and are of the inclosed type, excluding chips and eliminating accidents to the operator. A simple calipering attachment furnished with each machine enables the operator readily to size both wheels to the same diameter. When desired a pneumatic hoist can be furnished for raising and lowering the wheels. Either inside or outside journal turning attachments, or both, can be supplied. The machine can also be equipped with a wheel boring attachment. If facing the rims and hubs of the wheels is part of the shop procedure, a cross feed can be furnished. These machines can be supplied with a constant speed motor drive, a variable speed motor drive or a belt drive.

Equipment for Electrical Repairs

Mica Undercutter

HULLHORST MICRO TOOL COMPANY
Toledo, Ohio

MOUNTING on any make of lathe carriage through the medium of an angle plate is possible with the No. 9 commutator mica undercutting machine. The main standard is held to the angle plate with two cap screws, which provides for vertical adjustment to take care of commutators up to diameters of 22 in. Regulation of the depth of the undercutting is obtained with the depth gage mechanism mounted on the vertical standard. The lower arm of the undercutter slides on the depth gage bar.



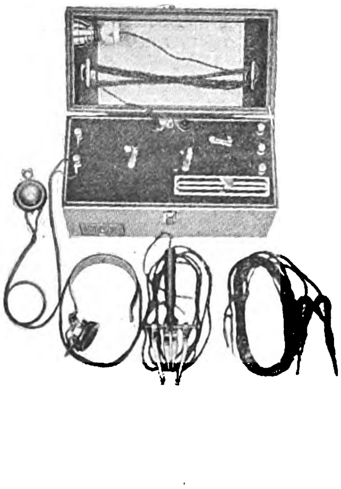
The cutter spindle and the tapering arbor are made of crucible steel lapped into bronze bearings. Sufficient rigidity is assured by building the spindle in the lower arm with a tapering arbor of $\frac{3}{16}$ in. diameter at the cutter.

Mill-cut precision cutters can be supplied for any depth of slot. The motor is installed at the top of one swinging arm and the power is transmitted to the spindle through a belt turning through a triple mechanism at the center pivot. It is stated that this machine will undercut mica $\frac{1}{32}$ in. deep at the rate of more than 200 ft. per hour. The undercutter is furnished with either a 60-cycle, 110-volt a.c. motor or a 110-volt d.c. motor. The swinging arm can be placed out of the way in the upward position when not in use.

Field Tester

CENTURY ELECTRICAL COMPANY
100-102 Randall Avenue, Syracuse, N. Y.

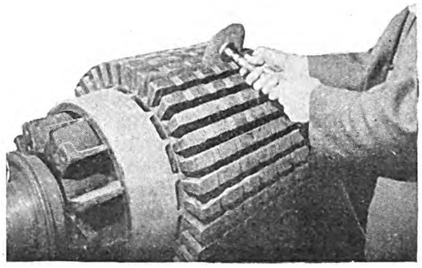
FIELD and armature coils of direct-current motors and generators may be tested conveniently with the New Century field tester. Fields may be checked either in place or out of the machine. By testing them in place there is no danger of removing the wrong coil unnecessarily, while the checking of new or repaired coils previous to installation prevents faults leading to the burning out of an armature or the remaining field coils. A scale shows the exact condition of the coil under test, making it possible to detect partial short or open circuits. In testing armature coils, the Century tester will locate open or short circuits, wrong or crossed connections and grounds without unsoldering any lead wires from the commutator or removing the hoods.



Martindale Slot Cleaning Outfit

MARTINDALE ELECTRIC COMPANY
Box 2660, Lakewood Branch,
Cleveland, Ohio

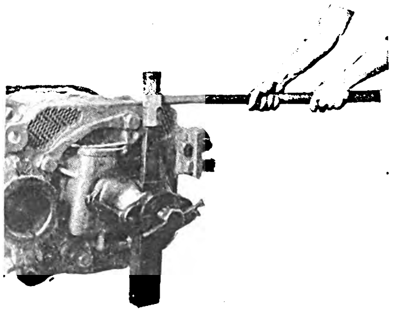
CLEANING the armature core slots by means of grinding disks is the ideal method of removing old insulation prior to the rewinding of the armature. It saves 75 per cent of the time and labor required for the usual cleaning process. The machine shown will perform this work and in addition will remove quickly old solder from the riser slots. With the addition of a fiber stiffener between the disks, burrs that will turn a file can be ground off easily. A complete outfit consists of a motor, flexible shaft, ball bearing handpiece disk holder, 36 assorted grinding disks, three fiber stiffeners and a box of shaft grease.



Pinion Puller

GENERAL ELECTRIC COMPANY
Schenectady, N. Y.

SPLIT rings are used with this pinion puller, each half being provided with lugs through which hinge pins are placed to hold the two firmly together. The wedging principle is used, but the wedge, instead of being where it can damage bearings and housings, is placed where it can do no harm. The puller ring grips all the pinion teeth equally, eliminating the possibility of damaging a number of teeth.

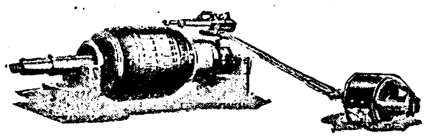


The component parts of the pinion puller are the puller ring, the pressure cap if required, the jack-screw, the wedge box, the wedge and the hinge pins. The wedge, wedge box and jack-screw are the same for all pullers, but the puller rings and pressure caps vary with the pinion for which the puller is required. A common ring may be used in some cases for pinions varying only slightly in diameter.

Commutator Grooving Machine

GENERAL ELECTRIC COMPANY
Schenectady, N. Y.

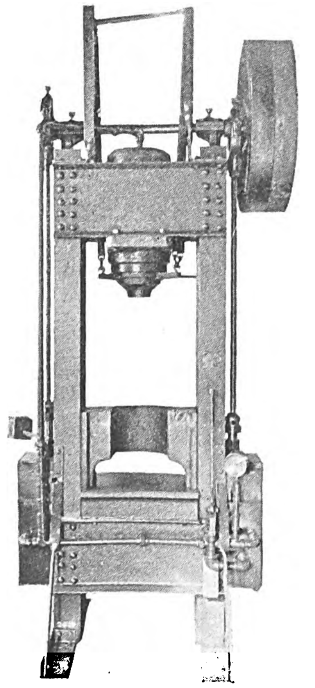
COMMUTATOR grooving machines of two types have been developed by this company, one portable and the other stationary. In form 2, the stationary machine, the base has adjustable pillow blocks with V-shaped bearing surfaces and brass rollers. The slide arm is designed for both vertical and angular adjustment, the latter to be used where the commutator bars are not exactly parallel to the shaft. The rotating saw is mounted on an extension of the motor shaft supported by an offset bearing. This readily permits the grooving of commutators having ears. Owing to the small size of driving motors used no starting resistance is necessary. The form 3 portable machine is simple and can be moved readily to any part of the shop. It is designed to be clamped to the armature shaft. This machine has adjustable stops which direct the travel of the saw to the brush surface of the commutator. A floating driving shaft permits the grooving of a number of slots at one setting of the armature. An angular adjustment can be used when the commutator bars are not exactly parallel to the shaft.



Inverted Forcing Press

LOURIE MANUFACTURING COMPANY
Springfield, Ill.

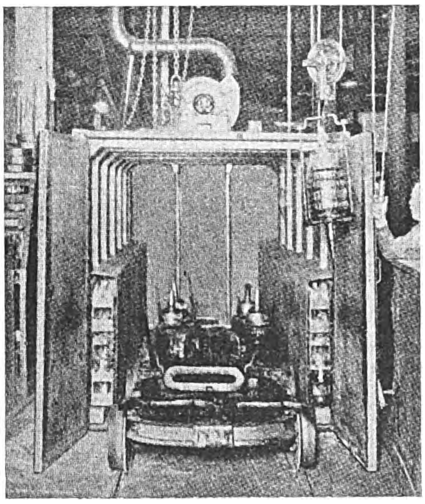
STRUCTURAL steel I-beams and channels hot riveted are used in this inverted forcing press. It is a complete self-contained unit. The pumps, most of the valves and the piping are inclosed in the oil reservoirs on the side. This eliminates leakage around the press. Leakage oil from the ram is carried to the reservoir by a telescoping pipe. The ram is returned into the cylinder by means of springs. The two pumps used on this press are of the differential type and work automatically. Two large pistons operate the ram rapidly under low pressure. When about one-seventh of the total pressure capacity of the press is reached the large pistons cease to function and the small pistons produce the heavy pressure. The press as shown is suitable for forcing, straightening, bushing work, etc. A hydraulic gage and a safety valve are furnished as a part of the equipment.



Electric Ovens for Baking Armatures

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
East Pittsburgh, Pa.

TYPE M electric oven is of the kiln type, consisting of an insulated room into which the work to be baked is wheeled on trucks or supported on angle brackets on the oven walls. The inside and outside walls are sheet metal and the 2-in. space between them is filled with high-grade insulation. The angle framework is bolted together and tie rods hold the sections firmly in place, making the oven capable of withstanding the heavy service of railway work. Sides, top and bottom are all of similar construction, giving the oven a high thermal efficiency. The heaters are placed on the side walls and, if conditions allow, along the middle of the oven floor, since this method gives better heat distribution. A wire screen protects the heaters from injury through contact when loading or unloading the oven. Ventilation is by a fan blower system, which increases the drying rate and prevents explosions. The control may be mounted on the side of the oven or separately, depending on which will be more convenient.

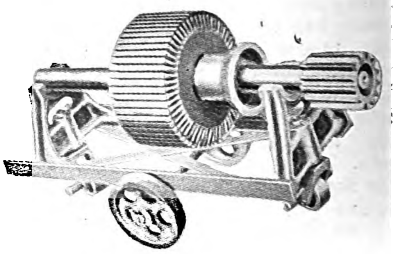


The temperature of the oven is held at the proper point by a sensitive thermostat. It is possible to maintain a temperature within 5 deg. F. of the desired point by this means. This control instrument actuates a magnetic contactor control panel which opens and closes the circuit supplying power to the oven and the temperature rises or falls. It is made in three sizes, M-107, M-109 and M-114. The M-107 size will handle six armatures per bake, the M-109 will handle eight armatures and the M-114 twelve armatures.

Armature Buggy Occupies Little Space

COLUMBIA MACHINE WORKS & MALLEABLE IRON COMPANY
3303 Atlantic Avenue, Brooklyn, N. Y.

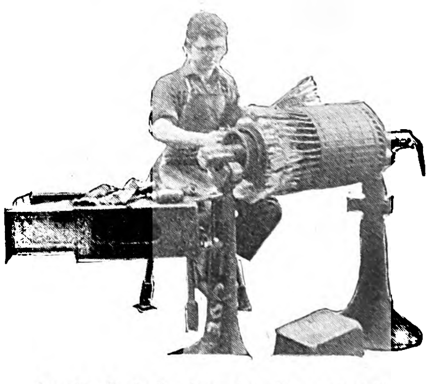
VERY small space is occupied by this adjustable buggy. Due to its adjustable features it is suitable for the reception of any size of motor armature. This adjustment is made by loosening two thumb screws located on the left-hand side of the frame and shifting the pedestals to the desired centers. A buggy of this type used for the transportation of armatures will reduce the possibility of injuring the commutators, shafts, etc. It is made of iron and strongly constructed throughout.



Adjustable Armature Stands Facilitate Repairs

COLUMBIA MACHINE WORKS & MALLEABLE IRON COMPANY
3303 Atlantic Avenue, Brooklyn, N. Y.

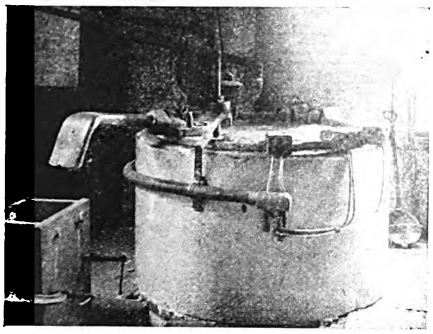
THESE armature stands are substantially made with a broad circular base, a low center of gravity and a screw to obtain a 10-in. height adjustment. The screw threads are made square in order to facilitate handling. Roller bearings in the cradles provide a means for the easy revolving of an armature as well as eliminating mechanical injuries to the armature shaft. Two pockets cast on the side of the stand provide receptacles for the brackets to support the workman's tool and material tables. These stands can be adapted to many repair jobs about the shop.



Electrically Heated Babbitt Melting Pot

GENERAL ELECTRIC COMPANY
Schenectady, N. Y.

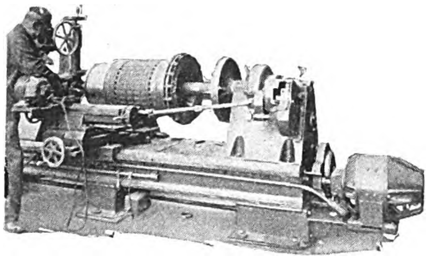
NEARLY all armature, axle and journal bearings for electric car equipment are rebabbitted. For this a conveniently arranged system for melting the babbitt is essential. To meet the requirement the General Electric Company has developed several different sizes of electric melting pots. The one shown in the illustration has a capacity of 5 tons. It is equipped with six cast-in heating units, each of 5 kw. capacity. This will melt 1,000 lb. of babbitt per hour. Temperatures of from 700 to 775 deg. F. are maintained by thermostatic regulation.



Banding, Slotting and Turning Machine

LEA COURTENAY COMPANY
Newark, N. J.

ON THIS machine an armature can be turned, slotted and banded without removing it. The machine is especially designed to handle heavy armatures such as are used on subways, elevated railways or interurban lines. The banding equipment is furnished with a device which can be adjusted to any given tension. An individual motor is used to drive each part.

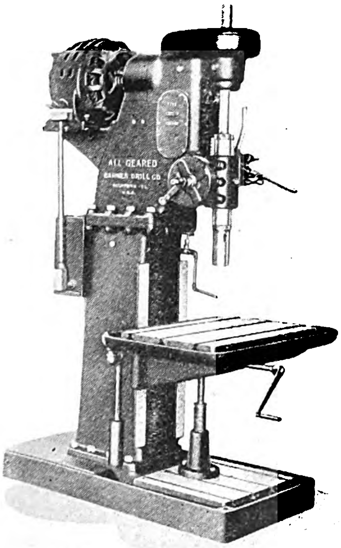


Machine Shop

Ball Bearing Geared Drill and Tapper

BARNES DRILL COMPANY
814-830 Chestnut Street, Rockford, Ill.

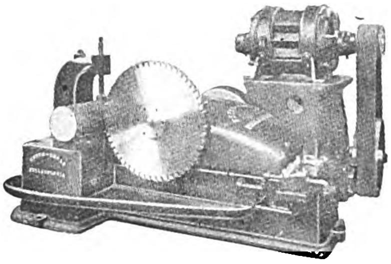
CORRECT speeds and feeds for any one size of twist drill from ⅜ in. to 1½ in. can be obtained on the machine shown. Its direct-connected motor drive through a multiple disk clutch gear provides for simplicity and convenience of control. All important shafts have radial ball bearings and a fixed splined spindle has a roller thrust bearing. The self-oiling system lubricates all radial ball bearings and gears. The gearing throughout is alloy steel and all important gears are heat treated. A 5-hp., 1,200-r.p.m. motor is recommended. The star wheel handle is conveniently located on the right-hand side of the machine. A table with a finished working surface of 27 in. x 17 in. is surrounded by oil channels. The rack is dovetailed to the sleeve and no screws are used. A counterbalance chain facilitates the quick return of the spindle. An added feature is a safety device to prevent overloading and minimize breaking of drills. There is an automatic stop, giving full spindle travel. The height of the machine is 75 in. and it occupies a floor space 34 in. x 48 in. The net weight without motor and starter is 1,750 lb.



Cold Saw Cutting-Off Machine

ESPEN-LUCAS MACHINE WORKS
Front Street and Girard Avenue,
Philadelphia, Pa.

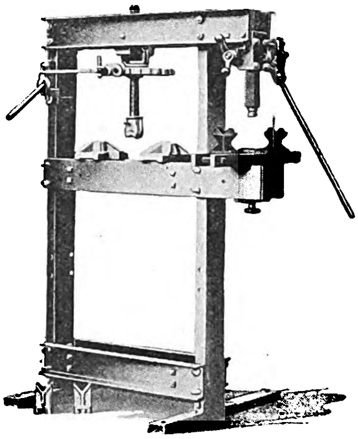
BARS, billets and other steel shapes can be sawed quickly on this machine. The housing and other principal castings are made of gray iron having thick walls and heavy webs. Spindle, driving gears and other working parts are made of high carbon steel forgings. The driving worm gear and main bearings are of bronze. Roller bearings take care of the heavy thrust. A self-priming pump supplies the lubrication for the saw. The feed, as well as the quick traverse in both directions, is accomplished by means of a low-pressure oil feed system. All speeds of traverse, including feed variation, are controlled by the movement of conveniently located levers. Automatic control can be had at the limits of the traverse, or at points determined by the operator. The machine can be operated by individual motor drive or from a countershaft, as desired.



Forcing Press

MANLEY MANUFACTURING COMPANY
York, Pa.

CAPACITY of 35 tons is obtained in the new Manley Press. Five leverages are used to change quickly from one speed to another, thereby enabling the operator to use the power best suited for the job. To change the leverage it is only necessary to slide the retaining collar forward, lift the connecting link and drop the pin in the proper hole, using either the first, second or third leverage. The press has a winch-operated table which is raised or lowered through a chain working on two drums and controlled by a handle. A counterweighted handwheel suspended on ball bearings is used. The frame is of an open type which permits of long work such as shafts, small axles, etc., passing through the frame in a central position for straightening.



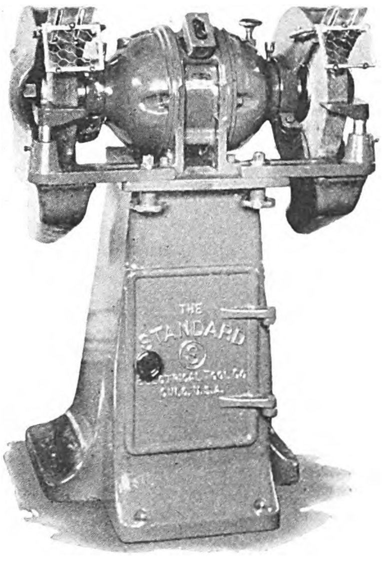
Quite often a bearing is rusted or frozen so that pressure alone will not remove it. The upper end of the 4-pitch Acme thread screw used in the press is so placed that it may be struck with a heavy hammer without injury. The leverage of the press is in the ratio of 4,800 to 1. High-speed leverage is used when pressure up to 8 tons is required. Ten notches on the hand wheel are obtained at each stroke. The high-speed screw leverage eliminates the criticism against screw pressure being too slow. The lever bar is placed at a suitable working height for full muscular action when pulling on it. The stroke is also made with the operator in such a position that he can see exactly what he is doing and just what is taking place on the pressing job. The frame is of bolted construction.

An independent rack and pinion press is also furnished with this outfit and is a separate and complete unit from the screw press. This can be used for small work. Leverage on this press is 44 to 1 and it has a capacity of 3 tons. The floor space required is 30 in. x 52½ in.

3-Hp. and 5-Hp. Improved Pedestal Grinders

STANDARD ELECTRICAL TOOL COMPANY
1938-46 W. Eighth Street, Cincinnati, Ohio

ELECTRICALLY driven grinders of this type are made in two sizes, 3 hp. and 5 hp. capacity, A General Electric motor and GE push-button control are furnished. The control is located on the inside of the pedestal or base of the grinder. The armature shaft is made of 3½ per cent high grade nickel steel. SKF ball bearings are used, incased in dust-proof chambers. Guards of the hinged door type with exhaust connections protect the emery wheel. The guards are equipped with a spark breaker, also a polished wire-glass adjustable eye shield.

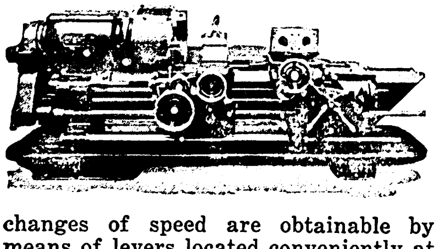


The 3-hp. grinder is equipped with emery wheels 12 in. x 2 in. or 14 in. x 2 in., as preferred. The 5-hp. grinder is equipped with emery wheels 18 in. x 3 in.

Turret Lathe

GISHOLT MACHINE COMPANY
Madison, Wis.

BED, headstock and bearing housing of this turret lathe are cast in one piece. By extending the headstock walls above the top of the turret housing an oil-tight reservoir is formed for the splash oiling system. The machine is driven by a single pulley. Eight changes of speed are obtainable by means of levers located conveniently at the front. All gears are made of treated alloy steel and a multiple disk clutch transmits the power. The transmission shafts are mounted on ball bearings. An outstanding feature is the short distance between the bearings.



The full swing feature of the side carriage eliminates interference of the square turret with the tools of the hexagon turret. Aprons of both side carriage and turret carriage are self-contained, each having complete independent feeds, lead screw, rapid traverse, automatic feed and traverse trips, screw-cutting index, micrometer dials and selective feed levers. Each carriage and the cross slide have micrometer dials. The feeds are all positively geared and eight changes of feed, forward and reverse, are provided in each apron.

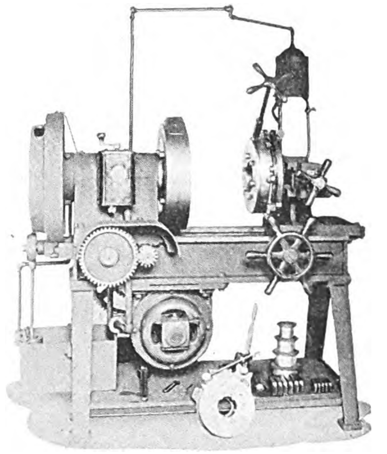
Independent longitudinal feeds permit the use of any one of the coarse or fine feeds of one carriage irrespective of the feeds on the other. One set of eight chain gears is provided for cutting all standard threads up to two per inch.

Each carriage has a separate rapid traverse independent of the feeds. The automatic feed trips are a feature. The 3-L machine occupies a floor space of 67 in. x 135 in. and the 4-L machine 80 in. x 190 in.

Motor-Operated Pipe Threading and Cutting Machine

D. SAUNDERS' SONS, INC.
Yonkers, N. Y.

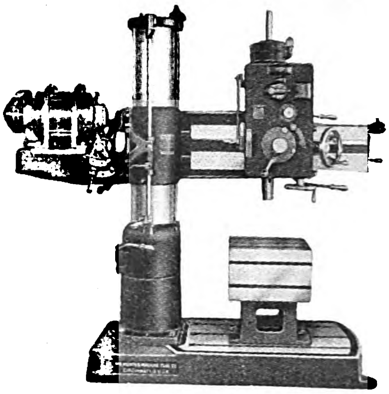
PIPE from ½ in. to 4 in. inclusive can be threaded and cut with the 4B machine, while the 5D machine cuts and threads pipe 1 in. to 6 in. inclusive. Where desired these machines can be furnished with a bolt-threading attachment. The machine is suitable for operation by either a.c. or d.c. A 5-hp. constant speed motor with a drum type controller designed for forward and reverse operation is direct geared to the driving shaft of the machine. Sufficient gear changes are furnished to obtain the correct cutting speed for all sizes of pipes within the capacity of the machine. The cutting off head is arranged with a tool slide and self-centering V jaws to steady the pipe being cut off. A handwheel connected to a rack and pinion moves the carriage containing the cutting off head and the die head. The die head slides on ways and permits it to be brought close to the gripping chuck for holding the pipe, which is of the standard universal type. The pipe is centered by a two-jawed self-centering chuck mounted at the rear end of the spindle on the side of the large driving gear. An automatic oil pump supplies a constant flow of oil to the chasers and cutting off tool.



Heavy-Duty Radial Drill

MORRIS MACHINE TOOL COMPANY
Cincinnati, Ohio

MORRIS radial drills are arranged for electric drive with the motor mounted on the arm. They are made in sizes of 3, 3½ and 4 ft. The head is fully inclosed and balanced on the arm. The spindle is a hammered steel forging running in bronze bearings in the sleeve and driven by two keys. It is fitted with a ball thrust bearing and the spindle gear is mounted on ball bearings. The helical spindle gears are made of alloy steel, heat-treated and hardened. Feed gears are of steel, heat-treated and hardened. The feed unit is mounted in the head. There are six feeds on the 3-ft. and 3½-ft. drill, ranging from 5 to 30 thousandths of an inch per revolution of spindle. On the 4 and 4½-ft. radial there are eight feeds ranging from 5 to 42 thousandths per revolution of spindle and four thread leads, 8, 11½, 14 and 18 threads per inch.

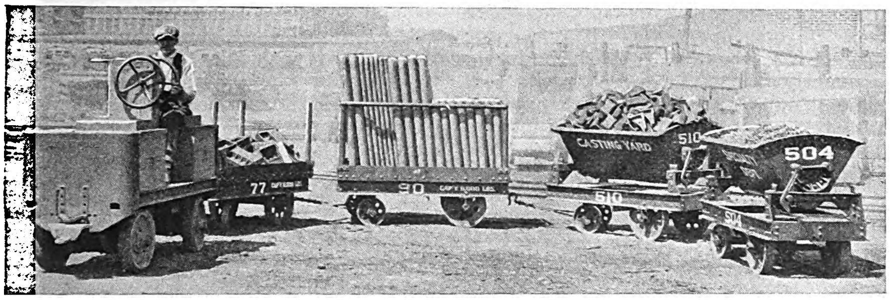


The tapping attachment and back gear bracket is a unit mounted on the back of the head. The back gears, back gear clutches, spindle gears and feed gears are made of chrome nickel steel, heat-treated and hardened. A sliding gear speed box is equipped with ball bearings. The alloy steel gears run in oil. A speed chart at the change-speed lever permits the operator to select quickly any one of the spindle speeds. The column or sleeve is mounted on an inner column which extends through to the top and revolves on ball bearings. The column is of semi-steel, ground to size. The arm is designed to resist torsional and lifting strains. The ribbed base is fitted with T-slots.

Trailer Trucks

AMERICAN CAR & FOUNDRY COMPANY
30 Church Street, New York

TRAILER trucks of this type are especially designed to withstand heavy loads and rough usage. The frames are of channel and angle steel, hot riveted with corners gusseted. The bodies are of sheet steel reinforced with angles and bands. Cast-iron wheels with self-contained roller bearings and Alemite pressure lubrication are mounted on high carbon steel axles, heat treated to a Brinell hardness of 250. Pressed steel caps are shrunk on the ends of the wheel hubs, making a close fit around the axle, keeping out



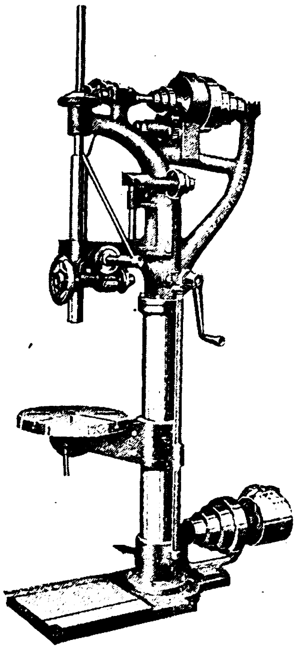
the dust and dirt. Each trailer is equipped with a rear drop forged gravity coupler hook to permit of train operation. Due to the counterweight it automatically locks and cannot be jarred open by rough roads.

These trailers are made with a gondola body or a dump body. The gondola body is adapted to the handling of miscellaneous loose material and crated or boxed material. The body has removable corner posts and if desired can be equipped with a special bolster for handling long material, loaded on two trailers. The dump body is self-clearing and automatically locks itself in the upright position after its return from dumping. The gondola trailer has a capacity of 6,000 lb. and the dump trailer has a capacity of 24½ cu.ft. or 6,000 lb.

Back Geared Upright Power Drill

BUFFALO FORGE COMPANY
Buffalo, N. Y.

INSTANT change from a plain to a back gear drive without using a wrench is possible in the machine shown by disengaging a knurled knob in the top gear and throwing in the back gears with a hand lever. A locking screw is provided for holding it in place. An adjustable automatic trip throws out the power feed when the piece has been drilled to the required depth.

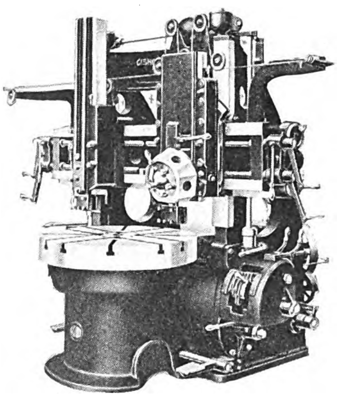


The ball bearing spindle is graduated and ground. The lever handle is adjustable from 6 to 18 in. and is held in place by a tension spring. All bearings are split and adjustable for wear. The latch hinged worm feed wheel runs in oil. All gears are machine cut and are fitted with heavy bronze bushings. With spindle travel of 14¼ in. the machine is amply fitted to handle reboring work with ease. It weighs 1,100 lb. If desired, the machine can be furnished with a direct-connected motor.

Vertical Boring and Turning Mill

GISHOLT MACHINE COMPANY
Madison, Wis.

TWO plain swivel heads are features of the machine shown. A driving pulley is geared to a friction back-geared headstock having six mechanical speed changes which, in connection with a two-speed countershaft, provides twelve changes of speed to the table, all in geometrical progression. The plain table has four pairs of parallel and four radial T-slots. The feed change levers, rapid traverse levers and table control levers are located on both sides of the machine together with a foot brake at either side. Two plain independent heads, furnished with the machine, can be swiveled to any angle from 45 deg. from the vertical. The ram is a box section type having a 3½-in. central core extending through the entire length. The bore for the tool holder is 3 in. diameter. Ten mechanical changes of feed are obtainable for each head. A feature is a device to eliminate breaking of gears and other parts. The micrometer index dials reading in thousandths of an inch facilitate accurate setting of tools.



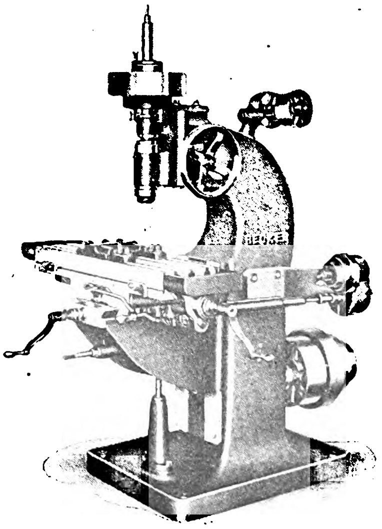
A feed tripping device stops the feed automatically at any predetermined point. In addition, safety stops trip the feed before the head reaches the end of the travel. Rapid traverse enables the operator to move the head quickly by power in either direction. The ratchet handles on the feed rods disengage automatically when the feed or rapid traverse is used, thus eliminating chance of injury to the operator caused by revolving handles. All feed gears and other gears subjected to heavy duty are made of steel. A two-speed tight-and-loose pulley countershaft is standard, but a motor drive is easily installed without increasing the floor space occupied, which is 97 in. x 120 in.

Improved Die Sinker and Vertical Milling Machine

REED-PRENTICE CORPORATION
Worcester, Mass.

LIKE other Becker machines, the model shown is supplied with an adjustable auxiliary head which keeps the spindle in perfect alignment. The spindle is made of high-grade steel with ground main bearings running in taper bronze bushings, adjustable for wear. Belt pressure of the spindle guiding pulley is taken by ball bearings supported in brackets at the top of the column. The main spindle has ball bearings at top and bottom. The table, of liberal proportions, has power longitudinal feed in either direction. The feed of the table is through a pair of three-step cones. Two additional changes can be effected by means of a pull gear on the feed box, to which the telescopic shaft is attached. Head, table, carriage and knee are furnished with adjustable gibs for taking up wear. The machines can be arranged for a single pulley gear box drive, if desired, which will permit of a direct drive from the main line without a countershaft. This machine is also suitable for direct motor drive. Where a constant speed motor is installed, it is necessary to provide a gear drive. This drive will provide fourteen spindle speeds ranging from 20 to 500 r.p.m. The quick changes in speed are obtained through two handles conveniently located on top of the gear box. For this method a 3-hp. constant-speed motor of 1,150 or 1,200 r.p.m. is recommended.

Where a variable speed motor is furnished it is not necessary to provide a gear box, since a spindle variation from 25 to 500 r.p.m. can be secured by means of shifting the handle of a regulating rheostat, located on the side of the machine.

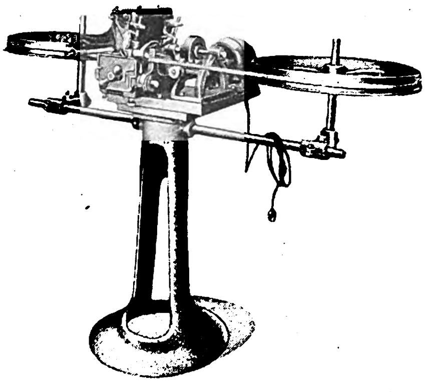


The floor space required for this machine is 74 in. x 60 in. x 75 in.

Machine for Filing and Setting Band Saws

WARDWELL MANUFACTURING COMPANY
110-112 Hamilton Avenue, Cleveland, Ohio

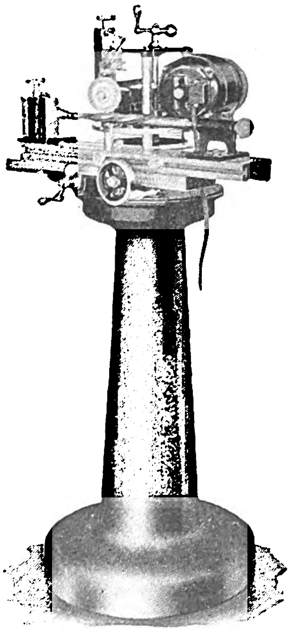
FILING, setting and joining of band saws all in one operation can be done by this machine. It will handle saws from ⅛ in. to 2 in. wide. Motor or belt drive can be furnished as desired. By the positive and powerful movement of the file all spring or medium tempered band saws can be accurately filed and set at a speed of 70 ft. a minute.



Circular Relief Grinder

CLEVELAND TOOL ENGINEERING COMPANY
Main and West 25th Streets, Cleveland, Ohio

YEARS of experience, development and expert engineering are claimed to have produced an original circular relief grinder that effects economy unapproached by the older methods of relief grinding. It has proved its worth in time, labor and money saved and in superior precision of the work.



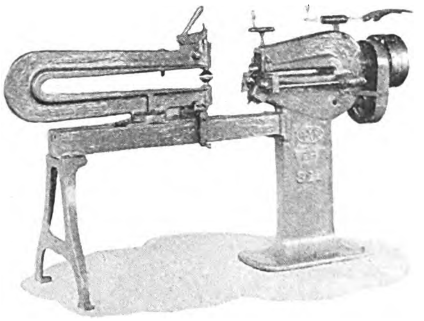
Grinding of the relief in a proper and economical manner can be performed on such tools as adjustable reamers, tapper taps, milling cutters, face mills and boring heads, core drills and various other tools. Where two or three distinct operations are usually needed to grind tools, it is said that the grinder shown will perform the entire work in one operation. The outside face of the wheel is dressed concavely to exactly the same curve as the tool to be ground. The tool is then offset from the center of the wheel curve to give the desired clearance. Then it is ground to the cutting edge. The circular relief leaves the outside of the tool convex with all the metal possible to support the cutting edge. The clearance is determined by the distance the tool is moved in or out against the curve of the grinding wheel.

Sheet Metal and Forge Shop Equipment

Power Ring and Circular Shear

PECK, STOW & WILCOX COMPANY
Southington, Conn.

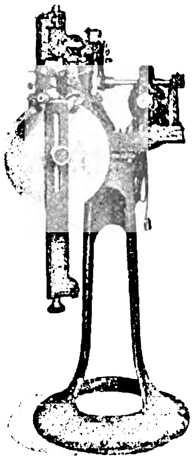
CIRCLES or internal rings and irregular curves can be cut on this ring and circular shear. Clamping disks are provided with center points and blanks and are held securely between clamping disks and released through an eccentric lever. The circle arm moves easily and freely by means of a rack and pinion and hand crank. The angular position of the cutter and the ability to raise and lower the upper cutter through a handwheel enable one to cut circles from square blanks, or to cut inside circles without cutting the outer edge. This machine is furnished regularly with tight and loose pulleys.



Turning, Wiring and Burring Machine

PECK, STOW & WILCOX COMPANY
Southington, Conn.

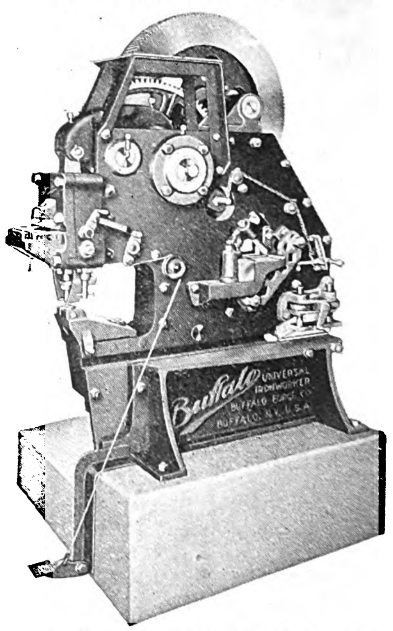
VARIOUS operations can be performed with the necessary additional rolls by this self-contained unit. With the belted motor drive the speed of rolls for turning, wiring or burring operations can be changed by simply changing the size of the motor pulley. It has a capacity for No. 16 gage steel and lighter and its turning capacity is for No. 16 gage steel with ¼ or 5/16-in. wire or No. 18 gage steel with 3/16-in. wire. With wiring rolls the capacity is No. 16 gage steel with ⅛-in. to 5/16-in. wire and with burring rolls No. 16 gage steel. The machine is furnished with a pulley drive and treadle friction clutch attachment. All bearings are bronze bushed.



Armor Plate Universal Iron Workers

BUFFALO FORGE COMPANY
Buffalo, N. Y.

BUFFALO armor plate universal iron workers are complete, reliable and modern machines for cutting metal. With one of these, rounds, squares, angles, tees, beams and channels can be cut and shear plates, flats, girders, H-columns, I-beams and angles punched. With a few special tools, angles, channels and I-beams can be coped. These machines are made in four sizes, No. ½, 1, 1½ and 2. The same design is used on all models. There is a punch at one end and a slitting shear at the other with a bar cutter adjacent to the shear. The machines are supplied with a high and low die block and long and short punch holder. The triple punching attachment may be used on the machine if desired. The shear knives are suitable for slitting plates of any width or length as well as for flats. An exclusive feature of the machine is the stripper used on the shear.



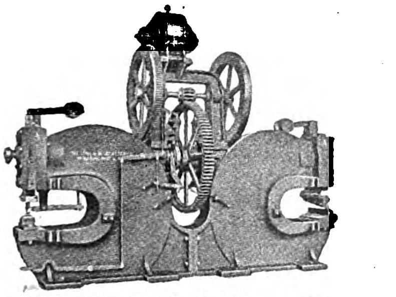
This is operated by means of a crank requiring no tools and is very wide to permit cutting short pieces of plates or flats. The bar cutter has five-piece knives so that replacement and sharpening are easy and inexpensive.

These machines, like all other Buffalo metal working machines, have frames of rolled steel armor plate, guaranteed forever against breakage. Due to the heavy cast-iron base a concrete foundation is unnecessary. The gear and pinions are made from machine cut steel.

Punching and Shearing Machine

LONG & ALLSTATTER COMPANY
Hamilton, Ohio

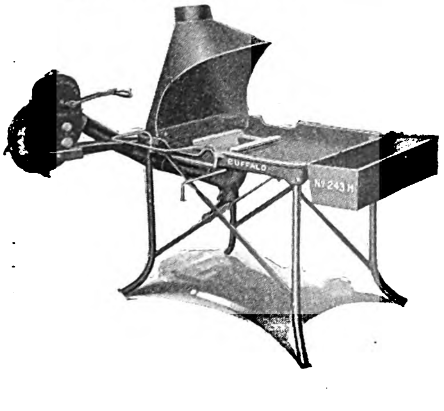
PUNCHING and shearing machines of this type have the slide counterbalanced and fitted with a bronze gib for taking up wear. Camshaft and pintle are made of steel. Bronze bushed bearings are furnished for the main journal and the cam pintle. The clutch is made of high-carbon cast steel and the face is fastened to the main spur wheel by means of a tongue, groove and bolts. It is detachable, providing for renewal of worn parts. An automatic stop will throw out the clutch at the completion of each stroke and may be adjusted for any point of the stroke desired. The camshaft may be turned by hand for any adjustment.



Standard Blacksmith Forge

BUFFALO FORGE COMPANY
Buffalo, N. Y.

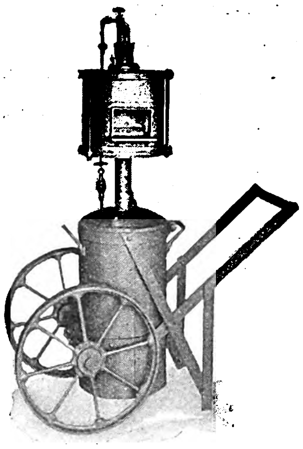
FORGES of the type shown are equipped with the No. 200 ball-bearing silent blower with a 14-in. fan. The forge has a cast-iron hearth mounted on four steel pipe legs and reinforced with cross-bar braces. A steel half hood vulcan tuyère is part of the regular equipment. The gear ratio of the blower is 47½ to 1. The fire pan is 28 in. x 40 in. and the net weight of the entire outfit is 273 lb.



Oil-Burning Rivet Forge

BUFFALO FORGE COMPANY
Buffalo, N. Y.

INCONVENIENCE and danger from flying sparks in heating rivets are overcome by using the oil-burning rivet forge shown. This forge consists essentially of a welded steel oil tank on which is mounted a head or fire chamber. This head is made up of a cylindrical steel plate housing held between cast-iron top and bottom plates by means of three through bolts. The lining is a one-piece circular firebrick 2 in. thick made of the best quality of refractory material. To replace the old lining it is necessary only to unscrew three nuts and lift the top off the fire chamber. The oil tank is tested with air at a pressure of 125 lb. Air is supplied through a single connection which furnishes pressure for the oil supply as well as air for the atomizer. It will burn kerosene, distillate, or any fuel oil. The tank has two convenient handles, one on either side. A forge mounted on a truck as shown makes an ideal arrangement for portability.

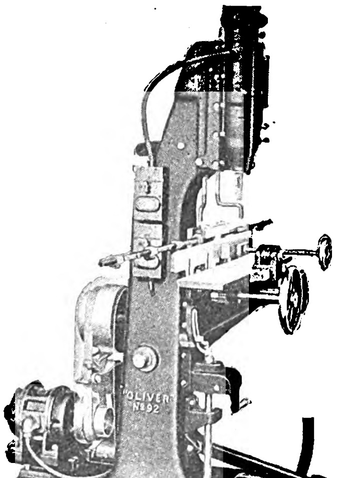


Woodworking Machinery

Power Feed Hollow Chisel Mortiser

OLIVER MACHINERY COMPANY
Grand Rapids, Mich.

USE of a rigid, hollow, box type, one-piece casting having a wide flanged floor support for the column features this hollow chisel mortiser. The column incloses the power feed mechanism, with the exception of the drive pulley. A built-in fan blower behind the column furnishes a constant air blast for cooling the tools and keeping the work free from chips. The mortising ram or plunger reciprocates in adjustable gibbed ways and has an adjustable travel from 2½ in. to 4 in. long, controlled by the treadle for single or continuous power feeding strokes. The machine will handle chisels from ¼ in. to ¾ in. square. Hollow chisels with 4-in. blades will mortise in 12-in. high material.

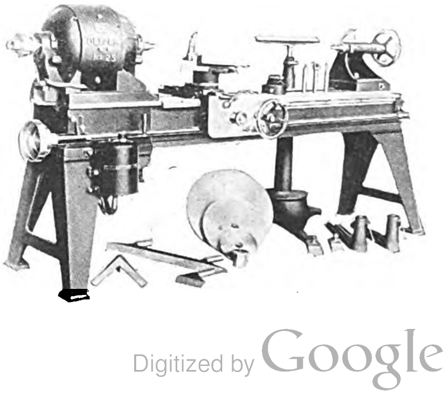


A universal compound table with screw clamp for 6-in. wide stock and a handwheel, rack and pinion for longitudinal travel, gaged by adjustable stops, are regularly furnished. The table is 36 in. long, 6 in. wide, 32 in. above the floor at the lowest position and 44 in. at the highest. It is fitted with a vertical adjustable back fence having a lip hold down and carries a 6-ft. layout stop rod with six spring stops for automatically locating mortises. A rod and two adjustable stops directly in front of the table govern the length of the mortises. The floor space required for the machine is 3 ft. x 5 ft.

Motor Head Pattern Lathe

OLIVER MACHINERY COMPANY
Grand Rapids, Mich.

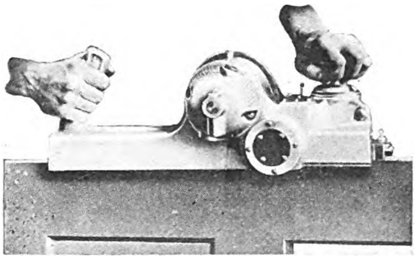
PATTERN lathe No. 25, shown in the illustration, is made in three sizes, 16 in., 20 in. and 24 in. swing. The head incloses an Oliver direct-current motor of 2-hp. capacity whose speed can be varied from 400 to 2,000 r.p.m. The armature shaft is made hollow for faceplate work and with suitable take-up for end thrust. The front end of the shaft is bored for Morse taper. Ordinarily a drum type controller with proper resistances is attached to this machine. The tailstock is made with a strong spindle and bored for Morse taper. The iron bed can be furnished in any length from 6 ft. upward, advancing by 2-ft. sections. All sizes of lathes are provided regularly with power feeding carriages, but hand-feeding carriages can be substituted.



Electric Hand Plane

WAPPAT GEAR WORKS
Meade Street and Braddock Avenue,
Pittsburgh, Pa.

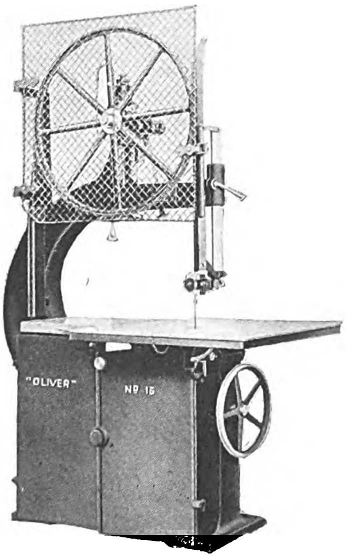
THIS electric hand plane can be used on doors and sash. The cutting is done by a jointer head which is driven through gears from a $\frac{3}{10}$-hp. universal type motor that operates from any light socket. The short shoe at the front of the plane and just ahead of the cutter can be raised or lowered by turning a knob with the left hand, thereby regulating the depth of cut. A graduated dial at the base of the knob enables the operator to set the knife for any cut from zero to $\frac{1}{8}$ in. This adjustment feature is unique in that by turning the knob forward or backward while advancing along the material it is possible to vary the depth of the cut and smooth out any high spots in one stroke. Another interesting feature is the beveling attachment, which can be set to cut accurately any required bevel on the edge of a door or sash. The body of the tool is aluminum and the total weight is 19 lb. It is easy to handle and simple to operate. The high speed blades in the cutter are easily removable for sharpening.



Band Saw

OLIVER MACHINERY COMPANY
Grand Rapids, Mich.

BASE and column arm of this machine are cast in one piece. The main table is carried on rockers for the angle adjustments. The table can be tilted both ways by means of a worm gear and hand wheel at the right of the operator. An auxiliary table is supplied between the column and the work table. The upper and lower wheels, of 38 in. diameter, are made of cast iron. The lower one is inclosed in a metal casing, provided with two doors. The wheel shafts are fitted with machine ground journals and are mounted on tapered babbitted bearings. Each bearing has an oil well and cap. The upper shaft and bearing are adjustable vertically to suit various lengths of blades.



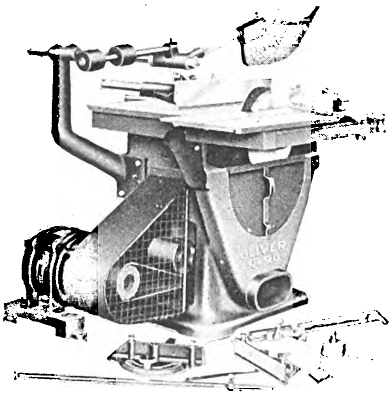
An outboard bearing which supports the lower wheel shaft is bolted to the frame. Saw tension is adjusted by a telescope spring. A guide post made of square steel is counterbalanced by an incased coil spring and can readily be locked in a fixed position. A grooved wooden saw guard on the column protects the saw on both sides. A steel front guard with a wood facing is carried on the guide post and covers the saw above the guide.

The main table is 36 in. x 40 in. and is designed to tilt 45 deg. to the right and 5 deg. to the left. The auxiliary table is 21 in. x 22 in. The floor space occupied by the machine shown is 68 in. x 54 in.

Universal Saw Bench

OLIVER MACHINERY COMPANY
Grand Rapids, Mich.

UNIVERSAL saw bench No. 90 is furnished with a cored form ribbed for strength with a wide flange at the base. A metal partition divides the saw from the balance of the working parts and prevents the sawdust from penetrating to them. The metal table has two sections, one stationary and the other arranged to slide past the saw. An extension bracket at the right supports the fence when ripping stock the maximum width. The table will tilt to an angle of 45 deg., the movement being controlled by means of a handwheel engaging a worm and gear. The movable table is mounted on a tongued cross slide and moves past the saw for use in cutting off and for dado work. The cross slide is gibbed to main table frame and can be drawn 4 in. away from the saw line so dado heads and grooving saws may be used. The stationary section of the table is graduated its entire width in eighths and the sliding section is graduated into degrees.



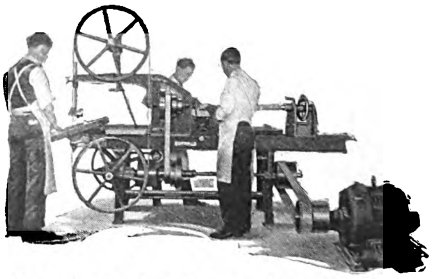
Two crucible steel machine ground arbors fitted into bearings are lined with interchangeable sleeves having oil wells and wick conveyors that keep them flooded with oil continuously. The arbor pulleys are of the pneumatic type, machined and balanced.

The universal ripping fence may be used on either side of the saw or secured at any angle not in line with the saw, on either the stationary or the rolling table. It has a quick adjustment of 12 in. without changing the locating pins to the next set of holes. A micrometer will set the bench to and from the saw for fine and extremely accurate adjustment. It has a parallel adjustment whereby it may be set to or from the operator 9 in. A miter and cut-off gage on the sliding table swings to an angle of 30 to 135 deg. It has 18-in. and 36-in. auxiliary rods and stops for determining lengths to cut off. Two universal gages are supplied for the table grooves each side of the saw. They are graduated from 30 to 150 deg. The machine has a capacity to rip 22 in. wide, cut off 34 in. wide up to $1\frac{1}{2}$ in. thick. The 14-in. saw projects through the table 4 in. The machine with motor brackets occupies a floor space of 4 ft. 1 in. x 5 ft. 6 in.

Complete Woodworker

BUFFALO FORGE COMPANY
Buffalo, N. Y.

TEN machines in one is the manufacturer's description of the woodworking machine shown. It includes a rip and cross cut saw, a band saw, a planer, jointer, shaper or edge molder, a lathe, a drill and a sander. A grinder can be furnished at extra cost. Three men can work on it at one time without interference with one another. Practically any woodworking operation can be performed.



Tight and loose pulleys are provided on the main shaft at the left of the cone pulleys, below the table. This construction makes it possible to run the belt up through the table to a lineshaft or motor overhead. There are three distinct parts to the machine, which may be operated together or individually. One is a lathe which is used also for drilling and grinding. The second is the band saw, and the third the arbor used for circular saw, planer, sander, jointer and shaper. These main parts are engaged by three conveniently arranged clutches. The main driver is provided with a belt shifter which can be operated from either side of the machine. With all parts of the woodworker operating at the same time only 4 hp. to 5 hp. is required.

An adjustable mandrel furnished can be run horizontally or vertically and on it may be inserted planer and dado heads and circular saws or knives of any size. It is made of cold rolled steel and carefully machined. A planer table is made in two parts which fit into the channel on the main table. An adjustable guide for the planer is furnished which can be set at a 90-deg. angle with the table top or tilted back to allow planing at an angle. The planer slides are 29x10 in. and 21x10 in., respectively. By raising the mandrel to a vertical position a shaper is obtained on which any kind of knives may be used. Rip and cut-off saws of 12 in. diameter are furnished with the machine. Cuts of any size or desired depth up to 3½ in. may be made. The removable gage for cross-cutting has a quadrant which permits adjustment for sawing at any angle from 30 deg. to 90 deg. The lathe will handle work up to 20 in. diameter by 40 in. long. Four step cone pulleys, of 5½, 7½, 9¾ and 12 in. diameter respectively, are an essential part of the lathe. A clutch is provided on the lower cone pulleys. A band saw table is cast in one piece with the main table. It measures 29½ by 30 in. The saw wheels are 27 in. in diameter and the maximum clearance below the guide is 15 in. A ½-in. band saw is furnished with the machine. The band saw is as strongly constructed as it would be in an individual machine, the shaft diameter is 1⅜ in. and the upper bearing is 10 in. long.

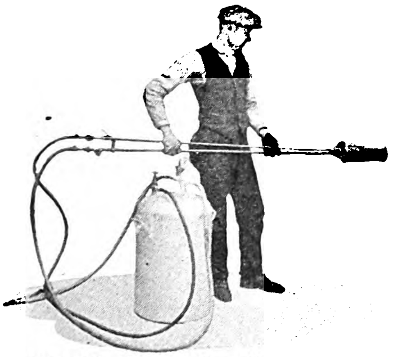
◆

Track Maintenance Tools

Oil Preheater

ALEXANDER MILBURN COMPANY
1416-1428 West Baltimore Street,
Baltimore, Md.

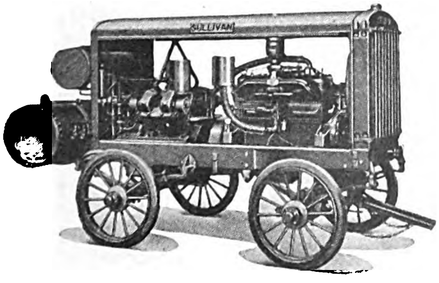
CASTINGS can be heated prior to welding, tar kettles can be heated, pipe can be thawed, etc., with the Milburn preheater. The oil burner is of the atomizing type, utilizing crude, fuel, kerosene oil or distillates, and compressed air varying from 50 to 100 lb. pressure. The tank is constructed of heavy gage steel and the bottom is welded. Two handles welded to the tank facilitate handling. The weight of the unit is 60 lb. The outfit consists of a 5, 12 or 22-gal. reservoir, an atomizing burner, 25 ft. of air hose with couplings, 25 ft. of special composition oil hose with couplings, oil pipe feed line, air pipe feed line and suitable valves for air regulation.



Portable Air Compressor

SULLIVAN MACHINERY COMPANY
122 South Michigan Avenue, Chicago, Ill.

COMPRESSED air is supplied at the rate of 220 cu.ft. per minute by the four-cylinder V-type compressor shown, which is direct connected to a Buda engine. The parts, together with an air receiver, gasoline fuel tank and radiator, are mounted on a steel frame with sheet steel canopy top and removable side covers. The wheels and truck are a matter of selection. All compressors in the line are single acting and employ a Sullivan "wafer valve." They are automatically lubricated and have water-cooled cylinders, barrels and heads. The flywheel and crankshaft assembly are carefully balanced on a special machine. The compressor is said to be a new departure in design, the V-type arrangement of cylinders adopted entirely eliminating vibration and decreasing the weight. Each of the four cylinders is 6½ in. x 5¼ in.

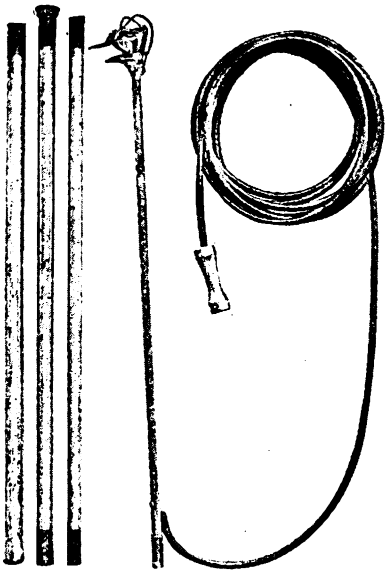


The Buda engines are four-cylinder machines provided with four-point suspension. They can be equipped to use kerosene instead of gasoline if desired.

Contact Hook and Pole

RAILWAY TRACK-WORK COMPANY
Clementine, Thompson and Mercer Streets,
Philadelphia, Pa.

PIVOTED jaws 5 and 6 in. long, of special composition, grooved to grip the trolley wire above and below are features of the Ajax contact hook and pole. The weight of the pole clamps the jaws on the wire. The lower jaw comes in contact with the clean under-surface of the trolley wire, preventing arcing and burning. When in position on the trolley wire, cars can pass without removing the pole. When the pole is raised, the lower jaw drops behind the guide lug, so that the upper jaw slips on the trolley wire into position for clamping. The lower end of the pole can be rested in any convenient position to clear passing cars. The contact will handle 300 amp. without injury to the wire.

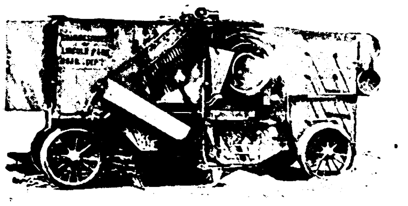


Chausse Model E-3 Portable Asphalt Repair Plant

CHAUSSE OIL BURNER COMPANY
West Beardsley Avenue, Elkhardt, Ind.

MODEL E-3 asphalt repair plant is an improved development of the model E-1 and E-2 machines. It permits of laying hot asphalt and is suitable for large or small patchings or for supplementing stationary plants. The machine may be used as an independent unit directly where the repair work is being done as it is self-propelled on rubber-tired wheels and contains ample storage for raw material.

The plant is equipped with a Continental motor, small Kellogg air compressor for fuel-line pressure, S.K.F. ball bearings on the sand drier, high-pressure lubricators on all other bearings, Cotta transmission, twin disk clutch, Geneva wheels and standard solid rubber tires.

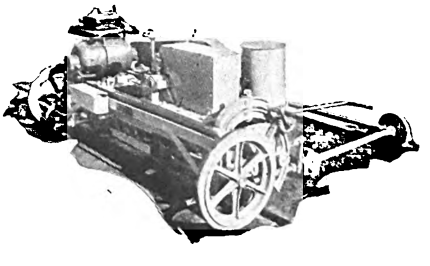


The capacity of the plant is rated at 150 sq.yd. of 2-in. compacted mix per eight-hour day. Old asphalt can also be reclaimed during regular operations. A tool heater with an oil furnace is located at the rear of the machine. Bins provide for the storage of 135 gal. of asphalt, 2¼ cu.yd. of mineral aggregate, 1,750 lb. of cement or lime dust, 50 gal. of kerosene and 9 gal. of gasoline. The light weight of the machine is 9,400 lb.

Rail Joint Grinder

RAILWAY TRACK-WORK COMPANY
Clementine, Thompson and Mercer Streets,
Philadelphia, Pa.

BLOCKS of abrasive material 10 in. x 4 in. x 2½ in. with a steel pin inserted in one end are used in this machine. Two blocks are used in one setting of the machine, providing a grinding surface of 8½ in. x 2½ in. The blocks are placed endwise in the crosshead or brick holder which slides bodily in guides. It is reciprocated over the rail by means of a simple rocker arm movement at a speed of 340 strokes a minute. As the blocks wear, the end wedge is slackened by turning the small hand wheel over it, while the blocks are fed downward by means of the large hand wheel operating the feed screw directly over the blocks. With the long straight grinding surfaces it is impossible to grind the low spots. A 3-hp., 600-volt direct-

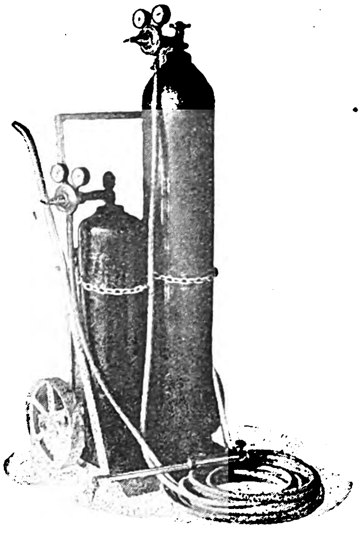


current constant-speed motor is used for driving the grinder. Turning the hand crank at the right of the machine lowers the derail wheels to the pavement and raises the grinder from the track, supporting 95 per cent of the weight so that the operator can lift the outrigger end of the machine and roll it off the track. The grinder weighs 1,350 lb. complete. The outrigger is hinged so that it can be raised vertically for storage or transportation.

Portable Oxyacetylene Plant

ALEXANDER MILBURN COMPANY
1416-1428 West Baltimore Street,
Baltimore, Md.

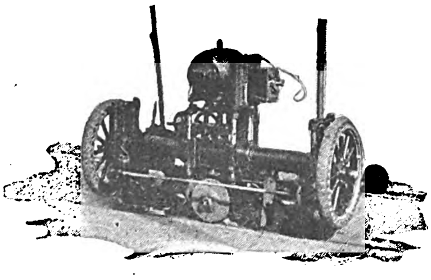
WELDING, cutting or a combination of the two can be done with the Milburn portable oxyacetylene plant. The truck is made to accommodate the small or large sized oxygen or acetylene tanks. The truck illustrated is constructed of heavy steel angles bent and strongly welded to withstand rough usage. The diameter of the wheels is 16 in. A strong chain welded to the frame of the truck holds the cylinders in place so that there is no danger that they will slip when in transit.



Automatic Rotary Track Grinder

RAILWAY TRACK-WORK COMPANY
Clementine, Thompson and Mercer Streets,
Philadelphia, Pa.

ROTARY track grinders of the type shown are automatic in travel. The motor and grinding carriage are mounted in the center of the machine, which travels along the track at a speed of 30 in. per minute when grinding. Its movement can be reversed for any length of travel. By means of a clutch operated by a hand lever the speed is increased to 100 ft. per minute for moving the machine from one joint to the next. Two shoes 16 in. long are attached to the frame on which the machine rests. The shoes have openings through which the track wheels extend. By means of a heavy spring over each wheel, any tension can be applied so as to distribute the weight equally over the shoes and track wheels.



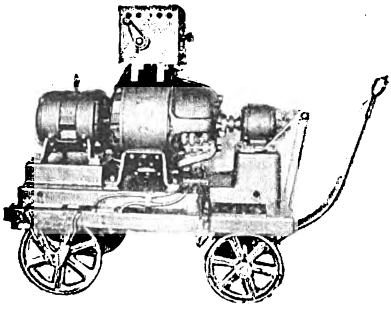
The machine is controlled from the operator's seat. Within his reach is a handwheel for feeding and one for tilting the grinding wheel, a hand lever for instantly or gradually raising the grinding wheel to obtain a run-off on the rail head and also the lever to control the lateral adjustment of the grinding wheel. The long lever shown at the left of the machine is for raising the machine from the track to the two roadway wheels to allow cars to pass.

A substantial silent chain drives the wheel arbor direct from a 5-hp. motor. The machine accommodates grinding wheels 14 in. in diameter by 2½ in. or 3 in. face. The grinding wheel arbor is operated on ball bearings with dust-proof caps. The outrigger is hinged for raising when transferring the machine or transporting it on a truck.

Single Operator Arc Welding Equipment

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
East Pittsburgh, Pa.

PORTABLE 200-amp. single operator welding equipment as shown is an entirely self-contained unit. The control of the welding current is simplified so that only one handle rotating through 360 deg. is required for adjustments. The apparatus is mounted on a truck and the sturdiness of the various parts insures against breakage and accident on account of rough handling to which such apparatus is usually subjected. The generator will deliver 200 amp. at 25 volts to a resistance load for one hour with a temperature rise not to exceed 50 deg. C. Its continuous rating is 93 per cent of its one-hour rating with the same temperature rise and the same voltage. It will deliver 275 and 300 amp. at the arc for welding duty. The generator operates at arc voltage and no external resistance is required in the circuit. The generator is designed to stabilize the arc inherently, thereby eliminating the necessity for automatic moving devices such as relays, solenoid-controlled resistors, etc. Either a direct-current motor or an alternating-current motor may be used, depending on the characteristics of the supply circuit. The driving motor and the generator are mounted on a common shaft and bed plate. To eliminate bearing and shaft troubles the exciter is coupled to the common shaft by means of a special flexible coupling and is supported by an extension of the common bed plate. Ball bearings of the radial type are used throughout, which allows the equipment to be operated in any location without danger of oil spilling and without the necessity for exact leveling. The complete control equipment for starting and regulating the current output is contained in a steel cabinet mounted on top of the generator. This company also manufactures arc welding rheostats for railway use as well as multiple operator equipment for manufacturing plants.



Electric Arc Welder

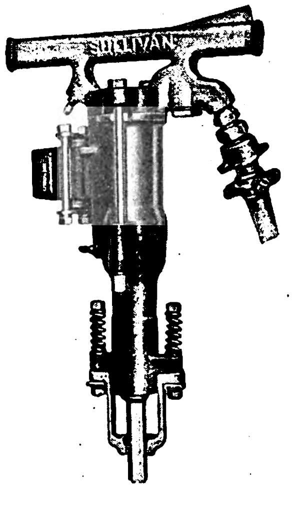
RAILWAY TRACK-WORK COMPANY
Clementine, Thompson and Mercer Streets,
Philadelphia, Pa.

COILS of a high resistance wire, supported by insulator bars, which in turn are carried by a light but sturdy steel angle frame, form the essentials of this arc welder. At one end of the frame is mounted a switchboard to control the current. The unit is light and portable, having large capacity with ample ventilation and accessible parts. The Ajax welding machine type RWY weighs approximately 120 lb. It is 18 in. x 28 in. x 36 in. The type IND machine weighs approximately 55 lb. Its size is 15 in. x 20 in. x 25 in. The hinged handles for carrying the machine drop parallel to the corner posts when released. Regulating switches provide a range of current from 19 to 333 amp. under normal line voltage with intermediate steps of 18 amp. each. If the line voltage drops to as low as 300 volts, 209 amp. can be obtained. It is claimed that the resistance wire used will not oxidize. A shunt switching device controls the several groups of coils independently, whether the full length of the coils is in operation or they are shunted. By means of the switchboard, 36 different values of current can be obtained. A sheet steel truck mounted on four rubber-tired ball-bearing wheels can be furnished if desired. This truck has compartments in the bottom for carrying a supply of welding rods and a box in the front for accessories.

Heavy-Duty "Busters" for Breaking Concrete

SULLIVAN MACHINERY COMPANY
122 South Michigan Avenue, Chicago, Ill.

SULLIVAN "Busters" are designed to meet the wide and increasing demand for a one-man compressed air tool to do quickly and cheaply such work as breaking up concrete, cutting asphalt, excavating frozen ground in trenches, etc. The DW-221 type weighs 75 lb., is economical of air and runs with little vibration. It uses a 1⅛-in. steel with plain hexagonal collar shank and requires a ¾-in. air hose connection. Characteristic features are the valves and piston motion, automatic differential pressure lubricator, inclosed dust-proof chuck, steel retainer, all-steel construction, light-weight, rapid action, positive control of the piston and the hard powerful snappy blow in parts through the piston. The valve mechanism is secured in the chest by side rods, and the valve buffers are made of heat-treated tool steel to resist shock and breakage. The pistons are made from bar stock of alloy steel and ground to fit the cylinders, which are solid drop forgings. The chuck and chuck bushing are inclosed in a dust-proof housing. Ample lubricating ports are provided in addition to the automatic lubrication incorporated in the machine.

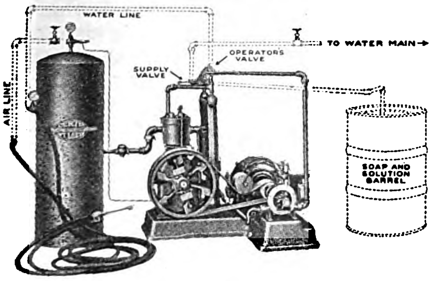


Bus Repair Equipment

Car Washing System

CURTIS PNEUMATIC MACHINERY COMPANY
St. Louis, Mo.

THE Curtis air-mist car washing system is furnished with a 4½-in. x 4½-in. water-cooled compressor belt connected to a 5-hp. motor. The self-contained compressor is fully inclosed to protect the working parts from dust and dirt. The crankshafts and connecting rods are made from steel forgings. The cylinder head and valves are water cooled and a radiator of suitable proportions is provided. The valves are of the light disk type, tempered, ground and polished. The valves seat on a phosphor bronze flat seat of a large area and can be removed independently without taking off the cylinder heads or loosening the pipe connections or fittings. An air pressure governor is part of the equipment. When the maximum pressure in the tank is reached the governor unseats a suction valve and the compressor runs idle until the tank pressure has dropped 5 or 10 lb. A centrifugal unloader prevents the motor from being started under load. The oil in the crankcase is picked up by knife blade throwers on the crankshaft.



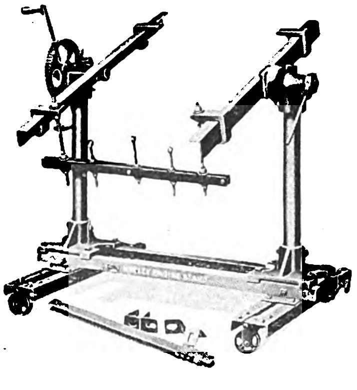
The equipment furnishes a full force spray for washing the undersides of fenders and chassis and a soft or mild spray for washing the body. The adjustment is made by turning the operating valve. A third position of this valve will shut off the water. A supply valve permits of the withdrawal of water from a barrel or tank or from the regular water service line as desired.

The equipment shown is furnished in only the one nozzle type. The whole unit, including the air tank, can be installed in a floor space of 3 ft. x 7 ft.

Universal Motor Stand

MANLEY MANUFACTURING COMPANY
York, Pa.

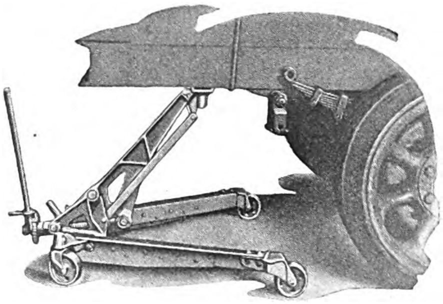
GASOLINE motors placed on the stand shown can be turned by one man into any convenient position to facilitate his work. The three-point suspension bar, of which two are furnished with the stand, is an important improvement. These suspension bars make it easy to mount and balance practically all types of three-point suspension motors. In addition to this a set of brackets slide on the side members for ready mounting of four-point suspension motors. A cone clutch installed on the top of the upright permits of locking the side rails to any desired position.



High-Lift Jack

WEAVER MANUFACTURING COMPANY
Springfield, Ill.

UNUSUAL range of lift is found in a sturdy, dependable jack designed with increased capacity for handling buses and trucks. This jack incorporates all of the good features which made the previous models popular, as well as many new ones. The lifting arm, of the screw hoist type, is raised and lowered by a traveling nut attached to the end of the arm. The handle operates a wheel on the end of the shaft through a ratchet and dog. It has a capacity of 8,000 lb. and a lifting range of 40½ in. The screw extension permits a lift to be applied directly to the chassis frame in spite of low running board or gas tank. Accidental release of the load is impossible due to a special locking mechanism. A broad wheelbase prevents tipping.



Power Tire Spreader

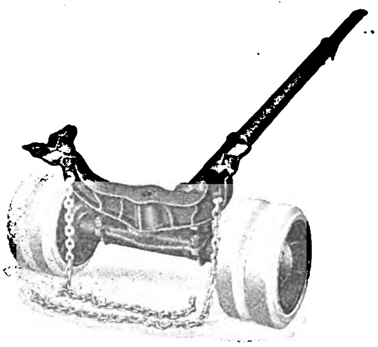
WEAVER MANUFACTURING COMPANY
Springfield, Ill.

QUICKER and easier means for spreading pneumatic tires up to 10½ in. for inspection and repairs without danger of injuring them is possible by use of the machine shown. A feature is the method of spreading the tire naturally over the convex buffing plates with an outward and downward motion without subjecting the tread to any undue strain. Operation of the spreader by compressed air permits the repairman to devote his entire attention to the inspection of the tire. The device does not have to be bolted to the floor, since it is designed to support the largest and heaviest tires without the possibility of being overbalanced. Shipping weight of the spreader is 253 lb. and it occupies a floor space of 15 in. x 26 in.

Truck Ambulance

WEAVER MANUFACTURING COMPANY
Springfield, Ill.

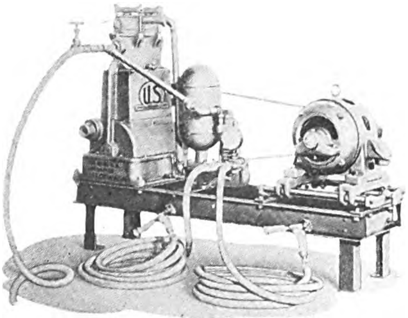
PROVISION for quicker, easier and safer pulling of disabled buses and trucks is given as the reason for the design of the truck shown. The load is supported by a 2½-in. high-carbon-steel axle held to the frame by two heavy U-bolts. The wheels are supported on the axle by dustproof ball bearings which take the radial weight of the load and the thrust strain. Heavy double tires mounted on 16-in. diameter wheels 8½ in. wide insure strength as well as lack of vibration and noise when towing. The cast-steel yoke which supports the load turns on a pivot, permitting guidance by the tongue. Interchangeability of saddles permits of center variation from 19¼ in. to 28¾ in. This truck can be readily attached to rear or front axle. The pole is of telescoping design and its length can be adjusted from 7 to 13 ft.



High-Pressure Washing Machine

UNITED STATES AIR COMPRESSOR COMPANY
Cleveland, Ohio

SEVERAL models of this washing machine are built. The one shown is a two-gun unit. Other models developed are the AW-Jr., which is a one-gun machine, and the AW-4, a four-gun machine. The equipment is capable of increasing the normal city water pressure of about 40 lb. to more than 300 lb. continuous pressure with the gun wide open. It is said that this pressure will remove the most stubborn caked grease and crusted dirt. By a slight turn of the valve on the special U. S. pistol grip gun a soft, penetrating mist can be obtained for soaking and washing the body. A feature of these units is the fact that they can be connected directly to the city water supply line for both hot and cold water without danger of the high pressure backing up into the plumbing system and causing damage. This is made possible by a vacuum breaker valve supplied with the equipment. A double suction connection permits drawing a soap solution from a barrel or tank if desired. The pump of this machine is totally inclosed and all moving parts are continually bathed in oil.

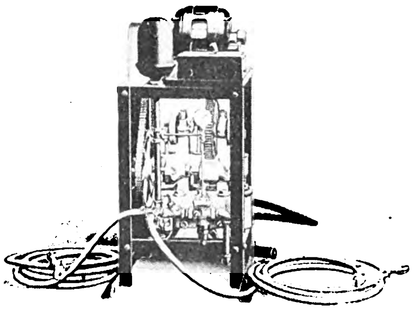


Two-Gun Auto Washer

MANLEY MANUFACTURING COMPANY
York, Pa.

IN BUILDING the machine shown the Worthington Triplex pump was selected as most suitable. This pump has three cylinders 120 deg. apart on the crankshaft so the flow of water is continuous with a maximum pressure. The pump has a single casting and no cup washers or leather buckets are used. The valves are bronze, wing guided in a vertical position on bronze seats. The crankshaft of the pump is drop forged, having babbitt connecting rods with cap screw connections for taking up the wear. The pump is driven by a silent chain from the motor on the top of the steel framework. Suitable sheet steel guards over the chain and gear protect them from water.

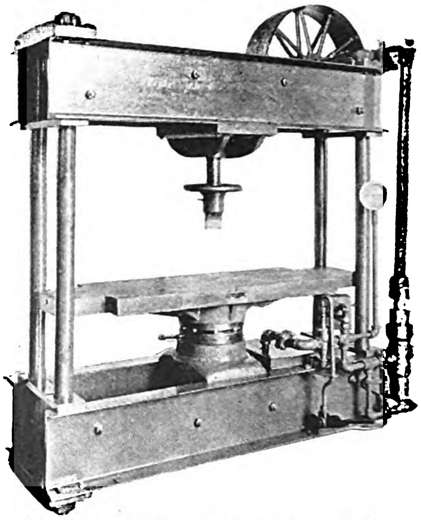
The unit is vertical with the motor at the top, so that it occupies small floor space. The reduction gear is of extremely wide face, coarse pitch and machined cut teeth. A feature is an automatic control valve furnished with the machine. It unloads the pump as soon as the system is up to pressure. This adds life to the pump and reduces the energy consumption. If for any reason the machine is overloaded, the safety valve discharges the water and relieves the machine of strain. The suction line contains a three-way valve so that city water can be pumped, or when thrown in another position the suction hose can be used in connection with a barrel of soap solution, etc. Automatic ring oilers are used on the motor, whereas all other parts of the pump are lubricated by the alemite system. The guns can be adjusted from a fine mist to a hard stream of any volume. The height over all is 46 in. The floor space occupied is 24x30 in. The size of the water fitting is ¾ in. The washer is furnished complete with triplex pump, safety guards, silent chain drive, 6 ft. of suction hose, two 25-ft. lengths of pressure hose, two guns, automatic pressure control, pressure gage and motor.



Hydraulic Straightening Press

LOURIE MANUFACTURING COMPANY
Springfield, Ill.

STRUCTURAL steel construction is used in this press for straightening such parts as automobile axles, crankshafts and camshafts. It is furnished with one differential piston pump, which gives a rapid movement of the ram under low pressure and automatically slows down under heavy pressure. One additional piston can be furnished if desired which will give double the ram speed. It is operated by pedal control valve, which permits the operator to have free use of both hands. The machine shown occupies a floor space of 16 in. x 60 in.



60-Ton High-Speed Press

WEAVER MANUFACTURING COMPANY
Springfield, Ill.

MORE powerful, quicker and more easily operated, and said to be capable of handling any job, is this 60-ton press. The ball-bearing construction, combined with the steep pitch screw, insures greater power and speed with less effort. These are considered outstanding features. It affords two distinct leverages for light or heavy work, either of which can be used without changing the position of the work. Three leverages are available for heavy pressure. The safety bolster is easily raised or lowered by a crank to bring the work in direct contact with the screw. Vertical operation of the lever makes it unnecessary to bolt the press to the floor.

Motor Coach Maintenance*

Proper Layout for the Garage Is Important to Obtain Greatest Efficiency from Shop Forces—Tool Equipment Need Not Be Elaborate but Should Be Chosen to Meet Requirements

By H. P. McDonald
Superintendent of Automotive Equipment
East St. Louis & Suburban Railway, East St. Louis, Ill.

How large should an operator build his garage? Based on experience, the width should be not less than 100 ft. and the length, of course, would depend on the present size of the fleet and the probable future purchases of additional coaches. In using a minimum width of 100 ft., I am going on the basis that the garage, when built, will have no obstructions, such as columns or posts. This width permits coaches to be backed in along each side wall so as to leave an aisle in the center. Any particular coach can then be pulled out without having to move four or five other coaches. When the fleet is so large that center aisle storage becomes necessary, the 100-ft. minimum width still permits the greatest economic use of space. Coaches that are first out in the morning should be the ones stored in the aisles. In storing coaches along the side walls, the distance between coaches should be not less than 12 in., with 2-ft. wall clearance at the rear. This space provides proper access to night men to grease and clean the vehicles properly.

The last two items are very essential because a sanitary and clean coach attracts passengers and the ultimate achievement of low operating cost cannot be secured unless there is proper lubrication. The spacing also provides ample room for extinguishing possible fires.

In these days of rapidly changing conditions, a ceiling or truss height of 16 ft. should be a minimum. This gives plenty of ventilation and also provides for possible future purchase of double-deck equipment. Low-cost constructed garages are dangerous, as carbon monoxide gas causes men working on coaches to develop serious headaches.

Wash Rack Location Important

The wash rack should be located just inside the main entrance door, its length depending upon the size of the fleet. The gas and oil pumps should be located at the inner end of this rack. This enables the largest part of the night's program to be completed at this point and all operations can be observed closely. Coaches coming in off their runs go over the wash rack for cleaning, then are filled with gas, oil and water, and, if not due for any inspection, would be immediately stored along the sides. If due for inspection, they would take their turn in going over the pits. Alongside the wash rack small pits should be provided in the floor, in which water hose and nozzles can be kept ready for use. The number of inspection pits depends upon the mileage of fleet over a 30-day period and the mileage basis adopted for periodical inspection. The tool room, stock room, and work benches should be located as near the pits as practicable, in order to save time in obtaining supplies. Plenty of room should be left between the work benches and the edges of the pits so that floor cranes for handling engines and other heavy apparatus can be readily used.

Motor coaches of today are being built lower and lower and there may be some possibility of making them still lower. Pits, therefore, are a necessity to speed up the work that has to be done underneath a motor coach. They enable the men to use their full efforts in the maintenance of the coaches. The pits should be well lighted and ventilated and should have a sewer connection so that they can be washed out occasionally and kept in a sanitary condition. The size of the pits will vary with the size of the vehicle, but their length should be such that any unit on the chassis can be inspected and serviced readily. Ample general illumination by means of ceiling lights should be provided, and there should also be frequent drop or portable light wall connection sockets. Of the latter at least two should be on each side of each pit and they should also be located not more than 20 ft. apart along all sides of the garage.

There are several methods of heating garages. Based on experience, it appears the use of radiators along the walls is the best. This enables you, in cold weather, to head your coaches in toward the wall so that the engines are close to the radiators and thus kept warm. This makes starting easier, keeps the oil at proper temperature and enables it to function when the engine is started, thus ultimately reducing maintenance costs.

Training of Drivers

In order to have low maintenance cost, drivers must be properly instructed and trained. They must first be impressed with the fact that motor coaches are to be operated primarily for the comfort and convenience of the passengers. They should be started easily and smoothly and stops should be made in the same manner. While this provides comfort and convenience to passengers, it also, in the end, results in lower maintenance cost and less abuse of equipment. Drivers should be instructed to check oil and gas on leaving the garage and to make two or three checks during their day's run and, when they are relieved on the road, the relief crew should be instructed to do the same. This prevents running out of gas on the road, which may cause loss of patronage, due to irritation of passengers, and also prevents oil getting low, which may completely ruin a motor in a short time.

Drivers should also be impressed with the importance of reporting any and all unfamiliar noises which may develop during a day's run, and where obvious defects occur they should be required to report them on proper forms when they turn in to the maintenance department. We quite often find defective motor coaches sent out on the road just because drivers have failed to make the necessary reports so that the mechanical department can make repairs. Proper operation of motor coaches with low maintenance cost is just as much the business of the transportation department as it is of the mechanical department, and unless

COMING MEETINGS
OF
Electric Railway and Allied Associations

March 24—New England Street Railway Club, annual meeting and banquet, Copley-Plaza Hotel, Boston, Mass.

April 1—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

April 26-29—Southwestern Public Service Association, convention, New Orleans, La.

May 31—June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.

---

*Abstract of paper presented at the Illinois Electric Railway Association convention, Springfield, Ill., March 17-18.

there is close co-operation between these departments proper maintenance with consequent increase in reliability cannot be secured.

Good Lubrication Essential

Maintenance on high-class automotive equipment can be conservatively stated to consist of 90 per cent lubrication and 10 per cent adjustment and replacement. If the lubrication is neglected the necessity for adjustments and replacement will increase all out of proportion to the lack of proper lubrication because, taking into account the quantities used, the highest priced lubrication is vastly cheaper than labor and repair parts. When the maintenance department realizes that the cost of lubrication represents a very small percentage of the total operating cost, the reliability of the coaches under their charge will increase and the cost of maintenance decrease.

Only the highest grade of lubricants should be used. In my opinion, there is no standard by which it may be gaged by laymen. Buying automotive oil on specifications doesn't mean anything, as we find several oils have the same flash, fire, viscosity and specific gravity tests and yet they may have different lubricating qualities. Therefore, the safest plan is to buy your oil from a reliable firm with an excellent standing in the industry and, within reason, accept the recommendation of that firm as to the grade and type of lubricant best suited to your needs.

General overhauling instruction sheets should be supplied so as to give the men a definite list of the work to be done. In our case printed instructions are placed on the left side and all gas and oil averages next to them; then the list of the mechanical defects that are reported from one inspection to another shows which of the various units on the coach have given the most trouble and need special attention. The record of gas and oil averages show readily the condition of the engine. The operator should analyze defects carefully that come up and if a particular type of defect recurs, he should notify the manufacturer so that a remedy can be found and applied in future production. In this manner all future purchasers of the particular type of coach equipment are benefited.

The printed instructions on the general overhaul sheets should be divided into different classes of work and in this way it is possible to develop the ordinary type of man into a valuable worker. Men can be developed from the ranks and promotion made from one grade to another, as performing these various operations day by day develops where an operator has an assortment of equipment. These instructions should be made to cover operations on all makes of coaches. Training of mechanics to do efficient work is a serious problem and the cost is great. Care should be used in selecting these men so that the turnover will be at a minimum.

Electrical work should not be tampered with by the ordinary mechanic. An automotive electrician should be the only man to look after electrical units, with the exception, of course, of changing lamp bulbs or changing an entire generator or magneto unit.

Provision of sufficient tools, blocks, jacks, etc., and satisfactory working conditions should be given careful consideration. In our case, we personally give shop men ten minutes in the morning at 10 o'clock and in the afternoon at 3 o'clock in the hot summer months for a smoke and recess. Of course, any smoking done around the garage is done on the outside and not inside the building. We feel that by doing this, it freshens up the men and causes a friendlier feeling toward the company and the departmental head in charge. Lockers, ample washroom facilities and a place for the men to eat their lunches should be provided.

Few Machine Tools Needed

Men engaged in general overhaul operation do not require many machine tools, as the system does not call for actual repair of the units. It mainly consists of complete lubrication, complete adjustments and replacements of such units as are necessary. A drill press, bench grinder and arbor press are about all that are needed, and these only in emergency cases. We do not approve of furnishing mechanics with ordinary tools, such as wrenches, pliers, hammers and screw drivers as our experience has been that they are careless with company tools and let them lie around so that when they do need them they have to spend time to find the particular tool or wrench they want. If each mechanic is required to furnish his own tools of this character, he will not, as a rule, let them lie around and lose them. Large tools and other necessary shop tools should be furnished by the company and passed out on a check system, which makes the man taking it out responsible. Ample spare units should be kept on hand to speed up general overhauling work, so that the coach will not be tied up for a considerable length of time in order that the unit may be repaired.

Units which have been removed under general overhaul operations should be repaired in a special department, which gives better efficiency and enables the man in charge to hold the men working on those units responsible for improper repairs. Each unit should be numbered and a change slip made out when a unit is changed. A record should be kept of change slips and the reasons for such changes, so that when a particular defect shows up continually the cause of the defect can be analyzed and remedied. Except in emergencies temporary repairs should be avoided, as these are merely a makeshift and are apt to cause trouble and expense later. All major repairs should be made by the day force, leaving for the night force the running defects that are written up by the coach drivers on report cards. The latter usually consists of inspecting fan belts, setting up spark plugs, and checking up on brakes, etc. If the small defects are handled thoroughly at night, it will be found that road calls and involuntary stops will be materially decreased, as experience shows that road calls in general can be divided approximately 90 per cent to neglect, 5 per cent for flat tires and 5 per cent for defective materials and causes beyond control.

The success of motor coach operation depends on the thoroughness of the general overhaul or inspection, which must be done thoroughly in order to keep the vehicle at as near 100 per cent condition as is practical at all times. General overhauls or inspections should be carried out at such periods of from, say, 2,500 to 4,000 miles, in order to give satisfaction. In our opinion, 3,000 miles is the proper figure. If some program, such as the above, is not carried out, it will cause delays on the road, with consequent disruption of schedules and cause the public to lose confidence and stop riding, so that it may take months to get them back as customers. The man in charge of maintenance is held responsible for the mechanical condition of the coaches and if the transportation department does not allow him to keep the coaches over pits long enough to give them full inspection, best results cannot be secured. It must be remembered that a motor coach of proved merit costs from $8,000 to $12,000, and if it is not properly maintained its life will be short and the owner suffer a loss.

American Association News

Subjects and Meetings

MEMBERSHIP of the committee on subjects and meetings of the American Association has just been announced by President Sawyer. The complete personnel follows:

Harry L. Brown, secretary Ohio Brass Company, Mansfield, Ohio, chairman.

Edward Dana, general manager Boston Elevated Railway, Boston, Mass., vice-chairman.

James P. Barnes, Louisville, Ky.
F. G. Buffe, Kansas City, Mo.
F. L. Butler, Atlanta, Ga.
H. C. Clark, Newark, N. J.
Thomas Conway, Jr., Philadelphia, Pa.
L. J. DeLamarter, Grand Rapids, Mich.
F. W. Doolittle, New York, N. Y.
W. A. Draper, Cincinnati, Ohio.
R. W. Emerson, Cleveland, Ohio.
Thomas Fitzgerald, Pittsburgh, Pa.
J. R. Fitzpatrick, Chicago, Ill.
George Frey, Philadelphia, Pa.
Charles Gordon, New York, N. Y.
D. W. Harvey, Toronto, Ont., Canada.
W. W. Holden, San Antonio, Tex.
M. B. Lambert, New York, N. Y.
W. H. Lines, Portland, Ore.
E. B. Meissner, St. Louis, Mo.
Dudley Montgomery, Madison, Wis.
C. E. Morgan, Brooklyn, N. Y.
A. T. Perkins, St. Louis, Mo.
J. S. Pevear, Birmingham, Ala.
H. B. Potter, Baltimore, Md.
J. K. Punderford, New Haven, Conn.
G. A. Richardson, Chicago, Ill.
H. S. Robertson, Denver, Col.
E. J. Speh, Cleveland, Ohio.
E. P. Waller, Schenectady, N. Y.
E. A. West, Salt Lake City, Utah.
H. R. Whitney, Worcester, Mass.

3

Accidents are avoided by assuming that the other fellow is going to be careless. Keep your eyes and mind on the traffic. The greatest asset a street railway has is an employee who guards the safety of those intrusted to his care and lets the "scenery" go by without distracting his attention from essential duties.

ELECTRIC RAILWAY JOURNAL will be glad to furnish press proofs of this page free of charge for posting on bulletin boards and will supply electrotypes of this series at cost for use in company publications.

The News of the Industry

One-Man Car Case Decided

Iowa Supreme Court Refuses to Enjoin Union from Enforcing Two-Man Car Requirement.

All hope of instituting one-man car service as an economy measure by the Des Moines City Railway, Des Moines, Iowa, appears to have been banished in an opinion handed down on March 15 by the Iowa Supreme Court affirming Judge Joseph Meyer of the Polk County District Court and refusing to enjoin Local 441 of the Amalgamated Association from enforcing a 25-year contract calling for the operation of street cars by a motorman and a conductor.

COURT QUOTES WORDING OF THE 1916 FRANCHISE

The high court failed to rule directly upon the contention of the company that the contract was against public policy in that it prevented the introduction of economies which would, if instituted, result in the reduction of fares to the residents of Des Moines. The court disposed of this question by pointing out that the franchise ordinance of 1916 contains the provision that "in the operation of its railway by electricity each motor passenger car shall be in control of a motorman and a conductor."

This is practically the wording of the contract between the company and the association, the opinion states, and goes on to say that, "so long as this ordinance of the city of Des Moines exists all parties are bound thereby, and there is no ground for equitable intervention."

In a similar manner the court refused to assume jurisdiction in the question raised by the company over the validity of the check-off. The opinion says:

> The company has a clear, speedy and adequate remedy at law for the very thing about which it complains. It is true that the evidence shows that certain of the employees did so notify the company (to refuse to pay the check-off of officers of local 441), but such employees are not specifically named as defendants herein.

On the third main point raised by the company, which alleged that the contract was "invalid because it was in violation of the constitution and by-laws of the International Association," the court held that this was a matter wholly between the local and the international. On this point the ruling said:

> So long as no complaint is being made by the international against the local for non-compliance, it does not lie with third parties to raise such a question.

MATTER OF PUBLIC POLICY DISCUSSED

The company's charge that the contract has the effect of unionizing an entire industry and is therefore against public policy brought forth the comment from the court that "if it is true that the contract contravenes public policy, as between the parties thereto, both are *part delecto*, or, in other words, both are equally at fault."

The contract which the traction company sought to enjoin the union from enforcing was signed in 1915 and has thirteen years to run. The company has been operating under a 10-cent cash fare and selling weekly passes at $1.25, but has shown monthly deficits regularly for nearly a year with the exception of December, 1926, and January, 1927. The debit to the stabilizing fund as of Jan. 31 this year was $24,243. F. C. Chambers, president of the company, estimated that the institution of one-man cars would have meant a saving of more than $200,000 annually and a reduction of fares under the present service-at-cost franchise.

J. G. Gamble, attorney for the railway, announced that he will ask for a rehearing.

Dr. A. A. Mitten Made Chairman of Philadelphia Committee

Thomas E. Mitten, for sixteen years chairman of the executive committee of the Philadelphia Rapid Transit ComCompany, Philadelphia, Pa., relinquished his post on March 16 in favor of his son, Dr. A. A. Mitten. The elder Mitten will continue as chairman of the board of directors, but will shift much of the burden of active management to the son, it is understood.

Coleman J. Joyce, counsel, and Leon Jewell, vice-president in charge of traffic, resigned from the board of directors. They were succeeded by J. A. Queeney and Ralph T. Senter, respectively.

Terminable Permit Legislation in Illinois Unlikely

The long-delayed report on terminable permits for public utilities in Illinois has been presented to the state Senate by Senator Richard J. Barr, chairman of the joint commission which spent two years studying the subject.

The recommendation of the commission urges the adoption of terminable permits as the franchise scheme in the state. It does not suggest what agency shall issue the permit, nor the terms, nor under what conditions a permit shall be terminated. The recommendation does not go farther than urge that the terminable permit method be adopted.

The failure of the House and Senate to present a report in a formal way is said to have injured the chances of any terminable permit legislation at this session. Senate and House members predict that no act will pass the present session of the General Assembly. The recommendations contained in the report were reviewed in the ELECTRIC RAILWAY JOURNAL for Jan. 8, page 92.

Amends Fare Petition

New Plan Advanced by Pacific Electric Includes Reduction in One-Way and Round-Trip Fares

A supplemental application to its recent request for a hearing on the petition for a general increase in fares has been forwarded by the Pacific Electric Railway, Los Angeles, Cal., to the California Railroad Commission. The new application asks for an entirely new set of fares to be established temporarily on certain lines. The plan contemplates a material reduction in one-way and round-trip fares, but an increase in the present form of daily commutation tickets. It is proposed to provide only one form of commutation ticket, namely, the 30-ride family ticket with a limit of 90 days from the date of sale, which will be at a lower rate than the cost of the same ticket at the present time, yet will be higher than the present daily commutation ticket. In the new schedule of fares contained in the supplemental application only one-way fares and 30-ride commutation ticket fares are provided. The round trip will be double the one-way fare. According to the supplemental application these are to be tried out during the investigation by the Railroad Commission with the understanding that if a trial of these fares for a reasonable length of time proves that they are unsuccessful in materially increasing traffic volume, the company has permission to restore the present fares without delay.

The original application for a general fare increase asked to advance the fares 14 per cent over the present rate. At the present time the Pacific Electric is operating two distinct classes of services, a local and city service and an interurban service. The proposed set-up contemplates three classes of fares and service—the local or city service as it is at present; a scale of fares for suburban service extending to surrounding points of metropolitan district, and the interurban service to more distant points.

In commenting upon the new application, D. W. Pontius, vice-president and general manager, said that the purpose of the original application for an approximate average increase of 14 per cent was to provide sufficient additional revenue to meet operating expenses and fixed charges. As set forth he claimed these had been far below a reasonable return on the investment. He said that residents in communities near Los Angeles and chambers of commerce there had expressed the belief that a reduction instead of an increase in the one-way and round-trip fares would produce a material increase in travel volume and a like increase in revenue because of such volume. It was his contention that operating results had been so discouraging that the company was willing to experiment with the lower fares for a reasonable length of time, although it might lose in revenue, but with a view to the possibility of working some plan in the way of increased fares that would be of benefit not only to the railway but to the community served.

Jersey Legislature Passes Paving Bill

The New Jersey Assembly passed on March 15 the bill introduced by Senator Abell of Morris County to relieve electric railways of a part of their street paving obligations. The vote was 36 to 20. Governor Moore is expected to veto the measure.

The Board of Freeholders at Newark, N. J., has taken its fight against the electric railway paving bill direct to the people in paid advertisements in newspapers, a step which is believed to be without known precedent.

The Freeholders analyze the paving bill, present their arguments against it and wind up by repeating that a nonpartisan commission should be appointed to study the paving problem. They say in part:

> The Board of Freeholders of the County of Essex, in the interest of taxpayers, has consistently opposed for several years the repeated efforts of the traction interests to get from under their obligations in this manner, and the board has been continuously aided in its efforts by the State Association of Freeholders, the State League of Municipalities and representative civic bodies.
>
> The Board of Freeholders and these bodies have always advocated the study of the franchise, contractual and other financial relations between traction companies and municipalities and counties before any such sweeping legislation is enacted. We have requested our representatives in the present legislation to propose and further in the Legislature the creation of an impartial commission for the purpose of such study.

Each section of the measure is numbered and discussed by the Freeholders in an adjoining column in the "ad" itself. Traction company "sales talk" is the way the first section is described.

Henry L. Doherty Out of Routine Work

Henry L. Doherty, president of the Cities Service Company, New York, has addressed a letter to stockholders of his companies describing the condition of his health and announcing that he never expects again "to take an active part in the routine work" of the business.

He insisted that his organization had been so perfected that it would function perfectly without him. He intimated that on account of his health it had become necessary for him virtually to retire from active business and said that he was "still unable to conduct business in the ordinary way." Among other things he said:

> At all times my business affairs have been provided for by will and by provision for trustees. If anything should happen to me now, or at any other time, there is no reason why it should lessen the intrinsic value of the securities of the Cities Service Company by a single dollar. I have taken no part in the routine work of the Cities Service Company since the United States got into the World War, and never expect again to take an active part in the routine.

Wage Demands in New York State

Employees of the New York State Railways are drafting their demands for a wage increase and other concessions in their yearly agreement. The old agreement expires on May 1. While no formal demands have yet been presented to the railway, union officials make no secret of the fact that the men in Utica, Rochester and Syracuse will ask an increase in wages of 10 cents an hour, placing of two-man and one-man car operators on the same scale and a six-day week.

The present wage scale is 60 cents an hour for operators of one-man cars; 55 cents an hour for two-man car operators and 57 cents for interurban employees. The 10-cent increase has been filed in every proposal of the union since 1923. It is expected that 70 cents an hour flat scale for one-man and two-man car operators will be asked.

The union leaders base their plea for a pay increase on the fact that fares have been raised in all three cities, although very recently in Utica and Syracuse. Fares in Rochester were raised to 8 cents in January, 1925. Officials of the railway point to the increased costs of operation and the short tenure of the fare boost.

All proposals are submitted to joint vote of the workers in the three up-state cities. While the contract expires on May 1, any agreement reached after that date becomes retroactive. The contract provides for arbitration and there is a joint conference board made up of the presidents and business agents of the divisions of the Amalgamated Association in the three cities.

Disqualification Proceedings in Seattle

The United States Circuit Court of Appeals in San Francisco has denied a petition of John G. Von Herberg, a taxpayer of Seattle, Wash., to disqualify United States Judge E. E. Cushman from hearing a taxation action involving the city of Seattle and the Puget Sound Power & Light Company. Mr. Von Herberg has filed in the trial court an affidavit of prejudice and bias on the part of Judge Cushman. Judge Cushman certified to the Circuit Court the fact that such affidavit had been filed. In his petition to the Circuit Court Mr. Von Herberg, through counsel, contended that Judge Cushman in so certifying had automatically disqualified himself, and asked for an order selecting another judge. The court held that it lacked jurisdiction.

The Circuit Court of Appeals also has under advisement the matter of disqualification of Federal Judge Jeremiah Neterer in the Seattle Municipal Street Railway litigation and also a motion by J. Ambler Newton, assistant corporation counsel in Seattle, to dismiss all actions pending in federal court against the Washington municipality in the railway litigation. Attorneys for the Puget Sound Power & Light Company appeared before the court and argued to have Judge Neterer disqualified on the grounds that he is a Seattle taxpayer and therefore would be prejudiced.

Attorneys for the city of Seattle declared that the city is not a party to any disqualification proceedings and urged that the higher court dismiss the litigation.

Home Rule Referendum at Chicago's Mayoralty Election

Managers of the local Democratic organization have succeeded in collecting approximately 260,000 signatures on a petition for a referendum on the question of whether Chicago shall come from under the state public utilities act and restore to the city substantial control over its public utilities.

By virtue of the filing of this petition with the county election board on March 6 the question is automatically placed on the ballot at the Mayoralty election April 5. A minimum of 184,000 names was required by state law in order to submit the proposition to the voters. If the referendum is passed at that time, control of all local utilities will be taken from the hands of the Illinois Commerce Commission and vested either directly in the Chicago City Council or in a local commission created by the Council. This would take place as soon as the city clerk formally notifies the state commission of the outcome of the vote.

Under the state public utilities act, which created the Illinois Commerce Commission, it is provided that any city desiring to withdraw from the rule of the commission and set up one of its own selection may do so by agreement of a majority of the voters at a Mayoralty election. The acts of a city commission are, however, subject to review on appeal by the state commission. There is now pending before the Legislature, however, an amendment known as the McCluggage bill, which would bring appeals directly to the courts.

East St. Louis Goes to Church

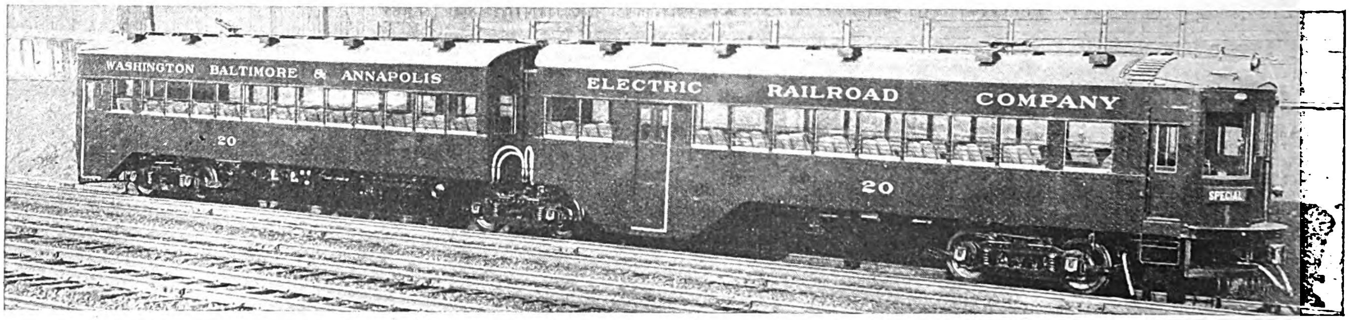
The "return pass" system to increase Sunday traffic on its street cars and bus lines has been temporarily adopted by the East St. Louis & Suburban Railway. Residents of East St. Louis, Belleville and Alton, Ill., will have an opportunity to use the plan during all of the Sundays of the Lenten season. The special plan became effective on Sunday, March 6, and on the first day 380 persons availed themselves of the reduced rate and much publicity for the railway was won. The passes, at first good only between the hours of 5 a.m. and 1 p.m., are now effective between 4 a.m. and 1 p.m. and between 6 p.m. and 10 p.m.

The cut rate was advertised by the company as a special inducement to residents along its lines to "go to church." Advertising cards have been placed in all of the street cars and buses operated by the company advising the patrons to take advantage of the reduced rates and "Go to Church During Lent." Under the pass system a passenger pays 10 cents and receives a coupon valued at 10 cents when applied toward the cost of the return trip. Residents of Belleville who wish to attend church services in East St. Louis can save 10 cents on the round trip.

New Fare Schedule on Massachusetts Interurban

An increased schedule of fares for the occasional rider went into effect on the Boston & Worcester Street Railway, Framingham, Mass., on Feb. 15. Zone tickets are still sold at 66 for $2.50 and there has been no change in the zones. The fare on the Marlboro crosstown line has been increased from 5 to 6 cents. The former basis of fare for the occasional rider was 10 cents for any two continuous fare sections and 5 cents for each additional fare section. The new basis is 10 cents within one fare section, or 6 cents a fare section. An exception is made on buses operating between Park Square, Boston, and Salem Square, Worcester, by way of Watertown and other places.

The former rate for pupils' tickets has been increased from eighteen zone coupons for 45 cents to twenty tickets for 60 cents. The old schedule of round-trip tickets from Chestnut Hill to Natick and thence to Worcester remains unchanged. The provision that each fare section is approximately 1⅔ miles is left out of the new schedule. A tariff rate for special buses filed with the State Department of Public Utilities is 50 cents a mile from point of origin to point of destination plus 30 cents a mile for dead mileage, plus operator's hourly rate for all time held.



First of Ten High-Speed Articulated Cars to Be Delivered to the Washington, Baltimore & Annapolis from the Philadelphia Plant of the J. G. Brill Company

Operation of Rochester Subway Railroad Urged

All indications point to operation of the municipally owned subway railroad in the bed of the abandoned Erie Canal in Rochester, N. Y., by the New York State Railways, Rochester lines. At a public hearing no serious opposition to leasing the line to the railways for a three-year trial operation was voiced. Previously Mayor O'Neil had intimated he was considering municipal operation if there were enough public and official sentiment for it.

Members of the Mayor's official family and of the city municipal research bureau, however, have gone on record as being in favor of turning the operation of the railroad over to the transportation company, which is the only agency with the equipment, experience and men to take it over at once. The Mayor has arranged conferences with city and transportation officials, from which is expected to evolve a new contract for operation by the railways under service at cost. Pressure of business interests will, it is believed, force early action by the municipal authorities. The line is nearly completed, the cost to the city has been heavy and leading industries and business houses are demanding that a plan of operation be speedily worked out.

New Articulated Cars Between Baltimore and Washington

The new Pullman type cars to be placed in operation by the Washington, Baltimore & Annapolis Railroad were inspected officially on March 11. Utility commissioners and operators from Cleveland, Washington and Baltimore asserted that the luxury of the new cars constituted an effective reply by interurban electric lines to the rapidly increasing competition of buses. The first of the two-car units to reach Baltimore was run over the line from Washington to Baltimore.

J. J. Doyle, president of the Washington, Baltimore & Annapolis, was in charge of the inspection party. Visitors present were J. H. Alexander, president; Charles H. Clark, maintenance engineer; Terence Scullen, master mechanic, and Paul E. Wilson, vice-president, all of the Cleveland Railway; Samuel Bole, engineer of the J. G. Brill Company; H. B. Potter, general manager; S. E. Emmons, assistant to the president, and Adrian Hughes, United Railways, Baltimore, and A. S. Wentworth, Westinghouse Electric & Manufacturing Company.

Six new units are now being placed in operation. The four others will be delivered the latter part of this month. Mr. Doyle has said that the early test trips were very satisfactory. He believes that the improvements in riding quality and in comfort attained by the articulated effect, the luxurious revolving seats and the other fine appointments are going to answer satisfactorily the demand for luxury on the part of the high-grade clientele.

February Safety Banner in Rochester Awarded

The safety banner for February on the lines of the New York State Railways, Rochester lines, went to the Main Street East division, which operated 8,932 miles per accident; second in line was the Portland division with a record of 6,713 miles per accident. Reports showed that the one-man cars operated more miles with fewer accidents than the two-man trolleys. This competition is part of the campaign under Safety Director Leon R. Brown.

Improvements on Skokie Valley Route in Effect

Operation of all except two through trains between Chicago and Milwaukee over the new Skokie Valley route, installation of a new fast service between downtown Waukegan and the Chicago Loop over the Skokie Valley line and the addition of several more stops made by certain limited trains were simultaneously effected by the Chicago, North Shore & Milwaukee Railroad on Feb. 20. The new schedule of operation over the Skokie Valley route centralizes all high-speed operations on this new stretch of private right-of-way. The new station stops scheduled for several of the Chicago-Milwaukee limiteds are North Chicago, Waukegan, Zion, Kenosha and Racine.

Phoenix Voters Will Pass on Rehabilitation Plan

April 30 has been set by the City Commission as the date for special election on the proposed $750,000 bond issue for the complete rehabilitation of the Phoenix Street Railway, Phoenix, Ariz. Mayor Frank E. Jefferson asked if it might not be feasible to submit also an alternate proposition to the voters on April 30 to provide for rehabilitation of only certain portions of the railway system at less cost. It was pointed out by City Attorney W. L. Barnum that the dominating issue was to determine whether the city was within its constitutional rights in incurring indebtedness for the rehabilitation of the system.

"Zero Hours" in Atlanta

During the month of February, 24 "zero hours" were posted for the trainmen of the Georgia Power Company, Atlanta, Ga., in which time only one accident occurred traceable to the negligence of a street railway employee. The "zero hour" idea was originated by W. J. Rountree, safety director for the company. Every day one hour is taken as "zero hour." The hour so chosen each day is posted on all of the transfer boxes of the company, and during that hour every precaution is taken by motormen and conductors to keep a clean record. The psychological effect of the "zero hour" has been to show train crews how easily accidents can be prevented if only a little thought and care are employed. Later it is planned to extend the "zero" period for a complete "zero" day.

Rate Increase Sought by Gary Railways

That earnings have never been sufficient properly to support service on the Gary and Valparaiso division was given as the reason for a proposal to increase certain commutation rates between Gary and Valparaiso filed on March 8 with the Indiana Public Service Commission by the Gary Railways.

Commutation rates between Gary and Valparaiso on the company's Valparaiso division are now considerably less than the lowest commutation rate offered by the Pennsylvania Railroad, the only competing line, the petition states. The proposed increase in fare will enable the railway, which operates cars directly to the various mills in Gary, to continue the present schedule between the two communities and to provide better service for the many Gary mill workers residing in Valparaiso, it is pointed out.

The company asks permission to cancel the present 25-ride commutation ticket, which is good for transportation between Valparaiso and any point within the first fare zone in Gary and sells for $7.50, and to issue a ten-ride bearer coupon ticket at the rate of $4. Should the authority be granted by the commission, the new rate will go into effect 30 days after the issuance of the enabling order.

In support of the company's application, the petition points to an extensive program of rehabilitation begun last year to make the Gary-Valparaiso division one of the most efficient interurban lines in the company's system.

Contract for New East River Line Approved

The Board of Estimate of New York City in committee of the whole has voted unanimously to approve the contract for the construction of the tunnel under the East River from the foot of East 53d Street, Manhattan, to Nott Avenue, Long Island City. Formal award of the contract to Patrick McGovern, Inc., for the bid price of $10,631,550 is expected to follow.

The board's action was taken on the recommendation of John H. Delaney, chairman of the Board of Transportation. Mr. Delaney denied the contention of opponents of the construction of the 53d Street subway that the tunnel was unnecessary. One particularly significant remark of his was that unification of the city's rapid transit lines was "inevitable." He did not indicate just how he expected this unification to be accomplished.

Trolleys Over Camden Bridge Assured

The first steps in the running of railway cars over the Delaware Bridge was taken on March 10 when the Camden City Commission passed an ordinance giving the Public Service Corporation of New Jersey the right to lay loop tracks from the Camden bridge plaza to the center of Camden. Since that date the Philadelphia Rapid Transit Company has announced that it would join with the Public Service Corporation of New Jersey in an application to the Delaware River Bridge Commission for trolley operating privileges across the interstate span. Permission to build the loop was given to the Camden Horse Railway, an underlying concern of the Public Service Corporation. Under the plan thousands of people each day will be able to travel in the trolleys of the Philadelphia Rapid Transit over the bridge and then over the Public Service rails to Camden. Details are being worked out by engineers of both companies, which now are operators of a bus service across the bridge.

News Notes

Weekly Pass in Texarkana. — The Southwestern Gas & Electric Company, Texarkana, Ark., is selling weekly passes on its lines for $1.

High Honor for Motorman.—Tal F. Harris, a motorman of the Nashville Railway & Light Company, Nashville, Tenn., was recently presented a handsome gold watch and made the subject of a citation before operators and officials of the company. Attention was directed to his ten years of operating without the semblance of an accident and to his equally notable record for courtesy. The watch presented to Mr. Harris bore an inscription signed by B. C. Edgar, president. It read: "Recognizing a distinguished safety and service record." His record shows approximately 320,000 miles run and 1,825,000 passengers carried.

Amends Fare Request. — The Colorado Springs & Interurban Railway, has asked the City Council of Colorado Springs, Col., to consider the retention of the present 10-cent fare, but abolish the two fares for 15 cents and instead accept tickets at six for 50 cents or fifteen for $1. The City Council had previously declined to approve the ticket-selling idea because it required the purchase of $1 in tokens.

Excursion Trips Offered.—The Union Traction Company of Indiana, Anderson, Ind., has started special excursions over its lines to various points of interest and the response thus far has been good. Each weekend the company offers special rates to certain points. Recently a trip to the Circus City zoölogical gardens, near Peru, was offered. Here the patrons can see one of the largest collections of wild animals in the country.

New Demands in Scranton.—Motormen and conductors of the Scranton Railway, Scranton, Pa., have prepared demands to be embodied in a new agreement replacing the old one which expires on April 1. They ask that the hourly rate be raised from 64 to 74 cents, while one-man operators, now receiving 72 cents, want 89 cents an hour. The men also want an eight-hour day on all runs with time-and-a-half pay on hour-over schedule runs. This stipulation is incorporated in the present working agreement, but the runs are said to vary in time from eight to 9½ hours. More than 600 motormen, conductors, brakemen and trackmen will be affected by whatever changes are made in the agreement.

Would Change Method of Handling Freight.—A change in the method of handling freight shipments on the Illinois Traction System at Champaign, Ill., has been announced with the completion of the "Champaign Belt," on which engineers of the Illinois Traction System have been engaged for about a year. The traction system has electrified approximately 5½ miles of the main lines of the Illinois Central and the Wabash Railroads at Champaign, and in future all freight transported by the Traction will go on the new belt line, hauled by electric locomotives.

Mutual Track Arrangement to Improve Service.—Residents of East Boston, Mass., have lost their fight to prevent the Eastern Massachusetts Street Railway from operating through cars over the lines of the Boston Elevated to Maverick station in order to improve the service to Revere. The public utilities department has issued an order providing for the through service, stipulating, however, that not more than six cars an hour shall be so operated. The department in its order referred to the contention of the trustees of both companies that this arrangement would effect a saving in operating expenses over that obtaining at the present time and would improve the service both for the people of Revere and the people of East Boston.

Conductor Punished for Theft.—Delbert Kraft, conductor on the Jackson lines of the Michigan Electric Railway, was sentenced on March 11 to serve from six months to five years in prison for pilfering fares. The court recommended that he serve six months. Conductor Kraft pleaded guilty and said he was driven to the theft by financial straits. Judge Benjamin Williams declared that he could not place Conductor Kraft on probation because there were 2,400 conductors in Michigan who might be tempted to take the funds of their companies if they thought that they could escape. The offender was not required, however, to pay any cost or fine or to refund any money to the company. He was $300 short in his returns.

Employees Enter Contest. — An essay contest for railway employees, arranged by W. J. Rountree, safety director for the Georgia Power Company, on the subject of "What Do We Owe the Passenger for His Fare?" resulted in the submission of approximately 100 essays of high quality. C. H. Strong, assistant to the manager of the railway department; B. K. Godfrey, manager of the compensation department, and L. K. Starr, publicity director for the Georgia Power Company, were judges. W. C. Alsobrooks, a conductor, was winner of the first prize, with C. H. Varn, a motorman, in second place and S. J. Steele, also a motorman, in third position. The first three essays are to be printed in full and distributed to the 1,500 trainmen in the railway department, as it is believed the essays, written by members of the crew, will go much further toward developing a spirit of courtesy among employees than any number of memos from headquarters.

Recent Bus Developments

Bus Activities in Springfield Planned

Sidney H. Sayles, superintendent of the Springfield Street Railway at Palmer, Mass., has announced that bus service will supersede railway service on the Three Rivers, Bondsville, Ware and Monson lines shortly after May 1. H. M. Flanders, general manager of the company, has applied to the Selectmen of the towns for the necessary licenses to operate buses. The railway was granted licenses to operate bus service in the territories mentioned one year ago and these licenses expire May 1. The Springfield company never attempted to make use of the privilege last year, but Mr. Flanders was assured that the licenses would be renewed. The company has also applied for licenses to operate buses between the Palmer-Wilbraham and the Palmer-Brimfield boundaries. The railway lines operating between Palmer and Worcester are to be abandoned. This will clear the way for a through line of buses between Springfield and Worcester. De luxe buses will be operated.

High Point Awaits Bus Operation

A bus system to be placed in operation in High Point, N. C., some time this spring will mark the discontinuance of railway service. An agreement to this effect was reached by the City Council, officials of a bus company and officials of the North Carolina Public Service Company, the railway operator. The latter company waived its carrying rights in favor of the buses. The buses will be operated by the Carolina Transit Company, Columbia, but if they do not meet the needs of the city, the North Carolina Public Service Company has agreed to re-establish railway service.

Ten new buses are to be started, covering about three times as much territory and serving several times as many people as the street cars at the present time. One line will extend to High Point College and the other will go to the baseball park.

Missouri Bus Bill Passes Senate

The Missouri Senate on March 9 by a vote of 25 to 5 passed Senator A. L. McCawley's bus control bill. It places all bus lines in the state outside of Kansas City under the jurisdiction of the Missouri Public Service Commission. The bill provides special taxes of from $60 to $1,000 per bus and limits the bus to not more than 25 ft. in length nor 84 in. in width. St. Louis buses will not have to pay the extra state tax, but will continue to give the city a percentage of their gross receipts for the use of its streets. The highways committee of the Missouri House of Representatives on March 8 voted to report favorably a bill placing control of bus lines using state highways and streets under the supervision of the Missouri Public Service Commission. The measure also provides for special license fees to be paid by the bus companies.

Bus Subsidiary of West Chester Street Railway Reorganized

Reorganization of the Peoples Transportation Corporation, a suburban bus subsidiary of the West Chester Street Railway, West Chester, Pa., was effected on March 4. The two companies operate under the route name of "The Chester Valley Lines." During the proceedings, participated in by representatives of fifty creditors with aggregate liability accounts of $500,000, the following were elected officers to handle the affairs of the company: C. B. Cooke, Jr., Philadelphia, president; F. G. Wilson, Chicago, treasurer and general manager, and Eric H. Biddle, Philadelphia, secretary.

Under the plan of reorganization, sufficient security and credit were offered to offset the unsecured liabilities of $102,000, which represented indebtedness to local supply houses, in addition to the amount owed the Yellow Truck & Coach Manufacturing Company for buses. The assets of the company, exclusive of value of franchise rights, before the reorganization plan was effected were almost equal to the liabilities. Secured loans from the parent company total approximately $300,000, and liabilities of $250,000 included in creditors' statements have been offset by a like amount in equivalent values.

The Peoples Transportation Corporation operates 40 buses through the Chester and the Schuylkill Valleys. Its lines connect Reading, Pottstown, Norristown, West Chester, Chester and Wilmington, and Media and Oxford. The West Chester Street Railway owns all of the outstanding stock of the Peoples Transportation Corporation.

More Plans Matured at Worcester

The Worcester Consolidated Street Railway, Worcester, Mass., has asked the Department of Public Utilities for permission to extend its June Street-Tatnuck bus line. The Consolidated plans a terminus at Dawson Road, a mile north of Tatnuck Square. At the start trips will be made at night, noon and morning to accommodate workers. The bus service in this section the company believes is desirable because of the growth of the neighborhood.

The company has started bus service between Worcester and Clinton, Mass., by way of Boylston. The Worcester terminal is the Union station and the Clinton terminal the railroad station in that town. The fare between the two places is 50 cents. The buses are express part of the way.

Bus Brings Increase in Riding.—The six months experiment in the substitution of bus service for city railway service at Manitowoc, Wis., by the Wisconsin Public Service Corporation has met with a certain measure of success. During December, 1926, there was an increase of 43.4 per cent in revenue passengers compared with December, 1925, when the railway cars were still in use. January, 1927, showed a further increase, with 46.1 per cent more passengers riding than in the similar month of 1926.

Would Extend Bus Service. — The Connecticut Company is planning further extension to its bus service and has applied to the Public Utilities Commission for permission to operate between Hartford and West Hartford, Conn., as an amendment to its present charter.

Bus Bill Favors Portland Company.—A bill to permit the Portland Railroad, Portland, Me., to operate buses as it may see fit has been passed by the Legislature. An attempt to amend the bill so as to prevent the railway from taking up any of its tracks or discontinuing operation of cars when bus operation is started was lost.

Bus Line Now Serves Oklahoma City Addition.—The Oklahoma Railway established a new bus line from the downtown section of Oklahoma City to the Crestwood addition in the northwest part of the city on March 1. Buses are being operated on a twenty-minute schedule. Several new buses of the latest design have been installed.

Another Motor Coach Route in Pittsburgh.—The Pittsburgh Motor Coach Company, Pittsburgh, Pa., has been granted a franchise to operate a fifth motor coach route beginning March 21 between Union Station and the intersection of Lebanon Boulevard and Washington Road in the high-grade South Hills suburbs. The distance is 7 miles and the expected running time 32 minutes. Limousine coaches each seating nineteen persons will be operated at intervals of twenty minutes off-peak and twelve minutes peak. As on the other routes of this company, the fare will be 25 cents.

Oppose Bus Operation.—Petitions of the Sandston Electric Railway for authority to abandon the 2½-mile stretch of tracks and to operate bus service between Richmond and Highland Springs, via Seven Pines and Sandston, have been dismissed without prejudice by the Virginia Corporation Commission, following a hearing at which considerable opposition was voiced to both petitions. The company is owned by the Richmond-Fairfield Railway, Richmond. The petitions were dismissed at the request of S. W. Zimmer, counsel for the railway, who said the opposition was "unexpected," and that he wished to consult with Oliver J. Sands, president of the railway and prominent Richmond bank president, now out of the city, before taking further steps. John Randolph Tucker, counsel for minority stockholders and for persons living along the line, explained that his clients feared that operation of a bus line would make the electric railway so unremunerative it might be abandoned.

Financial and Corporate

Day & Zimmermann Buy National Public Service

With Their Associates Acquire Controlling Interest from A. E. Fitkin—Mr. Zimmermann to Be President

Day & Zimmermann, Philadelphia, and their associates have acquired from A. E. Fitkin the controlling interest in the National Public Service Corporation. Mr. Zimmermann will be president of the company and Floyd W. Woodcock will be vice-president. No change in the operating personnel of the company is contemplated, but the company will have the benefit of the long experience of Mr. Zimmermann and his organization in the public utility field. The National Public Service Corporation with gross receipts of more than $27,000,000 has been built up by Mr. Fitkin, who remains on the board. The gross receipts of the Day & Zimmermann properties prior to this addition were about $12.000,000.

The most important properties controlled by the company are situated in the states of New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, Georgia and Florida, and serve an aggregate population of more than 2,000,000.

The principal companies controlled by National Public Service Corporation include Jersey Central Power & Light Company, Virginia Public Service Company, Tidewater Power Company, Florida Power Corporation, Eastern Shore Gas & Electric Company and the Municipal Service Company.

Mr. Fitkin in confirming the sale stated that he is surrendering the control and supervision of the affairs of the company because of his desire to devote all of his time and attention to his western properties known as the Inland Power & Light Corporation system.

The trackage of the railway properties included in the National Public Service Corporation totals 356 miles. Statistics of these properties follow:

	1926	1925
Transportation Department:		
No. of car-miles	12,206,733	12,218,198
No. of bus-miles	1,702,006	1,809,639
Total vehicle-miles	13,908,739	14,027,837
Passengers carried:		
Street railway	80,609,958	82,221,883
Bus	3,982,043	3,568,171
Communities served:		
Street railway	96	103
Bus	47	43
Population served:		
Street railway	772,980	755,000
Bus	686,844	683,000

Of the total earnings of $27,788,680 the receipts from transportation were $5,761,704, or 20.7 per cent.

The Tidewater Power Company operates the electric railway in Wilmington, N. C., and surrounding territory. The Municipal Service Company operates an interurban railway in Ohio known as the Youngstown & Suburban, the railway properties in York and Oil City, Pa., and controls the Keystone Public Service Corporation, which in turn, through its subsidiaries, operates the electric railway and bus lines in and around Scranton and Altoona, Pa.

Voters Disapprove Rainier Purchase

The Seattle & Rainier Valley Railway purchase was voted down in Seattle, Wash., by the people on March 8. The public showed by a large vote their disapproval of the purchase for $1,200,000 of the only privately owned car line remaining in the city.

Would Purchase Railway Bonds

The Massachusetts State Department of Public Utilities has received a petition from the New York, New Haven & Hartford Railroad for permission to purchase $330,000 in bonds of the Springfield Street Railway, Springfield, Mass. It is explained that there are now outstanding an equal amount of bonds of the Springfield & Eastern Street Railway maturing on Jan. 1 next. These are held by the New Haven and in order to refund them the Springfield company is to issue new bonds. As the terms said to have been offered by the bankers for the bonds are said not to have been considered sufficiently liberal by the New Haven, that company desires to take the entire issue in exchange for the maturing bonds at 6 per cent paying par.

1,574,969,902 Ride Surface Lines

Residue Receipts of $13,302,112 in Chicago Show an Increase of $1,144,438 or 9.41 Per Cent, the Highest Except 1922, the Year of an Eight-Cent Fare

The fiscal year Feb. 1, 1926, to Jan. 31, 1927, covered by the report of the Chicago Surface Lines, although the last under the 1907 and 1913 ordinances, was the most remarkable from the standpoint of service, traffic and earnings in the history of the companies comprising the Chicago Surface Lines. Gross earnings for the year were $61,173,601, an increase of $2,387,720, or 4.06 per cent, as compared with the previous year. This total was the highest in the history of the companies. Operating expenses including taxes were $47,871,490, an increase of $1,243,283, or 2.67 per cent. Residue receipts were $13,302,112, an increase of $1,144,438, or 9.41 per cent. This was the highest with the exception of 1922, the year of an 8-cent fare. The city's share of divisible receipts was $2,620,326, an increase of $498,273, or 23.48 per cent over the preceding year. The purchase price of the properties was increased $237,632, making the total of $163,745,856 as of Feb. 1, 1927.

Each month of the year showed an increase in traffic over the corresponding month of the previous year and the impressive total of 1,574,969,902 rides is an increase of 57,459,241 rides, or 3.79 per cent. Revenue passengers totaled 876,249,663, an increase of 34,048,210, or 4.04 per cent. To provide service for this great increase in traffic there were added during the year more than 4,000,000 passenger car-miles.

The daily average of revenue passengers during December—2,505,338—was the highest for any month in the history of the companies. The peak of the previous twelve months was exceeded seven times during the year. The biggest day of the year and the greatest in the history of the companies, both in earnings and in traffic, was Saturday, Dec. 18, passenger receipts being $201,337, revenue passengers 2,934,771, and total rides 5,126,731. Revenue passengers on an average Saturday during the year numbered 2,668,342. On an average Sunday or holiday there were 1,632,844 revenue rides, an increase of 18,021 in two years. This is particularly interesting as most companies have experienced a decrease in Sunday and holiday business. There were 287 revenue passengers (or 517 rides including transfers) on surface cars during the year for every Chicagoan.

The Eucharistic Congress, from June 20 to June 24, inclusive, established new records for surface car riding in Chicago—the total rides for the three heaviest days being 15,069,000. Transportation of this immense throng with expedition and safety brought expres-

EARNINGS, EXPENSES AND DIVISION OF RESIDUE RECEIPTS OF THE CHICAGO SURFACE LINES FOR YEAR ENDED JAN. 31, 1927, COMPARED WITH PREVIOUS YEAR

Earnings:	1927	1926
Passenger cars	$60,436,705	$58,076,487
Chartered cars	5,347	6,337

Special Reserve for Renewals and Equipment:				
Balance in special reserve at Feb. 1, 1926	$489,415	$836,735	$768	$1,326,919
8 per cent of gross earnings	2,936,332	1,765,855	193,993	4,896,181
Interest earned	18,076	23,813	655	42,544
Total	$3,443,825	$2,626,403	$195,417	$6,265,646
Less: Expended for renewals	2,399,317	1,410,113	193,807	4,003,237
Expended for special equipment (new passenger cars)	927,934	666,999	....	1,594,933
Expended for track extensions	3,303	273,422	....	276,725
Expended for track reconstruction	....	40,255	1,557	41,812
Total expended	$3,330,555	$2,390,789	$195,364	$5,916,709
Balance in special reserve at Feb. 1, 1927	113,270	235,613	52	348,936
Total of balances at Feb. 1, 1927	$9,681,491	$5,514,570	$348,645	$15,544,707

Under orders of the Public Utilities Commission of Illinois and of its successor, the Illinois Commerce Commission, $7,753,736.09 has been expended since July, 1920, out of the "Special Renewal and Equipment Fund" for new equipment and for track extensions and reconstruction.

Although the property acquired by these expenditures is functioning as part of the operating plant, it does not appear in the Capital Accounts of the companies, inasmuch as the commission orders provided that such expenditures shall not be carried to capital account "unless and until the sum or sums thus expended have been paid into the renewal and depreciation fund."

The balance, $15,544,707, in "Reserve for Renewals" and "Special Reserve for Renewals and Equipment" is a cash balance and is on deposit in various banks.

sions of commendation from many sources.

In the period preceding the Christmas holidays, the peak of the year's riding, the companies attained 100 per cent operation. On Dec. 20 all passenger cars (3,639) were in service during the evening rush hours and on each of the three following days only one car was out of service. Henry A. Blair, president, says that better evidence could not be had of the condition of company equipment and the spirit of the men who worked together to accomplish this result.

In anticipation of the large increase in riding, 100 new cars of the multiple-unit type were ordered early in the spring and delivered in time for the pre-Christmas peak. This made a total of 445 new cars added to the service in a little more than three years.

Mr. Blair said it was worthy of note that during the past four years the Chicago Surface Lines have enjoyed a larger percentage of increase in passengers than any other street railway, and during the past year they carried approximately as many revenue passengers as all steam railroads in the country. It is also a fact that in spite of the handicap of expiring franchises, the 42 miles of track reconstruction and 5 miles of new track last year exceed the trackwork of any other surface system so far as available reports indicate.

Comparisons of extent of the Surface Lines' system at the end of the first year of unified operation (Jan. 31, 1915) and at the close of the thirteenth year (Jan. 31, 1927):

Items	1915	1927	Per Cent Increase
Gross earnings	$31,966,049	$61,173,601	91.37
Operating expenses	19,889,276	47,871,490	140.69
Taxes	1,439,279	3,400,000	136.23
Operating wages paid	10,560,039	29,812,518	182.31
Total wages paid	12,379,615	32,564,914	163.05
Revenue passengers carried	627,731,550	876,249,663	39.59
Total rides	1,115,312,129	1,574,969,902	41.21
Average fare per revenue passenger	4.99c	6.90c	38.28
Average fare per ride	2.81c	3.84c	36.65

A total of $107,141,358 has been paid for public benefits by the companies since the adoption of the 1907 ordinances, divided as follows: For cleaning right-of-way, including sprinkling and removal of snow and ice, $10,520,925; street paving, $15,968,578; maintenance paving, $6,094,824; general taxes, $33,572,782 (year 1926 estimated); track and overhead removal and replacement on account of sewer installation, etc., $1,889,378; city's 55 per cent of net earnings, $39,094,870.

TABLE OF INCREASE IN RIDING ON CHICAGO SURFACE LINES DURING PAST SIX YEARS

Year Ended	Weekday Average	Saturday Average	Sunday* Average	Total for Year

* Includes holidays.

† Trainmen's strike Aug. 1 to 6, 1922, inclusive.

In the past two years 2,984 cars, or 84 per cent of the 3,539 cars owned, were put through the shops. Adding to these the 100 new cars in the last few months made it possible successfully to accomplish the task of carrying record-breaking loads in the holiday period. Through co-operation between the transportation and shops and equipment departments, a new record was established also for the small number of cars taken out of service on account of equipment failures—the car mileage per pull-in being increased from 7,100 to 14,389. Each motor car on the system traveled an average of 37,445 miles during the year—another high mark in history. There are now in service 80 one-man cars and 95 trailer trains. The new type of multiple-unit cars, used in 66 trains, is giving entire satisfaction.

Interest of trainmen in the prevention of accidents was kept at a high point throughout the year by a contest among the various divisions which ended on Jan. 31, with North Avenue depot, the largest on the system, the winner, and Lincoln Avenue depot a close second. Results were so satisfactory that another contest has been started for the coming year.

Mr. Blair says that although the number of motor vehicles in the Chicago district increased greatly during the year, improved methods of traffic regulation facilitated the movement of street cars. As Mr. Blair sees it the public has been awakened as never before to an appreciation of the harmful effects of traffic delays. He then refers to the fact that late in the year there was issued under the direction of the street traffic committee of the Chicago Association of Commerce a report covering the local traffic situation and offering suggestions for relief. He says:

> Many recommendations will be helpful to users of street cars if put into effect. Action has already been taken by the City Council, providing for a Greater Chicago Street Traffic Commission and the creation of a division of traffic engineering in the Bureau of Streets. The big problem of automobile parking still awaits a solution. The prohibition of parking within the Loop district during the Eucharistic Congress demonstrated to the satisfaction of the authorities that, notwithstanding the overcrowded condition of the streets, traffic could be handled faster and more safely. Credit should be given to the traffic division of the Police Department for making the best of a difficult situation.

The favorable insurance contracts entered into in October, 1923, expired with the close of the last fiscal year with an unusually low record for losses during the period. Renewal of insurance beginning Feb. 1, 1927, was arranged on a basis which will result in a further saving. All insurable property of the companies, amounting to about $65,000,000, is covered as required by ordinance. This insurance, written at the rate in effect three years ago, would have cost the companies over $145,000 more per year than they are now paying.

On the subject of bus activities Mr. Blair said:

> While all other transportation agencies in the Chicago district showed an increase in traffic last year, the Chicago Motor Coach Company, in spite of additional routes, reported a material decrease in passengers carried. This would indicate that the novelty of bus operation in Chicago is wearing off and that this form of transportation is losing popularity, which may be due in part to the fact that the much heralded special and superior service with the pledge of a seat for every passenger has proved a myth. The bus company is still experimenting with different types of buses, and it has as yet no uniform or standardized equipment. Even with the newest model it is still employing the solid

tire, of which there is growing complaint not only from riders but from the owners and occupants of buildings along the bus routes, and from taxpayers who are charged with renewal of pavement.

The recent proposal of the Chicago Motor Coach Company to substitute buses for the street railways has excited little interest and has not been taken seriously by the general public.

In the last year that company was permitted to make an extension of its Marquette Road route along the north side of Marquette Park and also an extension of its South Park Boulevard line from 60th Street to 79th Street.

A hearing has been had by the Illinois Commerce Commission on the application of the Chicago Motor Coach Company for authority to establish additional routes in the north division of the city. In this case there is squarely presented for decision the question whether the Chicago Motor Coach Company shall be permitted to depart from its original plan and policy of boulevard and parkway operation and to establish a general motor bus service throughout the city in direct competition with the surface and elevated railways.

On Nov. 18, the commission entered an order authorizing and directing the Chicago Railways to operate an auxiliary or supplementary motor bus line on Diversey Avenue. The Chicago Motor Coach Company intervened in opposition to this order and is now seeking a review by the courts. There is still pending in the Illinois Supreme Court for decision the case in which the city is attacking the right of the Chicago Motor Coach Company to operate on city streets without first obtaining a grant of permission or authority from the city.

Interstate bus operation from adjacent cities in Indiana into Chicago continues, and no substantial change in this situation can be expected until Congress enacts a law for the regulation of this class of carriers.

A plan for the solution of the local transportation problem of Chicago was submitted to the Mayor and City Council on Jan. 8, 1927. It proposes the development of a complete rapid transit system, utilizing elevated and subway structures; the unification of the surface lines, rapid transit lines and feeder buses on the basis of one fare with transfers from one class of service to the other, and the development of this unified system with a view to the future needs of Chicago. The plan, which is worked out in elaborate detail, calls for a total investment in local transportation of $1,000,000,000 by 1950 and would give Chicago the best local transportation system in the world.

Mr. Blair says that contrary to experience in other cities, where the expiration of franchises has resulted in slackened maintenance, curtailment of service and loss of business, these properties approached the crisis in the best of condition physically and operating at a high degree of efficiency. He says that this remarkable showing has attracted attention in the industry everywhere and quotes from articles in both *Aera* and the ELECTRIC RAILWAY JOURNAL, to indicate the wide interest manifested in the Chicago situation.

Mr. Blair says that in the twenty years under the franchise that expired recently the properties have been completely rehabilitated. The roadbed has been rebuilt and 486 miles of single track added. There are now 35 miles of track per 100,000 population as compared with 27 miles in 1907. Old and small cars have been replaced by larger cars, and much additional equipment has been purchased. Seat miles (car miles multiplied by the average number of seats in the cars) are more than double the number in 1907, although the population has increased only 45 per cent, and the service improvement is even greater than this indicates because, by careful scheduling, cars are being operated where and when needed. According to Mr. Blair these facts show forcibly the remarkable improvement in service. In accomplishing it the companies have put $107,971,000 in new capital and $7,753,736 from the Special Renewal and Equipment Fund into the properties.

Although wage rates of employees have increased upwards of 175 per cent since 1907, the average fare per revenue passenger is only 39 per cent higher and the average fare per ride but 28 per cent higher.

During the thirteen-year period of unification the companies have constructed 119 miles of new extensions (single track equivalent) at a cost of $6,220,693 and reconstructed 476 miles of single track at a cost of $27,642,318, of which $19,666,967 was paid out of the renewal funds and $7,975,350 was new capital.

Statement of Track Mileage of Companies Included in Chicago Surface Lines System

Union of Washington Lines Goes Over to Next Session

One of the first problems to be studied at the next session of the United States Congress will be the merger of the railway lines in Washington, D. C. Chairman Capper said that with the work of creating the new Public Utilities Commission completed the committee would be in a position to concentrate on the question of the merger at the next session. The possible merger in the capital was one of the measures left unacted upon at the recently concluded session of Congress.

Columbia System Suspends

Railway service at Columbia, S. C., was indefinitely suspended on March 11 by the Columbia Railway, Gas & Electric Company largely because business has fallen off to a point where the expenditures needed to be made to the physical property to put it into proper operating condition would not be justified. Columbia is a city of more than 35,000 population. The railway system included 32 miles of line.

Ten-cent jitneys, operated at the whim of the owner, covering no particular territory but picking up passengers any and everywhere and taking them direct to their destinations—be it home or office—cut heavily into the patronage of the trolleys. They were considered quicker, the fare was the same as that charged by the street cars, and while they were often unsightly and in bad repair, their service seemed to appeal to popular tastes. Moreover, the street cars have met with sharp competition from two other systems of transportation. The Carolina Transit Company began the operation of about a score of 19-passenger buses some months ago, covering territory not touched directly by the railway lines, and as rapidly as the street cars would curtail their service, the bus company would expand, so as to serve, in a measure, the territory abandoned by the railway. By an arrangement between the two companies transfers from one system to the other were granted, but this arrangement did not seem to lessen materially the distress of the railway.

Months ago railway officials made known the straits to which they were reduced. One non-paying line after another was discontinued until only a few were left. Last month, on all lines in the city, not more than an average of 600 to 700 passengers a day rode the cars.

Personal Items

J. E. Wilmot Becomes Traffic Solicitor at Buffalo

J. E. Wilmot, formerly general manager of the Western New York Motor Lines, has been appointed general traffic solicitor for the International Railway and International Bus Corporation, according to a recent announcement issued by the company. He will devote his efforts to the stimulation of business throughout the Niagara frontier, including the Buffalo-Niagara Falls high-speed line, Niagara Great Gorge trip, the Falls View Bridge, the Queenston-Lewiston Suspension Bridge and Buffalo-Niagara Falls, Ltd., motorbus service.

J. E. Wilmot

Mr. Wilmot is a native of New York City, but is well known in Buffalo and vicinity because of his former connection with the Western New York bus lines, of which he was general manager. Under his direction the Rochester-Buffalo bus service was installed and operated. Mr. Wilmot has had five years experience with the White Company and three with the Mack.

F. J. Brennan New Brooklyn Division Superintendent

Francis J. Brennan, formerly superintendent of maintenance and operation of the Staten Island Railways, Department of Plant and Structures, New York City, has been appointed division superintendent at Maspeth Depot of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

Mr. Brennan was born in Brooklyn and was graduated from Erasmus Hall High School and Pratt Institute. In January, 1905, he was appointed a motorman at the 58th Street depot in Brooklyn. In December of the same year he resigned but returned two years later in the same capacity at the same depot. After several promotions he went with the Public Service Commission but returned to Brooklyn as supervisor of headways in the surface transportation department. He held that position until May, 1924, when he was placed in charge of operation of the bus subsidiary of the B.-M. T.

In March, 1925, Mr. Brennan resigned his position with the B.-M. T. and was appointed superintendent of maintenance and operation of the municipal railway lines on Staten Island.

G. S. Wills Resigns at East Liverpool

Gerry S. Wills, superintendent of the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, will resign on March 31.

Mr. Wills went to East Liverpool in September, 1925, from Wheeling, W. Va., where he had been general manager of the Wheeling Traction Company. For thirteen years he was in the employ of the West Penn Company, by which the Wheeling Company was controlled. In the fall of 1920 he went to Wheeling as assistant to C. P. Billings, vice-president and general manager, and on Jan. 1, 1922, was appointed general manager to fill the vacancy caused by the transfer of Mr. Billings to Pittsburgh.

As a young man Mr. Wills was employed by the Oneonta & Mohawk Valley Railway, Oneonta, N. Y., with which he remained from 1905 to 1906, when he secured a place as an apprentice in electrical engineering with the General Electric Company at Schenectady, N. Y. In 1907 Mr. Wills went with the Metropolitan Street Railway, New York City, as general carhouse electrician. His work there was supplemented by a two-year course in applied electricity at Pratt Institute.

Mr. Wills showed predilection for the railway business, however, for after two and a half years in the copper mining district of Arizona he returned East and entered the transportation department of the Citizens Traction Company at Oil City, Pa. In a short time he was made superintendent of the Franklin division. In 1916 he became affiliated with the West Penn interests at Pittsburgh, first with the general sales manager, as light salesman, then as power salesman and finally as assistant to the vice-president in charge of the commercial department. Mr. Wills was born in Norfolk, Va., in 1884. His activities and splendid results in public relations work in Wheeling were referred to in a review of Mr. Wills' career in the ELECTRIC RAILWAY JOURNAL, issue of Aug. 8, 1925. To him properly belongs a large part of the credit for the successful rehabilitation of the property at East Liverpool, described in detail in the ELECTRIC RAILWAY JOURNAL, issues of June 26, 1926; July 3, 1926, and July 31, 1926. It is said that Mr. Wills will engage in the brokerage business in Norfolk, Va.

C. L. Wilson Heads Radial Department at Toronto

Charles Lewis Wilson has been appointed superintendent of the radial department of the Toronto Transportation Commission, Toronto, Canada. Mr. Wilson's contacts in railway management extend over a period of 30 years. His experience acquired in his recent position as superintendent of the Toronto and York District of the Ontario Hydro-Electric Railways will be of invaluable assistance to the Toronto Transportation Commission, which took over these lines on Jan. 11.

The new head of the radial department started his railway career with the Grand Trunk Railway, Montreal, in 1891. In 1892 he moved to Toronto to take a position with the Toronto Railway. After twelve years service in various capacities he was made traffic manager of the Toronto & York Radial Railway, then under the same ownership as the Toronto Railway. Later he was promoted to assistant manager and when the city of Toronto bought the radial lines in 1922 and placed them under the management of the Ontario Hydro-Electric Power Commission Mr. Wilson was made superintendent of the three lines, which now constitute the radial department of the Toronto Transportation Commission.

C. L. Wilson

His long association with the radial lines and the warm friendships he has formed are among the valuable assets of the most recent addition to the Toronto Transportation Commission services. Mr. Wilson was born in Boston, Mass., of Canadian parents in 1871.

Charles H. Bucher, for a number of years with the Northern Texas Traction Company, which operates the Dallas-Fort Worth Interurban, has been made district representative of the company. He will be stationed at Grand Prairie.

G. R. G. Conway has succeeded R. C. Brown as president of the Mexican Tramways, Mexico City, Mexico, which is controlled by English capital and has its main office in Toronto, Canada. Mr. Brown remains a director, a vice-president and in a consulting capacity.

Brill Gets First Motors for Philadelphia Subway Cars

Actual operation of Philadelphia's new $100,000,000 North Broad Street subway was brought a step closer March 15 with the arrival at the J. G. Brill plant of the driving motors, electrical controls and other equipment for the first of the 150 passenger cars ordered by the city and to be built by the Brill company. When completed these cars, of all steel construction, will embody every conceivable safety device, including automatic stop controls. Their total cost will approximate $6,000,000.

The equipment was shipped from the East Pittsburgh Works of the Westinghouse Electric & Manufacturing Company, this company having been awarded the contract for all the motive equipment, including controls, as well as 750 especially designed electric fans for the ventilation of the new cars.

The cars, with 210-hp. motors, will be 67 ft. long, 10 ft. wide and have a total height from the rails to the roof of 12 ft. 3 in. They will seat 75 passengers. There will be longitudinal seats for 25 passengers and transverse seats for 50 passengers. The cars are being equipped with canvas-lined rattan seats with cone springs.

Milwaukee Electric Starts Interurban Cut-Off Work

Favored by mild weather, the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has already started construction work on the new $175,000 East Troy-Burlington interurban line cut-off which will connect West Junction on the rapid transit line with Fruitland station on the Burlington-East Troy line. The cut-off will permit trains to enter Milwaukee directly from the west instead of through West Allis, as at present. Completion of the connection will cut the running time between these cities and Milwaukee fully twenty minutes. Two trestles will be built, one of wood 450 ft. long and 40 ft. high and another of steel carrying the new line over parallel tracks of the Milwaukee Electric Railway & Light Company and the Northwestern Railway. An embankment of earth estimated at 54,000 cu.ft. will be included in the project.

Writ of Certiorari Denied in Resale Case

The Federal Trade Commission was defeated in another of its efforts to restrict enforcement of resale prices by manufacturers when the United States Supreme Court on March 14 declined to grant a writ of certiorari sought by the commission to review a decision of the Circuit Court of Appeals for the second circuit enjoining an order of the commission against Harriet Hubbard Ayer, Inc.

The commission had ordered the Ayer company to desist from certain practices to maintain observance of retail prices. The Circuit Court of Appeals, to which the company appealed, held that in order to establish unlawful price maintenance there must be a tendency to monopolize a line of commodities or an unreasonable restraint of trade; that there must be proved a general system of contracts between the manufacturer and all dealers, and that the practices must be characterized by fraud. The proof showed that the Ayer company refused to sell to only a few dealers because of price cutting and that most of its dealers maintained the resale price of the cosmetics sold by the company voluntarily.

Union Switch & Signal Gets Big Boston Contract

The city of Boston transit department has contracted with the Union Switch & Signal Company, Swissvale, Pa., to furnish all necessary automatic block signaling materials for the Dorchester rapid transit extension, involving an automatic block signaling system for the protection of train movements over 3½ miles of double track, 2½ miles of which is in the open and the remainder within the subway. Direct current at 550 to 600 volts is used for propulsion and the entire signal system, including the track circuits, will operate on 25-cycle alternating current fed to the transformers at 550 volts a.c. The signals will be of the color light type (indicating red, yellow and green), the work involving 38 light signals with instrument cases, 52 automatic stop layouts, 114 a.c. relays, 113 transformers, 91 Keystone insulated rail joints with track resistors, switch circuit controllers, etc.

Conference on Steel Cars Called in New York

THE New York Transit Commission on March 11 invited railway men and others to a conference on the subject of lighter steel cars to replace the present wooden cars in operation on the elevated structures in New York City. The meeting will be held on March 29 at the office of the commission at 270 Madison Avenue. Those invited to the conference are Frank Hedley, president of the Interborough; William S. Menden, president of the B.-M. T.; William H. Woodin, president of the American Car & Foundry Company; F. N. Hoffstet, president of the Pressed Steel Car Company; D. A. Crawford, president of the Pullman Company, and John H. Delaney, chairman of the city Board of Transportation.

For some months the commission, through its engineering force, has been conducting an investigation into the possibility of the development of a steel car sufficiently light in weight to be operated on the elevated structures of Manhattan, Brooklyn, the Bronx and across the Brooklyn Bridge.

The studies of its engineers have now reached a point where the commission feels that a conference is warranted, but it fixed an advance date to allow engineers time within which to gather their data on the present condition and weight capacity of the elevated structures and the experts of both the railroads and the car builders to formulate plans for the construction of modern steel cars light enough in weight to operate on the structures to which specific reference is made.

Where elevated structures are of insufficient strength to make possible the operation thereon of steel cars of the present design, the Transit Commission has pointed out that either these structures must be reinforced or a steel car of lighter weight must be designed. As the commission sees it, to reinforce the elevated structures so that they could bear the weight of the present steel cars would cost millions of dollars and would doubtless fail to have the approval of that portion of the public which is opposed to the indefinite retention of elevated structures. The commission says:

> Some time ago the Transit Commisssion's engineers began to plan for a lighter steel car for operation on the present elevated structures. These plans have progressed to such an extent that it was thought advisable to call the conference referred to.
>
> Steel cars for rapid transit operation were not developed until 1904. Up to that time all rapid transit operation was by means of wooden cars. Subsequent to the development of the steel car in 1904 more wooden cars came into operation because of the inability of the elevated structures to carry the new steel cars.
>
> The Transit Commission's engineers believe that recent progress in metallurgy and modern methods of steel rolling have made possible the designing of a steel car of lighter weight than, but of equal tensile strength to, the present steel cars.

Bradley and Wason Companies May Get $700,000 Car Order

Osgood-Bradley Car Company of Worcester, Mass., and Wason Manufacturing Company, Springfield, Mass., are expected to get the contracts for the new cars which the Worcester Consolidated Street Railway and the Springfield Street Railway plan to buy under the New York, New Haven & Hartford Railroad rehabilitation program. The Worcester company will build 50 cars for the Worcester Consolidated and the Wason company the 50 cars for the Springfield company. The cost of the cars is estimated at $700,000. Notice of the probable placing of this order was made in the JOURNAL for Feb. 19.

$800,000 Trackwork for Milwaukee if Council Consents

Application has been filed with the Common Council of Milwaukee, Wis., by the Milwaukee Electric Railway & Light Company for the necessary franchises which are needed to carry out several major street railway construction projects estimated to cost $800,000. Among these proposed improvements is the relocation and grade separation of the Milwaukee - Waukesha - Watertown rapid transit line for a distance of ten blocks within the Milwaukee city limits, a project which is regarded as one of the most important steps made in recent years toward improving transportation facilities. If approved by the city it will open the way for rapid transit service to a large and growing section and a vast area directly in line for annexation to Milwaukee. Plans call for the line to be relocated for a block south on a private right-of-way instead of running along Fairview Avenue. Grades will be separated at all crossings, and 61st and 62d Streets will be closed.

Another improvement proposed is the extension, within 90 days, of the Eighth-Muskego Avenue line along Teutonia Avenue from Nash Street to Lake Avenue and later to Atkinson Avenue. As soon as street improvements are completed on Atkinson Avenue a connection will be made between the Milwaukee Northern line tracks and those of the Eighth-Muskego Avenue line at Teutonia and Atkinson Avenues.

In order to provide a more direct connection between Wauwatosa and West Allis, which is another step toward the solution of the problem of rapid transit between those cities and Milwaukee, a crosstown line is to be built on 68th Street between Wells Street and the relocated rapid transit tracks, subject to later negotiations with the city of Wauwatosa. Upon completion of the 68th Street connection the company will seek permission to discontinue service over the private right-of-way near 51st Street between Wells Street and the rapid transit tracks.

St. Louis Car Company Issues New City Car Catalog

Designed especially to feature developments in the light-weight city type car, the St. Louis Car Company is mailing out a handsome 44-page catalog which contains, among other interesting features, general dimensions and a brief description of car orders filled in recent months. The text matter is profusely illustrated with exterior and interior views, and with floor plans of the various type cars. There is also a full list of details which the company considers essential in order to expedite delivery.

Commerce Department Warns Against Fake Publicity

Through Julius Klein, its director, the Department of Commerce, Bureau of Foreign and Domestic Commerce, has just issued the following letter warning American manufacturers against a gold brick publicity scheme that has originated with certain publishers abroad.

> Certain foreign publishing concerns, or parties purporting to be publishers, have approached a large number of American manufacturers by correspondence, offering to prepare and publish, without charge, in their trade publications articles of public interest respecting the business organizations of American concerns. An exchange of correspondence usually leads to the preparation of the article and finally to an exorbitant debit against the American concern involved for halftone cuts. The charges have varied between $100 and $600. Inasmuch as our investigations have developed that the publications have no circulation or standing and that an indication of fraud is very evident, it is suggested that you avoid direct dealings with any such publishers until after adequate investigation has been made.
>
> If approached in this way it would be well, before responding, to consult responsible American advertising agencies or this bureau. If you submit the name of the publication and the publisher to the specialties division of the bureau you will be informed whether these names are already known in connection with cases where other firms have been victimized. If you have had past experience with this class of solicitation, you will increase the effectiveness of our efforts to safeguard American industries by making the details available for the confidential use of this bureau.

Rolling Stock

Houston Electric Company, Houston, Tex., has placed an order for twenty new cars and ten buses, according to a recent announcement made by C. J. Kirk, Public Works Commissioner.

Mack Truck, Inc., New York City, reports the following bus sales to street car companies during the last few weeks: Boise Street Car Company, Boise, Idaho; Houston Electric Company, Houston, Tex.; Third Avenue Railway, New York City; Connecticut Company, New Haven, Conn., and the Utah-Idaho Central Railway, Ogden, Utah.

American Car Company, St. Louis, Mo., has been awarded a contract for seven 45-ft. 6-in., single-end passenger and smoking motor bodies by the Rockford Public Service Company, Rockford, Ill., which is part of Rockford & Interurban Railway, recently reorganized. Notice of the expected placing of this contract was carried in the JOURNAL of Feb. 19. The new bodies will be mounted on Brill 177-E trucks.

Track and Line

Arkansas Central Power Company, Little Rock, Ark., will lay new steel and permanent paving between its rails on Prospect Avenue from Lee Avenue to St. Mary's Academy, if plans to be submitted to the City Council are approved. The improvement, entailing a cost of approximately $150,000, will be one of the major construction jobs of the 1927 program of the concern, and will be the first work done under the 1927 budget. Rails of heavier section will replace the present 70-lb. rails now employed on the Pulaski Heights line. Work has been started on laying new tracks along Main Street from the north approach of the Main Street viaduct to 22d Street. All of the old rails have been removed and the new rails will be laid before work of paving the street is started.

Indiana Service Corporation, Fort Wayne, Ind., plans to extend during the coming summer its car lines in Fort Wayne. Such a project was discussed at the last meeting of the Board of Public Works. No definite arrangements were made, although President Feustel said more tracks would be needed badly before the summer was over.

ELECTRIC RAILWAY MATERIAL PRICES—March 15, 1927

Metals—New York

Copper, electrolytic, cents per lb.	13.075
Lead, cents per lb.	7.65
Nickel, cents per lb.	35.00
Zinc, cents per lb.	7.05
Tin, Straits, cents per lb.	69.375
Aluminum, 98 or 99 per cent, cents per lb.	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.575
Somerset mine run, Boston	1.95
Pittsburgh mine run, Pittsburgh	1.85
Franklin, Ill., screenings, Chicago	2.625
Central, Ill., screenings, Chicago	1.875
Kansas screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, $\frac{9}{16}$ in. and larger, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.35
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb.	4.20
Steel bars, cents per lb.	1.90
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb.	2.75
Sheet iron, galvanized (24 gage), cents per lb	3.65
Galvanized barbed wire, cents per lb.	3.25
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb.	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–17.50
Colored	10–14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.80
White lead in oil (100 lb. keg), cents per lb.	14.50
Turpentine (bbl. lots), per gal.	$0.78
Putty, 100 lb. tins, cents per lb.	5.25–5.50

Wire—New York

Copper wire, cents per lb.	15.25
Rubber-covered wire, No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, cents per lb.	16.75

Paving Materials

Paving stone, granite, 5 in.	
New York—Grade 1, per thousand.	$130–$142
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.00
Light copper, cents per lb.	9.50
Heavy brass, cents per lb.	7.125
Zinc, old scrap, cents per lb.	4.25
Lead, cents per lb. (heavy)	6.375
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	15.25
Rails (short), Chicago, gross ton	16.75
Rails, (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.50

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review
Published by McGraw-Hill Publishing Company, Inc.
CHARLES GORDON, *Editor*

Volume 69 New York, Saturday, March 26, 1927 *Number* 13

Two Developments that Mark Fundamental Progress

IMPORTANT places in the archives of transportation are destined for two achievements reported in this issue. One, the introduction of the articulated car into high-speed interurban service by the Washington, Baltimore & Annapolis Electric Railroad, is a development that at once makes a bid for increased patronage and reduced operating cost. Nothing has been spared to provide comfort of riding. This is brought out in the text and views of the cars in service. Yet, due to fundamental features of design, a 27 per cent weight saving was possible. Two men perform the work with greater ease than do three on a two-car train, and maintenance costs will be reduced because of the fewer number of units of apparatus to inspect and keep up.

The other event in the march of progress is the approaching début of the Springfield, Mass., car designed for city service. To be sure, it is still in the embryo stage, but it has great promise. Its conception grew out of the increasing desire to try out some of the plans the industry has talked about for many years. Finally, some two years ago C. V. Wood, president, and W. L. Harwood, chief engineer of the Springfield Street Railway, listed what in their opinion were the objectionable features of the design used universally in this country. On another sheet they listed the things that should be accomplished.

Then they began to build. Plans were made and immediately scrapped in favor of other plans destined to meet the same fate. Dozens of manufacturers were consulted. Finally, through the persistence of these Springfield executives, two trucks very different in appearance from the older types began to emerge, and steel and aluminum and wood shapes began to take the form of a car body also very different from that usually observed. The trucks are now complete and after many trials and changes the apparatus is being mounted.

While the proof of the pudding is in the eating, as the two Springfield men have emphatically stated, success has been attained in many of the aims set down two years ago. The car, accommodating 45 people in comfortable, amply spaced seats, will weigh something less than 24,000 lb. The body is attractively finished and is essentially an improvement in appearance, in the opinion of many who have viewed it in the state of partial completion. With the radical changes adopted in the truck material reduction of noise may be expected.

Coincident with this story of the Springfield car comes the announcement of the purchase for the electric railways at Springfield and Worcester of 100 new cars which do not embody the experimental features. It is to be regretted that the new design has not had a year or more of experience behind it so that it could have been adopted for this order. However, because of promises made by the New Haven Railroad at the time of its re-entry into the management of these two properties to effect an immediate improvement of rolling stock, it was considered inadvisable to postpone construction.

These two developments, one on the W., B. & A., the other at Springfield, are specific examples of the faith that large financial interests have in the future of the industry. They are not shaken in their belief that rail transportation never will become a thing of the past. But these events do denote the insistence of owners and operators that radical improvements must be made to compete with modern conditions. In the past the industry has not so much lacked in possibilities as in imagination and courage to progress.

An Excellent Measure Defeated After the Battle Was Won

PHILADELPHIA'S city government and the various local civic and merchants' associations were commended in the issue of this paper for Jan. 22 for the progressive spirit shown in adopting a sweeping no-parking ordinance for the downtown section. Now, unfortunately, it is necessary partially to retract the words of praise. For the City Fathers of the Pennsylvania metropolis have suffered a change of heart.

Startling charges have been registered against the no-parking ordinance by the Market Street and Arch Street Merchants' Associations and by certain organizations of motorists. Individual business men along Market Street, the principal shopping thoroughfare, declared that inroads have been made into their respective businesses, varying from 10 to 40 per cent. Some of the wealthier residents of the city have been heard to declare that they would rather have their chauffeurs drive them to New York, if necessary, so that they can park when and where they want to and for as long a time as they please!

When the original ordinance was passed Council voted unanimously to give the plan a fair trial. All objections by the merchants were temporarily stilled and it seemed that conditions were propitious for a valuable and revealing demonstration of the benefits accruing to the municipality and business men alike through relief from serious traffic congestion in the central delivery district.

But a wave of hysteria swept the merchants. Naturally many people who for years have been accustomed to use the city streets for free garage space set up a loud clamor against this "infringement" of their rights. Be it to the credit of Director of Public Safety Elliott that the ordinance was enforced fairly and impartially in practically every instance. So those who consider that they have an inalienable right to special privilege had their sense of the eternal fitness of things sadly wounded. Then, too, the no-parking ordinance was put into effect immediately following the holiday season. Business was naturally slack after the Christmas rush and many merchants unthinkingly placed the full responsibility for this condition at the door of the no-parking enforcement.

Violent agitation for a return to limited parking became the order of the day. The Committee on Public Safety was besieged with petitions and its public hearings were crowded with loud-speaking merchant representatives. Vainly did Director Elliott point out that limited parking was a physical impossibility without a considerable increase in the police force, that any weakening at this time meant a return to the old vice of the parking hog. Members of Council found it expedient to lend a sympathetic ear to the tearful tale of woe poured forth by the most prominent business men of the city. An amended ordinance was passed by the Council on March 24.

Those Who Defeated the Measure Will Find Themselves the Chief Losers

SO PHILADELPHIA is to have one-hour parking again on several important down-town streets. The boundaries of the restricted area have been moved in, so that parking is not to be prohibited over as wide a section as was first planned. True, the streets will presumably be swept clear during the morning and evening rush hours. But after 9:30 a.m. and before 5 p.m. it is to be feared that the old, old story will be told on Market, Arch and Broad Streets.

Back in their chairs the merchants will lean, with the comfortable feeling that they have scotched the transportation company and handily turned the tide in favor of themselves. But who have been the principal losers by this move? Who but the very merchants that have so persistently failed to look beyond the ends of their own noses? Every year more and more people have become disgusted with the intolerable congestion of traffic in the downtown area and have resolved to go to almost any lengths to avoid the mental and physical anguish incident to shopping in the center of the city. These people are ripe for picking by the neighborhood stores and the outlying shopping centers. Surely this class of shoppers constitutes a much bigger loss to the downtown merchants than the comparative few that have considered themselves injured by the recent legislation.

Relatively few shoppers can find, or ever could find, parking space for their automobiles on the narrow streets of downtown Philadelphia. Much of the limited space available is taken up by the clerk or other individual who usurps the space in front of the store in which he is employed—space which the store owner thinks is being used by his customers. Charles Hall, president of the Council, and Director Elliott have both predicted that it will not be long before the merchants wake up and realize that they have been deafened by their own oratory and confused by the false brilliance of their own theories of automobile shopping. Even now a large group of merchants have steadfastly refused to be carried away by the importunings of their fellows and have come right out in meeting with statements to the effect that strict no-parking enforcement is necessary and desirable. And the Automobile Club of Philadelphia has taken a similar stand.

As for Philadelphia, it started out bravely to move mountains and now wakes to find itself dealing in ant-hills.

Co-operation Will Bring Insurance Improvement

WORK which has been done over a period of several years by the insurance committee of the American Electric Railway Association typifies the character of activity in which an association committee can bring about material savings for members by acting as a clearing house for the interchange of data and experience.

Co-operation by member companies is essential to the success of such a committee's work. Of necessity it is dependent for its studies on information furnished by operating companies in answer to its inquiries. Unless such inquiries are answered completely, work of the committee is seriously curtailed.

This year the insurance committee is broadening its activity. It is not only interested in gathering fire loss statistics, so as to check up insurance rates directly, but is likewise endeavoring to stimulate the adoption by member companies of approved fire prevention measures which will reduce the fire hazard.

Questionnaires which were sent out some time ago are being compiled. The information developed is to be presented in the committee's report. This may be made complete or incomplete, depending on the degree to which operating companies furnish the necessary data. In order that the work of the committee may be the means for bringing about substantial improvement in the insurance situation, operating companies which have not answered the questionnaire will render a service both to the industry and themselves by sending in at once the information requested.

Appreciative Newspaper Comment Is Valuable to Railway Companies

SYMPATHETIC understanding of the problems of the electric railways is by no means uncommon among the daily press. This, of course, excludes from the list of commentators papers that never have anything but an axe to grind. The influence of such sheets will always be a subject of speculation, but there can be no question about the power for good of the best of the dailies. So in saying as it did, in a recent case in which fares were increased in an Eastern city, that the commission recognized a transportation and economic development familiar to every observing citizen in the present era of automobile competition, the paper in which this expression appeared put itself forcibly on record as recognizing this same condition.

The paper was not in full agreement with the schedule of rates authorized by the commission. It felt, for instance, that the short-haul rider had been penalized to the disadvantage of the company's revenues, but it did say in simple justice to the railway that "it has been struggling, like all other corporations of the same class, not only against tremendous difficulties, due to the automobile drain, but also against municipal exactions, in the way of taxation, that greatly handicap it in the resulting competition." There is no doubt that the paper did the city a real service in characterizing as fantastic the talk of enforcing the 5-cent fare condition of the original franchise grant. Of course, the courts have repeatedly ruled that, franchise or no franchise, electric railways cannot constitutionally be compelled to operate at a loss. It should be unnecessary to remind an intelligent community that the 5-cent fare was fixed in railway franchises at a time when operating costs, including wages, were radically different from what they are today, but it does seem necessary to repeat this truth again and again.

No sympathy was wasted by this commentator on the threat of retaliation against the local railway by the process of licensing buses to compete with the railway and "bring it to time." Very aptly it said, in substance, that, aside from the propriety of this kind of destructive revenge, its effect would be, not to restore 5, 6 or 7-cent fares, but to destroy railway service, the main reliance of the great bulk of the people. In that event the city would have to forfeit hundreds of thousands of dollars a year in franchise taxes and paving taxes or transfer the equivalent of these assessments to the bus companies. And the paper clearly sees that, in either event, the public would have nothing to show but a melancholy deprivation of railway facilities for its foolish experiment in municipal vengeance.

In thus ably presenting the case in its two editorials the commentator has done a real service to city officials, the public and the railway. No thoughtful, far-seeing citizen desires to cripple the corporate agency that furnishes to the city a considerable part of its daily transportation. On the contrary, that agency, having demonstrated its desire to carry on, must be sustained in every reasonable way. On its part, the city has the right to demand in return fair play to patrons, together with a demonstration by the railway of its sincerity in providing the highest grade of service that is possible under the particular economic limitations imposed.

Safety Co-operation from the Top

WITH respect to the all-important subject of safety and accident prevention work, a new note is sounded in a recent article by A. W. Robertson, president of the Philadelphia Company, writing in the N.E.L.A. *Bulletin*. He says in part:

"In order to get the most out of safety devices and wise safety rules, it is absolutely essential that the individual be protected and that his co-workers and companions have the right mental attitude toward both of these and all other matters pertaining to safety. If the mental attitude is wrong, it is quite possible to almost defeat the effectiveness of both. Safety devices will compensate in some measure for faulty rules and appliances. Here is where the executive can help very materially. If he has no interest in safety, the chances are he will affect his immediate subordinate officers and they, in turn, will affect those directly under them to have a contempt and disregard for safety work. This attitude tends to put the brakes on every safety movement in the organization, although the subordinate may have ample safety devices installed and adequate rules promulgated."

With this approach to the safety problem, Mr. Robertson has unearthed one of the greatest stumbling blocks to a perfect safety organization. In a few words, he promulgates the axiom that pressure from the top is much more effective than pressure from the bottom. Also that pressure from the top and from the bottom exerted at the same time will eradicate any faults that may lie in the middle of the pile. The whole history of the safety movement is justification of the assertion that executive indifference has retarded and devitalized some of the best plans and most enthusiastic efforts for the conservation of human life in the industrial world.

Speaking very plainly, the JOURNAL has had the opportunity to see the effects of this executive indifference, or, what is worse, a mild display of enthusiasm that is a shadow instead of a substance. Those familiar with the safety movement will undoubtedly agree that accident statistics decrease in direct proportion to the percentage of workers, from president to office boy, that are sold on the movement.

A Railway Operator Speaks Frankly

FRANK, indeed, were the remarks made before the recent meeting of the Illinois Electric Railway Association at Springfield, Ill., by J. R. Blackhall, vice-president and general manager Chicago & Joliet Electric Railway, regarding the manufacturers' responsibility for keeping abreast of the industry's present-day equipment needs. Some there may be who feel that Mr. Blackhall was unduly severe in his criticism, or at least neglected to give adequate credit for those improvements which have been made in electric railway equipment. Others might be inclined to hold that the speaker had overlooked the effect on car development of the buying habits of many operating companies. In this latter category would come the practice of buying cars to detailed specifications and the strong resistance encountered by manufacturers in the introduction of new devices.

But whether or not Mr. Blackhall recognized adequately the difficulties encountered by the car builders, the question of how to bring about car improvement merits more than passing consideration on the part of both manufacturers and operators. Electric railway equipment must be brought up to a level of attractiveness and performance that will meet present-day transportation standards, and the speed with which the industry may be expected to move forward into its proper place in the sun depends on the extent to which this is accomplished. It is indeed "a condition and not a theory that confronts us."

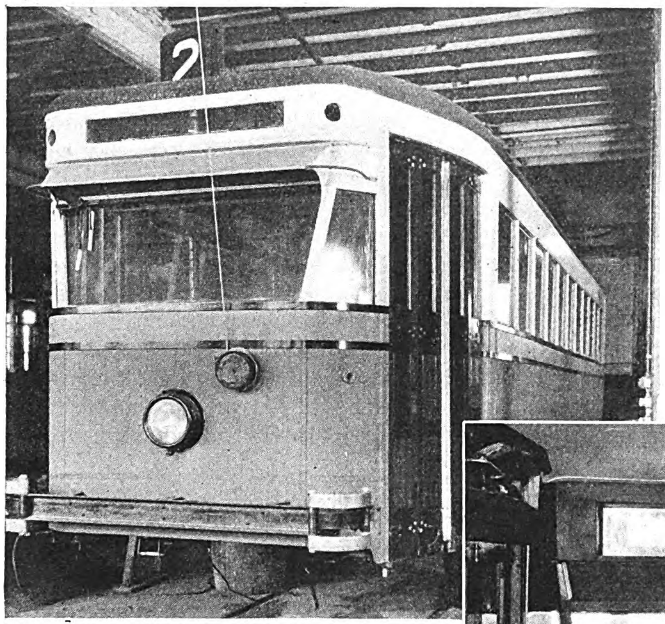
Just what is needed in the way of car improvements cannot be definitely cataloged. It would likewise be an ambitious undertaking to attempt to predict just what will form the developments of the next few years. But it is a simple matter to list the characteristics that are wanted in the car of the future. It must be faster; it must be more attractive to the eye and more comfortable to ride. Reduction of noise in operation is absolutely essential. It seems quite probable that this last requirement will lead to some fundamental changes in design. In fact, several interesting attempts to work out improvements in this direction are already under way. It was his own experience in the development of a truck with fully inclosed gears and spring suspended motors that led Mr. Blackhall to question the initiative of the car builders.

Frank discussion of a question so vitally important to the industry is decidedly helpful. Each day there is a growing inclination on the part of every one concerned to face the facts and to abandon the shackles of precedent and prejudice. The ultimate electric railway car will not be developed overnight. Mere changes do not necessarily constitute improvements. Failures and mistakes may be expected. In some cases the importance of making adequate provision for economical and rapid maintenance and repairs may be overlooked. But there seems to be no good reason why electric railway cars cannot be made as attractive to the public as any other vehicle on the streets. In fact, in comparison with the problems with which the bus designer must contend, the car builder's task is relatively simple.

Fundamental Design Changes

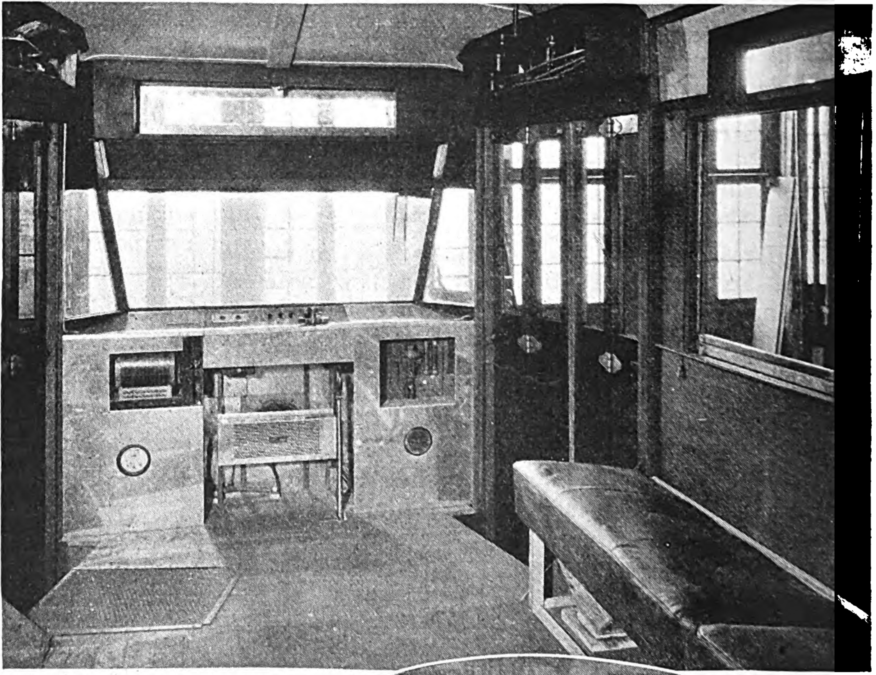
Feature Experimental Car at Springfield, Mass.

Inclosed Worm Drive from Four High-Speed Motors Mounted on Truck Frames, Tapered Roller Bearings and Internal Expanding Brakes Are Expected to Reduce Noise and Vibration—Combination Wood and Duralumin Streamline Body Has Rakish Appearance



Exterior lines of Springfield experimental car show many traces of motor bus influence

Compound curves have been used freely to create a pleasing appearance. The wide sloping windshield is an innovation in street car design. Doors will be painted to conform to general color scheme.

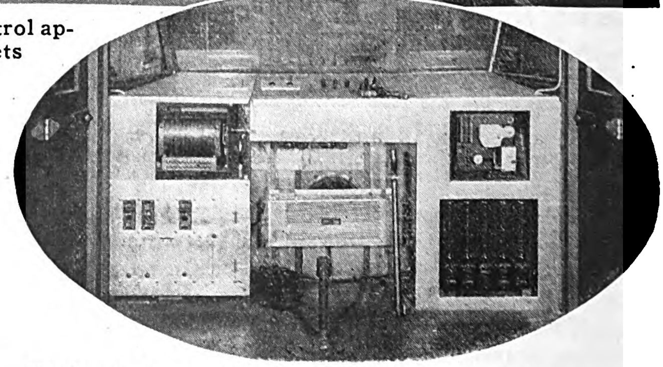


All switches and control apparatus are in cabinets at ends of car

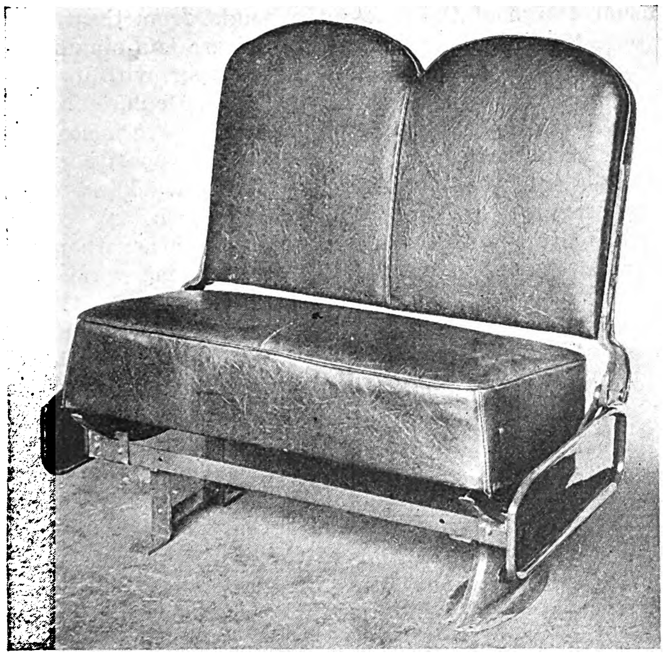
Air piping on the platform has been replaced by electric wiring. Covers are removed in this and other views shown. Treadle step is seen at the left. Floor will be covered with linoleum.

PRECEDENT has been cast aside in the design of a new car by the Springfield Street Railway, Springfield, Mass., and a vehicle has been developed which differs in many important respects from any hitherto operated by electric railways in this country. The object has been to build a car lighter, faster and more comfortable than those now in use. The outward appearance of this new car is novel, but not so much so as the design and arrangement of the equipment. This has been accomplished not by camouflaging an old design but by adopting an entirely new one. Many ideas borrowed from the automobile industry have been incorporated. Special effort has been made to reduce noise and vibration. To this end radical departures have been made from established practice in truck design. The practicability of the many innovations will be thoroughly tried out in a series of tests.

The idea of building a car radically different from any previously operated was conceived several years ago by Clark V. Wood, president Springfield Street Railway and Worcester Consolidated Street Railway. Because comparatively few major changes had been made in street car design in many years, he believed that this vehicle had come to be considered by the public as antiquated. The tremendous increase in the use of automobiles had accustomed people to many refinements not incorporated in the usual type of street car. He determined, therefore, to undertake the construc-



Handle of the master controller with horizontal drum, seen at the left, moves in a vertical plane. Automobile type lever at right is for emergency braking. The post in the foreground supports the operator's seat.



The deep-cushioned seats are upholstered in dark brown Spanish leather

tion of a car that would be far in advance of present practice. The work of designing the vehicle was intrusted to W. L. Harwood, engineer of power and equipment for the Springfield and Worcester railways.

After careful consideration of the problem, it was decided that efforts should be directed particularly toward reducing noise and vibration and toward giving the car an attractive appearance. It was thought that the journal bearings should be of the so-called frictionless type, which would be possible if the motors were spring supported instead of being dead weights on the axles. Gears should be of a design that would cut down noise and permit the use of higher speed motors. Brakes should be of the internal expanding type, eliminating the rattle of levers and rods. Interior fittings, seats, lighting, etc., should be made more attractive. In place of a bell or whistle, the car should be equipped with a warning signal having a more agreeable sound.

NOVEL FEATURES IN TRUCK DESIGN

Numerous unusual features have been embodied in the truck design. Dished steel wheels of 26-in. diameter are mounted on differential axles of the automobile type, which revolve on tapered roller bearings arranged as shown in an accompanying drawing. The truck is of steel with I-beam side frames inside the wheels. The wheelbase is 6 ft. Coil bolster springs carry the weight of the car body up to three-quarters of the seated load. In addition semi-elliptic springs mounted in seats provided with Mack rubber shock insulators are in use at all times. This truck design is a joint development of the Wason Manufacturing Company, the Timken-Detroit Axle Company and the Springfield Street Railway.

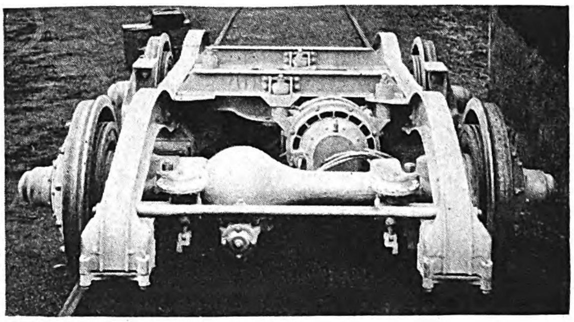
Each of the trucks carries two Westinghouse V91B, 300-volt motors, connected permanently in series. Variation in speed is obtained by placing the pairs in series and in parallel. Each motor is attached through rubber blocks to the truck frame with its shaft parallel to the direction of motion of the car. It is connected to the remote axle of the truck through a flexible Spicer propeller shaft. The gear reduction is 10 to 1, permitting the use of small high-speed motors, weighing 424 lb. each. The worm drive operates in a bath of oil. Universal joints between the motor and the axle permit placing the motors well up on the truck frame, where they will be out of the way of water, snow and slush.

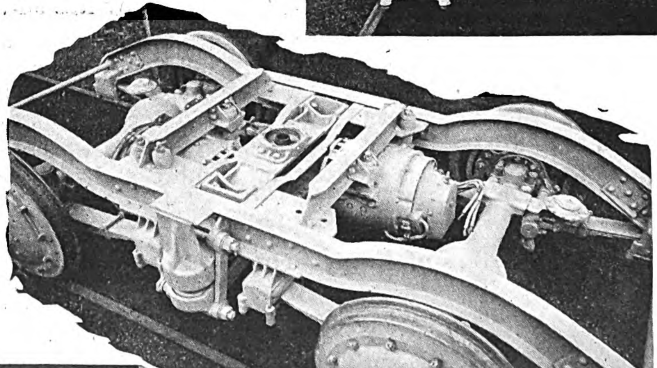
Brakes are of the internal expanding type similar to those developed for buses. They were designed by the Westinghouse Traction Brake Company. Composition inserts used as shoes were made specially by the American Brake Shoe Foundry Company. An accompanying illustration shows the brake mechanism.

This truck weighs only 5,650 lb. complete with motors and drive shaft. Scale weights of various parts are given in an accompanying table. The combination of the light weight and friction reducing features make it possible for a man easily to push the complete truck with one hand along the track.

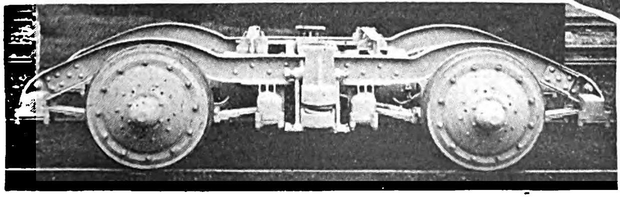
CAR BODY HAS RAKISH LOOK

Many novel features have been incorporated in the car body, which has been built by the Wason Manufacturing Company. Underframing is of steel with duralumin bolsters. The weight of each bolster is 101½ lb. It is interesting to note that this is less than the weight of



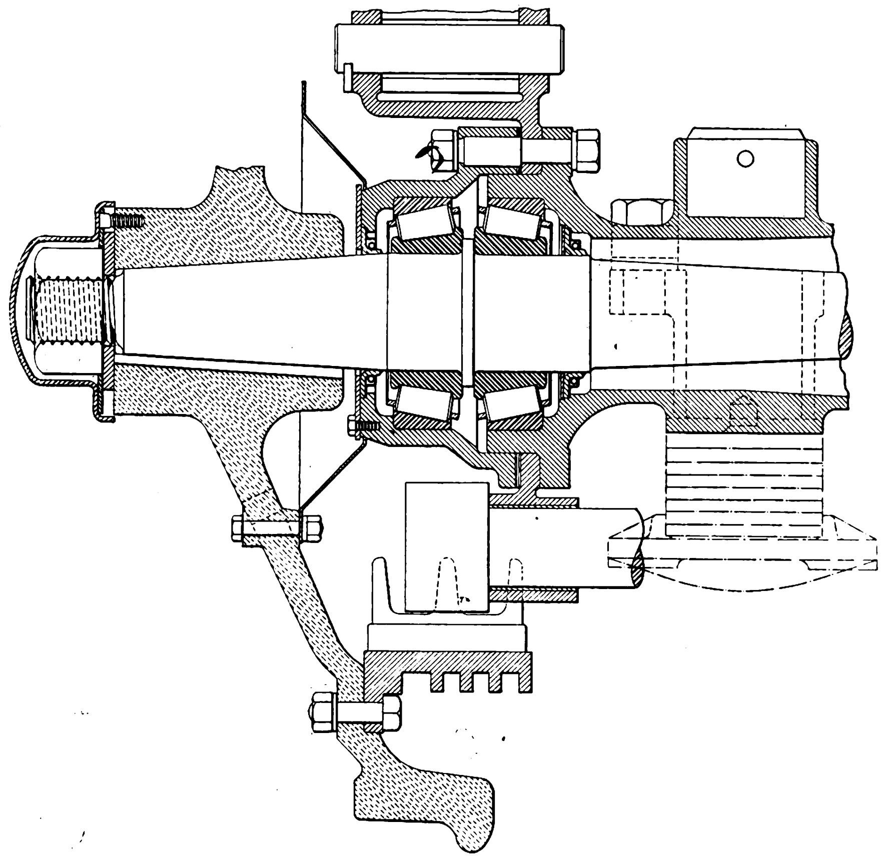


Unsprung weight is reduced by mounting high-speed motors on the truck frame and connecting them to the remote worm-drive axles through flexible propeller shafts. Brakes of the internal expanding type are located inside each wheel.



Worm-drive roller-bearing truck developed for experimental car the trolley base used on the car. By using duralumin a saving of 400 lb. was effected without reducing the safety factor. Window posts are of wood reinforced below the belt rail with duralumin angles. The sheathing below the belt rail consists of plates of sheet aluminum held in place by battens. These plates curve inward slightly at the bottom, giving an appearance similar to that of a bus body, and extend 8 in. below the underframe, forming an apron which conceals the greater part of the equipment and running gear.

Length over corner posts is 30 ft. and 40 ft. 8 in. over all. Width over belt rails is 8 ft. 4 in. Truck centers are 19 ft. 6 in. apart. The platforms are curved between the body corner posts and the end, which is straight for a distance of 4 ft. 8 in. Duralumin is used also for the letterboard and belt rail. Altogether 735 lb. of this metal is employed for the side members, letterboards, bolster, etc. Carlines are of steel and wood, while the roof is of tongued and grooved $\frac{3}{16}$-in. cedar covered with No. 8 canvas.



The 26-in. rolled steel wheel in dished to bring the throat vertically in line with the tapered roller bearings

Due to the use of small diameter wheels and the unusual design of the trucks the height from the rail to the car floor is only 2 ft. 8$\frac{3}{4}$ in. There is a single well step between the ground and the car floor, with its edge curved to conform to the body lines. Double outward folding doors conforming to the same curve inclose the four step wells. At two diagonally opposite doors, treadle steps are provided for rear exit. These doors are provided with street collector's control.

A feature which suggests the bus rather than the typical street car is a plate glass sloping windshield 56 in. wide. This has the practical advantage that it eliminates reflections from the interior lights of the car. An electric windshield wiper is provided. Above the windshield is a sloping sun shade. Under this is a hinged ventilator which may be raised to admit air. An automobile type bumper has been placed at a height of 24 in. above the ground.

Special attention has been given to the lines of the roof, which resembles that of a high-grade automobile. The inside height from floor to ceiling is only 7 ft. 2 in. This makes possible the small over-all height of 10 ft. 2 in. from rail to top of roof. All exterior lines are continuous from end to end of the car body. The color scheme is yellow below the belt rail and cream from the window sills to the roof. A red band 8 in. wide completely encircles the car immediately below the window sills. Outside the doors have been painted with bands of color to conform to the general scheme.

Seats are provided for 45 passengers. There are sixteen pairs of cross seats, spaced 31 in. apart, and four longitudinal seats at the ends accommodating three passengers each. Two revolving seats with backs are provided in the center of the platforms. The forward one is for the operator and the other is available for passengers. All seats are deep cushioned and covered with dark brown Spanish leather.

Windows have Rex single drop sash. The floor is a single layer of wood covered with brown inlaid linoleum. Illumination is furnished by five 94-watt dome lamps with a compensating panel, located in the platform cabinet. Ventilators are of the bus type, located in the roof. Chromolux electric heaters are used with thermostatic control. The interior of the car has been given a pleasing appearance by carrying the white Agasote headlinings straight through, unbroken by bulkheads. Below the window sills the sides

List of Manufacturers of Equipment Used on Springfield Experimental Car

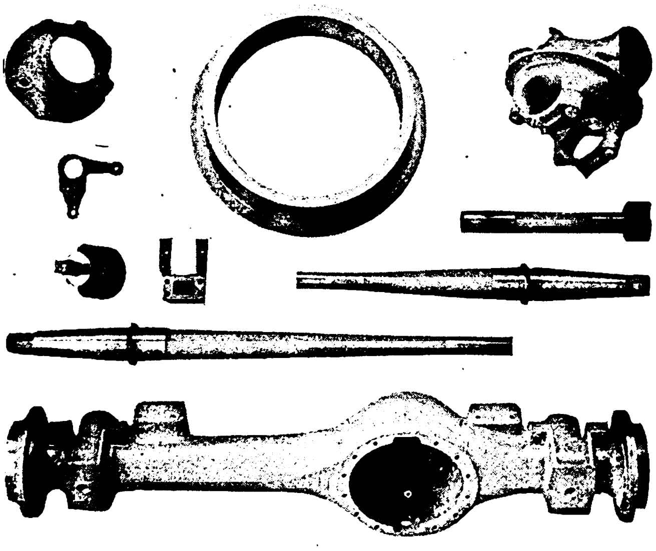
Wheels	Standard Steel Works Company



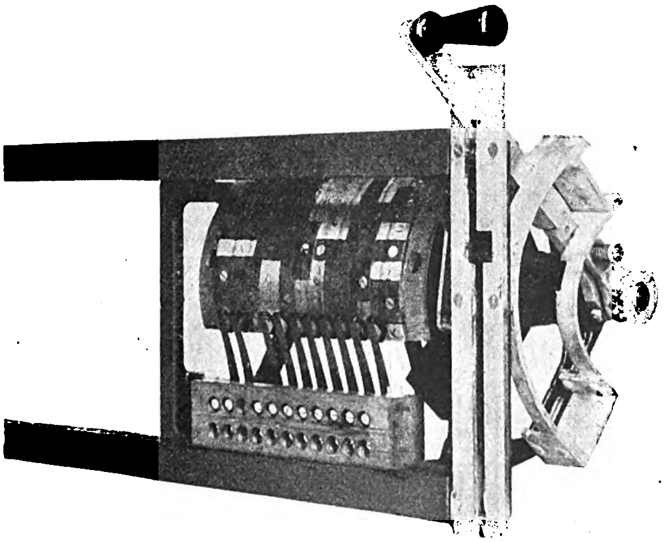
Differential axle and housing before assembly

are of mahogany-faced Haskelite, while brown imitation leather is used above. There are no bell cords or register rods. Faraday buzzers are provided. A two-toned electric horn is used in place of a warning gong.

ELECTRICAL EQUIPMENT IS UNUSUAL

Care has been exercised in locating the equipment and the old method of placing switches, thermostats, relays, etc., here and there throughout the car has been abandoned. In front of the operator is a cowl with two panels somewhat resembling a small desk. Switches, light relays, indicating lamps, pressure gage, controller, brake handle, etc., are all mounted flush in these panels. The operator has full control of the car and all apparatus while in his seat.

Remote control of motors is employed. On the platform a master controller operated at 24 volts actuates the main switches under the car body. This master controller is an adaptation of a type of electric vehicle control. The drum is mounted on a horizontal axis, as shown in an accompanying illustration, so that the handle moves in a vertical plane. Energy for the master controller is obtained from two U.S.L. 12-volt storage batteries, series connected. These batteries are charged by being in series with the car lamps and the air compressor. Energy is furnished from the same source for the tail lights, so that oil lamps are not required. It is estimated that the saving in this item alone will practically pay for the use of the battery.

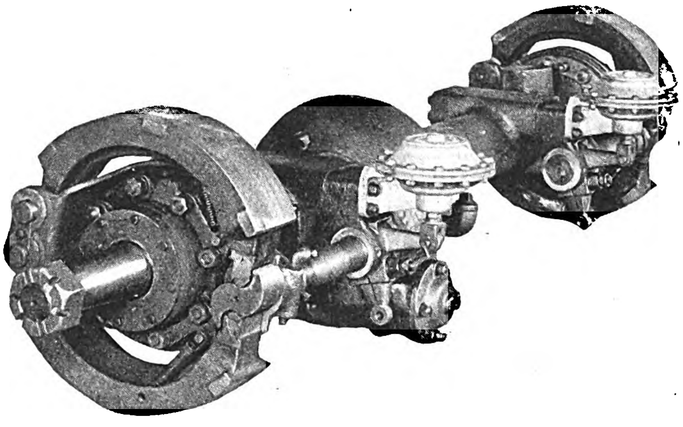


Master 24-volt controller with horizontal drum and handle which moves in a vertical plane is located in platform cabinet

REMOTE ELECTRIC CONTROL IS USED FOR BRAKES AND DOOR ENGINES

Air brakes and doors have remote control. The operator's brake handle merely establishes various electrical contacts which actuate magnet valves which are located under the longitudinal seats and above the doors. Thus the only pipe on the platform is that for the gage. The pneumatic door engines are of the light-weight type made by the National Pneumatic Company. With this type of door engine and the bus-type braking mechanism it is possible to use a General Electric CP-25-C8 air compressor of 10 cu.ft. capacity. In the compressor aluminum castings have replaced iron to lessen the weight. Flexible aluminum tubing with brass automobile type fittings is used for all the air piping.

The emergency brake mechanism is operated by a hand lever of the type used on automobiles. The lever at each end operates only on the adjacent truck. Connection between the lever and the cam by which the brake shoes are brought into play is through wire cables. This arrangement eliminates all chains and rods which might be a source of noise.



Movement of the camshaft causes brakeshoes of composition bronze to press against the drum within the wheel

Due to the light weight of the motors and the extensive use of duralumin throughout the body, the total weight has been kept down to 23,450 lb. It is expected that this will permit rapid acceleration and braking. The weight is divided between the various parts of the car body and trucks as shown in the accompanying table.

NEW FEATURES, IF SUCCESSFUL, WILL BE INCORPORATED IN FUTURE CARS

Work has been finished on the trucks and only a few minor details remain to be completed on the car body. It is planned to assemble the body and trucks at an early date and test the operation of the car. The management is hopeful that many of the innovations embodied in this design will turn out to be real improvements, but considers the car at this stage to be entirely an experiment. After thorough testing, if the new features prove to be as advantageous as expected, they will be adopted and

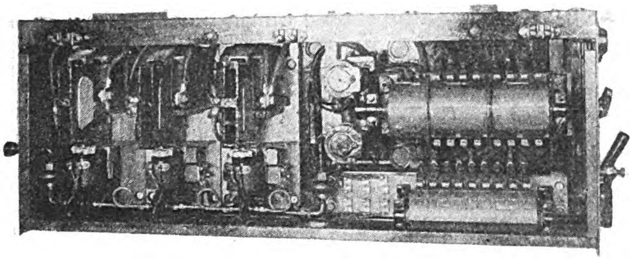
incorporated in the design of future cars. It is anticipated that under conditions of quantity production cars of this type could be built at approximately the same cost as that of the light-weight, double-truck car of the ordinary type.

It is planned to make complete tests of the car, using special apparatus where possible to determine the comparison of the new type with existing equipment. The instrument developed by the committee on noise reduction of the American Electric Railway Engineering Association will be employed to measure the noise. Following these special tests it is planned to place the car in service on one of the lines of the Springfield property and make service tests for a period of from six months to a year in order to determine whether any of the features require modification before the design is acceptable for use.



Switch group located under car body

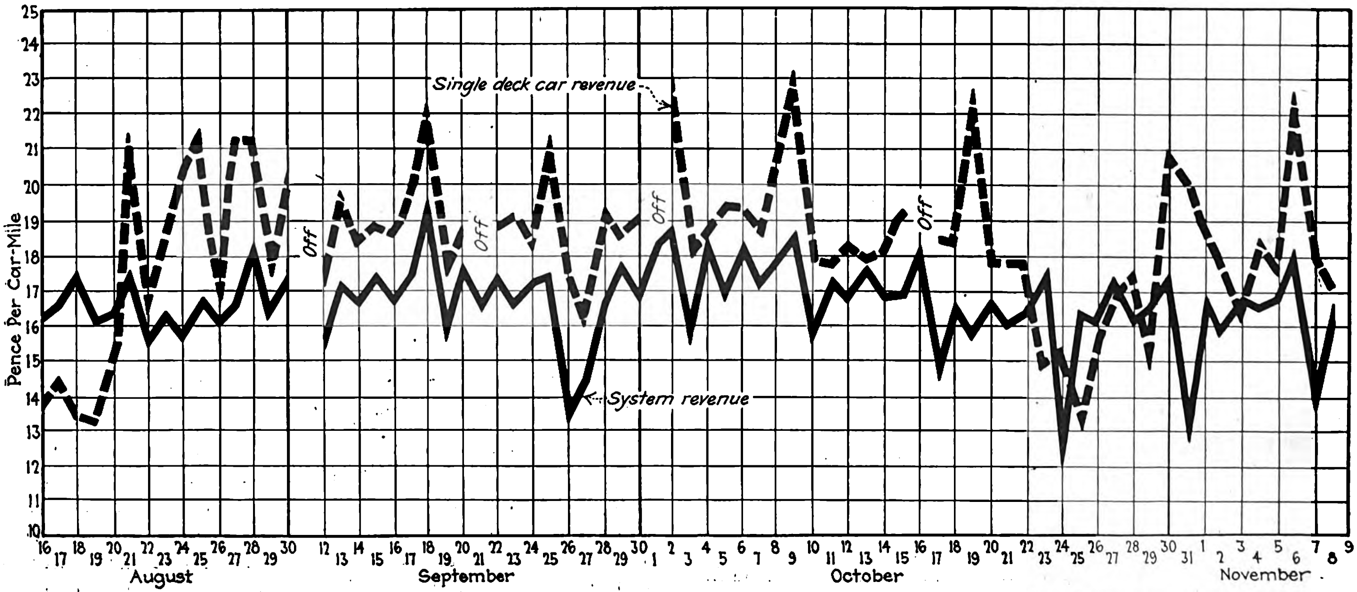
Total Dividend of St. Louis Loan Association $843,708

At a recent meeting of the board of directors of the United Railways Savings and Loan Association, St. Louis, Mo., the 23d consecutive semi-annual dividend was declared at the rate of 6 per cent per annum, payable to members of record Aug. 31. The dividend will total $99,000. It brings the grand total paid to members of the association to $843,708. The association has never paid less than 6 per cent dividends, compounded semi-annually, and has paid a dividend every six months. The association has placed 2,009 members in homes of their own. It now has 5,798 members. It was founded to encourage home owning and stimulate thrift.

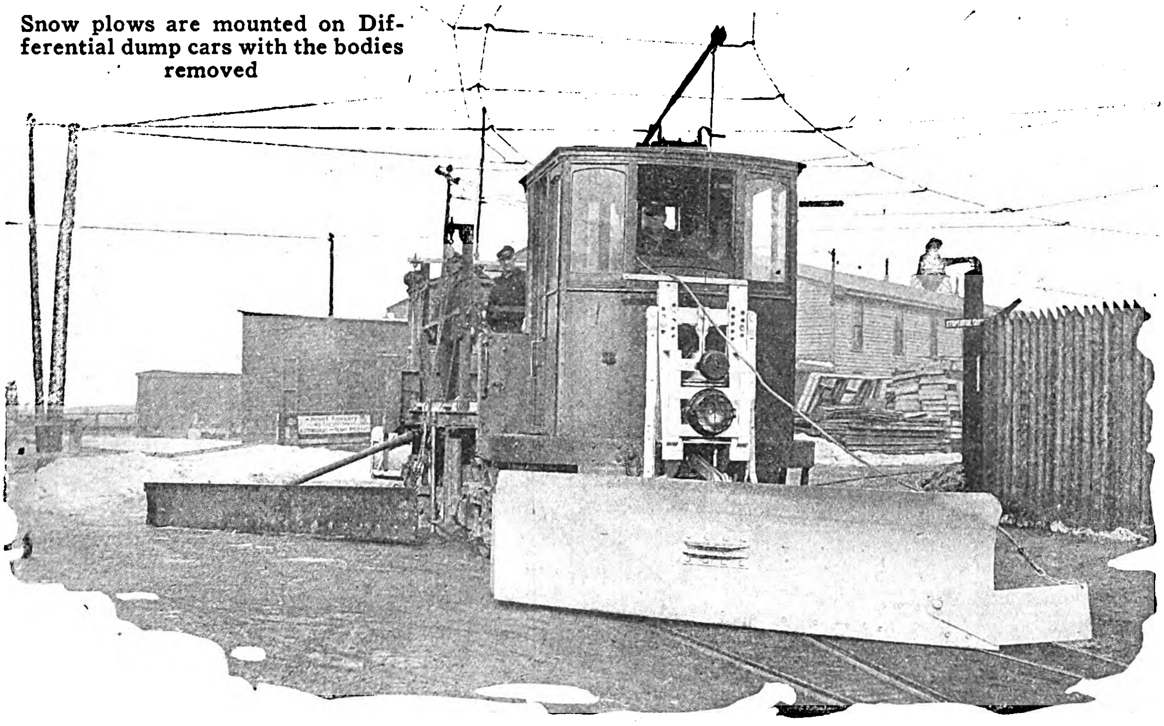
Glasgow Single-Deck Car Popular but Not Economical

Experience of several months with an experimental single-deck car designed by the Glasgow Corporation Tramways, Glasgow, Scotland, somewhat along American lines, has led the management to the conclusion that such a vehicle is not well suited to the transportation needs of that city. While this car has proved quite popular with the riding public, its comparatively small seating capacity has been a disadvantage, especially during rush hours. Details concerning the construction of this car appeared in ELECTRIC RAILWAY JOURNAL, Oct. 23, 1926, page 769.

A measure of the relative popularity of the single-deck vehicle and the double-deck tram long standard on the Glasgow system is had by comparing the revenue per mile of the new equipment and that of the entire system. Earnings have been consistently higher for the single-deck car, as shown by the accompanying chart. During 70 days of operation in August, September, October and November of last year, the revenue per car-mile averaged 18.2 pence for the single-deck car and 16.7 pence for the system as a whole. It is believed that these higher earnings may be due to the more attractive appearance of the new car, and to the use of transverse upholstered seats instead of longitudinal seats of wood. These features, of course, could be embodied equally well in a double-deck car.



Revenue per car-mile with single-deck equipment compared to revenue for the entire Glasgow system shows the popularity of the new car



Snow plows are mounted on Differential dump cars with the bodies removed

Snow-Fighting Methods Revolutionized

By H. M. Steward

Superintendent of Maintenance Boston Elevated Railway

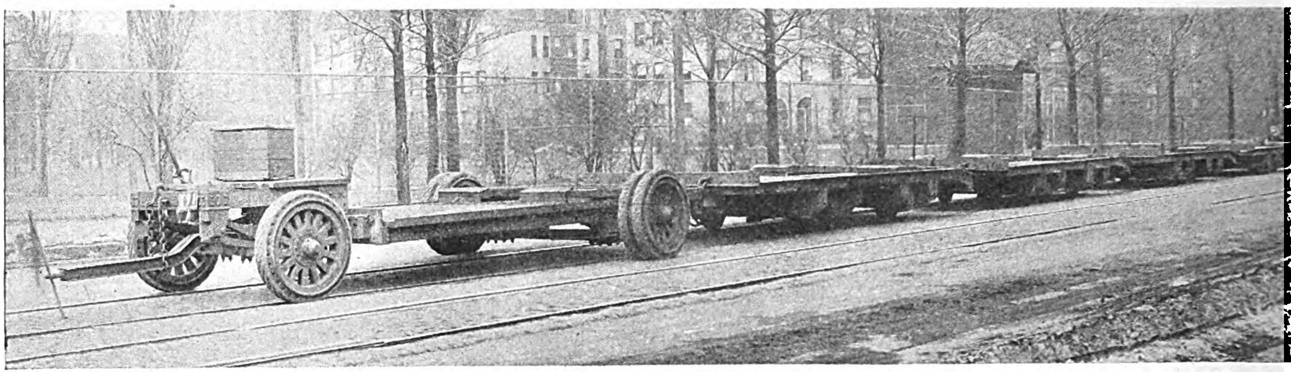
Boston Elevated Railway Now Plows Snow from Tracks and Roadway, Finding It Pays Well to Keep a Vehicle Road Open to Prevent Blocking Car Tracks

DUE to the changes in traffic conditions which have occurred in recent years; that is, the substitution of motor vehicles for practically all horse-drawn vehicles and the use of motor vehicles, particularly pleasure cars, throughout the year, the Boston Elevated Railway has found it necessary to readjust its method of handling snow.

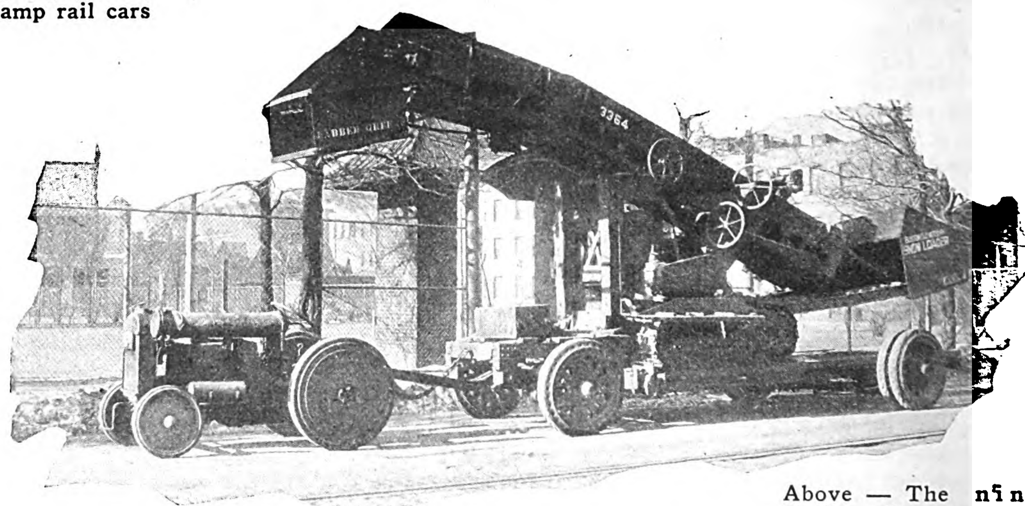
Formerly the railway plowed the snow from its tracks to provide a clear roadway for the operation of its cars, without being obliged to consider the roadway alongside. In fact, several of the municipalities desired that a certain amount of snow be left on the roadways in order that vehicles on runners could be operated without trouble. During this period, on streets where business would not permit the snow plowed from the tracks to remain, it was necessary for the railway to remove it.

The present method is to plow the tracks with the various types of electric car plows or sweepers, as before. As soon, however, as the snow at the end of the plow or sweeper wings reaches a depth of approximately 12 in. motor vehicles equipped with plows or shears are used to push the snow back further. This operation continues throughout the duration of the storm. On the first night following a snowstorm nine cars equipped with long steel wings come into play for the purpose of pushing the snow back to the curb. If certain streets are too wide for the wings of these cars to reach to approximately the curb, the snow is pushed back to the desired point by motor vehicles working in conjunction with the winged cars. This method of handling the snow provides a roadway for practically the full width of the street, which allows all vehicular traffic to use the entire roadway and does not make it necessary for vehicles to run in the track area only.

This method of handling the snow also removes almost entirely the menace of high ice which formerly existed, and consequently reduces the expense of car maintenance, prevents delays and materially reduces accidents due to vehicles slipping on the ice and sidewiping cars. During the heavy snowfall in the winter of 1919-20, when the tracks only were cleared, ice several inches in depth formed in the track and deep ruts occurred, due to the operation of motor and other vehicles. This resulted in severe losses to the railway on account of delays, repairs to cars, the expense of removing the ice and payment for accidents. By clearing the roadway for practically the full width of the street, the melted snow has an opportunity to run to the sides of the roads and thence to the gutters, instead of accumulating in the track, as it did formerly. It must be understood, of course, that it is necessary to use care and to remove the snow thoroughly from around hydrants and to open catch basins in the gutters. Snow must also be removed promptly from driveways to garages, business houses, gasoline stations, public buildings, etc. The extra expense, if any, of pushing back

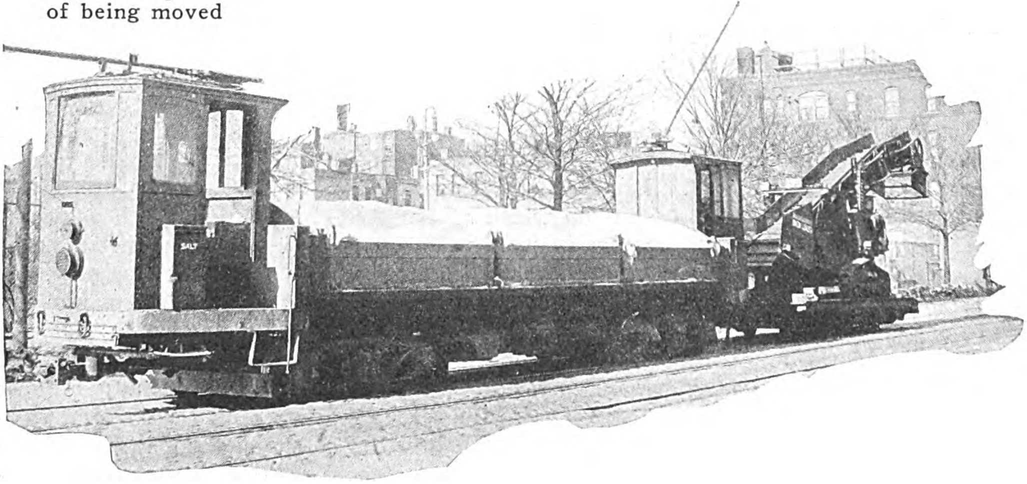


The company has an auto trailer that is useful in transporting equipment, and a fleet of four low ramp rail cars

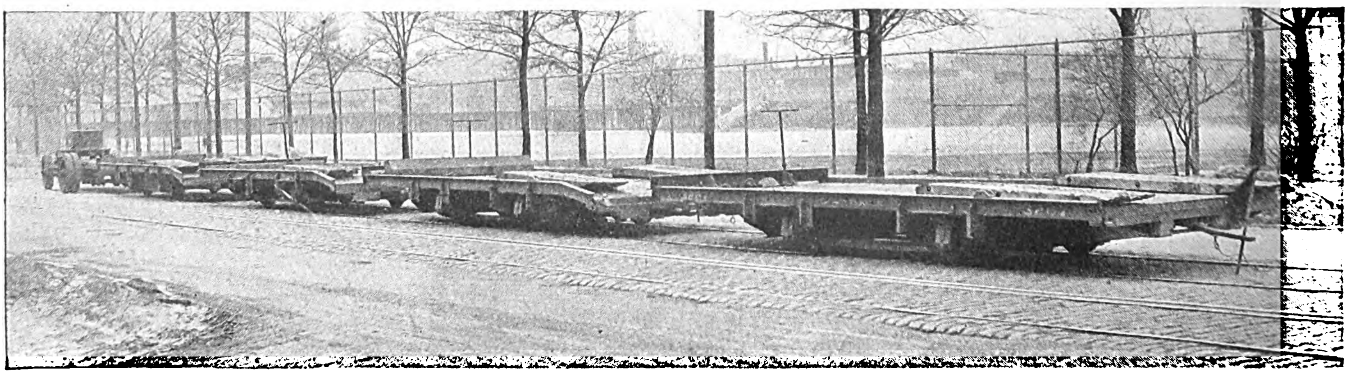


Above — The nine Barber-Greene snow loaders are transported from place to place by several methods. The one shown is on an auto trailer being hauled by a Fordson tractor

Below—Differential dump cars are used for pulling the ramp cars. A snow loader is shown in process of being moved

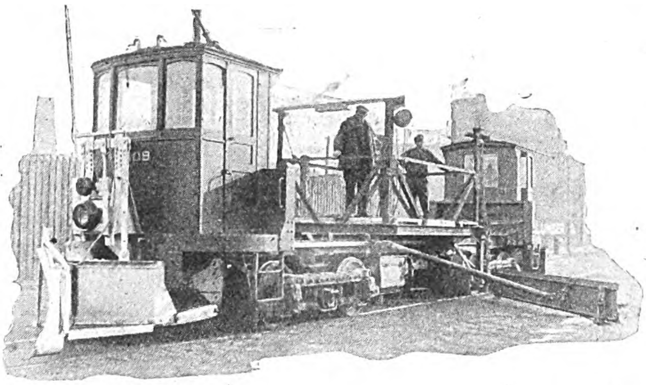


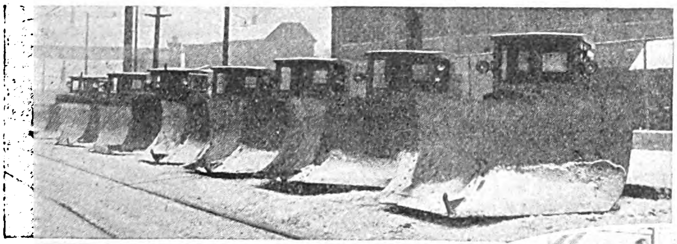
A close-up view of the ramp cars, showing their construction

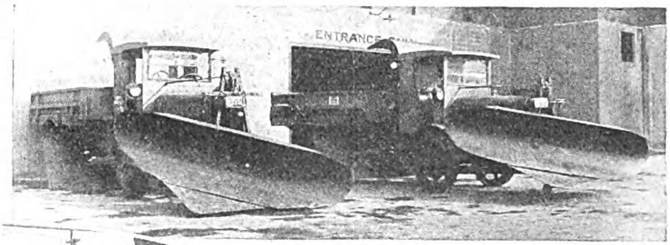


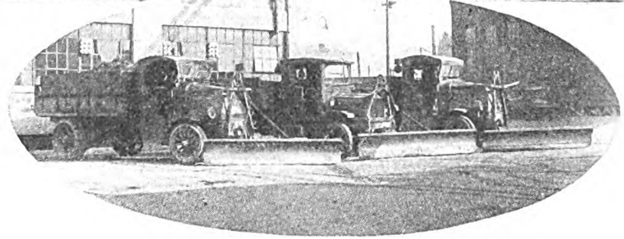
the snow for practically the full width of the street is probably more than offset by the saving resulting in lessened damage to cars, delays to traffic and accidents. During snowstorms, when all our plows and sweepers are in use, we have employed up to 22 trucks equipped with plows or shears, together with seven tractors, three Walter snow fighters and one FWD truck.

During snowstorms vehicles are liable to break down on the track area and prevent the operation of cars. To supplement the emergency equipment, which is sufficient during the summer months, it has been found advisable to use trucks equipped with jacks, block and tackle, towing ropes, picks, shovels, etc., stationed at strategic points with two experienced men, besides the driver, as a crew. These trucks are used only while the snow is falling or until the streets are opened for traffic. During snowstorms we have used up to eleven extra emergency trucks of this sort.









Top — Substantial outboard plows clear the roadway alongside the railway tracks

At left—This fleet of 5-ton tractors equipped with V plows has proved excellent for snow fighting in Boston

Above — Two of the three Walter snow fighters which have been used with good results on the Boston Elevated Railway

In oval—Three of a group of 44 trucks equipped with Champion snow plows

On bus routes it is also necessary to plow the snow and during snowstorms up to 29 trucks equipped with shears have been used. After the storm is over the bus routes are plowed to practically the full width of the street and down to the pavement where possible. This is accomplished by using Walter snow fighters which are equipped with scrapers located between the front and rear wheels. If the snow is not plowed down practically to the pavement, the roadways soon become rough and bumpy, with resulting severe damage to the buses.

The railway, in the development of its snow-fighting system, has accumulated a wide range of equipment, most of which has been found quite essential under present-day conditions. It includes the following:

- 9 Barber-Greene snow loaders.
- 4 trail cars.
- 1 motor trailer.
- 7 tractors.
- 3 Walter snow fighters.
- 1 Four-Wheel-Drive truck.
- 44 trucks equipped with shears.
- 6 Differential cars equipped with plows and wings.
- 3 rail cars equipped with wings.

Accompanying illustrations show some of this apparatus.

The railway owns seven 5-ton trucks which are used to plow snow and in addition owns 37 shears for trucks which are used on trucks hired from contractors. Arrangements are made with high-class contractors in the late summer to furnish trucks for plowing and for hauling snow. A list of contractors desiring this work is prepared and suitable arrangements are made for calling and responding promptly. Trucks to be used for plowing are required when a heavy snowfall is predicted and soon after snow begins to fall. In order to speed up the work, the trucks are sent to the railway shops at four different locations and the shears are put in place. After the plowing work has been done, the shears are removed, inspected, repaired and stored, all ready for the next storm. No difficulty has been encountered in securing the necessary number of trucks. During the heavy storms in February, 1926, 130 trucks were readily secured for plowing and removing the snow.

Formerly it was the practice to load snow, to be removed by hand, into sleds or other vehicles drawn by horses. These horse-drawn vehicles were then hauled to convenient dumps and the load was removed by hand.

The present method consists of pushing the snow into long piles parallel with the curbs, picking up the snow and loading it into trucks with Barber-Greene snow loaders. The trucks used hold an average of 7 cu.yd. of snow and 60 seconds on the average is required to load a truck. By the proper selection of dumps, the round trip per truck does not exceed 30 minutes on the average. Seven trucks are sufficient to keep a snow loader in continuous operation, except where the dumps are located beyond the average distance.

The Boston Elevated Railway owns and operates nine snow loaders, which are taken to the locations where they are to be used on low trail cars or on motor trailers. A few of the cities and towns also own snow loaders. When all of the Boston Elevated Railway snow loaders are in operation it is necessary at times, depending upon the amount of snow to be handled, to use up to 100 trucks per day.

By means of snow loaders and trucks the snow which the railway is obligated to remove can be taken care of in a storm of, say, 12-in. fall in not over 36 hours.

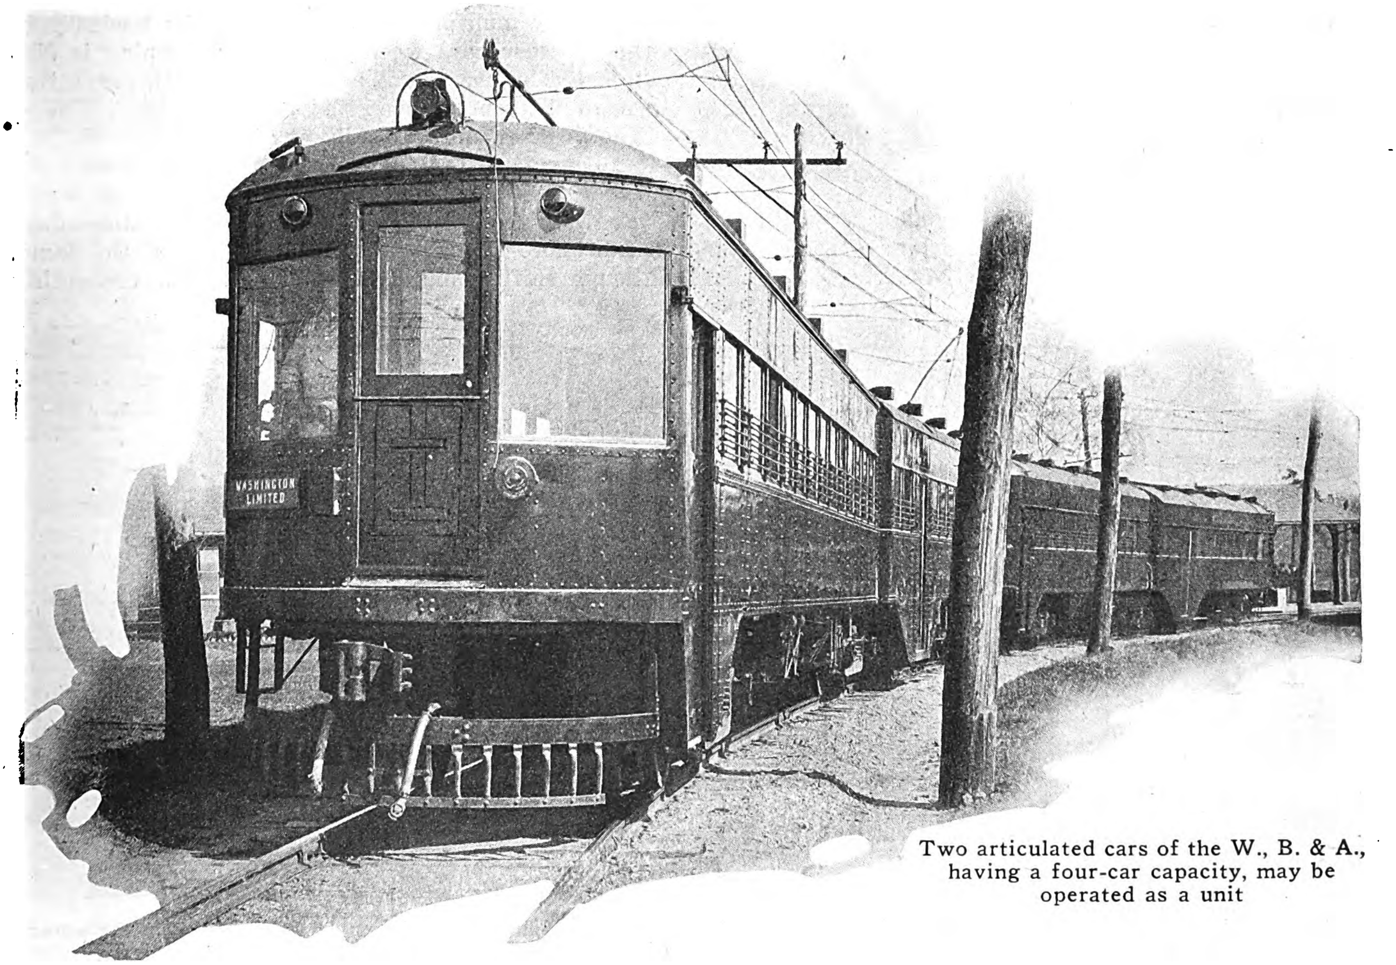
Articulated Cars in High-Speed Interurban Service

Two-Body, Three-Truck Units Built by Brill and Westinghouse-Equipped Go in Service on Baltimore-Washington Division of the Washington, Baltimore & Annapolis Electric Railroad



Two articulated cars of the W., B. & A., having a four-car capacity, may be operated as a unit

COMPLETE replacement of the high-speed equipment on the 40-mile Baltimore-Washington division of the Washington, Baltimore & Annapolis Electric Railroad is being made as an open challenge to all forms of competitive transportation. The new cars are of the articulated type and the first of this design to be operated in the United States in high-speed interurban service. In addition they are of a de luxe type with better appointments than those of many steam railroads.

Commencing April 1, eight of the new units, built in the Philadelphia plant of the J. G. Brill Company, will be used to fill the half-hour limited schedule between Baltimore and the national capital. Six of the twin cars were delivered early in March and are being "worked in" while the crews become familiar with the details of the equipment. The remaining four have just been delivered and will be ready for regular operation on schedule time. The cars will receive wide publicity as they will help to handle the crowds attending the Bowie race meet starting April 1.

The Washington, Baltimore & Annapolis has lines over two different routes between Baltimore and Annapolis and the main line between Baltimore and Washington. The latter consists of double-tracked private right-of-way as far as the Maryland-District of Columbia boundary line, from where entrance to Washington is over the tracks of the Washington Railway & Electric Company. In Baltimore the company runs its tracks into its terminal on Howard Street.

The two Annapolis lines serve the home of the United States Naval Academy and the intervening territory, much of which is suburban to Baltimore. The country along the Severn and Magothy Rivers is fast developing into summer resorts. Annapolis and the intermediate territory to Baltimore are served solely by the W., B. & A. both for passengers and freight.

The main line between the two major cities is the backbone of the service and revenue of the company. The intervening territory is sparsely settled and hence the need is naturally for high-speed, infrequent-stop service. The Baltimore & Ohio Railroad and the Pennsylvania Railroad are competitors, running many trains from terminal to terminal in 60 minutes or less. With its entrances to the terminal cities on public streets, the W., B. & A. trains require 1 hour and 30 minutes, but have the advantage of more central stations, and charge lower fares.

In recent years de luxe interstate buses between the cities have offered additional competition, and the country-wide automobile expansion has affected this company the same as it has all railways. Despite all this, the W., B. & A. has for a number of years carried annually 60 per cent of all Baltimore-Washington common carrier traffic. Following the enormous peak occasioned by Camp Meade and other World War activities in this territory, the gross traffic has been decreasing consistently, although the 60 per cent ratio has been substantially maintained.

COMBATING COMPETITION A PURPOSE OF THE NEW CARS

The new equipment has therefore been purchased not only to give the essential service but to combat the most serious of the competition. It is expected that additional traffic will be drawn from other channels, particularly private automobiles, as the single intercity highway is greatly congested and the parking situations in the two terminal cities are growing worse daily.

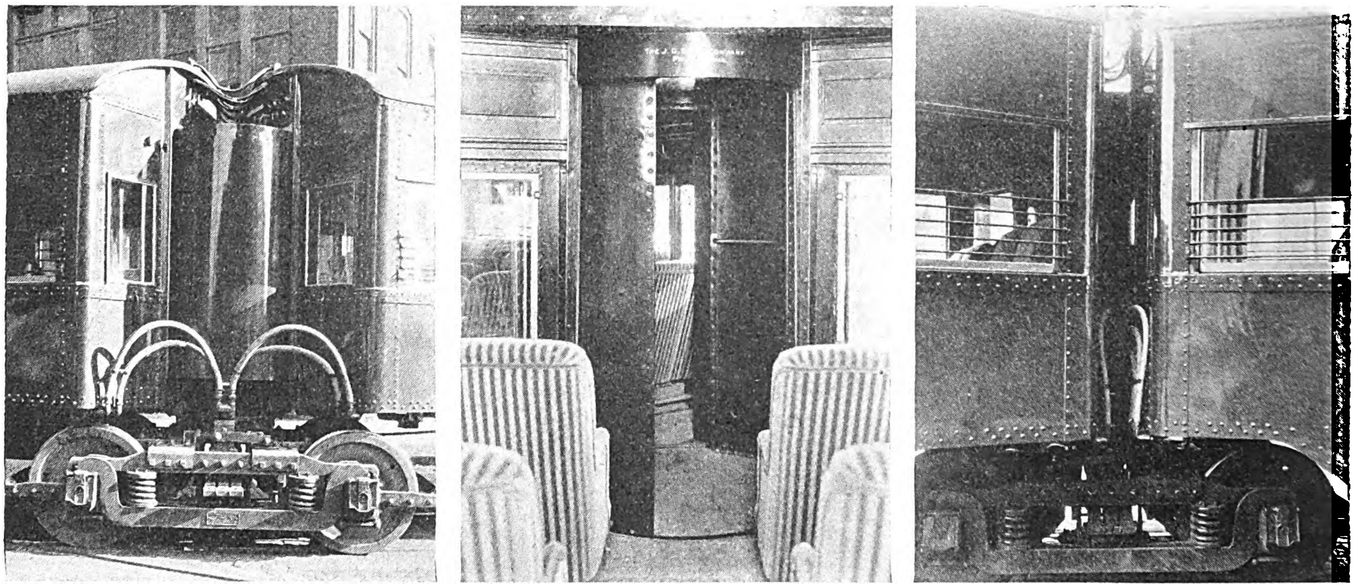
Patronage on the Washington-Baltimore division has always been great enough to require two-car trains, which heretofore have been made up with multiple-unit equipment. The old cars were built of wood in the conventional manner of 1910, weigh 40 tons apiece, or 80 tons per train, and have been in use since the change to 1,200-volt d.c. operation in 1910.

The new cars will provide equal passenger capacity with greatly superior facilities and marked economy. The weight saving of 27 per cent alone will reduce the power bill. Three trucks against four, one set of motors, control and equipment as against two, will immediately be manifest in the cost of equipment maintenance. Maintenance of the track should also be less, due to the lighter weight of the units. By means of the permanent connection, the unit is essentially one car, allowing the use of two trainmen as against three.

Loading and unloading at intermediate points is supervised by the conductor at the side door. All doors are pneumatically operated. At terminals the rear door, controlled from the conductor's position, is also used. Upon entering, the passengers choose either car, the rear body always being reserved for smokers.

Besides the innovation of the articulated feature the cars are equipped and finished with a view to comfort and pleasing appearance. Early trials indicate that these aims have been attained. The rigid connection of the two inner ends on the common truck damps out the nosing or side sway common in either single-car or ordinary multiple-unit operation. The tendency to surge between cars when starting or stopping is also eliminated by the use of a single unit with connection through the center track.

The drum mounted rigidly on the center truck provides easy access between the two sections, giving the effect of one long car unbroken by partitions or doors. Even when negotiating the limiting 50-ft. radius curve in Baltimore the width of opening remains the same, although shifted slightly to the side. The connecting drum is cylindrical, allowing each body to revolve about the outer surface. It is made of sheet steel ⅛ in. thick, supported on steel angles. The bottom is rigidly secured to the center of the pivot truck. Rubber rollers attached to each side of each body are held against the exterior of the drum by springs that allow the entire surface of each roller to engage the drum at all times. In this way practically a tight fit is obtained. A rainstorm was encountered during an early trip and no leakage at these points took place.



W., B. & A. articulated car easily negotiates the limiting curve of 50-ft. radius. View at the left shows the outer side of the car on the limiting curve, while at the right is illustrated the inner side. The center view shows appearance of the connecting drum opening shifted to one side, but still easily passable

The interior finish is pleasing. The floors are mottled gray and black rubber that presents a clean appearance even when soiled after a day in service. The double seats are of the individual chair type with heavy springs in the base and individual pads of light springs, heavily upholstered. The backs are firmly attached to the seats and have a well-shaped curve. The backs are constructed with springs and heavily upholstered. Each seat is completely covered with a striped frieze mohair, light gray in color. While operating loops are provided at each terminal, the cars often must be reversed. For this reason the pairs of seats may be turned horizontally on a center pivot, after releasing a pedal-controlled catch. This feature also permits the seats to be swung partly around should passengers desire to face the side. The twin unit car carries 47 double seats all alike, thus seating 94 passengers. The seats conform to the window spacing of 35 in., leaving ample knee and leg room.

Baggage racks of bronze are mounted overhead with ample clearance. One lavatory with a flush hopper and wash basin is provided at the end of one of the bodies, immediately behind the motorman's compartment. Paper towels and a tank for drinking water are included in the equipment.

Posts, sills, panels and doors are solid mahogany. The ceiling is finished a deep cream, which, with the mahogany trim, makes a pleasing contrast with the neutral gray of the seats and floor.

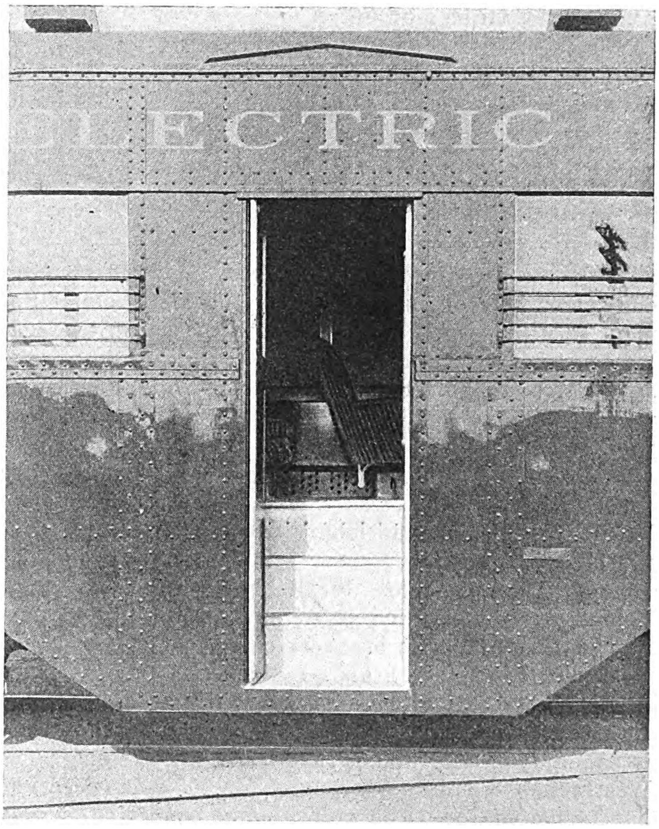
Plate glass set in brass sash is used in all windows. The single side sash may be raised upward into pockets behind the deep letterboard. Illumination is provided by shaded lamps mounted in two rows in the ceiling, one row directly over each seat.

There is a cab for the motorman at the right-hand side of each operating end. A hinged door, glazed in the upper portion, opens into the car. A 22-in. hinged door at the motorman's right, with a glazed drop sash above, gives access to the cab without need for the motorman to pass through the interior. The inclosed compartment contains all operating switches, the controller and the air brake valve. The narrow end doors and left-hand sash are also glazed with plate glass, allowing good visibility forward.

MULTIPLE-UNIT OPERATION POSSIBLE

For extraordinary conditions two units may be coupled together, operated as a train from one position, giving a capacity equal to four of the old cars. To accomplish this there are Tomlinson M.C.B. type couplers at each end and jumper cable connections are placed on the roof. Small end doors allow access between units for the crew. Headlights of the standard portable type used by the W., B. & A. are hung on the forward door, the connectors fastening into sockets in the ends of the illuminated sign boxes shown in the end views. There are two bullseye marker lamps in the letter panel at each operating end. Adams & Westlake No. 252 tail lamps are furnished by the railway.

Specifications tabulated elsewhere show the details of the equipment. In the Jan. 22 issue of ELECTRIC RAILWAY JOURNAL, page 165, were side elevation and floor plan drawings showing the dimensions. The cars are framed with steel, using side sills of 4-in.x4-in.x5/16-in. angles. Center sills are 8-in., 11.4-lb. channels with 3-in., 4.1-lb. crossing channels and 6-in., 10.5-lb. bumper channels. The corner posts are 2-in.x2-in.x¼-in. angles with 3/32-in. steel sheet, while the side posts are 2-in.x2-in.x¼-in. to 5/16-in. tees. The top rail is made of 2-in.x2-in.x3/16-in. angles and the belt rails of 3½-in.x¼-in. flat bar with 16-lb. sheet-steel coping. The letter panel and side sheathing are 3/32-in. patent leveled blue annealed sheet steel. Roof carlines are 1½-in.x⅜-in. steel bars covered with 7/16-in.x2½-in. poplar boards.



Between terminals passengers enter and leave by this center door, where the conductor is located. All doors are under pneumatic control from this position

Scale weights were slightly less than the estimated weights as published in the previous article. The units averaged 58⅓ tons, divided between equipment and distributed on trucks as shown in the accompanying two tables.

General Dimensions and Specifications, W., B. & A. Articulated Cars

Length over all, each section	48 ft. 8 in.
Length over vestibules, two-section unit	95 ft. 4 in.
Length over all, two-section unit	97 ft. 4 in.
Wheelbase, motor and pivot trucks	6 ft. 6 in.
Width over posts	8 ft. 8 in.
Width over drip rail	8 ft. 10 in.
Width of each side door opening	2 ft. 10 in.
Height, rail to top of floor	4 ft. 2½ in.
Height, rail to center line of coupler	33½ in.
Height, top of floor to top of roof board	8 ft. 5½ in.
Height, rail to top of roof	12 ft. 8 in.
Height, rail to top of trolley board	12 ft. 11½ in.
Truck centers, each section	35 ft. 10 in.
Distance center to center of side posts	2 ft. 11 in.
Wheel diameter	36 in.
Seating capacity, section without saloon	48
Seating capacity, section with saloon	46
Total seats	94
Interior trim	Mahogany
Headlining and side lining	¼-in. Agasote
Air brakes	Westinghouse Traction Brake Company
Car signal system	Consolidated Car Heating Company
Car trimmings	Statuary bronze
Compressors	Two Westinghouse D-2-K, 1,200-volt
Control	Westinghouse HL, double-end, 1,200-volt
Couplers	O-B Company Tomlinson No. 23 radial
Curtain fixtures	Curtain Supply Company Rex
Curtain material	Pantasote
Destination signs	Illuminated, in dash
Door mechanism	National Pheumatic Company, not interlocked with control
Fenders	Steel pilots
Gongs	Brill dedenda
Grab handles	Ellcon type, mahogany, porcelain finish
Hand brakes	Peacock tunnel type
Heaters	Railway Utility Company, truss plank No. 130
Journal bearings	4¼ in. x 8 in.
Journal boxes	Brill
Motors	Four Westinghouse 333-VV-8, inside hung on end trucks only
Sanders	Ohio Brass Company
Sash	Rex all-metal type
Seats	Hale & Kilburn No. 900 double rotating chairs
Seating material	Chase frieze plush, pattern No. 188, gray No. 2,082, quality X
Step treads	Kass safety
Trolley retrievers	Ohio Brass Company
Trucks	Brill 26-MCB-2
Ventilators	Railway Utility Company
Wheels	36-in. diameter, 3½-in. tread
Window glass	3/16-in. plate

AVERAGE WEIGHTS OF W., B. & A. ARTICULATED CARS

Bodies, including electrical and air equipment	70,993 lb.
Four motors	14,570 lb.
Three trucks	31,090 lb.
Total weight of complete unit	116,653 lb.
Scale weight on trucks of one unit:	
Front truck carried	41,180 lb.
Center truck carried	32,440 lb.
Rear truck, with saloon carried	42,710 lb.
Total weight of complete unit	116,330 lb.

With one set of four motors, two mounted on each end truck, only one set of control and air brake equipment is necessary. Air brakes are placed on the center truck as well as on each motor truck, giving brake applications on all wheels. Because of the difference in weight distribution, adjustments to apply equivalent pressures on all wheels are made. The straight and automatic type of brakes with emergency features are used with two compressors, one mounted under each body. This is a precautionary measure in case of failure of one compressor.

From the Baltimore terminal to the District of Columbia the operation is with 1,200-volt direct current obtained from an overhead catenary trolley. From this point to Fifteenth and H Streets, N. E., in Washington, a 600-volt direct-suspension trolley is used, and from there to the W., B. & A. terminal 600-volt energy is taken from the underground conduit system. The Westinghouse motors are wound for 600-volt operation, but insulated for 1,200 volts, being connected permanently in series, so that speed is reduced on 600 volts. The free running speed on 1,200 volts is 60 m.p.h., so that half speed is ample in the District and Washington. Control current at 600 volts is obtained through a 600/1,200-volt dynamometer when operating from the high voltage trolley.

The doors are of mahogany, 1½ in. thick, double-folding inwardly. They are weather stripped, and the upper portion is glazed with $\frac{3}{16}$-in. plate glass. They are equipped with National Pneumatic Company engines and may be controlled from the conductor's position or at the doors themselves. They are not interlocked with the control. There are three steps, which are all inside the doors and are stationary, with O. M. Edwards hinged trap doors to close over them. All steps have Kass safety treads. The height from the rail to the underside of the first step, that at the sill, is 11 in. The step heights are 16 in., 11½ in., 12½ in. and 12½ in.

The Readers' Forum

President Sawyer Commends Graham Articles

EAST ST. LOUIS & SUBURBAN RAILWAY

EAST ST. LOUIS, ILL., March 10, 1927.

To the Editor:

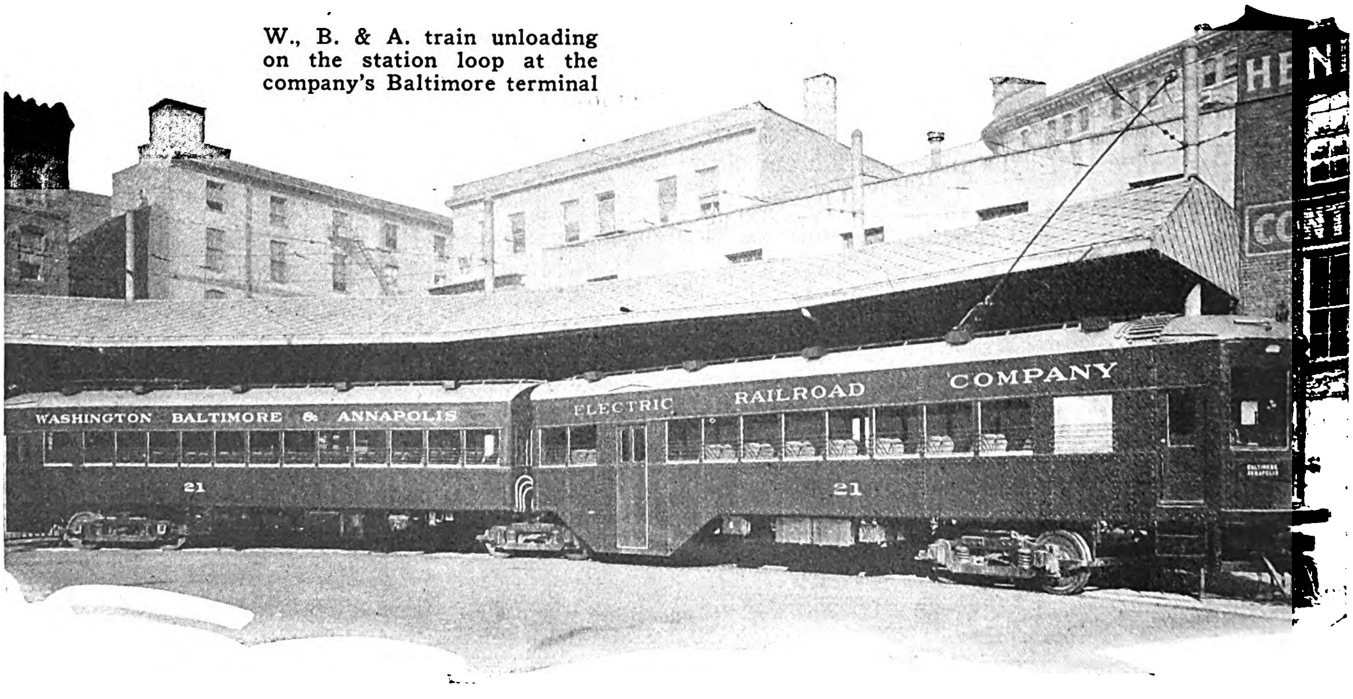
I, too, want to be recorded as one of those who believe that the two articles in the ELECTRIC RAILWAY JOURNAL by R. N. Graham, general manager of railways Pennsylvania-Ohio Electric Railway, represent an outstanding contribution to the discussion of one of the most important subjects before the local transportation industry, viz., "The Place of the Motor Vehicle."

We all agree that the motor vehicle has a place as a new and important transportation tool. Due partly to our own fault and partly to the fault of the motor vehicle manufacturers, few of us have as yet been able to arrive at definite conclusions as to the proper sphere or field of this most important tool.

We are doing neither ourselves nor the motor vehicle industry proper credit when we simply operate buses just to protect ourselves against irresponsible pirates, or because of the so-called "rubber urge," which has been largely an urge on the part of the bus manufacturers to sell rubber-tired buses.

The advantages and disadvantages of the bus have both been discussed in too broad terms, due to the fact that we have lacked definite experience and information. It has been used in places where it should not have been used and has not been used in places where it should have been used. Eventually the bus will take its place, regardless of past prejudices, either for or against. Electric cars will not continue to prevail sim-

W., B. & A. train unloading on the station loop at the company's Baltimore terminal



ply because we hide our heads in the sand and condemn the bus. The day will come when the bus will not be sold or oversold due to high-pressure salesmanship and distorted propaganda. The novelty and the glamor of the bus is fast fading, but not its value as a transportation vehicle.

Mr. Graham hit the keynote in his assumption that the problem is an economic one, and he well sums up the situation when he says that electric cars should not be operated where the bus can be used more effectively, nor should the bus be operated where the street car produces more satisfactory results—taking into account both service to the public and the financial results to the company. Our customers have a right to this service, which is most adapted to their needs, and Mr. Graham's articles, being based upon the actual experience of a progressive, unprejudiced manager, are most helpful in determining just how and where the bus can be fitted into our co-ordinated service.

W. H. SAWYER,
President.

Clean, Bright Cars Attract Riders

DES MOINES CITY RAILWAY
DES MOINES, IOWA, March 5, 1927.

To the Editor:

We are firm believers in the regular and systematic painting of cars, both inside and out, first to attract the attention of passengers and entice them to ride with us, and then from the clean, bright-appearing interior make them want to ride again, for it is always the repeat rides that count.

Several years ago we changed our color scheme from a green to a chrome yellow, with red letterboard and sash. We have found it much more satisfactory, both in appearance and from an accident standpoint, on account of greater visibility. It is our aim to keep all cars as nearly uniform as possible, especially the interior arrangement, as the passengers do not cause the congestion that would occur if several different plans were used. This also applies to the car mechanism, such as controller, brake, gong, etc., as the operator then knows just where to find things in an emergency. This is especially true with new men.

The necessity of changing cars on the road on account of car failure should be held to the lowest number possible, so that passengers will not be caused the inconvenience of changing from one car to another. Trolley wheels and poles are given the closest inspection as I do not believe any one thing can be more annoying to passengers than a trolley wheel that makes a noise multiplied many times by the roof and headlining, which act as a sounding board.

One other part of the equipment that is liable to cause passengers much discomfort is the motor resistance used in starting the car. It is very annoying to have the car give a violent lurch every time it starts, and also the jerking may cause damage suits by passengers falling.

In this day of fast schedules and heavy automobile traffic, flat wheels are more numerous than in years gone by, and must be given attention at once as they are not only uncomfortable to ride on, but are annoying to residents near the car line. We are giving the question of seat upholstery some thought, as clean and comfortable car seats will do much to get repeat riders.

C. R. McMAHON,
Superintendent of Equipment.

A.E.R.E.A. Research Department Proposed

DEPARTMENT OF STREET RAILWAYS
CITY OF DETROIT, March 15, 1927.

To the Editor:

With the trend that events in the electric railway field are taking, succeeding demands for modernization and all the things which follow in its train, we become conscious of one very great defect in our cosmic scheme and that is lack of reliable, unbiased data on many engineering problems. The present method of attacking them is either such research as individual companies can make or investigation by committee of the A.E.R.E.A.

The first plan, or company research, will work satisfactorily for small problems and for that company, but for the industry it is not economic because normally the results are not broadcast, thus necessitating its repetition by other concerns. Nor would the results be acceptable to others because of suspected bias of the investigators and special conditions of tests. The second plan, or that of committee investigation, is much better for the industry at large, but it, too, is far from satisfactory. In the first place, committees are slow in functioning, not through lack of interest but from the inherent nature of the structure. The procedure is too apt to fall into the old stand-by of issuing a questionnaire and basing a report solely upon it. The fault with questionnaires is that in engineering problems individual opinions are given instead of proved statements. Committees are usually formed of men widely scattered throughout the field, which prevents frequent meeting. The members are loaded with the duties incident to their jobs, consequently the gratuitous committee work must be crowded in wherever possible, and this leads to postponement. Heaven knows, procrastination is easy enough without any encouragement! Then, again, committees are mostly without funds, though the recent policy of making appropriations is opening possibilities for adequate investigation heretofore out of reach. This policy means real progress and should be given every encouragement.

However, it is believed that this is not sufficient for the highest and most rapid development. In order to achieve the best, it is thought that the establishment of a research department of the A.E.R.E.A., under the guidance of a competent research engineer with an adequate staff and funds to carry on the work, would meet the challenge to our industry for its place in the field of transportation. It is unfair and certainly undignified that a small group of companies should have to assume the burden of research, and yet this is what they have been obliged to do at times. The very nature of the situation lends itself admirably to co-operative research. The problems to be solved are common throughout the country and there is no competition between companies. This is an ideal situation for correlation of effort.

Under such a plan the committees should be continued, but their functions would be more akin to those of a board of directors. They would outline policy, digest findings and act as the balance wheel. The actual work of investigation and study would devolve upon the research engineers, who, being engaged solely in this work, would be able to go deeper into the subject and produce quicker, and it is hoped better, results.

H. S. WILLIAMS,
Assistant Superintendent of Equipment.

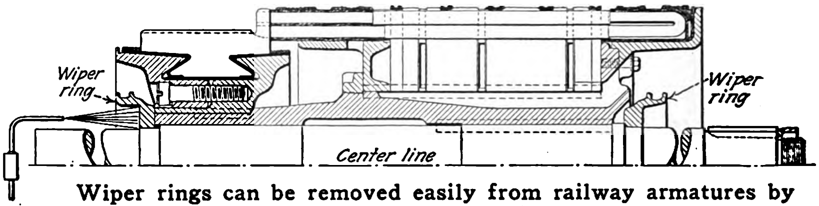
Maintenance Notes

Some Shop Uses for the Oxyacetylene Torch

By F. J. Foote

Superintendent of Motive Power and Equipment the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio

Quite extensive use is made of the oxyacetylene torch in the shop of the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, where it is employed to good advantage for several unusual operations. Wiper rings on railway armatures as a rule are not provided with any arrangement for removal, and they are sometimes stuck very tightly onto the shaft. By directing the flame from a torch against the inner face of the ring, and moving the flame around the ring several times, it is heated without appreciably heating the shaft. The expansion of the ring is sufficient to permit its removal easily with a pair of tongs. These rings are indicated on the accompanying sketch.



Wiper rings can be removed easily from railway armatures by heating with an oxyacetylene torch

Dismantling of car trucks is a tedious and disagreeable job, as many of the nuts are rusted onto the bolts or the thread is somewhat distorted due to excessive strain. The removal of such nuts by the old method often requires the cutting of many bolts and rivets and the splitting of the nuts with chisels. This work can be done very quickly and neatly with a cutting torch, and the ruining of a few bolts that might be reclaimed by the old method is more than compensated for by the time saved.

Various metal parts of the truck require straightening, and a common method is to remove them from the truck for this purpose. By heating such parts with a torch they can be straightened with a wrench or a sledge while in place. Care must be exercised in this heating not to burn the metal. This can be prevented by keeping the torch in motion constantly. The writer has seen an area about 6 in. x 6 in. on a 1-in. steel plate heated to a bright red heat in this manner.

In cases of car wrecks the cutting torch is indispensable. Work that formerly required hours can be done with the torch in minutes. The element of time under wreck conditions is frequently of utmost importance, and the matter of cost is of little consequence compared with the necessity of clearing the wreck in the least possible time.

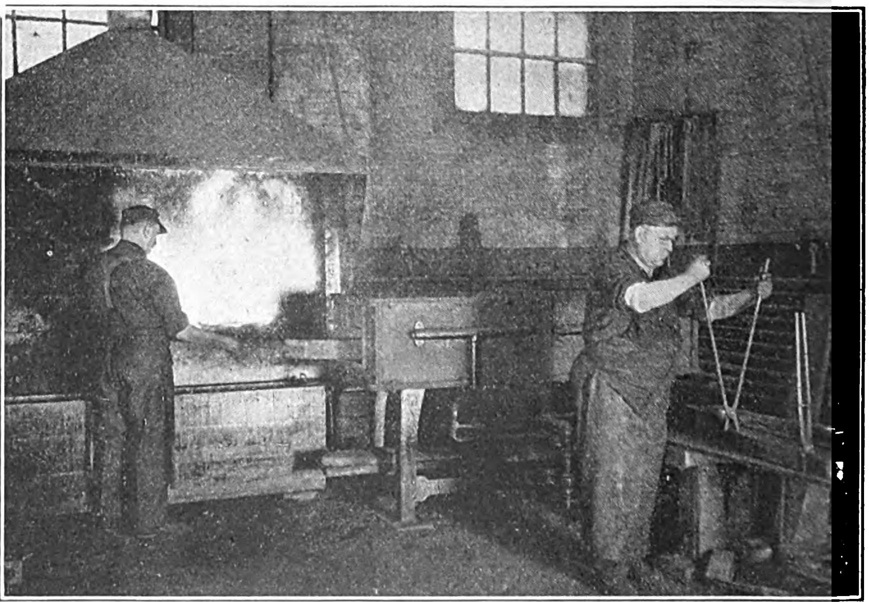
Another convenient use for the torch is the straightening of armature shafts and similar parts which must run true. To straighten a shaft, the complete armature is mounted on lathe centers and rotated slowly, the torch being held stationary and the flame directed to the point where the shaft is bent. Jacks or bars are used for the straightening, which is done as soon as the section is heated to the necessary temperature. Pressure is applied with the jack or bar and the heat from the torch can frequently be continued even while the pressure is being applied. The great convenience and time-saving feature is that the shaft can be tested repeatedly, marked, heated and straightened without removal from the lathe.

Tempering and Resetting Springs

By C. A. Kyle

Wolf Street Shops, New York State Railways, Syracuse, N. Y.

Spring repairs are facilitated and the cost of tempering and resetting springs has been reduced by a spring-tempering furnace of the gas-burning type that recently has been installed in the Wolf Street shops of the New York State Railways, Syracuse, N. Y. The furnace has a cast-iron frame, 6 ft. long by 2 ft. wide by 14 in. high. This is lined with retort brick, capable of withstanding very high temperatures without crumbling. Gas is supplied by a 2-in. pipe which is fitted into



Tempering and resetting of springs at the Wolf Street shops of the New York State Railways, Syracuse two manifold type burners, one on each side of the furnace. The flames from these burners are directed through port holes in the walls of the furnace.

To get the maximum amount of heat from the gas flame, air is mixed with the gas. The mixture is regulated by an inspirator which uses high-pressure air blown through a small opening in a Y fitting, one end of which is open to the atmosphere. This fitting is connected to the gas pipes ahead of the point where they reach the furnaces. It is regulated to furnish the right amount of air to obtain the pressure desired. A safety feature is a check valve in the gas meter that closes and automatically shuts off the flow of gas in case of a backfire in the pipes leading to the furnace.

Two of the principal troubles found with car and bus springs are flattening out due to loss of temper, and breaking of the leaves. Loss of temper is usually the result of improper tempering when the spring is first assembled. Over-tempering makes the steel too hard and causes breaking of the leaves when the car or bus is overloaded.

The practice in the Wolf Street shops when a spring becomes flat is to remove it and take it apart. Each leaf is reshaped individually to conform with specifications. The leaves are then placed in the tempering furnace, which has been heated to proper temperature, and are allowed to remain until they have obtained the proper color, usually a dark red. They are then removed and dipped in a tank of oil.

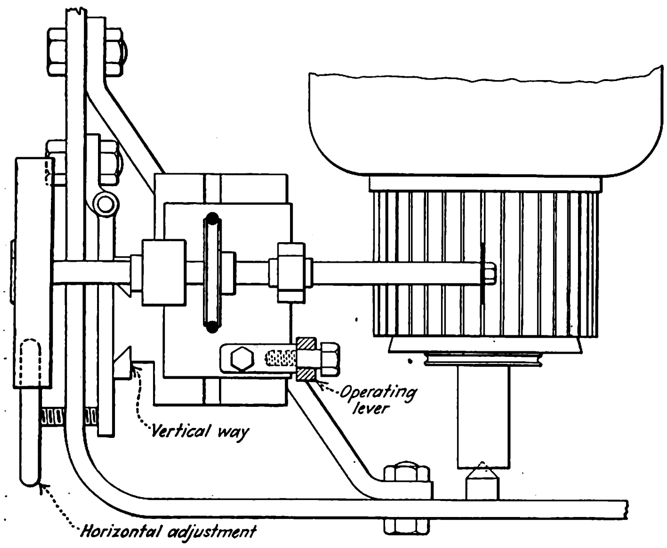
The oil for tempering is kept cool by having it in a double-walled tank, the space between the inner and the outer wall being filled with running water. The water enters at the top and is discharged at the bottom, thus keeping a continuous flow of cool water. The tempering cannot be done successfully if the oil gets warmer than 98 deg. F.

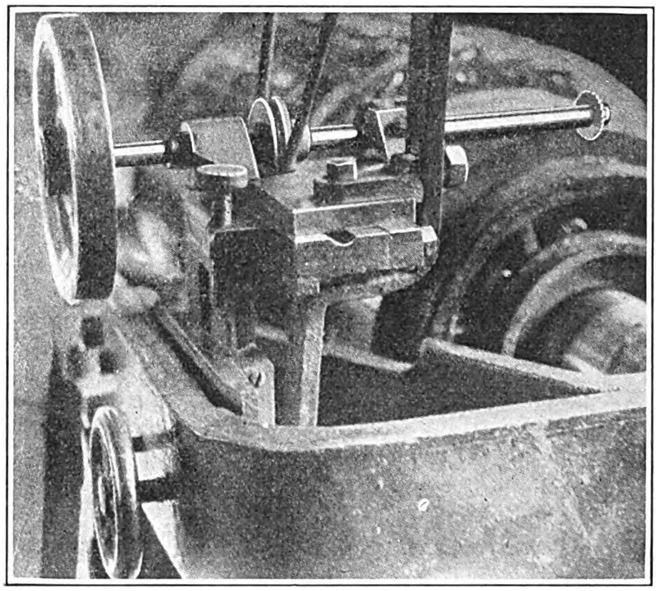
After the leaves have been removed from the tempering tank, they are assembled and retaining bands are shrunk on.

Where the leaves are broken the spring is taken apart and new leaves of the same material and dimensions are made and tempered for installation in place of the broken leaves.

Commutator Slotter with Alignment Adjustment

DESIGN of the commutator slotter built and used in the shops of the Los Angeles Railway combines simplicity with accuracy and ease of operation. In addition to the adjustments for depth of cut and length of stroke, it also permits of alignment of the cut to take care of slight variations in segments.





This commutator slotter provides for convenient adjustment to suit conditions

Plan of commutator slotting apparatus that is mounted inside of the main frame which supports the commutator while the mica is being cut away.

Alignment is controlled by screw which swings entire slotting apparatus in a horizontal plane about the hinged end of the supporting casting. The slotter spindle is driven by a round belt from an overhead shaft. A balance wheel is carried on the outward end of the spindle.

The spindle carrying the milling cutter on one end and a balance wheel on the other is mounted on the main carriage of the machine. This carriage is moved back and forward by a lever, the spindle being driven throughout the travel of the carriage by a ½-in. round belt, which in turn is driven by an overhead pulley with an idler taking up the slack in the belt. The entire carriage may be raised and lowered by a screw. The depth of cut is controlled by a set screw on the top of the carriage. The main frame with its vertical way is carried in a casting that is hinged at one side and is moved in or out by an adjusting screw. It can be locked in any position by a set screw. With this arrangement the entire apparatus inside the supporting frame may be swung in a horizontal plane to obtain alignment of the cutter with the slot of the commutator.

"Ask Dad, He Knows"
the value of systematic and regular inspection.

Old Rattan Seats Stained Green

IMPROVEMENT in the appearance of the car interior has been effected by the Atlantic & Suburban Railway, Pleasantville, N. J., by staining old rattan seats green. The problem of restoring these seats was complicated by previous unsuccessful attempts to improve their looks. Several years ago, when the rattan had become dirty, the seats were treated with mahogany stain. That color proved to be too dark to be satisfactory. Next the seats were painted, but the paint chipped off. Finally as much as possible of the previous treating material was removed. The seats were then given a coat of green Japan thinned with turpentine. This was immediately wiped off with a rag. Then a coat of Wilson's cane glaze was applied. As a result of this treatment the seats have a clean, fresh, green color, harmonizing well with the other interior fittings of the car.

New Equipment Available

Heavy-Duty Chassis

DESIGNED to meet the severe demands of constant starting and stopping and with abundant power and speed, a new heavy-duty chassis for the 21-passenger street car type bus has been announced by the Studebaker Corporation, South Bend, Ind.

The motor has a positive force-feed lubricating system and the chassis is lubricated by a high-pressure system. A specially designed 1½-in. double-jet, two-range carburetor is used. Current is supplied by a 12-volt generator, accessibly mounted at the right forward end of the engine, and by a threaded-rubber-separator storage battery. The distributor is at the left front of the engine and the entire ignition system is protected against moisture.

The starter is operated by a switch on the floor board. A 30-gal. gasoline tank is carried at the rear of the frame and the fuel is fed to the carburetor through a vacuum tank system. A tubular radiator, four-blade 20-in. fan and a circulating pump system cool the motor.

The clutch is of the double-disk, dry-plate type and the transmission, a selective type with four speeds forward and one reverse, is in unit with the clutch and engine. The semi-floating rear axle has extra large chrome molybdenum shafts. The drive gear is of the spiral bevel type.

The use of the Hotchkiss drive principle eliminates torque tubes or radius rods. The torque and drive are taken through the springs and the propeller shaft is a 3-in. diameter steel tube, turning through three universal joints and with the angle of drive a minimum because of the low-hung chassis design. The springs are semi-elliptic, with fourteen leaves in the 36-in. front units and twelve leaves in the 56-in. rear units. Newly designed short shackles reduce side sway.

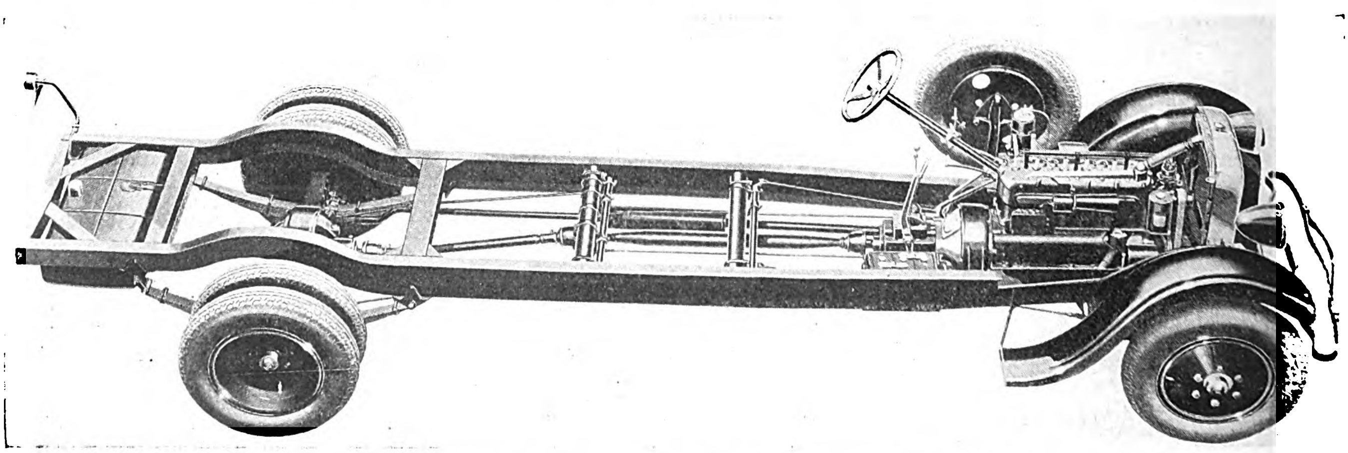
Mechanical internal expanding four-wheel brakes are used. These brakes are 3 in. wide by 17¼ in. diameter and have three expanding shoes which utilize the speed of the vehicle to increase the braking action. Hand emergency brakes operate on the rear wheels. The steering gear is of the cam and lever type, designed for balloon tires. The pressed channel steel frame is narrow at the front to allow a short turning radius, with side members 8 in. deep and 3-in. flanges secured by nine stout cross members, of which two are tubular. The non-skid 34 x 7.50-in. balloon tires and dual rear wheels add safety and comfort. Without changing wheels this chassis may be equipped with 32 x 6-in. high-pressure tires if desired. There is sufficient space between the dual rear wheels to allow chains to be put on or taken off easily.

Two-beam acorn headlights are controlled from a switch on the instrument board. The new chassis is equipped with speedometer, eight-day clock, engine thermometer, ammeter and oil pressure gage grouped under an oval glass on the instrument board, rear traffic signal light, ignition switch on instrument board, automatic windshield cleaner, rear view mirror, front full width bumper, spare tire carrier and four-wheel brakes.

Improved Welding Electrode

WELDING electrodes of a new type which combine the characteristics of a fluxed electrode and the quality of bead finish and the cleanness in handling of a bare welding electrode have been introduced by the merchandise department of the General Electric Company, Bridgeport, Conn. Recommended for the general welding of steel, the electrode has a uniform flowing quality. The absence of sputtering or spattering, characteristic of the usual commercial bare welding wire, is said to be one of the features of the new material. The elimination of the erratic arc condition leads to a deposit of more material with the same consumption of electrode per kilowatt-hour. The electrode penetrates quickly and produces high tensile strength and unusual ductility and elongation.

The electrode, which has been designated GE type F, is furnished in 3/32, 1/8, 5/32, 3/16 and 1/4-in. sizes. The standard package is 50 lb., burlapped. It is also furnished on steel reels of approximately 200 lb., or in coils of approximately 150 or 200 lb.



Many desirable operating features have been incorporated in this chassis

Association News & Discussions

Illinois Utility Men Denounce "Home Rule"

WITH the Illinois Legislature in session and committees considering two so-called "home rule" bills, members of the Illinois Gas Association, Illinois State Electric Association and Illinois Electric Railways Association met in Springfield on March 17 and 18 and in no uncertain terms denounced both bills. That the Illinois utilities associations are not in favor of home rule, but are vigorously opposed to it, could be gained after the first few minutes of the opening session of the two-day convention. Throughout the meetings at both the general and the several sessions of the individual associations, papers read and discussion offered pointed out the fallacy and difficulty of municipal regulation of such extensive utilities as exist in the state.

Of as great importance to the electric railway men in attendance were the papers and discussions on subjects which, according to W. H. Sawyer, president of the American Electric Railway Association, mark a new era in transportation. Today, according to Mr. Sawyer, in discussing one of the papers presented at the first session of the railway meeting, railway men are studying traffic control, one-man car operation, bus operation and modernized cars. Railway executives who even five years ago prided themselves on their knowledge of operating problems today have many new lessons to learn. More opportunities present themselves for advancement in the industry than ever before, he said.

NEW CAR TRUCK EXHIBITED

This point of view was forcefully illustrated by a new type of electric railway car truck of the Chicago & Joliet Electric Railway, shown for the first time so that both railway men and manufacturers could see the advancement made in truck construction on the initiative of J. R. Blackhall, vice-president and general manager of the company.

Abandoning the conservatism which usually characterizes a railway executive at conventions, Mr. Blackhall explained why it was necessary for him, as an operating man, to design and have built a piece of railway equipment in order to improve operating efficiency and reduce the weight per seated passenger of the completed car. He enumerated some of the obstacles which he had to overcome in pioneering a truck, not the least of which was the general indifference toward fundamental improvements in rolling stock. With the co-operation of the Timken-Detroit Axle Company, the Westinghouse Electric & Manufacturing Company and the Westinghouse Air Brake Company, together with automotive parts manufacturers, Mr. Blackhall was able to design his truck so as to make a large weight reduction from conventional construction. Reduction of noise by full inclosure of gearing, spring suspension of motors and easy riding qualities were other objectives sought.

HOME RULE SCORED

On the subject of home rule, which according to the bills now before the Illinois State Legislature means the regulation of utilities by municipalities rather than by a state regulatory body, S. I. McElhoes, attorney of Oklahoma City, Okla., gave an interesting statement of how the indeterminate or revocable franchise works in his state. That this type of franchise is equitable and just is shown by the relationship between the people of Oklahoma and the telegraph and telephone companies, which in that state have had continuous franchises for 35-year periods. Only in the last two years has the State of Oklahoma had the revocable franchise adapted to other utilities. At a recent referendum vote sponsored by the "anti" forces the people again indorsed the indeterminate franchise, and as a result all utilities are regulated by the corporation commission and not by the individual municipalities which they serve.

In addition to his active participation in the discussions of the railway section papers, W. H. Sawyer delivered a paper at the opening joint session of the convention. In this paper Mr. Sawyer presented an outline of the utility situation in Australia, where last summer he made a detailed study of utilities operations in the Antipodes.

COMING MEETINGS
OF
Electric Railway and Allied Associations

April 1—**American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.**

April 26-29—**Southwestern Public Service Association, convention, New Orleans, La.**

May 31—June 1-2—**Canadian Electric Railway Association, annual convention, Winnipeg, Man.**

June 6-8—**American Association of Engineers, annual convention, Tulsa, Okla.**

June 24-25—**New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Oct. 3-7—**American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.**

THREE IMPORTANT SUBJECTS DISCUSSED AT FIRST RAILWAY SESSION

E. J. McIlraith, staff engineer Chicago Surface Lines, opened the first afternoon session of the Electric Railways Association with an interesting technical discussion of traffic regulation for cities of all sizes. In the opinion of Mr. McIlraith, the problem needs practically the same treatment in all communities. As an example of the task which confronted the Chicago Surface Lines in establishing traffic regulations, Mr. McIlraith cited some figures on the pedestrians and vehicles making use of the downtown streets during a business day. More than 66,000 people pass between curb lines at State and Madison Streets in one hour. More than 800,000 vehicles, of which 90,000 are automobiles, come into the Loop district in twelve hours. It was Mr. McIlraith's suggestion that the railway management take up the burden of regulating street traffic.

Other factors in traffic regulation as brought out by Mr. McIlraith's paper, which will appear in a later issue, were discussed, tying them in specifically with conditions in Chicago and on the Chicago Surface Lines. According to Mr. McIlraith the traffic signals should be installed when there is a volume of 16,000 vehicles in the sixteen-hour period and only when traffic conditions warrant such installations for safety and speed.

In discussing Mr. McIlraith's paper, G. W. Welsh, vice-president, East St. Louis & Suburban Railway and president-elect of the Illinois Electric Railways Association, stated that the $50,000-per-mile cost of constructing track includes day work under heavy traffic conditions. In view of the plea of Mr. McIlraith for more extensive night work, Mr. Welsh was of the opinion that a considerable part of the cost of track construction could be saved by night work.

Specific details relative to motor bus maintenance on the East St. Louis & Suburban Railway were given in a paper read by H. P. MacDonald, superintendent of automotive equipment of that property. Mr. MacDonald's paper, in which the importance of good housekeeping was stressed, was published in the March 19 issue.

Discussing Mr. MacDonald's paper, Fred Klock, in charge of the maintenance of motor coach equipment for the Chicago, North Shore & Milwaukee Railroad, stated that garage design and operation necessarily must be modified to meet individual requirements. He suggested, however, that 150 ft. be the minimum width of the garage. Pits should be flush with the floor, with no curbing, thus providing for additional storage space with the pits not in use. An attempt has been made by his department to standardize small part fittings and units. He felt, however, that there was hardly a chance of standardizing the entire coach due to the rapid development in design and construction.

At the Springfield Engineers' Club dinner, Thursday evening, the new chairman of the Illinois Commerce Commission, David H. Jackson, spoke about the extensive work of that commission in giving fair regulation to 700 utilities, exclusive of bus lines and steam railroads, with a valuation of $1,600,000,000. He contended that in the past railways have relied too much on legal help to obtain raises in rates, which could be obtained with less effort if the utility would improve its service, spending the money in betterments.

MUNICIPAL OWNERSHIP AIRED AT FRIDAY JOINT SESSION

Following the report of the Illinois Committee on Public Utility Information, read by J. F. Gilchrist, chairman, Prof. H. B. Dorau, research assistant Institute for Research in Land Economics and Public Utilities, Northwestern University, explained by charts and data the transition which is taking place with respect to municipal ownership of power companies. Changing conditions have been responsible for the installation of municipally owned plants and their subsequent acquisition by privately owned power systems.

Dr. H. M. Gray of the University of Illinois explained in detail the courses given there in public utility work. While the university can teach the fundamentals, it is necessary that the students, both undergraduate and graduate, be given practical experience in the public utility plants.

Methods developed and used in the shops of the Illinois Traction System at Decatur were explained by J. D. Barnhart, superintendent, in a paper dealing with "Interurban Maintenance and Shop Practices." Mr. Barnhart dwelt upon four shop practices, namely, moving trucks from under cars, removing compressors, babbitting armature bearings and painting the equipment. An abstract of Mr. Barnhart's paper will appear in a later issue.

MECHANICAL MEN MUST KEEP UP TO DATE

Henry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad, discussed Mr. Barnhart's paper with a description of shop practices on the North Shore Line as compared with those employed in the shops of the Illinois Traction System. He felt that the present-day mechanical force must look to its laurels if it is to keep abreast of modern car design and construction. He referred to the truck exhibited by Mr. Blackhall as an example of what to expect in the future.

What modernization in car equipment will do to an electric railway property was given in a paper read by M. J. Oswald, sales representative St. Louis Car Company. Mr. Oswald took the facts and figures already presented in ELECTRIC RAILWAY JOURNAL'S new car story and supplemented these with suggestions of improvements on newer cars.

Following Mr. Oswald's paper, Mr. Blackhall gave figures on the result of new car operation by the Chicago & Joliet Electric Railway. For the six months period prior to installation of ten new cars costing $170,000 on the interurban lines of the system, the revenue on the city lines increased 1 per cent and on the interurban lines 0.65 per cent. For the six-month period following installation of the new cars, the revenue on the city lines decreased 0.47 per cent, while the revenue on the interurban lines increased 6 per cent, or $9,656. At this rate the new cars show an increased earning capacity of $20,000 per year. During this six months, however, the cars showed a saving in operating expenses of $17,000. If this continues for the next six months, the saving will amount to $34,000 for the year. Thus, with an investment of $170,000 the company has an indicated return of $54,000 per year, or almost 33 per cent on the investment.

How track is maintained on the largest electric railway property in the world was detailed in a paper read by Jonathan Wolff, assistant supervisor of track and roadway Chicago Surface Lines. Four points were brought out by Mr. Wolff as important in trackwork. These were: (1) Improved organization, (2) use of power tools, (3) electric welding, (4) safety precautions. Mr. Wolff's paper will be abstracted in a later issue.

Officers elected for the Illinois Electric Railways Association for the coming year are:

President, G. W. Welsh, vice-president East St. Louis & Suburban Railway.

First vice-president, Ray Palmblade, Illinois Power & Light Corporation.

Second vice-president, C. H. Jones, Chicago, South Shore & South Bend Railway.

Executive committee, the officers and B. I. Budd, Chicago; W. H. Sawyer, East St. Louis, and H. M. Lytle, Chicago.

One Man Better than Two*

By R. F. PALMBLADE
Manager Peoria Division Illinois Power & Light Company

ONE-MAN operation of city street cars is nothing new; in fact, as most transportation people well know, one-man operation of city horse cars was universal in early city transportation. However, development of the automatic pneumatic devices on street cars was, to my mind, the first attempt along sound engineering lines toward designing equipment with the working parts so co-ordinated and simplified that one-man operation of the unit as a whole was comparatively easy. After the car had been developed the first thought in the mind of the public was that the plan was simply one of eliminating the wages of one man on each car. This, in turn, suggested slower operation and less safe operation, for the reason that it seemed a natural deduction that two men could handle a car with more speed and in a safer manner than could one man. Some of you will, perhaps, recall that this view was shared, in part at least, by some of the executives in the industry. Of course most of us, as transportation men, knew that the theory of one-man operation was sound.

Let it be said, for the good judgment and loyalty of the car operators as a whole, when the new system was adopted they, as a rule, were not insensible of the advantages of this idea to the public, the companies and, directly and indirectly, to themselves, and, in general, they co-operated in a wholehearted way. Most of the foregoing applies to companies in cities of moderate size, which, of necessity, were usually the first to establish one-man operation. The idea is still growing, however, because, after all, facts are facts and cannot be controverted. There still are, perhaps, areas so congested from a traffic standpoint that two-man operation is still necessary. In areas of moderate traffic density an approximation of two-man operation in those particular sections can be worked out, still retaining the one-man principle.

REDUCES ACCIDENTS

There are some advantages to the public in this scheme, most of which were elaborated upon when the cars were inaugurated. Notwithstanding the increase in the average fare compared to a few years ago, on most properties it would undoubtedly be higher if it were not for the one-man car. The positive decrease in accidents per unit of miles operated and the fact that boarding and alighting accidents are almost a negligible quantity on one-man operated properties that employ the latest automatic pneumatic devices on their cars is a positive advantage to the public and one not to be lightly considered. On the Peoria Division of the Illinois Power & Light Corporation they do not average over one or two accidents of this type per year on the property. The accidents mentioned are of an insignificant nature, comparatively speaking, such as a heel catching in a folding step, which is not the fault of the equipment nor the car operator.

In this day of automatic traffic signals in our city streets the rider on a modern one-man car has a decided advantage in time saved, as the car operator can immediately proceed with the green light without waiting for the customary bell signal, which is usually necessary on a two-man unit. The pneumatic safety devices on the car, in conjunction with the automatic platform signal, permit the one-man car operator to take advantage of seconds, which in the aggregate through a day's run total many minutes. This is an undoubted advantage to the passenger, as he feels the operator has a chance to be alert and avoid the little trifling delays that irritate the public. Perhaps, in addition to the time saved, there may be that a little psychology enters into the passenger's demand to be on the move. Notice the auto driver who fails to start instantly on the green traffic light and listen to the chorus of sirens and horns. In the old days traffic flow was measured in minutes, but it is now measured in seconds—consequently, every second gained by one-man equipment eventually redounds to the benefit of the public.

---

*Abstract of a paper read before the Illinois Electric Railways Association, Springfield, Ill., March 17, 1927.

IMPROVED DEVICES SAVE TIME

In order to call attention to one of the advantages of one-man operation, it is perhaps permissible to dwell a moment on one of the arguments against the plan. For instance, it has been said that, in areas of heavy traffic density, one man on a street car cannot handle the business as rapidly as can two men. This is true if the unit is obsolete and old-fashioned schemes of handling fares and transfers are used. It has been demonstrated that if the one-man car has pneumatically operated twin front doors, so as to handle simultaneously outgoing and incoming files of passengers, and, in addition, has a rear door pneumatically operated where passengers can board with the assistance of a street fare collector, less time will be taken in loading the car than under the two-man system.

Ordinarily, with two-man operation, passengers board at one end of the car and pay their fare to one of the operators. With a street collector both he and the operator collect fares from separate files of passengers without interference from the outgoing file. It is needless to point out that the street fare taker is usually necessary only during the peak-load periods. This is a distinct advantage to the public because it facilitates loading beyond ordinary two-man operation and, again, time is saved to the passenger, to say nothing of largely eliminating crowding in boarding. Also, the advantage of prompt handling is available to the public when it really wants it, i.e., during the peak-load periods.

One-man operation has stimulated the development of the modern transfer, which has a higher degree of visibility through more simple arrangement, together with the elimination of cumbersome complex markings and punchings. The modern transfers require no punching by the operator while he is actually operating his car and may be torn off the pad as rapidly as giving out rain checks at a ball park. It seems to me that without the stimulus of relieving the one-man car operator of tedious duties the transfer would not be so far advanced in design. This is a direct advantage to the public, and further, it puts the one-man car on a parity with the two-man car in so far as speed in issuing transfers is concerned.

Speed in collection and registration of fares has been spurred by the widespread use of one-man cars in city service. Where registration is still followed automatic, speedy equipment has made it easier for the passengers to file into the cars without confusion and delay in loading. This all tends to a better relationship between the public and the company.

The passenger-actuated and pneumatically operated treadle exit on the rear of modern one-man cars permits the passenger to leave by the rear without waiting until a conductor has determined whether the car has stopped before opening the rear door. With this new device, immediately upon the car coming to a stop the rear door exit is at once available and there is no waiting for the conductor to close the rear exit and give the motorman the starting signal. This selectivity at the personal convenience of the passenger has a tendency to please, which is most assuredly an advantage to the public.

In cities where one-man operation has been given a fair test with modern equipment it has been proved to the entire satisfaction, not only of the operating companies but of the public as well, that one-man cars produce a more economical, a safer and a more satisfactory transportation service. The time may come when a man on the rear end of a street car will be unnecessary except perhaps in extreme cases. Even these extreme conditions have a way of solving themselves, due to advancement in the design of equipment and accessories.

The average American of today has developed what might be termed an "automobile sense." He likes decision, alertness and speed, to say nothing of safety, in his city transportation. The automobile driver will brook no interference in the handling of his car, particularly from the back seat. It is not the duties a driver performs in running an automobile that distract his mind, because these duties become mechanical, but rather the interference from other occupants of the car. So the average individual is content to permit one man to handle a public vehicle, knowing that it is an advantage to him as a passenger to have one man absolutely responsible. He knows that there will be no confusion resulting from a multiplicity of bell signals to the motorman, and that there will be no back-seat driving. The psychology is apparent.

ADVANTAGES OF ONE-MAN OPERATION

Our experience has shown that with the one-man operation it is possible to furnish more frequent service by the use of a larger number of smaller transportation units; a faster service by the use of a lighter car, capable of quicker acceleration; a more comfortable ride, by reason of the supplying of modern type of carrier; a safer ride, because of the automatic air brakes and the various pneumatically operated devices that have been outlined, including door-closing and step-raising equipment.

From the standpoint of the company, the use of the one-man car has decreased the cost of operation, since it uses less current and because of lighter weight does not require the high maintenance cost for track and roadway. While the saving in wages paid to car operators is negligible, because of the larger number of units operated, and a higher basic wage paid to the operators, still there has been some economy effected from the wage standpoint.

Were it not for the one-man type of operation the public would be paying much more today for a street car ride and many transportation systems would long since have passed out of existence.

Decision on Inspection and Testing of Electric Locomotives

PURSUANT to a petition of the American Electric Railway Association a hearing was held before the Interstate Commerce Commission Nov. 1, 1926, in regard to the rules and instructions for the inspection and testing of locomotives propelled by power other than steam. A decision has just been rendered. The primary question involved was whether or not the railway companies included in the membership of the association are subject to an order of Dec. 14, 1925, in so far as it relates to electric locomotives used or permitted to be used on lines operated by members of the American Electric Railway Association.

Questionnaires were sent to the respective carriers calling for data showing the general character of their lines, the equipment used thereon and the nature of the traffic handled. The association contended that the locomotive inspection law as enacted does not apply to electric locomotives or electric apparatus and, second, that the law as enacted does not apply to any electric railway unless such railway is being operated as an integral part of a general steam railroad system.

The Interstate Commerce Commission decided that this ruling applied to 116 carriers. To decide which were street, suburban or interurban electric railways, the carriers were considered individually. Returns to the questionnaires indicated that only one of the carriers is operated as a part of any other railroad. After careful consideration of the matter, it was decided that the carriers listed below, as at present operated, are street, suburban or interurban electric railways, not operated as a part of a general railroad system of transportation, and that they do not fall within the scope of the locomotive inspection act as enacted:

Berkshire Street Railway.
Hudson Valley Railway.
Hull Electric Company.
Kansas City, Clay County & St. Joseph Railway.
Key System Transit Company.
Massachusetts Northeastern Street Railway.
Milwaukee Electric Railway & Light Company.
Muskogee Electric Railway.
Omaha, Lincoln & Beatrice Railway.
Quebec Railway, Light & Power Company.
San Francisco, Napa & Calistoga Railway.
Southern Indiana Gas & Electric Company.
Tennessee Electric Power Company.
United Electric Railways Company.
Wiles-Barre & Hazleton Railway.

Wisconsin Power & Light Company.
York Utilities Company.
Kansas City Public Service Company.
Springfield Street Railway.
Worcester Consolidated Street Railway.

The record shows that no locomotives are used on the lines of the following carriers and therefore it is not necessary, at this time, to determine whether these carriers are subject to this act:

Alabama Power Company.
Androscoggin & Kennebec Railway.
Auburn & Syracuse Electric Railroad.
Augusta-Aiken Railway & Electric Corporation.
Aurora, Elgin & Fox River Electric Company.
Bangor Hydro-Electric Company.
Beaver Valley Railroad.
Benton Harbor-St. Joe Railway & Light Company.
Capital Traction Company.
Chicago, South Bend & Northern Indiana Railway.
Cleveland Southwestern Railway & Light Company.
Cortland County Traction Company.
Cumberland County Power & Light Company.
Dayton & Western Traction Company.
Denver & Interurban Railroad.
Elgin & Belvidere Electric Company.
Fresno Traction Company.
Indiana, Columbus & Eastern Traction Company.
Indiana Service Corporation.
Indianapolis & Cincinnati Traction Company.
Lehigh Valley Transit Company.
Marion and Bluffton Traction Company.
Michigan Electric Railway.
New Castle & Lowell Railway.
New York & Stamford Railway.
Northern Ohio Power & Light Company.
Ohio Public Service Company.
Ohio Valley Electric Railway.
Olean, Bradford & Salamanca Railway.
Peninsular Railway.
Northwestern Electric Service Company of Pennsylvania.
Rochester, Lockport & Buffalo Railroad.
Sioux City Service Company.
Southern Ohio Public Service Company.
Springfield & Xenia Railway.
Steubenville, East Liverpool & Beaver Valley Traction Company.
Toledo, Fostoria & Findlay Railway.
Toledo, Ottawa Beach & Northern Railway.
Union Traction Company of Indiana.
Washington, Baltimore & Annapolis Electric Railroad.
Washington-Virginia Railway.
Western Ohio Railway.
Winona Service Company.
Lima-Toledo Railroad.
Central California Traction Company.
Milwaukee Northern Railway.

The carriers listed below failed to file returns to the questionnaire, and no evidence was offered at the hearing with respect to the character of such lines, the equipment used thereon or the nature of the traffic handled by them. In the absence of evidence in these respects the Interstate Commerce Commission expressed no opinion as to whether these carriers are subject to the act and the rules and instructions established thereunder. To such carriers the relief granted herein does not apply.

Atlantic City & Shore Railroad.
British Columbia Electric Railway.
Cincinnati & Dayton Traction Company.
Cincinnati, Lawrenceburg & Aurora Electric Street Railroad.
Dayton & Troy Electric Railway.
Dayton, Springfield & Xenia Southern Railway.
Empire State Railroad.
Holyoke Street Railway.
Lake Shore Electric Railway.
New York State Railways (Rochester Lines).
Rochester & Syracuse Railroad.
Rockford & Interurban Railway.
Scioto Valley Railway & Power Company.
Trenton-Princeton Traction Company.
West Chester Street Railroad.
Youngstown & Suburban Railway.

The Interstate Commerce Commission found that the carriers listed below cannot properly be classed as street, suburban or interurban electric railways and are therefore subject to the locomotive inspection act, as amended:

Arkansas Valley Interurban Railway.
Bamberger Electric Railroad.
Chicago, Aurora & Elgin Railroad.
Chicago, North Shore & Milwaukee Railroad.
Des Moines & Central Iowa Railroad.
Detroit United Railway.
Fonda, Johnstown & Gloversville Railroad.
Illinois Traction, Inc.
St. Louis Electric Terminal Railway.
Interstate Public Service Company.
Lackawanna & Wyoming Valley Railroad.
Northeast Oklahoma Railroad.
Pacific Electric Railway.
Portland Electric Power.
San Francisco-Sacramento Railroad.
Southern New York Railway.
Terre Haute, Indianapolis & Eastern Traction Company.
Tide Water Power Company.
Waterloo, Cedar Falls & Northern Railway.
Sacramento Northern Railway.
Salt Lake & Utah Railroad.
Cedar Rapids & Iowa City Railway.
Utah Idaho Central Railroad.
Chicago, South Shore & South Bend Railroad.
Pacific Northwest Traction Company.
Yakima Valley Transportation Company.
Visalia Electric Railroad.
Petaluma & Santa Rosa Railroad.
East St. Louis & Suburban Railway.
Evansville & Ohio Valley Railway.
Grand Rapids, Grand Haven & Muskegon Railway.
Mason City & Clear Lake Railroad.
Pittsburg County Railway.
Toledo, Bowling Green & Southern Traction Company.
Washington & Old Dominion Railway.

At the hearing testimony was offered on behalf of the carriers attempting to show that some of the rules and exceptions included in the order of Dec. 14, 1925, should be changed in order to make them applicable to locomotives used on their lines. The commission decided that Rules 223, 225, 226, 227, 238 (d), 239 (b) and 253 should be given further consideration before they are made effective on locomotives used by such of these lines as are subject to the act, but that the remaining rules should be made effective promptly.

The order of the commission was that on and after the first day of June, 1927, except as otherwise specified, the rules and instructions for the inspection and testing of locomotives propelled by power other than steam, together with such tables, drawings and forms approved by said order of Dec. 14, 1925, shall be effective and shall be observed by each and every common carrier subject to the act aforesaid as minimum requirements except with respect to locomotives used on the lines particularly named below, the specified dates included in the rules 213 (b), 214 (a), 231 (f), 317 (a) 328 (a), 329 (a) and 337 shall be extended for a period of eighteen calendar months and until further order the requirements of rules 223, 225, 226, 227, 238 (d), 239 (b) and 253 shall not be effective.

The carriers referred to above are:

Arkansas Valley Interurban Railway.
Bamberger Electric Railroad.
Chicago, Aurora & Elgin Railroad.
Chicago, North Shore & Milwaukee Railroad.
Des Moines & Central Iowa Railroad.
Detroit United Railway.
Fonda, Johnstown & Gloversville Railroad.
Illinois Traction, Inc.
Evansville & Ohio Valley Railway.
Grand Rapids, Grand Haven & Muskegon Railway.
Mason City & Clear Lake Railroad.
Pittsburg County Railway.
Toledo, Bowling Green & Southern Traction Company.
Washington & Old Dominion Railway.
St. Louis Electric Terminal Railway.
Interstate Public Service Company.
Lackawanna & Wyoming Valley Railroad.
Northeast Oklahoma Railroad.
Pacific Electric Railway.
Portland Electric Power Company.
San Francisco-Sacramento Railroad
Southern New York Railway.
Terre Haute, Indianapolis & Eastern Traction Company.
Tide Water Power Company.
Waterloo, Cedar Falls & Northern Railway.
Sacramento Northern Railway.
Salt Lake & Utah Railroad.
Cedar Rapids & Iowa City Railway.
Utah-Idaho Central Railroad.
Chicago, South Shore & South Bend Railroad.
Pacific Northwest Traction Company.
Yakima Valley Transportation Company.
Visalia Electric Railroad.
Petaluma & Santa Rosa Railroad.
East St. Louis & Suburban Railway.

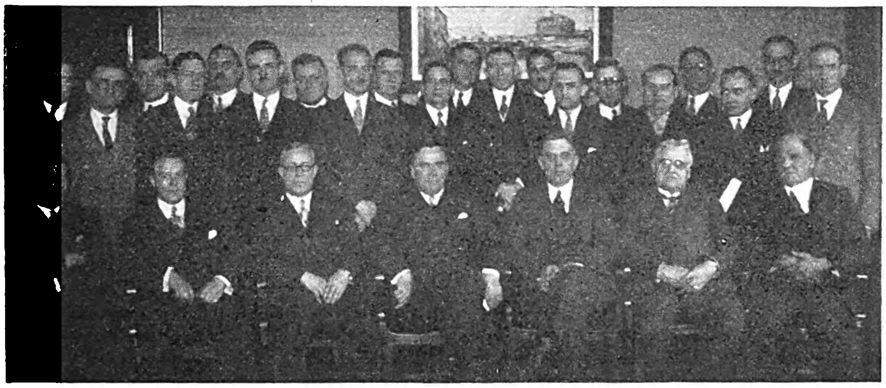
American Association News

Exhibit

PLANS for the annual exhibit at the 1927 convention were made and adopted at a meeting of the exhibit committee of the American Association held in the office of Col. J. H. Alexander, Cleveland, Ohio, on March 18. Those present were J. H. Alexander, chairman; C. E. Morgan, vice-chairman; T. O. Kennedy, vice-chairman entertainment committee; J. W. Welsh, executive secretary; F. C. J. Dell, director of exhibits; F. W. Campbell, secretary Cleveland convention committee; F. B. Bullock, assistant secretary Cleveland convention committee; J. W. Kellison, L. D. Bale, John Bender representing Herman Bender, C. P. Billings, R. M. Campbell, C. H. Clark, S. G. Down, Charles Gordon, R. N. Graham, H. F. Flowers, R. A. Hauer, C. S. Hawley, B. A. Hegeman, Jr., A. P. Jenks, J. E. Lytle representing H. J. Kenfield, A. F. Paul representing T. W. Casey, L. C. Paul representing J. C. McQuiston, A. L. Price, A. M. Robinson, S. P. Seward, L. W. Shugg and R. L. Twitchell. Mr. Dell was elected secretary of the meeting.

Mr. Dell presented a report outlining the work which has been done already. A contract has been drafted under which the exhibition is to function. In general this follows that of last year. The local contractors have been reappointed and the rates for service are in line with those quoted last year. Resolutions of the executive committee passed at its meeting on Feb. 4 were referred to, relative to outside bus demonstrations and other exhibits away from the convention, the setting aside of a special day for exhibits and arrangements for inspection trips. Mr. Dell's report was accepted and ordered spread upon the record.

Minutes of a special sub-committee to lay out a floor plan for the exhibit met at Cleveland on March 17. On account of building operations it was recommended to erect a temporary structure on East Sixth Street to be used as the exclusive entrance, with exits at the St. Clair end of East Third Street and at the St. Clair end of the auditorium



Representatives present at the meeting of the exhibit committee held in Cleveland, Ohio, March 18

on East Sixth Street. Several changes from last year's layout of meeting rooms and exhibit facilities were made. It was recommended to retain the Arena layout of last year. A plan for Exhibition Hall, the floor below the arena, was presented by the sub-committee and adopted. It was decided to provide rooms on this floor for meetings of the Accountants', Claims, Engineering and Purchasing Agents and Storekeepers. The balance of the space on this floor is to be used for exhibits. It was felt by the committee that this arrangement would be more satisfactory to exhibitors than that of last year.

The 1926 track layout was approved. Since a large car exhibit is expected, additional track space will be provided, if necessary, by closer spacing of the cars. The committee was in favor of stimulating by every means possible the exhibition of truck and car improvements by both manufacturers and operators. The chairman outlined a plan for squaring off the West Wing in the event that the Cleveland and Industrial Exposition's sale of space warrants. After discussion it was recommended that the meeting room space of last year be divided into exhibition space and that the American and T. & T. meetings be held in a new building to be erected on the north plaza, just north of the esplanade. If this building is not erected, it was voted that the meeting rooms of these two associations be retained in the same location as last year. In the event that the West Wing is extended, the committee voted authority to the director of exhibits to subdivide and sell the space to exhibitors. It was decided that Wednesday, Oct. 5, be designated as Exhibit Inspection Day.

Mr. Welsh outlined the budget for this year as compared with 1926 and explained that while the rental for the buildings will be reduced other expenses will increase. These include a greater expenditure for entertainment, general printing, including registration books not published last year, and contingencies. Having in mind that there was a deficit last year it appeared desirable to charge the same rates for space. It was voted to recommend to the executive committee rates of 75 cents per square foot for inside space, the same as last year; 45 cents per square foot for outside space and $3 per lineal foot for track space.

After considerable discussion a motion was passed unanimously recommending to the executive committee that the exhibits be opened at noon on Saturday, Oct. 1, instead of on the following Monday morning, when the convention itself is opened. Members of the committee representing various important exhibitors were in accord with this proposal, since it permits delegates arriving early to have additional time for inspection of the exhibits and tends to encourage early arrival by delegates and full attendance at the convention meetings.

It was voted that diagrams be prepared and contracts be submitted by Mr. Dell to prospective exhibitors on May 16, with the understanding that they have until June 15 to return formal space applications. It was further voted that a meeting of the committee for the purpose of assigning space be held in Cleveland at 10 a.m. on June 22.

W. & S. Special Committee No. 9

WAY and structures special committee No. 9 met in association headquarters in New York on March 2 and 3, with the following present: J. R. McKay, chairman; Adrian Hughes, Jr., L. F. Parlette, A. J. Blackburn, W. W. Wise, G. H. Haldeman and G. C. Hecker, association representatives.

Practically the entire meeting was devoted to a complete review and discussion of the effect of garage design on insurance rates. The tentative draft of the regulation for bus garages which has been prepared by the general garage committee of the National Fire Protection Association was carefully examined and discussed. Mr. Hecker, who is the association's representative on the N.F.P.A. conference committee on motor bus garages and hazards, explained the regulations and answered a number of questions concerning them.

It was decided that in addition to the assignment of garage design and its effect on insurance rates, the committee would consider only the three additional subjects of (a) door design, (b) bus washing facilities, (c) ideal layouts for various street frontage conditions. Sub-committees were appointed to obtain the necessary data for the investigation.

A tentative plan for a meeting in Pittsburgh in the latter part of April was proposed.

Service Betterment

REPORTS of sub-committees occupied the meeting of the committee on service betterment of the Transportation & Traffic Association held at association headquarters in New York on March 1. The following were present: S. E. Emmons, chairman; C. D. Smith, vice-chairman; A. C. Spurr, W. L. Barclay, Jr., representing E. A. Palmer, J. R. Ong representing J. B. Stewart, Jr., C. A. Burleson representing J. C. Thirlwall and W. B. Wheeler representing W. E. Thompson.

The meeting began with a report on "Convenience and Attractiveness of Service," by C. D. Smith, chairman of the sub-committee on this subject. Eight main topics were given consideration as essential. In the discussion which followed a number of additional topics were suggested for inclusion in an appendix to the report.

In the absence of J. A. Dewhurst, Mr. Smith also presented the report of the sub-committee on car design. In the discussion which followed quite a number of elements in car design were advanced as being very desirable in modern car design. The suggestions made covered in detail the following:

1. Adherence to A.E.R.A. standard double-truck car design.
2. Adequate ventilation should be more carefully studied.
3. Noise reduction should be carefully studied, taking into consideration noises caused by gears, air compressors, brake rigging, etc.
4. Cars should be designed so that they may easily be kept clean.
5. Careful attention should be given to interior and exterior finishes.
6. Giving cars names instead of numbers, as the possibility of stimulating local interest and friendly comment on small properties.
7. Push buttons should be in convenient reach of every seat.
8. Cars should be comfortably heated.
9. Cars should contain a maximum number of cross seats, spaced far enough for comfort.
10. The question of de luxe seats should be considered.
11. Cars should be illuminated so as to give the most restful and efficient lighting to passengers.
12. The design of hand straps, hand stanchions, bell cords, register cords, etc., should be carried out to give the least offense to passengers.
13. Ample floor space should be provided for passengers during fare payment.
14. Aisles should be of liberal width.
15. Circulating movement of passengers should be provided whenever possible.
16. Side windows should be provided with shades.
17. Floor levels should be kept down to a minimum.
18. Double-truck cars are preferable to single-truck cars in selling service, even on the small properties.

The final report of the session on "Speeding Up Service" discussed eleven points which should be given consideration whenever the question of speed is taken up. Later discussion by the committee emphasized the difference between the viewpoints of the operator and the public on the problem of speed.

The News of the Industry

$300,000,000 Subway Measure Passed by New York Legislature

Following favorable action by the New York Assembly, the Senate on March 23 passed by unanimous vote the resolution for the constitutional amendment to extend New York City's borrowing capacity by $300,000,000 for subway construction.

With the passage of the $300,000,000 amendment came word that Mayor Walker was planning a speaking tour to make sure that people throughout the state should become acquainted with the merits of the proposal before the referendum next fall. He is to open his campaign at Niagara Falls, where he will address the Summer Conference of Mayors on May 31. Several other dates for speaking engagements upstate will be arranged.

Mayor Schwab of Buffalo and Mayor Hanna of Syracuse, both of which cities have stakes in the amendment on account of provisions for increasing their debt limits, will join Mayor Walker on the stump. Since they are Republicans it will be a non-partisan effort to get voters outside of the cities to ratify the measure.

McChord Report on Philadelphia Presented

Charles C. McChord's report on the transit situation of the city of Philadelphia was submitted to the Public Service Commission of Pennsylvania on March 23. He suggests acquisition by condemnation of the underliers of the Philadelphia Rapid Transit Company as a step toward the city's becoming landlord of the existing system. He further suggests "condemnation of the P.R.T." While he apparently regards these steps as essential, he says that the rest of the plan should be carried forward immediately so as to achieve at once the following results:

1. Immediate operation of Broad Street subway without increase in fare.
2. Limitation of P.R.T. earnings to present dividends with payment of all surplus to the city.
3. Provision for increased sinking fund, sufficient by 1957 to purchase the P.R.T.
4. Local initial control by the city of all questions of service, fares and finance.

He would set up as a machinery to accomplish these results a local body with some such name as the Philadelphia Transit Conference Board, to consist of three members, one to be appointed by the city, one by the Public Service Commission and one by the company.

He says that it may be the wisest plan to acquire the underliers by condemnation with borrowed money and to acquire the P.R.T. in 1957 under the 1907 contract option "with the accumulated surplus." He feels that this latter step should be coupled with a definite limitation of dividends and complete control by the city of all the railway company's surplus earnings.

Through the direct expedient of underlier condemnations Mr. McChord sees an annual saving of $4,500,000 in the charges against gross revenue. According to him, this saving would be sufficient to permit a substantial reduction in present fares and very possibly an early return to the 5-cent fare "if this is desired."

Mr. McChord and his staff have been engaged in the survey for the last three months. During this same period the engineering bureau of the commission has been at work on a survey of service conditions of the Philadelphia Rapid Transit Company. A report based on these findings is expected to be filed within the next few weeks.

As the Philadelphia *Ledger* sees it, "the report justifies the hope that it will be made the basis for permanent adjustment of the relations between the city and the P.R.T., for it points the way not only to the lifting of the millstone of the rentals from the necks of the car riders but to a fair division of the cost of the city's high-speed transit facilities between the riders and the taxpayers."

Kansas City Franchise Passed

New 30-Year Grant in Favor of Kansas City Public Service Company Signed by Mayor—Reduction of Fares Effective Upon Franchise Acceptance

By a unanimous vote on the night of March 21 the City Council of Kansas City, Mo., granted a new 30-year franchise to the Kansas City Public Service Company. Mayor Albert I. Beach signed the document. It will become effective on March, 31, if accepted. The new franchise replaces the old franchise of the Kansas City Railways, known as the Jost franchise and passed in 1914 in the Jost administration.

Under the terms of the new grant a small reduction in fares is to be made immediately upon acceptance of the grant. The new rates will be fifteen tickets for $1, ten tickets for 70 cents. Until acceptance present fares, at the rate of two tokens for 15 cents and a cash fare of 8 cents, will remain effective. When purchased in the form of tickets in the larger quantities, fares will be one-third of a cent less than the present rates.

The city administration was for a time loath to grant any new franchise or an extension of the old one. With a change in the character of city government last summer, the new City Council granted a twelve-year extension to the Jost franchise, but a demand arose for a public referendum in the matter. Subsequently, the officials of the Kansas City Public Service Company asked that an entirely new franchise, mutually satisfactory to the city and to the operating company, be drafted and passed.

Since that time a special franchise committee of the City Council has been engaged in drafting a new instrument, details of which have been up for discussion almost every week in hearings to determine the public attitude toward the various tentative provisions of the new grant.

W. G. Woolfolk, president, has indicated that the Kansas City Public Service Company will accept the franchise at once.

Some of the principal provisions of the new franchise follow:

Time limit of the grant is 30 years, replacing the old franchise, which had eighteen years of unexpired term.

Bus franchise is considered separate from this grant, the company being required to follow the provisions of the present bus grant, which has an unexpired term of 1½ years.

No valuation on the properties is stipulated, but a return of $2,000,000 a year is permitted, plus 8 per cent on any new capital invested.

Fares are to be: Fifteen tickets for $1; ten tickets for 70 cents; two tokens for 15 cents and one cash fare for 8 cents; conductors on all cars to have the $1 books of tickets for sale.

The universal transfer system must be continued after the manner now in vogue here.

In accepting the franchise, the company agrees to consider income from the fare schedule of the franchise sufficient compensation, without recourse to the State Public Service Commission for increase in fares.

When the fare-reduction fund reaches an amount of $100,000, fares must be reduced by one-sixth of a cent; any surplus over the stipulated $2,000,000 a year and 8 per cent of the new investment must be added to the fare reduction fund.

The company must spend $6,600,000 on the property within the next three years, half for betterment of the service and equipment and half in repairs only. The first of these amounts is to be added to the capital account, but not the second.

Ordinary maintenance and repairs are to be taken care of by setting aside 16 per cent of the gross income each year, in addition to the $3,300,000 mentioned in the preceding paragraph, the unused amount of the 16 per cent to revert to the fare reduction fund.

Before the company may undertake any program of extraordinary maintenance, and then only in great emergencies, it must set aside a reserve fund of $400,000, interest on which, at 5 per cent per annum, must be paid into the fare reduction fund.

Two members of the company's board of directors are to be appointed by the city.

Violation of any single provision will be sufficient reason to rescind the entire grant upon a vote of the City Council

The company may mortgage its property up to $17,500,000 plus 75 per cent of new capital invested.

Possible proceeds from the sale of any of the property are to be spent in improvements of the remaining property and cannot be considered in the capital account upon which the 8 per cent dividend is allowed; while such proceeds remain unspent as provided, the company must pay

5 per cent of the amount per annum into the fare reduction fund.

Should extraneous causes increase the average operating costs by 5 per cent in any one year, the company may apply to the Public Service Commission for an increase in fares.

Paving Relief Measure Lost in Grand Rapids

Despite the loss of the measure to relieve the Grand Rapids Railway, Grand Rapids, Mich., from some of the costs of paving between its tracks, submitted to the voters on March 7, the Grand Rapids *Herald* regards it as a far cry from the old days of universal antipathy to public utilities to the results of the election, "when 3,375 out of 7,987 who voted favored a measure for relieving the railway from a tax load." The *Herald* says that "twenty years ago no scheme that offered even a crumb to any utility corporation could have hoped for one out of ten votes in a municipal election, whereas Monday's results show more than 40 per cent favorable to the railway."

The proposal lacked only 815 votes to carry, being a majority proposition. Analysis reveals that the adverse vote was probably due to the short time permitted for the railway's campaign, after the issue was initiated, in which to inform and educate the voters. The wording of the amendment also is believed to have had something to do with negative voting. City officials and prominent citizens supported the amendment by speaking in its behalf, but they were faced with an optional clause in the amendment that left a doubt in the mind of the property owners of how the cost was to be apportioned in all paving contracts. This was difficult to wipe away. The belief exists now that even if there had been a clean-cut elimination of costs with the paving expense charged to the general tax fund, the result might have been different.

The day of the election was not conducive to voting. It was so rainy and dismal that many women voters friendly to the company were kept away from the polls. Another thing, a 2½ mills tax levy to aid the city in meeting major improvements was initiated just before the primaries and injected a factor into the campaign.

In commenting the *Press* said:

> The *Press* is of the belief that when voters have been cured of the delusion about a "guarantee" and are able to look at this problem in the right light, it will not be difficult to change the slight minority of Monday's balloting to a majority. But that will require a greater interest on the part of intelligent citizens than was displayed in the turnout at this primary.

The *Herald* said:

> Upon the matter of paving between street car tracks, the probabilities are that the point which was deemed strongest in favor of the proposition is the real cause of its defeat. Those who advocated the charter amendment [illegible] out that it would not assuredly r[illegible] the paving burden from the railway, [illegible] rather would place upon the City Commission the responsibility of deciding each individual paving project separately. Commissioner Sweet, who earnestly advocated the amendment, believed that the railway should continue to pay for paving on residence streets. But there was nothing in the proposed amendment which guaranteed such procedure. That being the case, the voters, in order to protect owners of residence property on car lines from being burdened with increased taxes, voted against the plan.

Decision Becomes Indecision in Iowa One-Man Car Issue

When the Iowa Supreme Court on March 15 handed down a decision affirming Judge Joseph Meyer of the Polk County (Iowa) District Court, who ruled in favor of the local street car men's union in their fight to prevent the institution of one-man car service by the Des Moines City Railway, it was thought the question was settled until 1940, the date of the expiration of the two-man car agreement between the car men and the traction company. But when the high court on March 19 withdrew the opinion "for correction" it was discovered that the justices had disposed of the one-man car controversy by quoting a section of the street railway franchise of 1916, which was succeeded and replaced by the new franchise adopted in 1921 and under which the Des Moines City Railway is now operating. While the court in its brief order withdrawing the opinion give no inkling of what changes it intends to make in the ruling, it is believed by attorneys familiar with the case that the court may be forced to reconsider the entire one-man car controversy and to decide it on its merits.

The franchise of 1916 provided "that in the operation of its railway by electricity each motor passenger car shall be in control of a motorman and a conductor." In the corresponding section on motive power in the 1921 franchise this clause does not appear. Neither is it contained in any other section of the franchise. Obviously, the court overlooked this in making its decision. Referring to the discarded franchise of 1916, the court emphasized that as long as the wording of the franchise was practically identical with that of the contract between the men and the company "all parties are bound thereby," and the court finds "no ground for equitable intervention." In this manner the court passed by the question of public policy raised by the company, which contended in its arguments before both the District Court and the Supreme Court that in a city where a service-at-cost franchise is in effect any contract which prevents the city from instituting economies which would result in lower fares contravenes public policy.

The one-man car recent decision was referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 19, page 548.

Through Service on Fox River Line

The Aurora, Elgin & Fox River Electric Company installed half-hour through service from 6 a.m. to 11 p.m. connecting Aurora, Elgin and Carpentersville on March 20. John W. Gunderson, general manager, said the new schedule was in keeping with the company's policy to extend and improve its Fox River Valley service. Eight of the regulation interurban cars went into service, all one-man operated. Recent wage increases were in the nature of recompense for the added duties. Fares are scaled to the zone system, the passenger upon entering the car paying fare to a zone and upon leaving the car returning the stub to the operator. Coincident with this service, a de luxe motor coach system is to be put into effect between Elgin and Aurora, with a running time of an hour. A Fageol motor coach has been added to the equipment. Only one or two stops will be made between the terminals, affording faster time than the half-hour interurban system.

North Shore Announces Rate Increase

An increase in interstate passenger rates on the Chicago North Shore & Milwaukee Railroad, Highwood, Ill., from 3 to 3.6 cents a mile has been announced effective at once. The new rates are made effective by authorization of the Interstate Commerce Commission, acting on the petition recently filed by the company. However, it is announced, round trip tickets between Chicago and Evanston stations and Kenosha, Racine and Milwaukee will be sold at the present rates until April 1. Intrastate commutation rates in both Illinois and Wisconsin are in no way affected by the increase, it is pointed out. The new interstate rates will make the fare one way between the Chicago Loop and downtown Milwaukee $3.06, the same as on the steam railroads, which is 49 cents more than the present rate of $2.57.

Charles E. Thompson, vice-president, in commenting on the rate increase said that recent capital expenditures in giving the public additional service through construction of the Skokie Valley route, purchase of new equipment and extensive improvements had made the advance imperative. The new rates merely placed the cost of service on a parity with that of other carriers serving the same territory.

Philadelphia Ordinances Before Commission

Two ordinances passed by the City Council at Philadelphia, Pa., were signed by the Mayor on March 10. The first authorizes the removal of tracks from Filbert Street to make way for the city of Philadelphia-Pennsylvania Railroad boulevard and a $52,000,000 terminal development. The second gives to the Philadelphia Rapid Transit Company and the Pennsylvania Railroad bus franchise rights on the proposed boulevard. The agreement and bus ordinances now go to the Public Service Commission for approval. Signing of the agreement and ordinance by the Mayor was realized after more than a year of negotiations with the underlying companies of the Philadelphia Rapid Transit holding franchises in Filbert Street. The track ordinance authorizes the removal of rail from Filbert Street between Twelfth and Twentieth Streets. Filbert Street will become part of the Pennsylvania Boulevard connecting Broad Street with the new West Philadelphia station of the Pennsylvania Railroad. The Pennsylvania officials refused to carry out the improvement unless the tracks were removed. Abandonment of the plans meant that the plans for beautifying the city would fail.

New Jersey Paving Bill Becomes a Law

Senate bill No. 82, relative to paving obligations by electric railway companies, was passed on March 22 by the New Jersey Legislature over the veto of Governor Moore. The bill, which becomes a law immediately, states that whenever any street railway or traction company disturbs the pavement of any street, road or highway for the construction, reconstruction, repair or removal of its tracks it must pay for the restoration of that pavement, including the base or foundation.

Work must be done to the satisfaction of the board or body having charge of such street, road or highway. A clause says that whenever any part of the pavement between the tracks and 18 in. outside of any street upon which is located the tracks has been or shall be damaged by reason of the operation of railway cars and such company at the time of the passage of this act is obligated to repair such damage and fails to repair, any state board or any political subdivision of the state having control of any such street may apply to the Board of Public Utility Commissioners for an order directing the company to make restorative repairs and this board is given jurisdiction to determine the reasonableness of any orders given.

Whenever any municipality, board or body having authority to do so shall pave or repave any street upon which are located the tracks of any railway, the company must at the same time and at its own expense put its tracks and track structure in good operating condition, but is not compelled to put down new paving around its tracks. Continuing, the bill reads:

> The obligations imposed by this act shall be and are in lieu and substitution of any and all other obligations of any such company to pave, repave or repair any street, road or highway, or to pay any part of the cost thereof except as herein provided, and may be enforced in the same manner as similar obligations are or may be enforced under the laws of this state. Nothing herein contained shall be construed to relieve any such company from the repayment of any money which has heretofore been advanced or expended by any state, county or municipal board or body having control of streets, roads or highways, for any paving heretofore done under and by virtue of a specific contract or agreement made and entered into between any such board or body and such company providing for the repayment thereof, but the obligation for such repayment shall be and remain enforceable as if this act had not been passed.

Prizes Offered for Buffalo High School Art Students

An art poster contest open to all students of Buffalo high schools is now under way, conducted by the art department of the public schools and the International Railway, Buffalo. The contest closes March 25. The winner will be announced on April 1. Prizes will be awarded as follows: $25 first prize, $15 second prize and $10 third prize. The designs submitted are to be in two colors of suitable size for display purposes in the company's cars. The subjects selected are to be some interesting or outstanding points of Buffalo or the Niagara Frontier which can be reached by I.R.C. cars or buses. The purpose of the contest is to stimulate interest in the scenic and historical points in Buffalo and the Niagara Frontier.

North Shore Line Erects Illuminated Signboard

In carrying its message of speed to the public traveling between Chicago and Milwaukee the North Shore Line is using a novel advertising medium in the shape of a "scene in action" sign. It is an electrically illuminated sign, the high-speed electrically operated train being painted in colors on glass. A patented disk revolving around the light to the rear makes the train appear in motion, "full speed ahead." These signs are being displayed with telling effect in various stations and store windows throughout the territory served by the company.

M. O. Advocates Urge Traction Fund for Car Line Purchase

Appropriation of the $45,000,000 traction fund of the city of Chicago for the purchase and construction of local street car lines, as opposed to its use for downtown subway building, is the plan advocated by the Detroit Traction Plan Purchase Club in a report issued on March 8 announcing its proposal for solving the city's transportation problems by resort to municipal ownership.

In launching a campaign for city ownership of the entire surface lines system, the club, which was organized in January, urges that the city acquire these properties on the same basis the city of Detroit purchased its railway lines in 1922. According to the club's report, no constitutional amendment or new legislation, such as required by the joint surface and elevated lines franchise which is now awaiting action in the City Council, would be necessary in event of purchase by the city. Neither would it be necessary for the city to borrow money to make initial payment, if the traction fund should be appropriated, it is urged.

The plan proposes that the city take over the lines under contract, the companies to retain title until the property is paid for in installments from earnings. The purchase price would be the actual cost of the property now used and useful for street railway purposes, less depreciation from time to time.

In the purchase plan, it is also suggested that the present $16,000,000 depreciation reserve of the companies be deducted from the suggested $75,000,000 valuation, leaving a purchase price of $59,000,000. The municipal ownership advocates would have the city pay $40,000,000 from the traction fund as down payment, leaving $19,000,000 to be paid off in installments from operating profits. The remainder of the traction fund, they maintain, could be used in making immediate extensions and improvements.

With the estimated net receipts of $12,000,000 of the surface lines, the remaining $19,000,000 of the purchase price could be paid off in about five years, the plan suggests, and "leave over $7,000,000 a year to use in making extensions, improvements and renewals from earnings."

Akron Rerouting for Economy

Beginning March 16 the first of the proposed rerouting changes in the bus transportation system of the Northern Ohio Power & Light Company, Akron, Ohio, became effective. Changes were made in the Summit Hill, Diagonal Road and the Brown Street-Lover's Lane line.

In discussing the changes in the issue of *Service News* for March 19 the company says:

> Every car and bus rider in the city of Akron is interested in keeping down fares.
>
> So is the Northern Ohio Power & Light Company!
>
> The lower car fares can be kept the better off all of us are. It is a community interest.
>
> Because of this a number of changes have been suggested in an effort to cut down the mileage that has been growing more and more month by month without a corresponding increase in riding. By cutting down the mileage, costs can be reduced and this naturally helps hold down fares. At the same time headways can be improved without much additional expense if the present duplication of service is eliminated.

Accidents Reduced in New Orleans

Street car accidents in New Orleans, La., have virtually been cut in half since April, 1924, when the New Orleans Public Service, Inc., started its safety first campaign. The company awards a safety pennant to the carhouse which shows the lowest percentage of accidents each month. Thus far the Poland carhouse has won the pennant fifteen times and the Canal carhouse twelve times. Reduction of accidents in last four years is shown in the following figures announced by the company:

	1926	1925	1924	1923
Street car accidents......	4,729	5.774	7,260	8,509
Accidents per 100,000 passengers............	3.5	4.4	5.58	6.36
Accidents per 100,000 car-miles................	34.1	41.8	52.2	58.3

Vote of People Required in Tacoma

Mayor M. G. Tennent and the City Council of Tacoma, Wash., have signed an agreement not to enter into a purchase contract with the Tacoma Railway & Power Company without a vote of the people, nor to relieve the company of any franchise requirements, nor to increase the tax levy above that of the current year. The resolution was offered to kill all sorts of misleading statements made during the recent city charter campaign. Franchise requirements, which it is promised will not be altered without direction of the voters, are those regarding gross earnings tax, pavement between and along tracks and payment of half the cost of bridges.

"Street Railways—Major Method of Passenger Transportation"

Attention has been called by the New York Trust Company, New York, in the March issue of the "[illegible]" published by it, to the present [illegible] of electric railways. The writer [illegible]nds his readers this is still the major method of transporting passengers. Among other things the item includes a summary of the operating statistics of the 327 principal companies given in the bulletin of the American Electric Railway Association.

Brady Awards to Be Continued

Nicholas F. Brady has authorized the resumption of the Anthony N. Brady Memorial Medal awards, through the American Museum of Safety, to the American electric railway organization which does the most to conserve the safety and health of the public and its employees. The next award will be for the year ended Dec. 31, 1926. As in previous years, the American Electric Railway Association is giving its entire co-operation. A committee has been appointed from within the industry to determine the conditions of the competition; there is also to be a committee to pass on the award.

Franchise of Dallas Suburban Line Extended

The City Commission of Dallas, Tex., has voted to extend the life of the franchise granted to the Dallas Southwestern Traction Company to Dec. 31, 1927. The action was taken at the request of E. P. Turner, president of the company, in compliance with the provisions of the charter franchise granted the company and on payment by the company of $1,400 of the $15,000 fund originally deposited with the city when the franchise was granted. Mr. Turner pointed out that at least 82 per cent of the grading for the line has been completed, but that the company so far has been unable to dispose of its bonds. In the original franchise it was stipulated that the company must have completed 10 miles of the proposed interurban line from Dallas to Irving by a certain date, and this franchise has been extended from year to year. In the recent extension the City Commission reduced the mileage that must be completed from 10 to 5.

Work Started on $250,000 Chicago Terminal

Razing of a famous landmark of downtown Chicago—the Wells Street terminal of the Chicago Rapid Transit Lines, near Quincy Street—is nearing completion. The structure, which has seen 25 years service, will be replaced by a $250,000 passenger station for patrons of the West Side elevated lines and the Chicago, Aurora & Elgin interurban line.

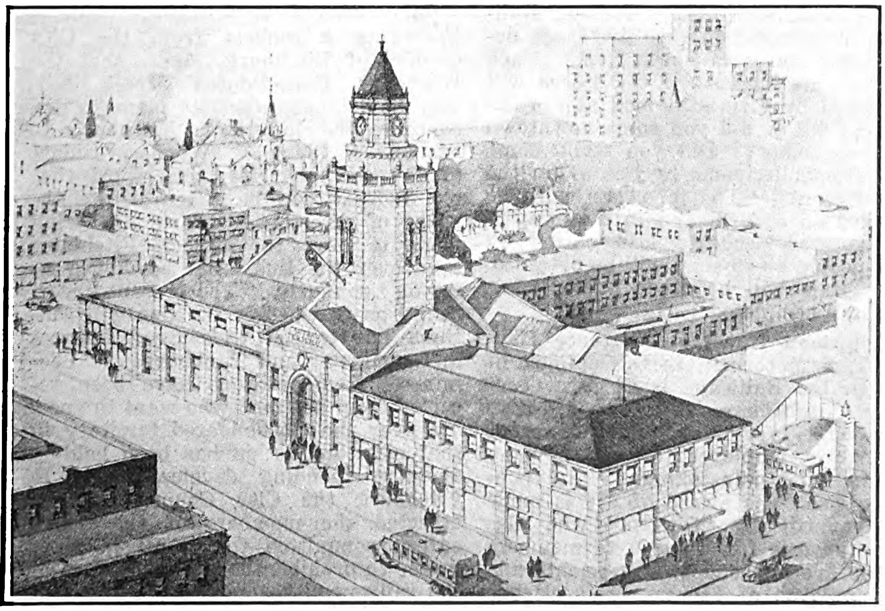
The new terminal has many unusual features. The waiting room will be on the third floor at train level. On the mezzanine floor will be a ladies' restroom, men's smoking room and trainmen's room. Space on the main or street floor will be given over to a ticket office, telephone booths, restaurant and concession counters.

A block-long, glass-inclosed steel bridge is to be erected along Wells Street, linking up the new third rail terminal and the Quincy Street station on the "L" loop. This means that passengers will be able to disembark from "L" trains at Quincy, walk a block sheltered from the weather, and step on to their suburban trains without descending to the street level.

Terminal Under Construction in Seattle

Active construction on the proposed $500,000 interurban and bus terminal for the Pacific Northwest Traction Company in Seattle, Wash., has been started by the engineering department of Stone & Webster, working under the direction of W. D. Shannon, chief engineer. This terminal, to be built for the subsidiary company of the Puget Sound Power & Light Company, maintaining head offices in Seattle, and of which Alton W. Leonard is president, will be of fireproof, class A construction, covering an area 62 ft. x 260 ft., two stories in height It will be located on the south side of Stewart Street, covering a block from Eighth to Ninth Avenue.

Plans for the improvement were prepared by John Graham, a Seattle architect, who has designed other utility structures, including substations for the Puget Sound Power & Light Company. Mention of this project has been made previously in the pages of the ELECTRIC RAILWAY JOURNAL.



Interurban and bus terminal to be erected in Seattle

Vote in Detroit Deferred

The plans of the Rapid Transit Commission to bring the question of subways before the voters of Detroit, Mich., at the April 4 election have been delayed. Action rescinding authority to submit the proposal was taken after Mayor Smith had pointed out possible obstructions. The plan was to construct and equip the so-called Woodward-Fort and Grand River-Gratiot subways at a total cost estimated at $125,000,000.

The Rapid Transit Commission acquiesced in the suggestion, but expressed regret that conditions seemed to make the action necessary. Mayor Smith stated that the complete lack of interest on the part of the people at the election on March 7, together with questions that have been raised, tending to cloud the issue in their minds, moved him to ask the postponement. It is further cited by the Mayor that the employment situation in Detroit is such that the mental attitude of voters might be unfavorably influenced toward undertaking large city projects.

The Rapid Transit Commission was commended by Mayor Smith for its work. He said that the recommendation for a postponement was in no way to be considered as disapproving its labors. The commission will continue its work and if, in the fall, untoward conditions do not exist the matter will be brought up again for the consideration of the Mayor and City Council with a view to putting the question to a vote.

It was the feeling of some of the city officials that the proposal was not sufficiently understood by the public to assure a favorable vote. The plan was condemned by the Mayor's finance committee in a recent report which urged that nothing be done until further study had been made. Full-page advertisements were being run in the local papers indicating the routes of the proposed system, the distribution of total cost between general taxation, special assessments and mortgage bonds, and the application of the special proximity assessments and the scale of rates recommended.

Last Five-Cent Fare Line in Massachusetts Passes

The last electric railway in Massachusetts operating under a 5-cent fare notified the State Department of Public Utilities on March 15 that its financial condition will no longer permit such a fare and that it proposes a new fare schedule to become effective on April 15. The road is the Union Street Railway, New Bedford, which has continued the low fare except to Dartmouth and Westport, where the fare has been 10 cents long after all other electric railways increased rates. It now proposes to charge a 10-cent fare throughout.

Under the old fare the company has sold tickets at the rate of twenty-one rides for $1, except to Dartmouth and Westport, where the ticket rate has been 7½ cents per trip. The tickets to Dartmouth and Westport will be continued at the same rate, but the strip tickets in the territory generally will be sold at the rate of four rides for 25 cents, or 6¼ cents per ride.

California Companies Seek Fare Increase

The Peninsular Railway, operating in the vicinity of San Jose, has applied to the Railroad Commission for an increase in rates. It alleges that the present rates are inadequate, that the utility had a net operating loss during 1926 of $90,952 and that its properties have a reproduction cost as of Dec. 31, 1926, of $4,525,082. Applicant asks the Railroad Commission to establish rates that will produce a fair return upon its investment in addition to operating expenses and fixed charges.

The San Jose Railroads, operating a street railway system in the city of San Jose and vicinity, has applied to the Railroad Commission for an increase in rates, alleging that it had a return during 1926 of only $12,245 and that its properties are estimated to have a reproduction cost as of Dec. 31, 1926, of $1,588,099. The commission is asked to establish rates that will produce a net return of 8 per cent.

The Stockton Electric Railroad has applied to the Railroad Commission for an increase of its rate of fare on its lines in the city of Stockton and vicinity, stating that the present fares do not produce a reasonable return upon the investment. The applicant sets forth that its properties have a reproduction cost new as of Dec. 31, 1926, of $1,160,461, and that it had a net income during 1926 of $30,089. It seeks a fair return upon the investment.

News Notes

Continuance of Sale of Tickets Ordered.—The Public Service Commission of Pennsylvania on March 8 instructed the Schuylkill Railway, Pottsville, Pa., to continue to sell reduced rate ticket books containing seventeen tickets for $1. The order was issued following a complaint of the Merchants' Association of Shenandoah and the Borough of Shenandoah against a new tariff rate in which the company planned to discontinue the sale of tickets.

Men Seek Wage Increase.—Trainmen of the Memphis Street Railway, Memphis, Tenn., are seeking a wage increase of 10 cents an hour. Under the contract signed last year, the wage section of which expires on April 1, the scale in cents per hour is, first year men, 47½; second year men, 52½, and third year men and older, 57½. Sections of the contract pertaining to working conditions will remain in effect for another year.

New Station Opened.—The new Seventh Avenue station of the Queensboro subway, operated by the Interborough Rapid Transit Company, New York, N. Y., was opened officially on March 23 under an order of the Transit Commission. The service which formerly terminated at Fifth Avenue will be continued to Times Square. It seems destined to become one of the most important transfer points in the rapid transit systems. The platform is 480 ft. long and extends under 41st Street from Broadway to a point west of Seventh Avenue. At present the Queensboro subway and its branches carry about 28,000,000 passengers a year.

Wage Increase in Aurora.—Employees of the Aurora, Elgin & Fox River Electric Company, Aurora, Ill., have accepted the two-year contract offered by the company, which gives them an increase of 2 cents an hour to a 62-cent basis for city force employees and a 4-cent raise to 64 cents for interurban employees. The present contract expires on June 1.

No Opposition to Fare Increase.—No protests were presented at the hearing before the Public Utilities Commission of Utah, at Ogden, on March 14 of the Bamberger Electric Railway's request to raise one-way and round-trip first-class fares between Salt Lake and Ogden 10 per cent. Officials of the road announced that the increase would not affect student tickets. They also testified that the present revenue falls short of bringing in 6 per cent on the investment by fully $150,000 a year. The increase, they said, will bring in only an additional $12,000 a year. It is understood that the road expects its bus line to ease the burden to some extent.

Fare Testimony in Council Bluffs.—Special Master Claude R. Porter began collecting testimony on March 1 in the federal court at Council Bluffs, Iowa, pertaining to the fare issue of the Omaha & Council Bluffs Street Railway. In 1924 the company obtained an injunction restraining the city of Council Bluffs from interfering with increased fares the company proposed to put into effect. The city thereupon took an appeal to the United States Circuit Court of Appeals and this court sustained the injunction. The reasonableness of the fares is now up for determination. The issue involves the value of the property used in the public service, revenues, expenses and net income.

Traveling Habits Will Be Disclosed.—Information on the traveling habits of the shoppers of South Bend, Ind., is to be sought shortly by the Chicago, South Bend & Northern Indiana Railway in co-operation with five large department stores in South Bend. Each patron entering one of the stores will be asked by girls stationed at the entrance: "How did you come downtown to shop today? Did you walk, come by automobile, come by bus or on the street car?" The answers will be checked on a form and in this way it is expected accurate information on how people go to shop will be obtained. The totals will be made public when they are completed.

Motorman Honored.—Clarence Hayworth, a motorman in the employ of the United Railways & Electric Company, Baltimore, Md., has been awarded $50 for making the best record among the employees of the company in rendering painstaking, helpful public service. The award of $50 is made anonymously by "Citizen," who also made awards for bravery to members of the fire and police departments and an employee of the gas and electric company. The year for which the awards are made ended March 1. Mr. Hayworth was selected specifically for the assistance he rendered elderly persons, especially women, in boarding and alighting from his car. It was said that on one occasion he left his car to assist an aged woman into a church. The award is the fifth that has been made by "Citizen" and on each previous occasion it went to a conductor with one exception, when it was given to the operator of a one-man car.

Students Paint Car.—Students of Rice Institute at Houston, Tex., have painted and decorated a car of the Houston Electric Company in regular operation on the line that serves the institute. The colors are those of Rice Institute, with large owls on the sides and ends of the car. The Rice students are known as "Owls" and all their athletic teams play under this moniker. This is the first time, it is believed, that an electric railway has lent its cars to the decorative ideas of a college.

Seek Car Line Extension.—Residents of the Lakewood Heights addition to the city of Dallas Tex., have drafted demands for presentation to the new City Commission to be elected on April 5. These demands include an extension of the car lines of the Dallas Railway & Terminal Company. A bus line is now operated by the company from the terminal of the car line through the Lakewood Heights addition to White Rock lake, but this bus service is termed inadequate.

Lecture Meetings Arranged.—The Foremen's Training or Service Club was formed recently by employees of the Utah Light & Traction Company, Salt Lake City, Utah. This organization, which is composed primarily of foremen and supervisors in the various departments, meets every Saturday morning for the purpose of listening to lectures and discussing various subjects in connection with their own work. The lectures cover various subjects of broad scope, given by prominent citizens of Salt Lake City. Trainmen and other employees are invited to attend these meetings.

Commotion Over Fitchburg Line.—Following a request from the City Council of Fitchburg, Mass., that the Worcester Consolidated Street Railway hold in abeyance its plans to discontinue the line from Fitchburg to Worcester, Clark V. Wood, president of the company, has sent word that the request will be taken before the board of directors. Efforts are being made to have the city of Fitchburg take over the line from Fitchburg as far as Leominster. The present uncertainty as to whether the line will continue has caused widespread interest in Leominster and Fitchburg. In Leominster four petitions have been received from bus men who want to operate over the Consolidated territory in that city, but action has been held in abeyance pending developments. In Fitchburg the City Council has instructed the members of the public safety committee to do all in their power to prohibit the discontinuance of the railway either temporarily or permanently.

Recent Bus Developments

Railway at Indianapolis Said to Seek Coach Company

Details of contracts for purchase of the Peoples Motor Coach Company, Indianapolis, Ind., by the Indianapolis Street Railway are being worked out, it is said. The bus company now operates four main lines, some in direct competition with the railway's own motor bus routes, and has petitions before the Indiana Public Service Commission for other lines. It is said the railway would take over the buses and all leases and assets of the coach company and assume responsibility for payments of $100,000 on buses.

It was learned that the general value of the buses such as those used by the motor coach company has been held at about $10,000 to $12,000 each. With a total of 37 buses the value of the physical property of the company would be approximately $440,000, leaving approximately $60,000 to be charged to garage equipment and supplies and good will and for the certificate, if the price of $500,000 which has been mentioned is agreed upon for the deal.

Truck Competition Hearings Held in Chicago

The Illinois Commerce Commission is soon to decide if it shall establish the precedent of permitting motor truck systems to operate as freight-hauling agencies in competition with railroads, as a result of a hearing on petitions which opened in Chicago on March 10 before Commissioner J. Paul Kuhn. Complaints have been filed by several railroads operating out of Chicago against the operation of the Interstate Trucking Company without a certificate of necessity and convenience from the commission. The trucking company has filed a petition for such a certificate.

Rules Buses Operating Through Park Are Poor Man's Rolls-Royce

The Minneapolis, Minn., park board acted "reasonably and within its rights" when it gave bus companies the right to transport passengers over city parkways upon payment of a tonnage fee to the board, according to a district court decision. The ruling was made in connection with the motion of A. S. Dowdall, as citizen, to have the fee ordinance voided.

"The parks and parkways of the city," Judge Leary declared in his decision, "are for the recreation and enjoyment of the public—for those who can view their beauties as well from a bus as from a Rolls-Royce."

The bus concession ordinance, Mr. Dowdall contended, not only is a menace to the rights of the public but also extends to commercial transportation companies privileges beyond the powers and contrary to the traditions of the Board of Park Commissions.

The ordinance in question was passed by the park board in November of last year. It grants bus companies the right to operate through the city parks or parkways upon receipt of a permit and payment of a fee at the end of each year. This fee is limited to a minimum of $10 and a maximum of 20 per cent of the state motor vehicle tax for the particular bus.

Buses Will Replace One-Man Cars.—The Portland Electric Power Company, Portland, Ore., will substitute buses for the present one-man cars now in operation in the Parkrose district. The Parkrose line is to be torn up to make way for a new paved roadway along the east end of Sandy Boulevard.

Would Substitute Buses.—The Public Service Commission has granted the petition of the Westchester Street Transportation Company, Inc., to substitute buses for street cars on what is known as the Rosedale route in White Plains. At the hearing of this application, it was shown that by the use of buses connections could be made with the New York, Boston & Westchester line.

Would Extend Bus Service.—Expansion of the bus system of the Rochester lines of the New York State Railways is indicated in the petition to extend its Rochester-Penfield line to the villages of East Penfield and Marion and a movement for bus service in the Ridgeway Avenue section of Rochester. The petition for extension of the Penfield line was made to the Public Service Commission by the Rochester Interurban Bus Company, a subsidiary through which the railway operates its interurban bus system. Citizens of Ridgeway Avenue have applied to the Council for bus service.

New Service Schedule May Be Installed. — The Connecticut Company may install permanently a new type and schedule of service between New Britain, Conn., and Berlin, Conn., if the trial service started on March 6 meets the general requirements and approval of the traveling public. Under the plan buses will leave New Britain every twenty minutes and every other bus will continue to Meriden, as at present, but will operate through Franklin Square, New Britain. Service by trolley will be used to Berlin only when the traffic is heaviest.

Abandons Coach Lines.—The Pacific Electric Railway, Los Angeles, Cal., has been authorized by the Railroad Commission to abandon operation of its Clearwater-Bellflower, its Rosemead-San Gabriel and its Del Mar-New Avenue coach lines. It was decided these lines were not required by public convenience and necessity. The railway has also been authorized to discontinue operation of its coach service between Twentieth Street and Long Beach Avenue in the city of Los Angeles and the Union stock yards.

Bus Services Enlarged.—The Sioux Falls Traction System, Sioux Falls, S. D., has taken over the operating rights of the Worthington - Sioux Falls Transportation Company, operating buses between Sioux Falls and Mankato, Minn., by way of Worthington, according to R. C. Mills, manager of the railway. The company plans to put on its own equipment about April 1, Mr. Mills said, and will add this line to its expanding motor coach service. The addition of this new route will give the Sioux Falls Traction System a total of 1,726 miles daily on its various intercity motor coach lines operating over six different routes and reaching into four states, South Dakota, Iowa, Nebraska and Minnesota.

Buses to Be Substituted.—The Worcester Consolidated Street Railway has decided to abandon its railway between Worcester and Webster, Mass., and will substitute bus service. The New England Transportation Company, bus subsidiary of the New York, New Haven & Hartford Railroad, is expected to furnish the bus service. It is also announced that the Worcester Consolidated would abandon service over its Blackstone Valley line between Worcester and Woonsocket, R. I. In this case also the New England Transportation Company will furnish transportation by bus.

Must Abandon Bus Service.—The Key System Transit Company, Oakland, Cal., has applied to the Railroad Commission for permission to abandon its bus service between Los Angeles Avenue and Spruce Street, and Alta Road and Spruce Street in Berkeley. This service was established under a franchise granted by the City Council of Berkeley on Sept. 14, 1926, with the approval of the commission, and it was proposed to operate said service for a period of 180 days to determine if the patronage of the line would warrant its continuance. The company reports that the earnings have averaged $150 a month, while the cost of operation has averaged approximately $1,160 a month.

Permit Granted.—The Board of Public Works has granted the St. Louis Bus Company, auxiliary of the United Railways, St. Louis, Mo., a permit to operate buses on Watson Road from Penrod Avenue to the city limits. It has taken under advisement the application of the same company for a permit on South Kingshighway between Delor and Devonshire Avenues.

Bus Service Suggested—Abandonment of the electric railway line connecting Springfield and Worcester, Mass., is proposed. Clark V. Wood, the president of the Springfield Street Railway, has petitioned the Transportation Board in Springfield for bus licenses to replace the trolley service. He said the bus line would parallel the present trolley line through Palmer, Brimfield and Southbridge. The electric line would still be run between Springfield and Palmer, but east of Palmer the removal of tracks and wires was deemed probable. This forms part of the New Haven Railroad's rehabilitation program, he said, and would be put in effect as soon as licenses could be obtained.

Financial and Corporate

Extension of Public Control at Boston Suggested

First official indication from the Massachusetts Legislature is that the public control period of the Boston Elevated Railway, Boston, Mass., will not be extended 50 years, as the Harriman commission proposed. An extension of 25 years is favored by the committees on metropolitan affairs and on street railways, sitting jointly. There are 30 members on these committees and twenty of them are in favor of the 25 years. Ten members may formally dissent. The discussion of the measure, as now framed, will be before the ways and means committee of the Senate.

A financial reconstruction is proposed by the committees along the lines suggested in the Harriman bill. In this refinancing there would be an annual saving of $1,061,813 in dividends and taxes. It is proposed to issue 4½ per cent 40-year debentures to be exchanged for the 7 and 8 per cent preferred stock; this would save the road $454,050 annually in dividend payments. Dividends on the common stock are to be reduced from the present rate of 6 per cent to a new rate of 5½ per cent. This would result in an additional saving of $119,397 a year. The saving on federal income taxes on the preferred dividend would be $225,920. The state franchise tax, amounting to $262,375 a year, would be saved.

Out of this annual saving the bill applies $250,000 to a sinking fund to extinguish the debentures, $750,000 a year for about three years to pay back what the company owes cities and towns on what they advanced when the company was running behind. After this indebtedness has been paid the $750,000 would be used for rentals and charges on the Governors Square subway and the Lechmere Square, Maverick Square and Huntington Avenue extensions, and it is suggested that this money be applied also to the purchase of the Revere branch of the Eastern Massachusetts Street Railway.

At present the reserve fund of the company is $2,132,495. It is proposed to use this to buy new equipment.

Five trustees are provided for, the same number as in the present board, and they would be elected for two, four, six, eight and ten years respectively at the outset, reappointments to be for a term of ten years.

Financial features are made contingent upon the approval of the Elevated stockholders. Their attitude toward the matter is of course not known, but it was argued some weeks ago that they should not be required to make the sacrifices in income return called for in the original 50-year bill, a measure which has been the subject of comment before in the JOURNAL.

Lake Shore Electric Sold

The Lake Shore Electric Railway, Cleveland, Ohio, was sold on March 23 to F. W. Coen and associates by the Union Trust Company, Cleveland, acting for E. W. Moore. Recently the company applied to abandon its line between Sandusky and Norfolk because of decreased receipts. A proposal was advanced to supply the residents of this section with a bus service operated by the Lake Shore Motor Coach Company, a subsidiary organized by the railway.

The Lake Shore Electric Railway, with general offices at Sandusky, covers 183 miles of territory operating in 25 cities and towns. It controls the Lorain Street Railroad and the Sandusky, Fremont & Southern Railway. F. W. Coen, one of the new owners of the line and a former official of the railway, has declared his faith in the future of the interurban in the growing freight business and in the decline in automobile competition owing to parking difficulties in the cities.

$3,027,694 Net for 1926 in Philadelphia

P. R. T. Gross Revenue, Including Eight Months of Taxicab Operation, Was $57,196,610—$20,285 Transferred to Surplus—Estimated Earnings by 1930 Are $70,000,000

PASSENGER revenue of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for 1926, including subway-elevated, street cars and buses, with eight months of taxicabs, was $57,196,610. Operating expenses and taxes were $44,915,254. As usual there was a deficit on bus operation, through providing needed but unprofitable transportation service in the more sparsely settled areas of the city. This amounted in 1926 to $274,247. Taxicab net income for the eight months ended Dec. 31 was $198,339, being at the rate of approximately $300,000 per annum, thus offsetting the deficit from bus operation. After providing for payments to city sinking fund, rental for Frankford elevated, fixed charges, 7 per cent dividend on preferred stock and 8 per cent dividend on common stock, there remained $20,285 to be transferred to surplus.

In the annual report, issued under date of Feb. 28, the statement is made that the net income of the entire system for 1926 was $3,027,694. This figure was, of course, reached by adding to the net income of the Philadelphia Rapid Transit Company the net earnings of the taxicabs and subtracting the deficit due to bus operations.

During 1926 the company made considerable progress toward its goal of a fully rounded system of co-ordinated transit. It now co-ordinates every phase of Philadelphia's public passenger transportation, operating about 660 miles of surface track, 39 miles of elevated and subway track and 362 buses over a system of routes in Philadelphia which totals 244 miles and also connects Philadelphia with New York, Atlantic City, Baltimore, Washington and intermediate points. As a necessary step in co-ordination P. R. T. entered the field of taxicab operation by the purchase of the Yellow Cab Company, Philadelphia, for $3,000,000. More than 1,100 cabs are now operated,

INCOME ACCOUNTS OF PHILADELPHIA RAPID TRANSIT SYSTEM AS COMPARED BY THE "ELECTRIC RAILWAY JOURNAL"

	1926	1925
Gross passenger earnings	*$57,196,610	$49,911,702
Other operating revenue	830,942	691,883
Total	$58,027,552	$50,603,585
Maintenance and depreciation	$9,278,331	$8,760,903

Equipment trust series "J" 1926-1936			1,700,000
Real estate mortgage			150,000
Total			$22,866,000

*Figures for 1926 include taxicab earnings for eight months while those for 1925 are based solely on electric railway and bus earnings.

STATEMENT OF WAGE TREND IN PHILADELPHIA

Calendar Year	Maximum Hourly Wage, Cents	Passengers Carried per Trainman	Calendar Year	Maximum Hourly Wage, Cents	Passengers Carried per Trainman
1911	23½	72,405	1919	58	137,785
1912	25	77,561	1920	72½	150,785
1913	30	85,762	1921	65	137,432
1914	30	89,790	1922	69	141,528
1915	30	96,106	1923	70½	146,658
1916	32	107,800	1924	71½	148,264
1917	35	113,940	1925	77	148,632
1918	48	120,102	1926	77	151,173

this co-ordination tending to protect the system against the inroads of competitive operation and consequent diversion of earnings to which electric railways are now being increasingly subjected. It was stated that the absorption of all taxicabs in the city, when effected, will work toward the elimination of cruising and a corresponding lessening of vehicular congestion in the streets.

Nine new bus routes, operating 127 miles, had been established during 1925. The system was further added to in 1926 by the installation of nine additional routes, operating 101 miles over city streets—a net addition of 32 per cent to P. R. T.'s route mileage accomplished within two years. In assuming the burden of the deficit incident to its bus operation the company has had in view the necessity of establishing a more complete transportation service to newly developed outlying areas, where population is not sufficient to warrant the expense of car tracks and where rubber-tired vehicles—with a seat for a fare—are necessary to supply a type of transportation more nearly comparable to the private automobile.

The company estimates that the system's earnings should reach $70,000,000 by 1930, of which 25 per cent may be earned by taxicabs and buses. If bus and cab service had not been developed by P. R. T., it is believed that 1930 would find the company with earnings entirely insufficient to enable it to supply adequate city-wide transit without endangering its own present financial position.

During this present year the company has purchased 218 new gas-electric buses. In 1926 P. R. T. purchased 50 new surface cars and 135 gas-electric buses. More than $2,000,000 was expended in constructing and equipping track extensions to the Sesqui-Centennial grounds. This was done with the twofold purpose in view of serving the exposition and of pushing forward the development of the too-backward southern section of the city. While the actual number of passengers carried to and from the Sesqui was only about 15 per cent of those for which provision was made, the immediate losses sustained by the company in this respect are not regarded as of a permanent character, but rather as an investment made in advance of the immediate needs of the section served.

The company extended itself during 1926 to meet the views of the city. The bankrupt Frankford, Tacony & Holmesburg Street Railway was taken over to supply increased feeder service to the Frankford "L." A single fare from the city center, by means of a free transfer with the "L," was extended northerly to Rhawn Street and a bus service with 10-cent fare and 3-cent exchange ticket was started to serve the sections from which the non-paying car lines were removed.

At the urgent request of the city the company agreed to increase its rental for the Frankford elevated from $780,200 to $936,850 per annum. The city desired that this be done in order that its borrowing capacity might be released to the extent of some $14,000,000, to accomplish which it was then necessary that the lease be extended to 1957. It was determined by the Public Service Commission to withhold its approval of this lease extension until the completion of its investigation now being conducted into P. R. T. matters. This decision was approved by the company.

Included in the report is a restatement of the three basic principles of Mitten Management, namely:

> *To the Public:* To furnish an adequate system of transportation, operated efficiently and courteously; to improve service to the fullest extent that improvement can be supported by the fare collected, and to offer the fullest opportunity to the car rider to share in the ownership of the property.
>
> *To the Employees:* To pay wages adequate to the necessities of life and comfort, and sufficient to permit of reasonable savings. To provide opportunity for participation in increased earnings made possible by the increased effort of the employees, and to encourage the investment of this added compensation in such a way as to make the employees owners as well as workers.
>
> *To the Owners:* To pay a reasonable return on the actual value of P. R. T. property, in justice to those who make P. R. T. possible, and to keep the credit of P. R. T. at a point necessary to support a high standard of public service.

Then follows a summary of accomplishments which have been made under these three heads during the sixteen years in which Mitten Management has been in charge of transportation matters in Philadelphia. These results are set forth in the comparisons shown in the following:

STATEMENT OF INCREASED RIDING IN PHILADELPHIA

Calendar Year	Revenue and Transfer Passengers	Rides per Capita
1911	517,697,478	329
1912	549,674,683	343
1913	580,011,057	357
1914	581,297,949	352
1915	594,220,409	354
1916	669,008,258	392
1917	726,936,340	419
1918	763,008,395	432
1919	866,944,336	483
1920	908,482,135	501
1921	836,547,351	451
1922	848,883,512	450
1923	918,775,871	480
1924	913,855,751	469
1925	926,928,994	468
1926	966,469,223	480

The P. R. T. report for 1926 is concluded with a reprint of an article on the "Underlying Companies of the City Transit System," by Edmund Stirling, a local newspaper authority on transit matters, which appeared in the *Public Ledger*. There has been much agitation in Philadelphia to eliminate the "underliers" and with them the heavy rentals which P. R. T. must pay each year. Whether this latter step could be accomplished without heavy payments which would wipe out any savings is frankly questioned, but, at any rate, P. R. T. officials, city authorities and the general public are all agreed that some step should be taken to place the original franchises and charters, now controlled by the underliers, under a unified ownership. To dispel the false notion that confiscation proceedings could be instituted against the underlying companies, P. R. T. has quoted Mr. Stirling, in part, as follows:

> The fairness and equity of these rentals are not here an issue. It is well known that the grant of the charters was in many instances clouded by corruption and the execution of the leases was attended by the infusion of a vast amount of water. Some of the contracts were deliberately made to escape tax and other legal obligations of the companies. But these maneuvers were all carried through under the forms of law, and the validity of the contracts and leases has been repeatedly confirmed by legislative action.

INCREASED RETURNS TO STOCKHOLDERS OF THE PHILADELPHIA RAPID TRANSIT COMPANY

Calendar Year	P.R.T. Surplus	Dividends on P. R. T. Stock Preferred Per Cent	Dividends on P. R. T. Stock Common Per Cent
1911	$358,250	....	....
1912	260,236	....	....
1913	676,849	....	....
1914	930,564	....	....
1915	1,128,017	....	....
1916	2,987,975	....	$1,348 656–4½
1917	4,345,900	....	1,499,277–5

1919	4,482,532	....	1,499,290–5
1920	4,195,356	....	....
1921	5,748,980	....	....
1922	5,640,664	....	1,799,148–6
1923	5,616,833	....	1,799,148–6
1924	5,652,582	....	1,799,575–6
1925	6,178,916	$60,871–7	2,399,639–8
1926	6,489,188	607,766–7	2,399,644–8

> Had their legal status been assailed at the time, something might have been accomplished toward lifting the burden of excessive fixed charges from the car riders. But while the crookedness of transit policies and the selfishness of the financing methods of the street railway owners were notorious, the people went on electing officials who gave these transactions a binding force.
>
> Furthermore, the persons who profited by the juggling of street-railway leases and finances have long since disappeared from the stage. Their holdings were unloaded upon the public, until today it is doubtful whether any of the stocks and bonds of the underliers are held by the descendants of original purchasers. Bought as safe investments, under repeated guarantees, the greater part of them are to be found in trust estates. It is inconceivable that any court today would permit their condemnation at less than their present-day, fair market value. And if the effort to cancel the original charters were to be made, under the state's constitutional right to alter, revoke or annul charters of incorporation, that power and right are definitely limited by the same fundamental law, so that it can only be exercised in such a way that "no injustice shall be done to the corporators."
>
> Few will question the desirability of getting rid of the traction underliers. But only those agents of a selfish propaganda which is designed to confuse the public mind about the real facts of the case have dared suggest this can be accomplished by other than legal means and without doing justice to innocent investors.

Takes Over Another Line. — The United Railways & Electric Company, Baltimore, Md., will take over the Lorraine Cemetery car line on April 1 and improve the service. This line has been operated by the Lorraine Cemetery Company for some time.

New Members Elected to Eastern Massachusetts Board

At the annual meeting of the stockholders of the Eastern Massachusetts Street Railway, Boston, Mass., recently held, the following directors were elected:

Charles Hayden, Lester Watson, Roger Amory, Franklin T. Miller, Albert A. Harrison, Robert B. Stearns, Henry G. Lapham, A. W. Pinkham, L. Sherman Adams and Cornelius J. Corcoran. Only three of the former directors are carried in the new board. They are L. Sherman Adams, Roger Amory and Franklin T. Miller.

Charles Hayden and Lester Watson are members of the firm of Hayden, Stone & Company, which acquired a substantial financial interest in the company after the so-called Adams suit.

Balance in Detroit Shows Increase

The operating revenue of the Department of Street Railways at Detroit, Mich., for the year ended Feb. 28, 1927, was $24,651,578 against $23,756,099 for the year previous. These figures included a railway operating revenue of $22,213,412 and a coach operating revenue of $2,438,166 in 1927 against $22,734,840 and $1,021,058 for a railway and coach revenue respectively in 1926. Total operating expenses increased from $17,934,835 to $19,070,140 in 1927. The railway operating expenses decreased from $16,938,688 in 1926 and $16,788,206 for the year ended Feb. 28, 1927. Coach operating expenses increased from $996,147 for the year ended Feb. 28, 1926, to $2,281,933 for the year ended Feb. 28, 1927. Net revenue was $5,858,149 against $6,019,663 in 1926. Net income fell from $3,357,854 to $3,187,287 for the current year. The balance was $587,060 for the year ended Feb. 28, 1927, and $571,810 for the year ended Feb. 28, 1926. Total railway passengers numbered 476,716,753 in 1927 and 488,589,883 in 1926. Total coach passengers numbered 13,611,347 in the 1926 period to 30,714,819 in 1927.

Loss in Alliance in 1926

Abandoning buses, scrapping the machines which were practically worthless and disposing of antique equipment during 1926 increased overhead expenses for the Stark Electric Railroad, Alliance, Ohio, to $153,851 and resulted in a net loss for the year of $80,141. The financial summary as made public was as follows:

	1926	1925
Gross earnings	$460,865	$467,223
Operating expenses	387,155	361,474
Operating revenue	73,709	105,748
Taxes and fixed charges	153,851	113,631
Net Loss	$80,141	$7,882

From this summary it is seen that gross earnings in 1926 were nearly $7,000 less than 1925. Operating expenses last year were about $26,000 greater than 1925 and fixed charges about $40,200 greater.

Last year the Stark Electric Railroad, with about 30 miles of track, in addition to the city bus routes in Alliance was patronized by 2,845,996 persons, compared with 2,871,730 persons during 1925. Last year this number was divided, 1,897,101 being carried on interurban cars and 948,895 being carried on city cars. In 1925 interurban patrons were 1,965,228 and city patrons 906,502.

During the greater part of 1925, when the larger number of passengers were transported, street cars were operated in Alliance on a regular schedule over about 2 miles of city lines. During the latter part of 1925 and the majority of 1926 buses were used.

For 1927 the outlook is very good for a small loss or a possible profit. This is due mainly to steps taken by the company during the last few months. Discarding buses, which proved a loss instead of a gain, and returning to street cars is believed to be a big step in reducing the operating cost due to the large expenses in maintaining buses. At the same time the company abandoned a number of old cars.

Although it serves two cities and one fair-sized town, the Stark Electric operates city cars only in Alliance. Interurban service is run between Canton and Salem, in addition to the city cars in Alliance.

New Directors at Louisville.—At the annual meeting of the stockholders of the Louisville Railway, Louisville, Ky., Ralph C. Gifford, vice-president of the First National Bank, and William C. Campbell, manager and chief engineer of the Kentucky & Indiana Terminal Railroad, were elected directors. S. T. Culver, an interurban motorman, became employee representative on the board, to replace J. J. Blackerby.

Net Income Increases.—For the eight months period ended on Feb. 28, 1927, the total operating revenues of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., was $30,714,101, against $29,522,318 for a similar period of the previous year. Total operating expenses increased from $19,249,877 to $19,829,161 for the eight months period ended Feb. 28, 1927. After a consideration of income deductions a net income remained of $4,137,106 for the eight months ending Feb. 28 of the current year, against $3,648,345 in 1926.

Line Will Be Abandoned.—General Manager John McIntosh announced recently that in consequence of an annual operating deficit of $30,000, the Chicago & Interurban Traction Company operating from 63d and Halsted Streets, Chicago, to Kankakee, Ill., will be discontinued before April 30. Failure of the line to pay, he said, was in part due to automobile competition and in part to being forced to pay the same high wage scale as that received by employees of Chicago surface lines. Coincident with the announcement was the granting by the Illinois Commerce Commission to the Schappi Bus Lines, Inc., an Insull company, of a certificate permitting it to operate between Chicago Heights, Halsted and 63d Streets.

Abandonment of Asbury Park Belt Line Authorized.—Abandonment of the inside belt line, operated by the Coast Cities Railway in Asbury Park, N. J., has been sanctioned by the Board of Public Utility Commissioners. Suspension of the service and surrender of charter has already been approved by a municipal ordinance. Evidence indicated the line is not well patronized and is operated at a heavy deficit.

Conspectus of Indexes for March, 1927

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 137 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Personal Items

Changes Among Chicago Division Superintendents

Three important changes in the ransportation department of the Chiago Surface Lines have been announced by the management. Michael Harrington, who has been in the service since 1884, resigned his position as ivision superintendent at the Kedzie epot, division No. 7, and took a furough from the service. R. J. McKiney, division superintendent at Elston epot, division No. 10, was transferred o Kedzie in Mr. Harrington's place, nd Walter M. Kroll, assistant superntendent of the tenth district, suceeds Mr. McKinney as superintendent n that district. E. E. Victorson, conected with the downtown supervisory orce, was made assistant division suerintendent to succeed Mr. Kroll.

Mr. Harrington entered the service s a horse car driver and became a motorman after the electrification of he lines. He was appointed supervisor n 1901 and made foreman at Kedzie epot in 1903. He became division uperintendent at Kedzie in 1914 and was sent to the general office as assistnt superintendent of transportation in 923, returning to Kedzie as division uperintendent two years later.

Mr. Kroll entered the Surface Lines ervice as a motorman in 1894 and has een foreman at the Elston depot, assistnt superintendent, assistant superinendent of train service employment nd division superintendent.

Mr. Victorson entered the service with the track department in 1905 and was transferred to the train service as conductor in 1910. He served in the rmy during the World War and upon is return was employed by the Elgin, oliet & Eastern Railway, re-entering he Chicago Surface Lines service hree years later as a starter at the Kedzie depot.

Deane Ackers Local Manager at Topeka

To fill a newly created position Deane Ackers, formerly local manager of the Kansas Power & Light Company's properties at Atchison, has been made ocal manager of the company's proprties in Topeka, it has been announced by A. M. Patten, vice-president and general manager of the company.

Starting in 1924 with the Illinois Power & Light Company, the parent ompany, Mr. Ackers was made local manager at Atchison, to succeed C. A. eland, Jr., who had been transferred o Topeka.

A graduate of the school of engineering at the University of Kansas n 1917, Mr. Ackers attended the first fficers' training camp and was commissioned a second lieutenant in the nfantry in August, 1917. Later he was promoted to the rank of first lieuenant and finally to the grade of capain. He served with the Sixteenth nfantry of the First Division.

After two years overseas, taking part in all engagements with the First Division Mr. Ackers returned to the United States in 1919. He joined the United Power & Light Corporation and had headquarters at Abilene with the position of construction engineer. He was there until 1924, when he joined the Kansas Power & Light Company.

Dr. A. A. Mitten Will Carry On Industrial Democracy

Dr. A. A. Mitten, whose succession to the chairmanship of the executive committee of the Philadelphia Rapid Transit Company, Philadelphia, Pa., was referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 19, page 548, has been the silent influence and power in the company's co-operative welfare and public relations work. He is as much at ease with a track employee as with an official and is eminently qualified to maintain contacts between men and management. His activity with the company began on May 1, 1919, when he became secretary of the Co-operative Welfare Association. Ever since that time he has taken an active part in the co-operative activities of the company and is personally known and highly regarded by thousands of the company's employees. At the same time Dr. Mitten became secretary of the employees' Co-operative Association he also assumed the duties of supervisor of welfare and employment.

A. A. Mitten

T. E. Mitten's only son was educated as a physician and surgeon. He entered the electric railway industry in 1915 as industrial surgeon with the company in Milwaukee. When the United States entered the World War Dr. Mitten went to France as a captain of an ambulance company, was twice severely gassed, was wounded and then captured in August, 1918. He was imprisoned at Villingen until after the armistice was signed.

On May 15, 1922, Dr. Mitten was elected a director of the company and he has served in that capacity without interruption since that time. Until his election as chairman of the executive committee he acted as secretary of the board of directors. Dr. Mitten has also served for several years as vice-president of Mitten Management, Inc., which operates both the Philadelphia Rapid Transit Company and the International Railway, Buffalo, N. Y.

Now the time has come around when T. E. Mitten sees fit to relinquish some of the overwhelming mass of details which constantly spring into being on a property the size of the Philadelphia one. For sixteen years Mr. Mitten has served as chairman of the executive committee. Now his son has stepped into this position. The father will continue as chairman of the board of directors of the company.

At the annual meeting of the stockholders at which Mr. Mitten relinquished his post to his son other officers, in the main, were re-elected. C. J. Kelley replaced W. D. Witt as auditor of the company. Coleman J. Joyce and Leon Jewell were replaced on the board of directors by J. A. Queeney and Ralph T. Senter respectively. However, both will continue their services with the company. As a matter of fact, no particular significance attaches to the absence this year of the names of Mr. Joyce and Mr. Jewell from the board of directors. It is a policy of the management to assign men to meet the exigencies of the particular situation at hand. When an expert on rates and valuation was needed on the P. R. T. board, Mr. Joyce was the logical man to fill the post. This year the Philadelphia problems will chiefly be matters of operation, while in Buffalo the questions of valuation and rate-fixing were never more pressing than at this time.

Andrew Marshall Resigns as Boston Elevated Trustee

Andrew Marshall has resigned as a member of the board of public trustees of the Boston Elevated Railway, Boston, Mass. He was appointed by Governor Fuller on Aug. 26, 1925, to succeed former chairman James F. Jackson, and it was the Governor's intention that he should serve as chairman of the board.

Mr. Marshall opposed the original proposition for the reorganization of the company because of the sacrifice which he felt would be imposed on the stockholders to obtain a 50-year extension of the public control law. He argued the case exhaustively before the legislative committee, and the 25-year control plan which finally came out of the committee is a little closer to what he urged, but it is not his plan and he has not expressed himself regarding it.

Mr. Marshall was not elected chairman of the board, as that designation was given to Samuel L. Powers by the other trustees, who contended that they, and not the Governor, had the power of electing a chairman.

In his letter of resignation to the Governor Mr. Marshall explained that the demands of his law practice, consisting in part of the trial of cases which occasionally are of extended length, are such that it is difficult to meet these demands and at the same time to perform the duties of the public trusteeship in a manner which he considered adequate.

It is understood that no successor to Mr. Marshall will be appointed by Governor Fuller until the Legislature has acted upon the pending plans for the reorganization of the Elevated.

S. B. Irelan Transferred to Kansas City

S. B. Irelan, vice-president and general manager of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., for the past four years, has been appointed Western manager of the securities department of the Henry L. Doherty interests, with headquarters in Kansas City.

In the course of his career he has been identified in an executive capacity with Doherty properties in almost every section of the country. From Denver he went to Fremont, Nev., and thence to New York to the engineering and statistical department, where he engaged in special work of revising the classification of accounts and report system. In 1914 he became vice-president and general manager of the Bartlesville (Okla.) utilities, but two years later he was transferred to Sedalia, Mo., in a similar capacity. From 1917 to 1923 Mr. Irelan was connected with the companies at Montgomery, Ala., which in the latter year were sold to the Alabama Power Company. It was at this time that he removed to St. Joseph as vice-president and general manager.

As manager of the securities department of the Western division, he will have charge of all the territory west of the Mississippi River.

Francis X. Sullivan was appointed to the Board of Transportation, New York, N. Y., by Mayor Walker, on March 23. The new incumbent succeeds William A. De Ford, a holdover from the Hylan administration, who resigned last November. Commissioner Sullivan has been prominent for many years as an attorney for labor unions and at present is counsel for the State Federation of Labor. He was graduated from Union College in 1901. From 1917 to 1921 he was Commissioner of Public Works in Queens. For two years he served as a member of the Home Rule Commission of New York.

T. H. Steffens, vice-president of the Sand Springs Railway, Sand Springs, Okla., for the past fifteen years, has succeeded the late Charles Page as president. Mr. Steffens has been with this property since its organization. Prior to that time he was connected with the St. Louis-San Francisco Railroad, St. Louis, Mo.

Ralph H. Love, manager of the Hiawatha, Kan., properties of the Illinois Power & Light Corporation, has been appointed local manager of the Kansas Power & Light Company's property at Atchison, Kan., to succeed Deane Atkins, transferred to Topeka. Mr. Love will continue in charge of the Hiawatha plant.

Changes Announced in New Jersey Property

Changes in personnel of the Public Service Railway and the Public Service Transportation Company, Newark, N. J., were announced recently by Arthur T. Warner, general manager in charge of traffic. They are: Morton H. Dean, formerly superintendent of time-tables, as traffic engineer; Herbert E. Conway, formerly traffic investigator, as superintendent of time-tables; Harold B. Whitman, formerly assistant manager, Passaic Division, as passenger agent.

M. H. Dean

Morton H. Dean, the new traffic engineer, began work for the Public Service in 1906 in the time-table department at Newark. Later he became a schedule maker and then chief clerk in that department. In 1925 he was appointed superintendent of time-tables.

Herbert E. Conway, who has replaced Mr. Dean as superintendent of time-tables, entered the Public Service Railway employ in 1910, upon leaving Stevens Preparatory School. He took a position in the time-table department and three years later was transferred to the traffic department as traffic investigator. In 1917 he returned to the time-table department as schedule maker and became chief clerk of that department in 1925.

H. E. Conway

Harold B. Whitman, passenger agent, became a checker in the traffic department after returning from the Mexican border in 1917. He served as sergeant in the Argonne during the World War and returned to Public Service in 1922, becoming superintendent of the Market Street carhouse in Paterson. He was appointed assistant manager railway and transportation, Passaic Division, Nov. 1, 1925, and recently has been attached to the traffic department in Newark.

Frank T. Freeman, who for the past two years has been superintendent of bus maintenance and repairs of the Public Service Transportation Company, subsidiary of the Public Service Railway, Newark, N. J., resigned on Feb. 25. At one time he was in the garage business in Florida and later he built and equipped a modern plant at Rahway for general machine, foundry and electrical contracting and automobile repair work. For many years Mr. Freeman has been identified with the maintenance of automotive fleets, having previously worked in that capacity with the Standard Oil Company of New Jersey and Kaufman's Department Store, Inc., Pittsburgh, Pa. Mr. Freeman has not announced any plans for the future.

Obituary

Wallace Heckman

Wallace Heckman, a vice-president of the Chicago Railways and former business manager and general counsel for the University of Chicago, died in Chicago on March 7. As a member of the operating board of the Chicago Surface Lines Mr. Heckman served as an arbitrator in several labor controversies involving the railways.

Mr. Heckman was born at Moscow Mills, Ohio, May 2, 1851. He was admitted to the Illinois bar in June, 1876, and from 1885 to 1908 was senior member of the law firm of Heckman, Elsdon & Shaw. In 1903 he was made counsel and business manager of Chicago University, which position he held until 1924, when he became associated with the Chicago Surface Lines.

Oren Joseph Smith, at one time chief engineer of the Denver Tramway, Denver, Col., died recently in Denver. He was 74 years old.

Joseph J. Heim, financier of Kansas City, Mo., and at one time an important figure in transportation, died in Kansas City recently after a year's illness. Mr. Heim's specialty was railway construction. With J. W. Ground, T. K. Irwin, W. W. Calhoun and Fred Fitch he constructed the Joplin & Pittsburg Railway, of which he later became president. Some ten years ago he was the principal owner in the Kansas City, Kaw Valley & Western Railway, which he also built. More than 30 years ago Mr. Heim built the East Side Railway of Kansas City at his own expense. The road extended from the north side business district of Kansas City to the East Bottoms district. An amusement park served by the railway was erected shortly afterward near the Heim Brewery.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions

for Discussion of Manufacturing and Sales Matters

Dr. Gilbreth Urges Psychological Test for Workers

Stressing the need for more attention to the psychological aspects of the worker when building an effective industrial organization, Dr. Lillian Gilbreth, of Gilbreth, Inc., consulting engineer, New York City, made the principal address before the New York Railroad Club in the Engineering Societies Building on March 18. Mrs. Gilbreth is one of the three women members of the American Society of Mechanical Engineers.

In the opinion of the speaker, the first step necessary in building an effective organization is to inculcate a healthy philosophy toward work. The worker is pessimistic, especially when production is being pushed. He has an undeveloped economic theory. He must know whether or not he is going to suffer if he increases production. From the standpoint of the speaker, motion-study, stop-watch analyses are not half so effective as a deep study of the psychological effects caused by the pressure of work, worry, friction, fatigue, financial troubles, isolation, and lack of appreciation. Dr. Gilbreth also pointed out that a man might display ability for a certain job, yet not like the job, because it had no emotional appeal for him.

It is highly important to determine whether the nervous stability of the worker is of the kind that would make him benefit by the work he is engaged in. After such studies are made, and the man selected on the basis of these psychological facts, then the workers must interlock in so far as their jobs are concerned. In other words the worker must be teaching the man below him, while he is learning the job up ahead of him. Dr. Gilbreth laid great emphasis on the necessity of making a study of machines before planning better methods. In her opinion, the betterment of machine design has never been given the attention it deserves.

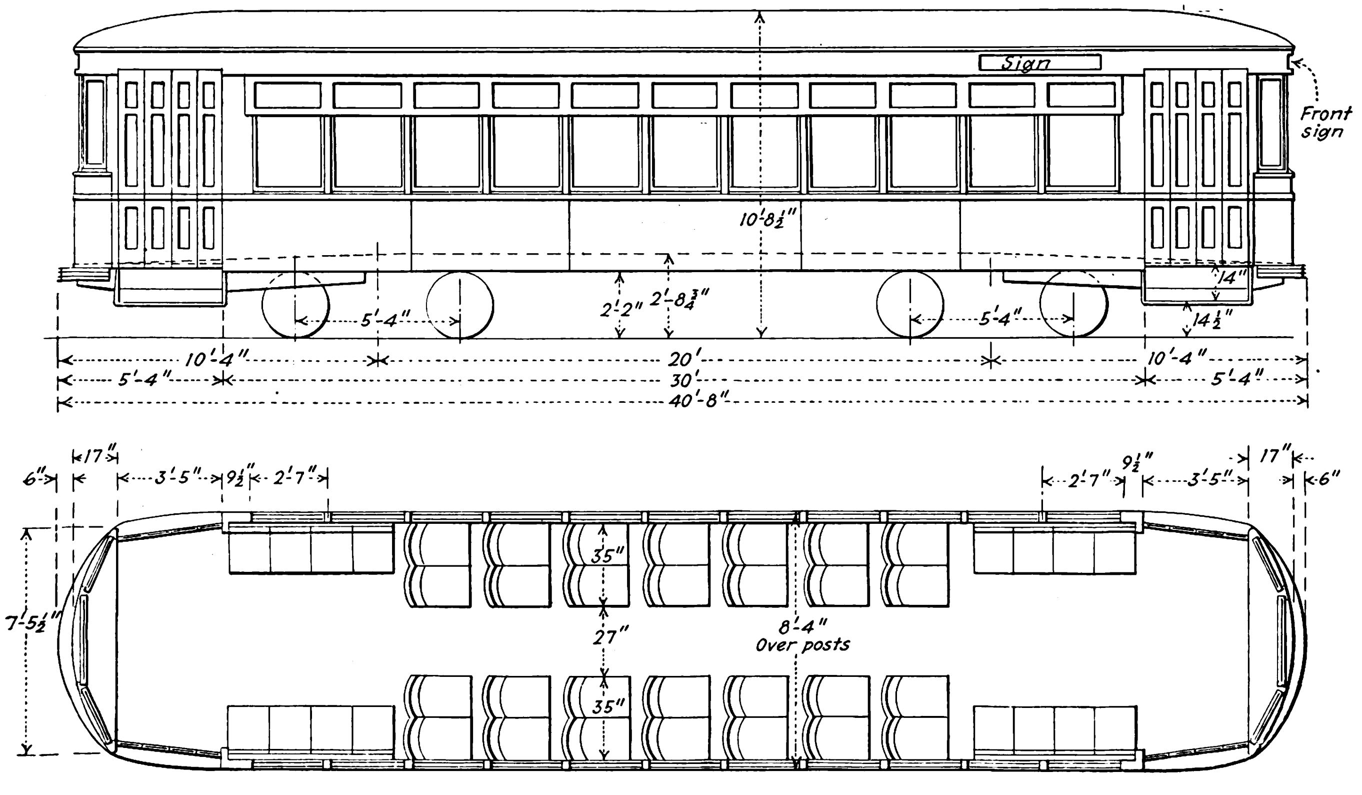
The psychological test to be absolutely effective and practical must begin at the top, said the speaker. It must be good for everybody, and records of each test are essential. In illustrating the point that rapidity of motion and nervous energy often resulted in lost motion, Dr. Gilbreth cited the case of the lazy man who, he said, often makes good by reason of his laziness.

Springfield-Worcester Car Order Placed

Total Cost of 100 New Vehicles Will Be $1,650,000—50 Cars to Be Built by Osgood-Bradley and 50 by Wason —Delivery Promised July 1

PROMISES made by the New York, New Haven & Hartford Railroad to improve the facilities of its street railway subsidiaries in Springfield and Worcester, Mass., culminated on March 22 in the placing of orders for 100 cars costing $1,650,000. As forecast in the JOURNAL of March 14, contracts for 50 cars for the Worcester Consolidated Street Railway were awarded to the Osgood-Bradley Car Company and 50 for the Springfield Street Railway to the Wason Manufacturing Company. They will be of the double-truck, light-weight, one-man, city type, semi-steel construction.

Aside from the accompanying specifications, general specifications issued by the two companies call for four longitudinal seats and fourteen cross-seats of the deep cushion type with welts on the cushions to give individual seat effect. The backs of the cross seats are to be concave and scalloped to give individual seat effect. Panels under longitudinal seats are to be of aluminum. The railway company is to have the option of genuine leather or best quality Chase mohair upholstery. Rico rigid retrieving sanitary car straps are to be provided over each longitudinal seat. The wainscot of



Exterior and floor plan of new Worcester-Springfield cars the car from the top of the seat support panels to the window sills is to be ¼-in. mahogany-faced three-ply Haskelite.

All movable windows are to have Rex brass removable sash. Root, Wason or Bradley air-operated scrapers will be installed at the option of the companies. Specifications with respect to the trucks call for the car body to be mounted on low-level trucks to be selected by the railway company, the trucks to have solid forged side frames and cast-steel bolsters. The proposals of the car companies must contain estimates for both plain and roller bearings. Brakeshoes are specified as A. B. S. & F. Co. Diamond "S," pattern D-67. Safety car devices are to be manufactured by the Safety Car Devices Company. The floor is to be covered with $\frac{3}{16}$-in. battleship linoleum. Automatic window wipers are to be supplied in the center front vestibule window.

Each car is to be equipped with double-faced advertising sign racks to carry public notice cards attached to car lines and extending across the center of the inside car body. An outside color scheme of yellow, cream, and red for lettering, has been specified. All mahogany interior finish is to be stained mahogany. Weights of the cars have not yet been announced.

General specifications are as follows:

Number of cars ordered	50 each
Date order was placed	March 22, 1926
Builder of car body	Osgood-Bradley Car Co., Wason Manufacturing Co.
Type of car	Double truck, city type, light Weight, one-man, two-man
Seating capacity	44
Bolster centers, length	20 ft. 0 in.
Length over all	40 ft. 8 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	10 ft. 10¾ in.
Body	Semi-steel
Interior trim	Mahogany
Headlining	$\frac{3}{16}$-in. Agasote
Roof	Arch
Air brakes	General Electric Co. or Westinghouse Elec. & Mfg. Co.
Axles	A.S.T.M. spec. annealed carbon steel
Bumpers	7-in. Hedley anti-climber
Car signal system	Faraday
Car trimmings	Bronze
Curtain fixtures	Curtain Supply Co.
Curtain material	Brown denim
Designation signs	Hunter
Door mechanism	National Pneumatic Co.
Energy-saving device	Arthur
Fare boxes	Cleveland Model 5
Hand brakes	Peacock staffless
Heater equipment	Railway Utility
Headlights	Golden Glow or General Electric
Motors	Four 35-hp. General Electric or Westinghouse
Paint	Vitralite
Seats	Brill, Heywood-Wakefield or Hale-Kilburn—optional
Step treads	Kass Safety
Trolley catchers	Ohio Brass
Trolley base	Nuttall No. 20 or Ohio Brass
Ventilators	Garland, Railway Utility or Nichols-Lintern
Wheels	A.E.R.A. standard 26 in.

$7,000,000 Additional Insurance Carried by G. E. Employees

More than $132,000,000 in life insurance was carried by employees of the General Electric Company under the free and additional group plans on Dec. 31, 1926. During the first two weeks of 1927 a recanvass of employees resulted in securing 5,000 additional names for a total of about $7,000,000 insurance, increasing the number of all employees of the company insured to 83 per cent of those eligible.

Since the additional insurance has been in force, 340 employees have died. They had free insurance to the amount of $390,825, and 255 held additional insurance totaling $354,500, making a grand total of $745,325.

Approximately 64,000 employees were insured under the free insurance plan, and 46,300 employees under the additional group policy. The average policy under the free insurance was $1,108 and the average under the additional plan was $1,331, making an averoge of $2,439 per employee for the 46,300 in the additional group.

A.E.R.A. Exhibit Blanks Will Be Mailed In May

Fred C. J. Dell, director of exhibits, American Electric Railway Association, is now preparing a new application form for exhibition space for the annual convention of the association at Cleveland, Oct. 3-7. The form will be sent out on May 16 and must be returned within the 30-day limit.

Industrial Exposition in Cleveland

Joseph H. Alexander, president of the Cleveland Railway, Cleveland, Ohio, is the president of the committee in charge of the Cleveland Industrial Exposition, to be held in the Cleveland Auditorium from Aug. 6 to 28. The exposition committee is composed of men prominent in the financial and industrial activities of the Cleveland district.

The purpose of the exposition is to present to the world a concentrated picture of the industrial activity and human progress achieved by northern Ohio; in other words, to "sell" the Cleveland district, its products and its opportunities, to itself and to the world. It is expected that the exposition will inspire not only constructive thought in the community but will open to individual exhibitors new market fields, new accounts and increased consumption of the products displayed.

The exposition will be open from 10:30 a.m. to 10:30 p.m., daily and sunday. Exhibition space is available to products made or sold in the northern Ohio district.

Heads of Electrical Industry Hold Policy Meeting at Briarcliff

Nearly 300 executive officers of the electrical manufacturing industry attended a two-day meeting of the Policies Division of the National Electrical Manufacturers Association, held at Briarcliff, N. Y., March 17 and 18. John H. Trumbull, Governor of Connecticut and president of the Trumbull Electric Manufacturing Company, Plainville, Conn., made the keynote address. Governor Trumbull flew from his home in Connecticut to attend the meeting. An outstanding result of the conference was a definite set-up for the three major divisions of the industry, namely, apparatus, radio and supplies.

Gerard Swope, president of "Nema," was authorized to appoint a committee to study the patent cross-licensing as practiced in the National Automobile Chamber of Commerce, and formulate a plan whereby an interchange of patents in the electrical industry may be achieved. The investigating committee is to report back to the policies division for further action.

In the opinion of those present price cutting has been found to be distinctly uneconomic for both buyer and seller. "We don't like to do business with a merchant who has three prices," said one speaker. "That is one reason for the tremendous growth of department stores. They have one price, based on actual cost and a fair profit, and they stick to it." The consensus of opinion was that a more accurate knowledge of costs will increase sales because it will not result in unintelligent shifting of prices, and it will not cause companies to go into bankruptcy when they should be making money.

The business policies committee reported on such subjects as cash discounts, terms of payment, length of guarantee terms, consigned stocks, freight allowances, service charges, appraisers, charges, and similar items.

Among other speakers were Owen D. Young, chairman of the boards of the General Electric Company and Radio Corporation of America; Clarence L. Collens, vice-president in charge of the Policies Division of "Nema"; H. D. Crouse, president of the Crouse-Hinds Company of Syracuse; A. Penn Denton, president of the Denton Engineering and Construction Company of Kansas City; F. L. Nicholson; H. P. Kirkland; Marle Thorpe, editor of *Nation's Business;* Robert A. Brannigan, manager of the patent department of the National Automobile Chamber of Commerce; L. B. F. Raycroft, vice-president in charge of the association's Radio Division, and others.

Virginia Electric & Power Company Parades New Cars

With various city officials and business and civic club representatives as guests, the Virginia Electric & Power Company, Norfolk, Va., staged a parade for five of its new cars recently ordered from the American Car Company, St. Louis, Mo. The cars will be put in service on the Norfolk and Pinners Point run. This equipment is part of an order for ten cars placed Dec. 1, 1926. Illustrations and full specifications will be carried in a later issue of the JOURNAL.

Diesel Prize Announced for Oil Power Week

Edgar J. Kates, chairman of the national committee in charge of Oil Power Week, has announced that it will be observed this year from April 18 to 23. It is also announced that the national committee will award a cash prize of $100, accompanied by suitable certificates, to be known as the Rudolph Diesel award. This award will be made for the best contribution toward the advancement of oil engines, either in the form of a paper presented at one of the meetings throughout the country under the auspices of Oil Power Week, or a written discussion of a paper, by any one attending any of the meetings. Manuscripts should be in the hands of the national committee not later than June 1, 1927, and the award will be announced by Aug. 1. All persons interested are asked to get in touch with Mr. Kates at the national committee headquarters, 29 West 39th Street, New York City.

Oil Power Week observance will consist of meetings throughout the country for a discussion of subjects of oil-engine fuels, engine design, operation, economics, research problems, etc.

Fifty Cars and Five Buses for St. Louis

Application for authority to build 50 street cars at an estimated cost of $510,000 was filed in the United States District Court on March 21 by Rolla Wells, receiver for the United Railways, St. Louis, Mo. Federal Judge Faris referred the application to Special Master Fred L. Williams for investigation and recommendation. Mr. Wells pointed out that they are needed to take care of traffic requirements.

If permission is granted the company will build the cars in its own shops. The company has built no new cars since July, 1924, and since that time 71 old cars have been retired and scrapped. Mr. Wells informed the court that funds are in reserve sufficient for the construction of the cars.

Application was also filed for permission to purchase five additional buses at a cost of $41,000. This expenditure was also referred to Mr. Williams for approval.

Trends in the Metal Markets

Commencing with this issue of Electric Railway Journal, through the courtesy of and in co-operation with *Engineering and Mining Journal*, there will be published in these columns a weekly review of the non-ferrous metal markets. The prices quoted and the general situation will be as of Wednesday preceding date of issue.

Major non-ferrous metal markets with the exception of zinc have been generally dull during the week ended March 23, according to *Engineering and Mining Journal*. This is the third quiet week for copper, whereas lead has heretofore been moderately active. Zinc buying was close to the average in volume. Zinc, tin, silver and antimony closed the week at prices differing little from those of last Wednesday. Both copper and lead prices are lower; copper is available at 13.25 cents and lead has been cut to 7.55 cents, New York. The sinking of a vessel carrying about 800 flasks of quicksilver has created keen demand in the American market and the price has soared to about $115 per flask.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	March 22, 1927
Copper, electrolytic, cents per lb	13.025
Copper wire, cents per lb	15.25
Lead, cents per lb	7.55
Zinc, cents per lb	7.03
Tin, Straits, cents per lb	68.875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.625
Somerset mine run, Boston, net tons	1.925
Pittsburgh mine run, Pittsburgh, net tons	1.85
Franklin, Ill., screenings, Chicago, net tons	2.25
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.80
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.76

As regards copper, the large producers during the present week have consistently maintained their asking price of 15.375 cents and some business had been done at that level until March 23. On the other hand, second-hands and custom smelters have been willing to shade this price. As low as 13.275 cents delivered in the East was done, but 13.30 cents represented fairly the low range of the market. A general disposition on the part of consumers, who bought heavily during February, that they can afford to wait is said to be the reason for the present situation of the market. Some of the consumers question the authenticity of the reports of curtailment and say they have been deceived by such rumors before. On the other hand, the attitude of the producers indicates that they have confidence in the belief that demand will exceed the current supply in the next few months and that they do not need to lower their present price to get business. The exporters' price remains unchanged at 13.65 cents c.i.f., though the volume of business has declined sharply during the week.

Lead demand during the last week has been much quieter than usual. With the February rate of world lead production even greater than that of January, producers feel keenly any dull period, and a pronounced tendency to shade prices to effect sales has been in evidence for the last few days. Corroding grades of lead have been somewhat scarcer than chemical lead and have generally commanded about $3 a ton premium in the Middle West. The leading producers in the Middle West have receded from the 7.40 cents, St. Louis, level of a week ago, and on March 23 were at 7.30 cents. Lead at 7.30 cents has been available all week from Friday on, first as resale lots and then from the producers. In the East what little demand there was was satisfied at the American Smelting & Refining Company's price, which continued at 7.65 cents, New York, until March 23, when the price was reduced to 7.55 cents.

Consumers took little interest in tin, either for prompt or future delivery, and dealers were not particularly active. Spot and prompt Straits sold during most of the week slightly above 69 cents, with June about 2¼ cents less. The .99 per cent grade is now only slightly less than a cent below Straits, owing primarily to decreased supply from China.

Zinc prices have fluctuated within narrow limits except for one large sale on Monday, which brought 6.60 cents. There has been some recovery since, although the price is still below that of a week ago. High-grade is quoted at 8½ cents delivered in New York.

M. L. Sindeband Now Vice-President American Brown Boveri

Maurice L. Sindeband has been elected a vice-president of the American Brown Boveri Electric Company. Since 1915 he has been in the engineering department of the American Gas & Electric Company and he was recently elected a vice-president of this company in charge of the electrical engineering department.

Mr. Sindeband was educated at Columbia University. He started his engineering career in 1907 with the New York Central Railroad. His next occupation was station-design work with the Brooklyn Edison Company, and in 1915 he entered the engineering department of the American Gas & Electric Company. His rise here was rapid, and he was made electrical engineer in 1918. The rapid growth of the American Gas & Electric system called for working out large-scale interconnection plans and the building up of a consolidated operating organization. In this executive engineering work Mr. Sindeband was so successful that he was made a vice-president. Several patents attest his ability as an inventor. He has been very active as a writer of articles for the technical press and has presented several papers before the American Institute of Electrical Engineers.

Car and Bus Order at Houston Held in Abeyance

Recent advices are to the effect that the purchase of twenty street cars and ten buses reported in the March 19 issue of the Journal as having been bought by the Houston Electric Company, Houston, Tex., is included as part of a $1,500,000 program of expenditures dependent for its consummation upon a readjustment of the relations between the city of Houston, Tex., and the Houston Electric Company, as reviewed in the Journal for March 12, page 464.

Foreign Trade Convention Set for May 25

The fourteenth national foreign trade convention will be held in Detroit, Mich., on May 25, 26 and 27. A call for the convention, issued by the chairman, James A. Farrell of the United States Steel Corporation, states that the object is "to afford opportunity for thoughtful examination of the present condition and future possibilities of our foreign trade; to stimulate co-operation in the best use of our resources, and to secure the judgment of practical and experienced traders on the problems that confront us."

All Americans concerned in the development of foreign trade as a factor in national prosperity, whether in agriculture, commerce, education, industry, finance or transportation, all chambers of commerce, boards of trade, national and state associations, and other industrial and commercial organizations, as well as firms and individuals, are invited to participate. A full opportunity will be afforded for free discussion from the floor. The secretary of the National Foreign

Trade Council, under the auspices of which the convention will be held, is O. K. Davis, 1 Hanover Square, New York, N. Y., from whom further details may be secured.

Bakelite Caravan Treking Through Central States

Bakelite Corporation, New York City, announces that there is now in progress throughout the Central States a traveling exhibition of Bakelite in industry. The exhibition includes the products of some two hundred manufacturers throughout the United States who have contributed their devices to be used in this demonstration of Bakelite's varied function. From March 10 to March 26 the caravan visted the following cities: Columbus, Dayton, Canton, and Cleveland, Ohio, and from March 28 to May 7 the itinerary will be as follows: Toledo, Ohio; Hotel Commodore Perry, March 30-31; Ann Arbor, Mich., University of Michigan, April 4; Hotel Tuller, Detroit, Mich, April 6, 7 and 8; Lansing, Mich., Hotel Olds, April 11; April 13, Hotel Pantlind, Grand Rapids, Mich.; Hotel Keenan, Fort Wayne, Ind., April 18-19; April 21, Hotel Grand, Anderson, Ind.; April 25-26, Hotel Lincoln, Indianapolis, Ind.; April 28, Purdue University, West Lafayette, Ind.; May 2-3, Hotel Seelbach, Louisville, Ky.; May 6-7, Hotel Sinton, Cincinnati, Ohio.

Rolling Stock

Beaver Valley Traction Company, New Brighton, Pa., will purchase six new passenger cars. They are to be double truck, one-man operated. Delivery is to be made by June. This purchase of cars follows the reseating of ten of twenty recently purchased single-truck cars that were found not to conform to the standard of ease and refinement set by the company for its patrons. The new seats are Kemi-Suede covered and replace those of the wood slat type. The improvement is meeting with public approval.

Pittsburgh Motor Coach Company, Pittsburgh, Pa., a subsidiary of the Pittsburgh Railways, has placed an order for ten type X parlor coaches with the Yellow Truck & Coach Manufacturing Company of Chicago. The new coaches are the 20-passenger type and are similar to those now in service between East Liberty, Point Breeze and the downtown section of Pittsburgh. Delivery will be made at an early date.

Indiana Service Corporation, Fort Wayne, Ind., has announced, through its president, Robert M. Feustel, that ten new city street cars will be purchased this year for operation in Fort Wayne. This is part of a $1,600,000 improvement program outlined for the city. A general plan of $2,000,000 improvement includes rehabilitation of interurban lines running through northern Indiana.

Yellow Truck & Coach Manufacturing Company, Chicago, reports the following bus sales to electric railways: Seven gas-electric buses, Portland Electric Power Company, Portland, Ore.; three type Z city service coaches, Los Angeles Railway Corporation, Los Angeles, Cal.; three 21-passenger city coaches to the Louisiana Electric Company, Lake Charles, La.; four 21-passenger Yellow coaches, Oklahoma Railway, Oklahoma City; three 21-passenger city service coaches, Eastern Texas Electric Company, Beaumont, Tex.

Track and Line

Fresno Traction Company, Fresno, Cal., has been granted a certificate of public convenience and necessity by the Railroad Commission of California to exercise the right and privilege granted by an ordinance of the city of Fresno to extend its lines upon McKenzie Avenue from the intersection of Fresno Avenue, easterly to Ninth Street and McKenzie Avenue and along Fresno Avenue from Fresno and Belmont Avenue to Olive Avenue, or the edge of the city limits of Fresno.

Stark Electric Railroad, Alliance, Ohio, is now laying 300 tons of new rail in and about Alliance and expects to make approximately 7,000 tie renewals during the summer months. According to a statement recently issued by E. W. Sweeney, general manager, the materials for the new work represent an expenditure of $17,000.

Rome Railway & Light Company, Rome, Ga., is planning an expenditure of $75,000 on railway improvements in Rome.

Arkansas Central Power Company, Little Rock, Ark., is planning to lay new rails and paving between its rails on Prospect Avenue from Lee Avenue to St. Mary's Academy. Work will commence as soon as the City Council of Little Rock grants the necessary permission. The improvement, entailing a cost of approximately $150,000, will be one of the major construction jobs of the company's 1927 program. Rail of a heavier section will replace the present 70-lb. rail, and in addition all joints will be welded.

Dallas Railway & Terminal Company, Dallas, Tex., has received approval from the City Commission of Dallas for an additional expenditure of $1,100 on an extension of the Vickery Place street car line. The extension from Vickery Boulevard to Ridgedale Street was included in the extensions to be made under the Everman Plan No. 4. It was completed two months ago, but when its cost was disclosed it was found to have exceeded by $1,100 the estimated cost of $9,770. The additional expenditure authorized by the commission will be credited to the improvement fund of the traction company.

Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va., recently installed eight heavy groundthrow electric switches manufactured by the Cheatham Electric Switching Device Company, Louisville, Ky. Three of the switches have been placed on Washington Avenue, three on Chestnut Avenue, one on Virginia Avenue, and the two remaining switches on Hampton Avenue, and King and Queen Streets.

Trade Notes

Waukesha Motor Company, Waukesha, Wis., furnished the engines for the new Twin Coach designed by Frank R. Fageol of Oakland, Cal., and described in the JOURNAL of Feb. 26.

Robert C. Lanphier has been elected president of the Sangamo Electric Company of Springfield, Ill., to succeed the late Jacob Bunn. He had been vice-president and general manager ten years. Mr. Lanphier is also president of the Sangamo Electric Company of Canada, Ltd., and a director of the British Sangamo Company, Ltd. Otis White, general superintendent, was elected vice-president in charge of manufacturing, and Fred C. Holtz, chief engineer, was elected vice-president in charge of engineering.

Safety Car Devices Company, Wilmerding, Pa., during the past eight months has furnished safety car devices for the following rolling stock orders other than those reported in detail in the ELECTRIC RAILWAY JOURNAL: Five cars, Gary Railway; 50 cars, Pittsburgh Railways; six cars, Roanoke Railway & Electric Company; five cars, Williamsport Passenger Railway; three cars, Alabama Power Company, Birmingham, Ala.

Armco Culvert Manufacturers' Association announces the opening of two new district offices, one in Lincoln, Neb., with Mont C. Noble, formerly chief of bureau of roads and bridges, Nebraska State Department of Public Works, as district engineer in charge, and the other office in East Point, Ga., with Tom M. Neibling, formerly research engineer, Georgia State Highway Department, as district engineer in charge. This office will be in charge of association work in Alabama, Florida, Georgia, Louisiana, Mississippi, Tennessee, North Carolina, and South Carolina, and the Nebraska branch that of the work incident to Nebraska, Kansas, Iowa and Missouri.

The Lincoln Electric Company announces the following changes in its sales personnel: G. N. Bull, formerly with the Worthington Pump & Machinery Company in its Washington, D. C., office, has been made district manager of the New York office; C. S. Freeman, previously in charge of the Lancaster office, has been transferred to the Buffalo office and made district manager; S. W. Shultz, formerly of the Philadelphia office, has been put in charge of the Lancaster office, and E. J. Pfister, formerly of the Buffalo office, has been transferred to the Philadelphia office.

Nichols-Lintern Company, Cleveland, Ohio, is now prepared to furnish the N-L bus heater, which has been under development in practical service and according to the maker has proved its capacity to provide a comfortable heated vehicle and exceptional ventilation.

Bragg-Kliesrath Corporation, Long Island City, N. Y., has recently furnished 100 brakes to the Chicago Motor Coach Company and 37 brakes to the Fifth Avenue Coach Company, New York City.

An Alligator Meant Motion to the Pharaohs

STRANGE is the concatenation of events. Change is often kaleidoscopic. Even at the risk of seeming to be overzealous the urge is irresistible to call attention again to a week's news that brought forth the stories of the new Springfield car, the new cars for the Washington, Baltimore & Annapolis Railroad, the new car truck for the Chicago & Joliet Electric Railroad and in another field the announcement of a new type of sleeping car containing fourteen rooms with a bed in each.

Surely the world of motion seems to be emerging rapidly from the era of utility to that of luxury, and maybe that is as it should be. No longer does the phrase *magnum vectigal est parsimonia* hold true. It is just the other way around. Economy is no longer a great revenue. Money can be made by spending money. And the transportation industry is finding it out. People want comfort. An alligator is just as good as he was in the days of the Pharaohs for riding upon. That was the affair of the Pharaohs. But the terms good and bad indicate nothing positive considered by themselves. Just because reverence is due to Noah and his ark is no reason why the effort should be made to emulate him today. Yet unconsciously this has been done too often in the case of rolling stock.

The present day Sophists notwithstanding, times do change. Reasoning *à posteriori* from these and other events, the conclusion is inescapable that the railways in their equipment advance are crossing the Rubicon. One must still live before one can philosophize. But in transportation today one must philosophize if one is to live. In the light of recent events it does not seem sacrilegious to chant *te Deum laudamas.*

It Has Penetrated to the Roots of American Life

HE WAS just a little chap, not more than twelve years of age. He was standing in the middle of one of the busiest streets in New York City. He represented the conglomerate type that is an integral part of our city life. On his face was an expression of responsibility far beyond his years. He was directing traffic at a critical time, and traffic was obeying every motion of his hand. There was no confusion. Rattling trucks, screeching taxicabs, clanging street cars, halted at his whistle. In his alert gestures and frail little body was the fruition of one of the greatest movements mankind has ever undertaken. He proclaimed better than all the screaming posters and reams of propaganda that the safety movement has penetrated to the very roots of American life.

Now let us glance Westward. Take the recent case of Albert Frick, the young salesman for the Public Service Company of Northern Illinois, whose life was prolonged for 108 hours through the devotion of more than a score of his co-workers who had been trained in the art of artificial respiration; their skill was made possible because safety had been sold to the company for which they worked. Did Albert Frick die in vain? Certainly not. His death set up another beacon that will dispel the gloomy idea that corporations are soulless; that their employees have no regard for life and limb.

The gasp of the dying man, "Press a little harder, boys," is a motto worthy of the safety movement. If it is obeyed the roots of the movement will not only be sustained, but there will come a time when the unsafe man or woman will be considered a menace to society.

The little boy at the corner, and Albert Frick; what powerful arguments for the doubter!

Further Recognition of Need for Relief from Paving Obligations

RELIEF for electric railways from part, at least, of their paving burdens is a burning issue. So far five states—New Jersey, Connecticut, Massachusetts, Montana and Utah—have extended relief of this kind to the railways. In addition more than 50 municipalities also have granted such relief in whole or in part.

New Jersey is the latest state to recognize the need for relief for its railways from burdens to which they should not be subjected under the changed conditions of the present day. There the Legislature, as noted in the ELECTRIC RAILWAY JOURNAL for March 26, has just passed over Governor Moore's veto a bill to relieve electric railways of a large part of their paving costs by not requiring them to put down new paving around their tracks when municipalities pave. The companies, however, are compelled to repair paving for 18 in. on each side of the track when damage is caused by the operation of cars, but are not compelled to repair damage other than that caused by the cars.

Passage of the bill over the Governor's veto followed a hard fight. Virtually the same bill was passed by both houses last year, but was vetoed by the Governor. When the measure came up again this year some local officials went to the extent of running display ads in the newspapers attacking the bill. However, the bill was carried in both houses by a good margin and was passed up to the Governor. Immediately upon his veto, the bill was reintroduced into both houses and quickly repassed.

The passage of the measure, particularly under these circumstances, should have a salutary effect elsewhere. In New Jersey the issue was coupled with that of the preservation of the 5-cent unit idea on the lines of the Public Service Railway. True, the plea for relief was the plea of the railway in the interest of its patrons, but the public did not have to accept the company's word alone. Rightly, the Board of Public Utility Commissioners as long ago as 1925 aligned itself on the side of the railways. The board then stated that paving obligations have no logical relation to present-day operation as conditions have changed since these obligations were imposed; that they must be considered in fixing the rate of fare, and are a factor in fare increases. The commission went on record to the effect that economies effected by modification of paving obligations more nearly to represent present-day conditions would help not only to maintain the 5-cent unit of fare, but would provide additional revenue toward the better upkeep and maintenance of equipment and in general make available funds for betterment of service and improvement of operating conditions.

These are the conclusions of the state regulatory body. It was a position not taken without due deliberation. Already the passage of the measure has attracted favorable attention elsewhere, notably in New York State, where the cudgels for similar relief have been taken up, notably by the Syracuse *Herald*, which characterizes the relief measure as essentially just. There should be no let-up by electric railways elsewhere in their efforts to secure relief similar to that obtained in New Jersey from conditions that are anachronistic under present-day conditions.

Where One Man Is Better than Two

EVIDENCE continues to accumulate in favor of the one-man car. Not only is it a satisfactory substitute for the two-man car, but service on many properties shows that it is distinctly better than the two-man car. Some of the advantages were referred to briefly in an editorial in this paper for Feb. 19. In a paper read before the recent meeting of the Illinois Electric Railways Association R. F. Palmblade spoke along similar lines from his experience in Peoria and other cities of the Illinois Power & Light Corporation system. He points out that there is a positive decrease in accidents per unit operated when the one-man car is used. Of course, the cars must be equipped with the pneumatic and electric devices that have been developed to forestall man-failure and equipment failure, but these have become so nearly universal in their adoption that one scarcely thinks it necessary to call attention to them any more. In fact, these devices are being used on many of the cars specifically designed for two-man service.

Mr. Palmblade also pointed out once more that the one-man car, properly used, is a time saver. Since the operator does not share responsibility with another, he can proceed with his duties just as soon as he is satisfied in his own mind that he should, without waiting for signals. With the assurance given by the automatic safety devices, many seconds can be taken advantage of which in the aggregate will amount to many minutes in the course of a day. Many of us who have ridden on a street car to save time have listened to the traffic officer's whistle that caused a wait when a fraction of a second saved by the conductor in giving the signal or closing the door would have let the car move through on the previous signal, and have groaned inwardly at the waste of our own time, though we gave not a thought to the company's.

It is well for all those who oppose the introduction or extension of use of the one-man car to ponder well Mr. Palmblade's closing words: "Were it not for the one-man type of operation the public would be paying much more today for a street car ride and many transportation systems would long since have passed out of existence."

Enter the Villain of the Piece

EVEN today on a goodly number of electric railway properties one will find being enacted the typical blood-curdling melodrama of the Roaring Nineties. The hero (Public Relations Department) woos the innocent lass (the General Public) with soft words and gallant gestures. But the wicked villain (Claims Department) grasps the curly locks of our heroine in his vile paw and makes away with her. Ensues a battle royal between hero and villain, with the hero, alas, not always triumphing in the end, according to glorious tradition.

So the standards of the local utility stage must be elevated. Our heroes cannot be allowed to suffer ultimate defeat—it is too unsettling to audience morale. No, the villain in the piece must be given his just deserts, even as he snarls his memorable line "The Public Be Done."

Of what avail the honeyed phrases of the public relations department—its persuasive assurances that its sole desire is to deal in an eminently fair manner with each and every member of the public—when the individuals charged with administering claims settlements are fairly bristling with a "try and get it" air?

The car of a passing motorist is caught between a street car and a coal truck and squeezed into a shapeless and unbeautiful hulk. Possibly the claims investigator will call on the disconsolate owner and assure him that by no stretch of the imagination could the railway company be blamed for the unfortunate occurrence; probably the motorist will be completely ignored. At any rate he is indisposed to let the matter drop and pocket the loss himself, so he writes to the public relations department in the belief that from *this* quarter he will be assured fair consideration. Public relations asks claims about the case and is informed that even though the company may be at fault it would not be "expedient" to arrange a settlement unless the injured motorist actually files a suit. The hands of public relations are tied, so it either writes a letter of meaningless generalities or fails to reply at all.

In high dudgeon the motorist then retains a lawyer and files a suit. Quite as a matter of routine the claims department then waits upon the attorney for the complainant and grudgingly dickers for a settlement. The car owner has won his contention without bloodshed, but must split the amount with his lawyer, so that half of the cost of repairing his automobile probably devolves upon him anyway. When next he reads in the friendly little publication of the transportation company of the great efforts being made to render 100 per cent service and insure cordial relationships with the public, does he believe it? Alas, gentle reader, he does not.

A little public relations psychology injected into the activities of the claims department would make a world of difference on properties where incidents similar to the one just described are all too frequent. Nor does it mean that any claims should be paid unless they are just ones. It is the treatment the claimant receives that counts. A knocker can tear down more good will than ten boosters can build up. On every large city system there is bound to be a considerable number of accidents. Is it good business to develop a first-class knocker out of every individual who comes into unpleasant contact with a reactionary claims department? Let's scrap the villain in the first act and make the local "drammer" a thing of beauty and a joy forever.

Practicing Penance in East St. Louis

LENTEN mortification has been assuaged in East St. Louis, Ill., with the East St. Louis Railway and subsidiaries playing the rôle of moderator. Beginning on Sunday, March 6, and each Sunday until Easter, each city passenger paying a 10-cent cash fare is given a free return trip coupon. On the interurban cars coupons valued at 10 cents are given upon payment of each regular cash fare and can be applied at that value toward the purchase of a return ticket. The reduction is in effect on Sundays only, and in compliance with numerous requests the courtesy has been extended to cover the hours of morning and evening church services.

Although, with the attendant advertising needed and the actual transportation costs, the company will find itself out of pocket an appreciable amount, still even before the advent of mi-carême, the possible revenue loss had been more than compensated for in letters of commendation, newspaper comment, pulpit approval and general good-will publicity.

But granting that many Laodiceans were in need of just such stimulation as a reduced fare or a free return, who would then deny the efficacy of this novel plan? Seemingly unalluring inducements have a telling effect sometimes, although the tale is seldom told.

Aside from the ethics of incentives to attend church exercises and the commentaries on the possible diversion of the money saved through this plan, the railway is to be commended for its co-operation and contribution to the penitential program. It is another instance of the changed status of the utility in sensing the needs of its patrons and in tangibly supplying such wants. In helping its patrons "to carry on" in Lent, perhaps the railway is doing a service more far reaching than it contemplated!

The Safety Car Duckling Growing Into a Swan

IN THESE days, when a posy thrown in any direction is pretty sure to hit a de luxe trolley car, let us not forget that in many cases this pleasing development was made possible by that ugly duckling the automatized, light-weight safety car.

Born of the dire need for economy, the safety car with its exposed carlines and slat seats could not make claim to that comfort and beauty which create patronage by stimulating the desire to ride an attractive vehicle. Its first job was to cut down costs; its second to hold or recapture business through greater frequency. Those jobs were done so well that hundreds of properties were able to keep their heads above water through all the awful struggles of post-war price increases and personal car expansion.

Now that this phase of the industry is past, electric railway operators are finding that the time is opportune to take the further step of producing transportation of a quality that has something more than mere utility. People use their personal cars not because they have to but because they like to. The present effort is to secure the same viewpoint for the public conveyance. Of course, that can never be 100 per cent possible, but when we consider the increase in the habit of riding brought about by the automobile and the great difference in cost between private and public transport there is plenty of business in sight for cars designed to attract it.

In view of the varieties of de luxe cars coming forward, it is pleasant to observe that the Stone & Webster organization, which did so much pioneering with safety cars, has encouraged its operators and its car specialist, C. O. Birney, to adapt themselves to the needs of the new ride-selling era. The Birney safety cars on various Stone & Webster properties today, with their cushioned seats, treadle doors, rich illumination, bright interior trim and exterior treatment in combinations like red, white and gold, afford a striking and happy contrast to their barebone predecessor of the war and post-war periods. The duckling hatched under grim necessity shows promise of becoming a beautiful swan.

Manufacturers of Tools Are Missing a Great Opportunity

NOW that the time has rolled around for securing exhibition space at the annual convention of the American Electric Railway Association at Cleveland next October, one is tempted to review the list of exhibitors at last year's convention, having in mind the very few tool manufacturers who have availed themselves of this medium of acquainting the industry with the value of their products with respect to servicing buses.

With the ever-increasing sale of buses as an auxiliary transportation for railway utilities, the need for proper servicing grows daily. Investigation reveals that in instances too numerous to mention the railway companies operating bus lines are at a loss to make emergency or general repairs due to lack of the proper tools. That these tools are being manufactured for every class of bus goes without saying. On the other hand, very few bus operating companies know that the right tool for the right job is available, which brings up the all-important subject of proper exhibits at a convention which attracts practically the entire personnel of the industry.

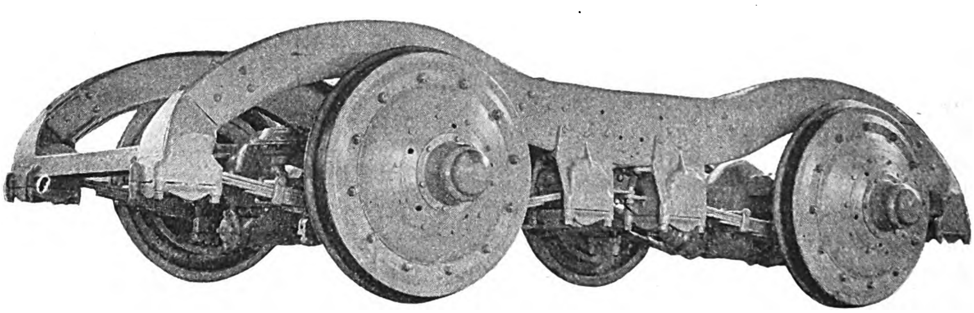
It appears to the JOURNAL that an exhibit of these tools is highly important and will be of mutual benefit to the railway companies and the manufacturers. It is one thing to have a fine stock of tools adapted for all purposes of repair and quite another thing for them to repose unexploited upon the shelves of the manufacturer. A golden opportunity is being missed in this respect, and in a spirit of absolute disinterestedness the JOURNAL suggests that tool manufacturers join the big parade in order that every one concerned may profit by physical inspection of their wares.

As illustrative of the value of showing a tool for every purpose and every job, one prominent member of the American Electric Railway Association was high in his praise of the Annual Maintenance and Construction Issue of the JOURNAL, basing his remarks upon the improved equipment section, which illustrated a wealth of tools and devices of inestimable value to the industry. This gentleman expressed the opinion that a section of this kind not only would give the master mechanic a splendid idea of the tool, and create a desire to possess one in his shop, but it would benefit the manufacturer in one of his greatest problems, i.e., making the purchaser visualize the usefulness of the tool.

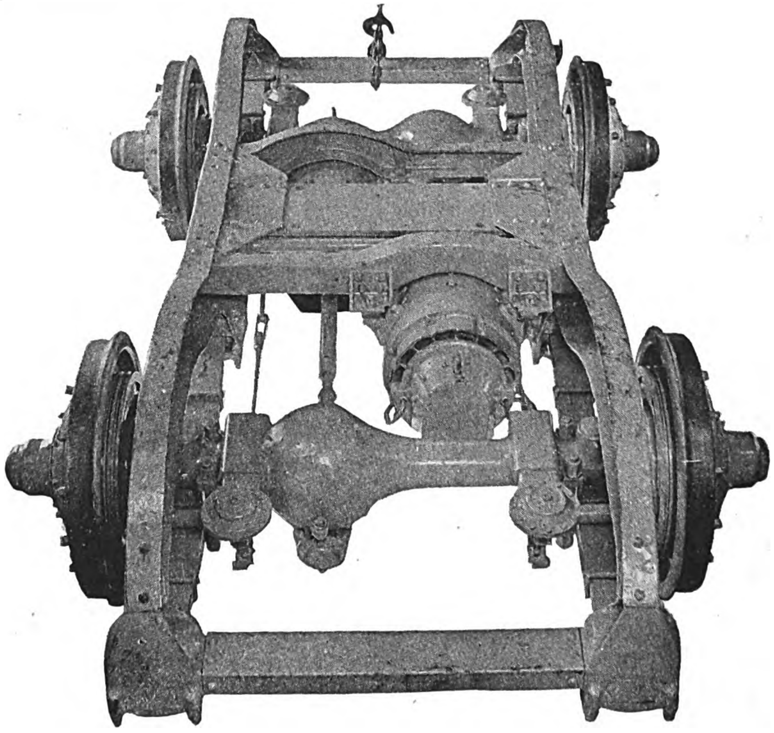
Joliet Develops

Worm-Drive Trucks to Reduce Unsprung Weight

Complete departure from conventional design is expected to reduce noise, cause less wear and tear on the car and track, and increase riding comfort



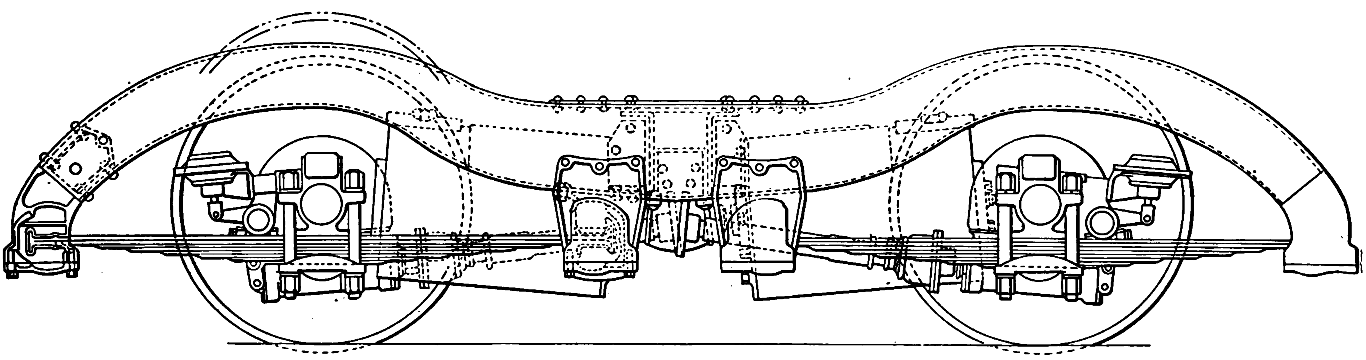
Reduction of unsprung weight, elimination of noise, smaller weight and operating economy were the objectives in the Joliet truck design. Although still considered in the light of an experiment, this departure from customary railway practice is based on the application of design features which have proved successful in heavy-duty automotive vehicles



A very simple type of construction is obtained in this application of automotive axle construction to a street railway truck. The side frames are made of $\frac{5}{16}$-in. pressed steel. The bolster is likewise pressed steel, $\frac{3}{8}$ in. thick

FURTHER radical departures from conventional design are incorporated in a pair of sample worm-drive street car trucks completed for the Chicago & Joliet Electric Railway by the Timken Detroit Axle Company. This development is the outgrowth of a conviction in the mind of J. R. Blackhall, vice-president and general manager of the Joliet property, that an entirely new standard of street car performance is needed to meet the demands of present-day conditions. As in the case of the experimental trucks for Springfield, Mass., an account of which was published in last week's issue of ELECTRIC RAILWAY JOURNAL, reduction of noise was one of the principal objectives sought. This seemed to dictate a design which would provide driving gears fully inclosed, protected from dust and immersed in oil. It also seemed clear that unsprung weight must be reduced to a minimum by carrying the driving motors on spring-suspended members of the truck framing rather than directly on the car axles. This is expected to reduce wear and tear on both equipment and track, while at the same time reducing those noises attributable to the pounding of the conventional construction over joints and special work. A gear reduction of $8\frac{1}{2}$ to 1 is used. The effect of the large gear reduction made possible by worm drive is cumulative in the design, since it permits the use of comparatively light, high-speed motors giving necessary driving power with a large saving in weight. One truck completely equipped with two Westinghouse V-91-B motors having a one-hour rating of 35 hp. and with brake apparatus weighs only 5,328 lb. This weight reduction, together with the probable increased efficiency for frequent stop service resulting from the high gear ratio, is expected to show a considerable economy in power consumption.

Several railway and automotive manufacturers col-



Half-elliptic springs on the Joliet worm-drive truck are carried in Masury rubber shock absorbers mounted in cast steel housings on the truck frame. A fixed pressed steel bolster is used

laborated with Mr. Blackhall and the Timken Detroit Axle Company in the truck design and construction. These include the Westinghouse Electric & Manufacturing Company, the Westinghouse Air Brake Company, and A. F. Masury and C. Froesch of the International Motors Company, who co-operated in the spring mounting design. Special section rolled-steel wheels were furnished by the Standard Steel Works. The pressed-steel side frames and all other pressed-steel parts were made by the Inland Steel Products Company. Although the trucks for Springfield, Mass., and the Joliet design are similar in many respects, they differ in several important features. A fixed bolster is used in the Joliet truck, the frame is of different design and the gear reduction is 8½ to 1 instead of 10 to 1 used by Springfield.

A specially designed body of combination wood and Duralumin is being built by the Cummings Car & Coach Company. This will be 45 ft. 1 in. long over all, 8 ft. 6 in. wide and 11 ft. ½ in. extreme height. The body will be arranged for one-man, two-man, double-end operation with automatic rear exit doors and will seat 51 passengers. It is estimated to weigh 14,000 lb. with all equipment. This will make the weight of the car complete with double trucks and four motors approximately 24,600 lb.

The worm-drive axle is not new in principle but is an adaptation of construction features which have been successfully used on heavy-duty automotive vehicles. It is of the underslung worm, fixed-hub type. The housing

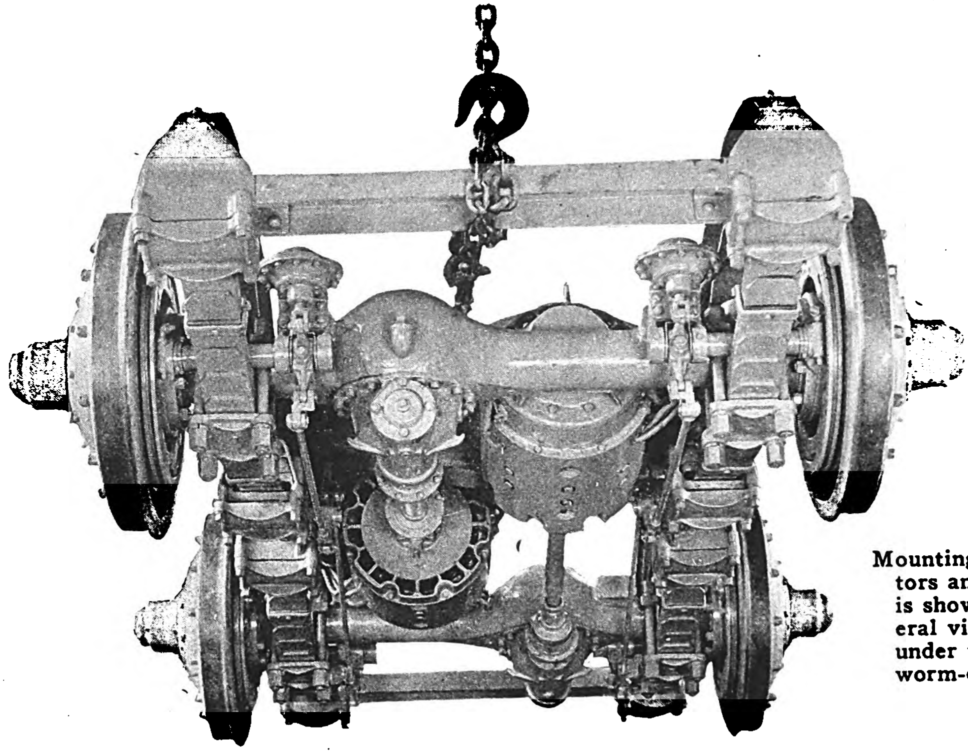
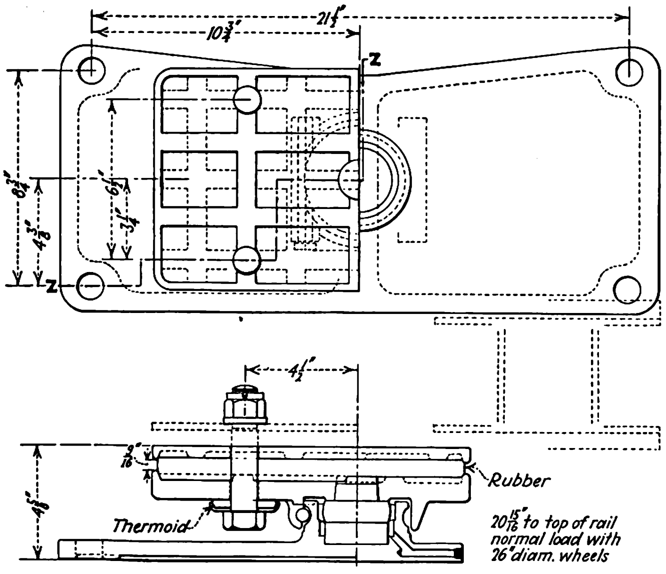
Cross-section through the Timken worm-drive car axle shows the special dished wheel section which reduces the overhang at the wheel bearing. The underslung worm has a clearance of 4 in. to the rail



Mounting of the motors and drive shafts is shown in this general view looking up under the new Joliet worm-drive truck

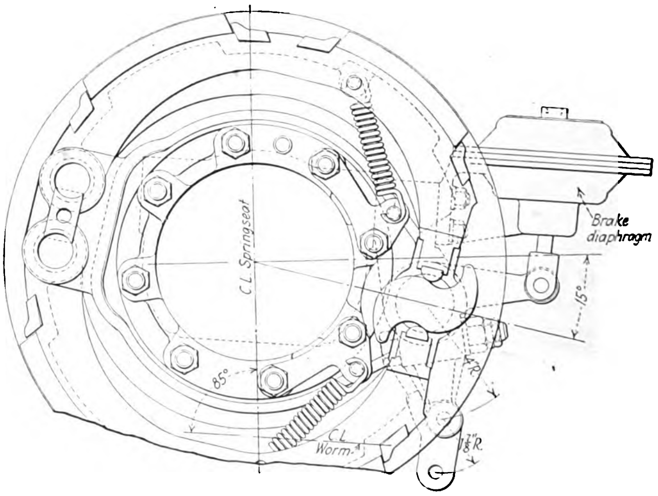
is a one-piece steel casting with the worm carrier bowl offset from the center so as to permit the motors to be offset in the truck, driving in each case the far axle by a short driveshaft connected through two Spicer universal joints. Spring seats for the 4-in. wide half-elliptic truck springs are cast integral with the axle housing. The axle shafts are made of heat-treated alloy steel, designed with a large margin of safety for the calculated loads. Compared with the conventional automotive shaft the spline end is quite small in proportion to the load end. This is for the reason that the maximum torque that can be exerted is considerably less than in automotive practice because of the relatively small coefficient of friction between steel wheels on rails in comparison with that obtained on a rubber-tired vehicle.

Customary factors of safety have been considerably increased in the sample truck. A 3-in. axle diameter is used in place of 2⅝-in., which has proved satisfactory in heavy-duty vehicle practice under the same loading. By the use of dished steel wheels a still further improvement is made over automotive practice. With the conventional fixed-hub automotive axle it is customary to have a considerably overhung load on the wheel bearings because the small inside diameter of the rubber tire does not permit dishing the wheel to bring the center line of the tire in line with the wheel bearing. In the Joliet car axle the dished wheels materially reduce the overhung load and the only serious bending stresses expected are those due to thrust on curves.



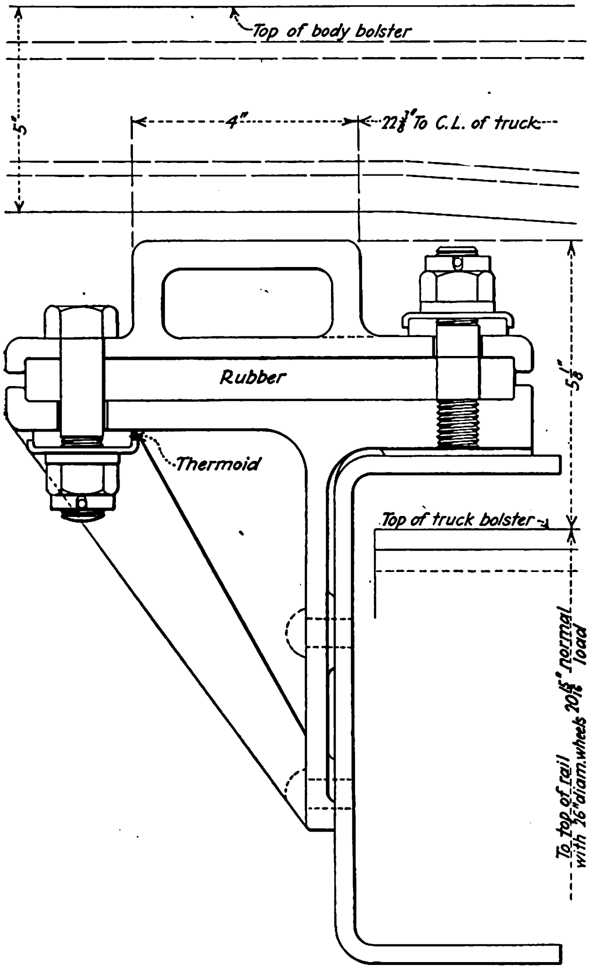
Section Z-Z

A rubber pad to absorb vibration and noise is used at the center bearing



Westinghouse automotive type brake diaphragms are mounted on the axles adjacent to each wheel. The brake drums are bolted inside the special wheels and have a diameter of 17¼ in. The effective braking surface is almost four times that obtained in automotive vehicles

The wheels have a taper fit on the axles and are held in place by a nut on the end, covered in turn by a protecting cap. Clearance under the worm housing is 4 in. to the rail. Westinghouse automotive type brake diaphragms are carried directly on the axle housings and are connected through the brake mechanism to the internal expanding shoes at each wheel. The brake drums are 17¼-in. diameter with 4-in. face. They are bolted to the inside of the wheels and have fins turned on their outside surface to improve heat radiation. There is 7/16 in. of effective wearing metal to insure long life before renewal is necessary. Two brake blocks are used on each shoe, having an area 4 in. x 5½ in. Almost four times the braking surface ordinarily provided on buses is thus obtained. Comparisons of weight per unit of brake block surface on present cars and buses with that on the experimental trucks gives an expectancy of between 75,000 and 100,000 miles per set of blocks.



Rubber pads are used under the side bearings to deaden sound

Side frames of the truck are made of 5/16-in. pressed steel in channel form, proportioned to carry the loads and give necessary stiffness. The fixed bolster is made of ⅜-in. steel, pressed into the form of a deep pan, with a cover plate of the same material riveted in place. It is attached to the side frames by gusset plates. Rubber pads of special design are to be used between the bolster and the center bearing to reduce noise and vibration and to improve riding.

Four-inch semi-elliptic springs of automotive type are securely clamped by bolts under the spring saddles provided on the axle housings. At their ends these springs are carried in Masury rubber shock insulators mounted in special cast-steel housings on the truck side frame, as shown in accompanying illustrations.

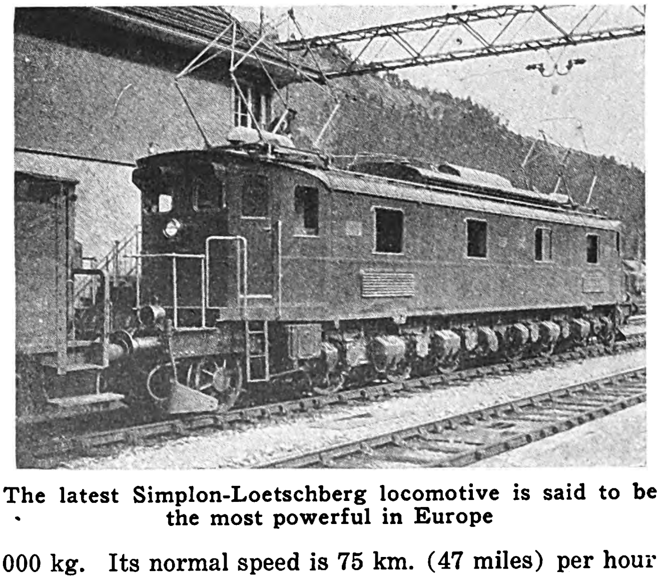
The motors are securely carried on three-point suspensions in the truck frame, so that they are fully protected from vibration and shock through the truck springs. They are wound for 300 volts and are permanently connected in series in pairs of two, for operation on 600 volts. Series parallel control is obtained by treating each pair of two motors like a single motor on an ordinary two-motor control car. The mounting is so arranged that the motor may be readily dropped out of the truck for quick replacement or repair.

Use of automotive type air brakes permits a very simple and workmanlike brake rigging construction which is expected to eliminate much of the rattle attributable to the customary type of street car foundation brake rigging. Adjustment for wear on brake blocks can be conveniently made through an adjustment nut on the brake application shaft. The equipment is arranged so that a hand brake can be conveniently attached. It will be arranged so as to apply the brakes to only one truck from each end of the car. This is considered ample to hold the car on a grade.

Although the new trucks are such a wide departure from customary practice as to make many features of the design experimental in nature, experience with this type of construction in automotive practice indicates a reasonable expectancy of low maintenance and long life. It is claimed that 500,000 miles of life is not uncommon for this type of axle in heavy-duty automotive practice, and that 1,000,000 miles should be obtained under the reduced loads and shocks encountered on street cars. On the basis of an average annual mileage of 40,000 this would give a 25-year life.

Largest Electric Locomotive in Europe

CLAIMED to be the most powerful in Europe is an electric locomotive of the Berne-Lötschberg-Simplon Electric Railway which began service July 22, 1926. There are six driving axles, each driven by two Westinghouse twin motors with quill mounting. Each twin-motor group has a one-hour capacity of 700 hp., making the total capacity of the locomotive on this rating 4,200 hp. The one-hour tractive effort of the locomotive is 22,600 kg. and its starting tractive effort is 34,000 kg. Its normal speed is 75 km. (47 miles) per hour and it is capable of hauling a trailing load of 586 metric tons up a grade of 2.7 per cent at a speed of 50 km. (31 miles) per hour. The weight of the locomotive is 135.5 metric tons, of which 68.5 tons represents the electrical part and 67 tons the mechanical part. The length of locomotive over all is 20.2 meters or 64 ft. 4 in. The drivers have a diameter of 53¼ in.



The latest Simplon-Loetschberg locomotive is said to be the most powerful in Europe

Energy is taken from the overhead system at 15,000 volts, 16⅔ cycles.

Electric Locomotives Stand Up Well in Service

After Nineteen Years Operation St. Clair Tunnel Equipment Is Available for Service 97.7 Per Cent of the Time, with Low Maintenance Costs

NINETEEN years ago the St. Clair tunnel of the Grand Trunk Railway, now the Canadian National Railways, between Sarnia, Ontario, and Port Huron, Mich., was electrified with the single-phase alternating-current system at 3,300 volts. Speaking before the heavy electric transportation class of the Westinghouse Club, Walter D. Hall, superintendent of the tunnel, gave an interesting account of the service that has been performed by the equipment in that time, a portion of which is given in the following abstract.

The electric service was inaugurated in 1908, with six 67½-ton Westinghouse Baldwin electric locomotives. In 1908 these locomotives made 154,392 miles, hauled 288,516 cars weighing 9,231,500 tons. Last year, 1926, these same locomotives made 248,025 miles, hauled 468,760 cars weighing 19,696,708 tons.

In the nineteen years since these locomotives were first operated they have hauled 6,617,590 cars, 268,917,150 tons and made about 3,934,010 miles, an average of 655,660 miles per locomotive; during all these years there is not a total of one hour's delay charged to locomotive failures, and in their nineteenth year, 1926, they were available for service 97.7 per cent of the time; time not available being made up as follows:

	Per Cent
Changing wheels, mostly due to soft tires	0.57
Electrical, changing armatures, etc.	0.57
Mechanical, equalizers, brake rigging, pinions, etc.	0.33
Hydrostatic and hammer tests and other tests for government reports	0.63
Derailment damage	0.20
Total	2.30

The average cost of maintenance per locomotive-mile over the entire period was 9.45 cents. Last year, 1926, this cost was 6.21 cents per locomotive-mile, cost per car-mile 0.659 cent, and cost per ton-mile 0.015 cent.

The locomotive auto-transformers have been rewound once and the commutators of the traction motors were renewed once. The fields of all motors have given practically no trouble. Five air compressor armatures have been repaired, but there has been practically no trouble with the blower motor armatures. Controllers and wiring have required only proper inspection and care. Three or four preventive coils have failed and practically all the union joints in copper rods from these gave trouble at some time, apparently due to the piece of fine copper gauze used in them; the gauze perishes and leaves a loose joint.

The pinions and gears have done remarkably well. Some pinions have exceeded 200,000 miles when removed. Some of the original gears are still in service, having made about 655,000 miles.

The frames of these locomotives are rigid from end to end and on account of the many curves encountered in the terminal yards wheel mileage has been low; on account of sharp flanges experiments were made with oil and hard grease applied in various forms, but without success.

At that time, 1910, the yard engine tires were making about 42,000 miles between turnings, and a maximum of about 250,000 miles, which meant a lot of time lost over the pit as well as a big expense. Realizing the seriousness of the situation, Mr. Hall and one of his foremen rigged up an old lubricator body with spray nozzles, similar in principle to an atomizer, so that the engineers could spray oil onto the wheel flanges when approaching curves by pressing a contact button at any of the controllers. This was so satisfactory that some of these tires made more than 150,000 miles between turnings and a total of more than 300,000 miles. The bearings of these locomotives have given practically no trouble.

IMPROVEMENTS MADE IN OVERHEAD LINES

Strain insulators began to blow up during wet weather and it was found that due to a slight movement having taken place in the insulator, or perhaps due to expansion, the ends had cracked and soot and acid from steam locomotive gases were washed into these cracks during rain storms; this difficulty was overcome temporarily by making shields of sheet fiber which were wrapped around the insulators, allowing the shield to extend beyond the ends about 8 in.

As opportunity presented other insulators were installed, but even with these some difficulty was experienced when hauling heavy ore trains beneath them with steam locomotives; the exhaust gases and moisture would short circuit insulators and result in a ground to the bridge structure; this trouble was overcome by placing two insulators in series a sufficient distance apart to prevent gases emitted from the locomotive stacks striking both at the same time.

In the tunnel were 480 insulating devices which supported two trolley wires from parallel messenger cables. The insulating medium was about 6 in. of impregnated wood. The two messenger cables were supported on barrel-type porcelain insulators. Apparently due to unequal expansion and contraction, the barrel type insulator would sometimes crack, and during damp weather the 480 wood insulators allowed sufficient leakage to blow up the line. An average of eleven short circuits per year resulted from this cause and some danger was present at all hours during the night or day. The wood insulating devices were assembled with hexagon-headed bolts and hexagon nuts and were very difficult to get at even with a box wrench.

To overcome this difficulty 480 insulating supports were made of ½-in. x 1-in. strap and standard 10,000-volt pin-type insulators. This was in 1915, and since that time there has not been a single failure, although the barrel-type insulators continue to crack, and sometimes sections even break away and fall to the floor of the tunnel. In this device bolts square under head and square nuts are used so that they can be easily and quickly removed from the line.

Emergency Service at Montreal Completely Motorized

ALL horses of Montreal Tramways, Montreal, Que., used in the past for construction activity and assisting in maintenance of overhead lines, have been sold. Motors have taken their place. The company's stables on Cote Street are now in process of demolition. Car storage tracks will replace the building. Thirty horses comprised the company's equine fleet, grandsons and great-grandsons of the source of power for the old-time horse cars in Montreal. They were all in good shape and brought good prices when they were sold.

Buses and Cars Give Co-ordinated Local and Express Service

By George H. Harris

General Manager Key System Transit Company, Oakland, Cal.

Key System Transit Company has reduced running time between Oakland and Berkeley by five minutes. The fare is the same for both types of service, with free transfer

Express car and local bus in the co-ordinated service recently established by Key System Transit Company

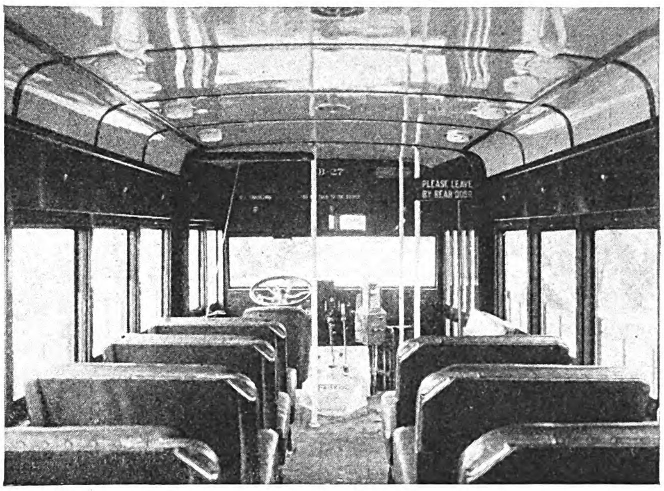
USE of buses in conjunction with street cars, not as feeders, but along the same route, providing local service and leaving the tracks for express service by cars, is being tried by the Key System Transit Company, Oakland, Cal. This railway serves a metropolitan area populated by some half million persons. Consequently on a number of long car routes rapid transit is desirable. Most important of these are the routes between Oakland and Berkeley, which are separate municipalities, but in reality form one large community.

Three car lines operate between the downtown districts of the two cities, via College Avenue, via Telegraph Avenue and via Shattuck Avenue, the two latter running on Telegraph Avenue to a point some 40 blocks from down-town Oakland where Shattuck Avenue branches to the left and, later swinging to the right, becomes Berkeley's principal business street. The Telegraph Avenue line, which is a little longer between the two business centers than is the Shattuck Avenue line, was chosen for the experiment because it is a direct run between the campus of the University of California and the rapidly growing business district on the Oakland side of the campus. From a point a block distant from the campus it veers to the left to rejoin the Shattuck Avenue line in the heart of the Berkeley business area. Traffic on this route is exceptionally heavy.

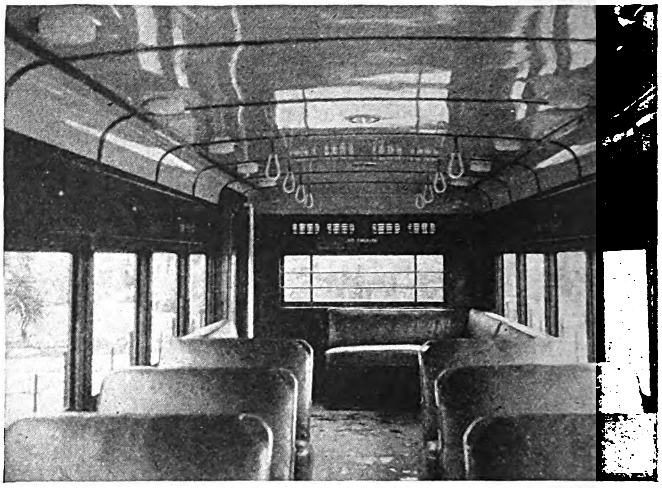
FEWER STOPS RECOMMENDED

Steps which led to the plan now in operation are interesting. Two years ago, in the interest of better service to the public, a survey of the traffic situation was made by a committee of three composed of representatives of the California State Railroad Commission, the city of Oakland, and the railway. This committee recommended the establishment of feeder bus lines in various parts of the city, reducing the number of car stops from 13 or 14 per mile to eight and consideration of some form of express service to outlying districts.

After the two first recommendations had been carried out attention was directed to a study of the third. Express bus service between Oakland and Berkeley was first considered and an application was filed for per-



Passengers enter at front and deposit fare in Johnson box



At the rear a sizable well is provided to accommodate passengers leaving by the automatic rear door

mission to put it in operation on a 10-cent fare with the approval of the two cities concerned. Further study indicated that 10 cents per passenger would be insufficient, so the application was withdrawn and revised to call for a 15-cent fare. Meeting with the disapproval of the cities, this, too, was withdrawn. As a result of further consideration the system now in use was developed.

Buses are operated on a local schedule out Telegraph Avenue as far as Alcatraz Avenue, which is about two-thirds of the distance between the two business districts and is the approximate boundary line of the two municipalities. Telegraph Avenue cars operate on an express schedule of three stops to the mile as far as Alcatraz Avenue and then resume local operation. Shattuck Avenue cars run on the same schedule as far as Shattuck Avenue on Telegraph and there resume local operation.

The fare for both buses and street cars is the same as in other sections of the cities—7 cents—and passengers boarding buses outside of the downtown areas, where the cars make regular stops, may transfer to cars at any express stop. Oakland-bound passengers on express cars may leave at any stop along the route provided they have boarded the cars outside the express limits.

The present express service on the Shattuck and Telegraph Avenue lines, respectively 5 and 6 miles long, saves from three to five minutes per trip between the business districts. Cars are operated on a ten-minute schedule and the buses every four, six, or 7½ minutes, depending on traffic conditions.

BUSES HAVE AUTOMATIC REAR EXIT

For this service fourteen Fageol 29-passenger buses are used. The bodies are all steel and were designed by the railway's engineers. They are the front-

Local transportation service is given by bus between the Oakland terminus and Alcatraz Avenue, cars stopping at specially designated points

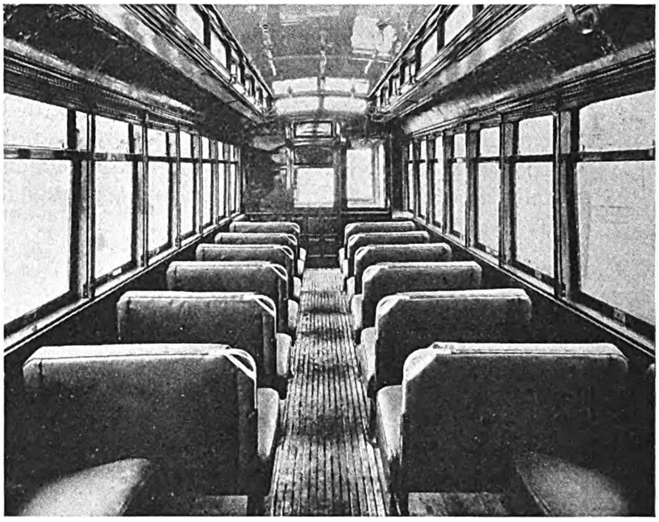
entrance, rear-exit, single-deck, pay-as-you-enter type. The rear door is controlled by a treadle step. In addition the rear door may be operated by compressed air from the driver's seat, the front door being similarly manipulated.

How successful this experiment will be it is still too early to determine, but the management is optimistic. If it proves as successful as is hoped this type of operation will be extended to other sections of the metropolitan area.

Cincinnati Remodels Interior of Cars

Electric Heaters and Cross Seats Installed in 21 Pay-as-You-Enter Cars—All Thoroughly Painted Before Return to Service

INTERIORS of 21 double-truck pay-as-you-enter cars were recently remodeled by the Cincinnati Street Railway, Cincinnati, Ohio. These were manufactured by the Cincinnati Car Company and originally had longitudinal seats to accommodate 34 passengers. Replacing these with twelve cross seats, two longitudinal seats on one end of the car and one longitudinal seat at the opposite end of the car has improved greatly the interior appearance as well as providing additional comfort for the passengers. The upholstering of these seats, which are of Hale & Kilburn manufacture, is in Spanish leather. The color creates a pleasing contrast with the mahogany stained interior finish and the cream headlining.



Full-upholstered Spanish leather seats are a feature of the new equipment

One Railway Utility Chromalox heater is installed under each cross seat and four are installed in the front vestibule. The cross seats are spaced at 31 in. centers and the seating capacity of the car with the new seats is 34.

The outside of the car is painted burning bush orange with cherry enameled sash, cream letterboard and cream window posts. A black stripe makes a very favorable appearance. Painting the trucks red and the roof slate gives a pleasing contrast of colors. Electric Service Supplies Company air-operated sand valves facilitate sanding. The remodeling of these cars was part of the 1926 reconstruction program.

The Men Who Are Responsible for th

Annual Maintenanc

# of Electric Ra

SEVERAL new features were included in the annual maintenance and construction issue of ELECTRIC RAILWAY JOURNAL dated March 19. A maintenance notebook section began with this issue and will be continued in the monthly maintenance and construction issues to supply desirable information on maintenance practices for the men who are actually doing the work. A very complete section was devoted to improved devices and equipment for carrying on maintenance work. The new and special tools illustrated point the way to reduced cost and higher grade maintenance workmanship.

The articles in the issue were written by men who have made outstanding progress in the improvement of maintenance practice. ELECTRIC RAILWAY JOURNAL takes this means of thanking them for helping to make this issue so successful by contributing of their time to tell the electric railway operators the results of their experience.

That the industry appreciates the efforts of those who contributed to the issue is evidenced by the many letters received from electric railway maintenance men throughout the country. The following are extracts from some of these comments:

JAMES E. DOOLEY, master mechanic New Haven Division of the Connecticut Company, writes:

"To my mind the maintenance data sheets of the JOURNAL of March 19 are what all equipment men need, so let this good work go on."

H. E. WEYMAN, manager Levis Tramways Company, comments in part as follows:

"I would like to congratulate you on your maintenance notebook section, which I think will prove a real help to the industry. I assume it is your intention to include track and overhead maintenance data sheets and special tools developed for the work, which will be of considerable interest. Some of the special tools developed by railway companies are very good and should lead to further developments and improvements."

E. S. FITZ, operating manager Gulf States Utilities Company, Beaumont, Texas, comments as folows:

"Your new maintenance notebook section, started in the March 19 issue, appears to me to be a step in the right direction, since these sheets will be available for filing much better than clippings that many of us have been taking out of the JOURNAL in the past. Our organization, I know, will be glad to contribute to this department whenever we feel that we have some ideas that would be of benefit to your readers."

J. L. SMITH, superintendent motor coach department, Toronto Transportation Commission, says in part:

"I have read the maintenance notebook section in your March 19 issue with a great deal of interest and I think that a full set of articles along this line will be very valuable indeed to electric railway men."

CLAUDE BRYAN, engineer of ways Wilmington & Philadelphia Traction Company, says in part:

"I have read very carefully the issue of ELECTRIC RAILWAY JOURNAL of March 19. Your maintenance notebook section starting in this issue is a mighty good thing and I think it will prove very valuable to electric railway men."

From H. A. LEONHAUSER, assistant superintendent of rolling stock and shops the United Railways & Electric Company, Baltimore, Md., comes this letter:

"Your annual maintenance number containing the new maintenance notebook section, as well as the JOURNAL in its entirety, appeals to me very much."

J. B. CORDERMAN, master mechanic Lima-Toledo Railroad, Toledo, Ohio, says:

"I think your annual maintenance number of March 19 is fine. It is a real help to the shop men and is good for the management as well. Any property that is worth operating should be in good condition."

JOHN LINDALL, superintendent rolling stock and shops Boston Elevated Railway, says in part:

"Please accept my congratulations on the many timely and interesting articles contained in your March 19 issue of ELECTRIC RAILWAY JOURNAL. Maintenance men will undoubtedly read this issue from cover to cover. Your proposition to provide a maintenance notebook section looks good to me, as it will enable maintenance men to have such notes in convenient form for ready reference. More power to you in the good work."

E. K. MILES, superintendent of transportation New York State Railways, Syracuse, writes:

"Your issue of March 19 leaves nothing to be desired from a maintenance standpoint. The description and explanation of shop equipment was exceptionally fine."

J. E. COLLER, division superintendent Pittsburgh Railways, comments as follows:

"I have read most of your annual maintenance number and I think it is very interesting and useful, and I hope to follow up the suggestions made."

Condition of Electric Railways Commend

and Construction Issue

way Journal

A. F. Rexroth, master mechanic Harrisburg Railway, says:

"Fine! I never saw a better number."

Frank E. Sheridan, master mechanic Boulder Street Railway, Boulder, Col., says:

"I wish to compliment you on the various articles on high class maintenance in your March 19 annual maintenance issue. They are very instructive to the maintenance man."

D. L. Fennell, superintendent of transportation Kansas City Public Service Company, writes:

"A very fine issue and in keeping with your high standards. I have read most of it with great interest. Why not have special issues devoted specifically to transportation practices, accident reduction, claims work and selling rides?"

D. E. Blair, general superintendent Montreal Tramways, says in part:

"Your issue of March 19 is very interesting. I would especially commend the maintenance notebook section. My experience is that most of the small repair shops around the country are equipped very badly in the way of reference data."

Nels C. Rasmussen, superintendent Wisconsin Valley Electric Company, Wausau, says:

"You struck the right idea. This certainly will be the best reference library that the operating men have ever had. Wish you luck in this good work."

Herman Eickhoff writes from Philadelphia as follows:

"In conducting any business efficiently and progressively, it is absolutely necessary continuously to inform ourselves of what and how our competitors are proceeding and the ultimate results accomplished. Your annual maintenance number of March 19 gives just such information. I am sure that it is welcome to the great majority of your readers. Permit me to congratulate you upon the timely improvement."

W. J. Smith, master mechanic Twin City Lines, Minneapolis, says:

"I was very much interested in reading the articles in your March 19 issue. Am sending a note to all the foremen in this department asking them to read the various articles."

Horatio Bigelow, superintendent of railway South Carolina Power Company, Charleston, writes:

"My compliments on your March 19 issue of the JOURNAL. I am pleased particularly with the maintenance notebook section. So often a problem arises, you remember a solution suggested in the JOURNAL, but it takes time to spot the article. The maintenance notebook will help in this regard. I suggest that comparative pull-in records and maintenance costs be included in this section, if possible."

J. W. Hulme, assistant superintendent of car equipment Interborough Rapid Transit Company, New York City, says:

"The maintenance number of ELECTRIC RAILWAY JOURNAL for March 19 was a big success and fills a much-needed want. I consider it the most progressive step the JOURNAL has ever taken."

A. F. Townsend, local manager Northern Texas Traction Company, Fort Worth, Tex., says in part:

"We have received and read the annual maintenance number of the JOURNAL with a great deal of interest. This is a splendid edition and reflects a great deal of work and thought upon the part of those responsible for it.

"I think the notebook section, starting in this issue, is an advanced step in trade journal work, and will be of great value to the industry as time goes on."

Niles Persons, master mechanic Schenectady Railway, makes the following comments:

"I have read the March 19 annual maintenance issue or ELECTRIC RAILWAY JOURNAL with much interest and do not hesitate to say that it is one of the best issues I have ever read. I was particularly interested in the article and pictorial section of the new DeKalb Avenue shop of the Brooklyn-Manhattan Transit Corporation."

From **P. W. J. Smith**, superintendent New York, Westchester & Boston Railway, comes the following:

"I think the March 19 issue was fine. The articles on proper maintenance had the kick that most of us need, and if followed properly should bring about considerable good to all departments. We obtained many good points from this issue from the experience of others."

R. A. Bird, Portland Electric Power Company, Portland, Ore., says:

"Being a transportation man, I do not know much about the maintenance part of the business, but I enjoyed the March 19 issue of ELECTRIC RAILWAY JOURNAL very much and got a lot of valuable information from reading it."

J. W. Knecht, superintendent Grand Rapids Railway, said:

"I enjoyed the March 19 issue of ELECTRIC RAILWAY JOURNAL very much. A maintenance issue always creates much interest among operating employees. The maintenance notebook feature is excellent and should be read by all equipment employees."

H. A. Davis, superintendent of railway Nashville Railway & Light Company, commented in part:

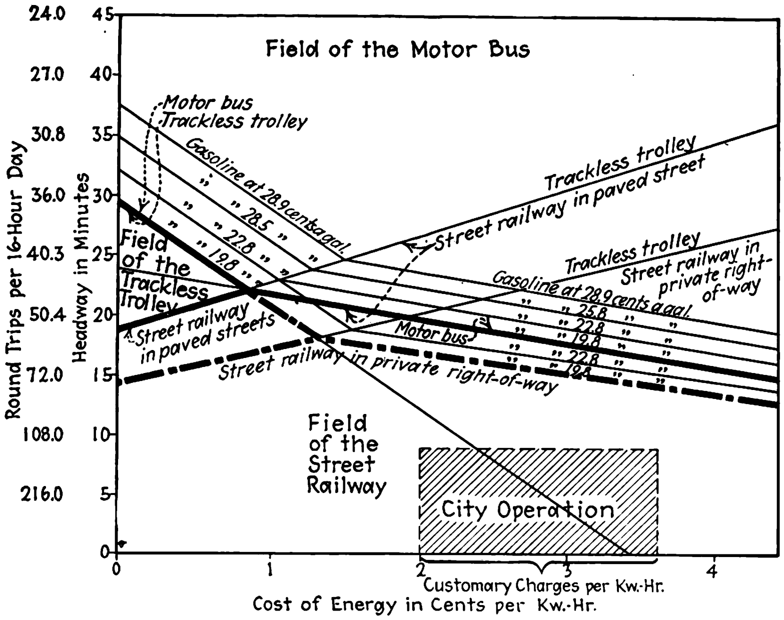
"Your annual maintenance number is a great step forward in solving one of the greatest problems any company has to contend with. I do not believe that we have yet awakened thoroughly to the realization that poor equipment inefficiently maintained will soon demoralize an entire organization—with disastrous results.

"It is equally important that each employee in the mechanical department know his job and be trained thoroughly in the performance of his duties, in order that unnecessary loss of time be eliminated. Old material and old and worn-out equipment help to demoralize the organization. Keep up the morale of your employees by keeping up the equipment, is my advice to any organization. We congratulate you upon this maintenance issue."

Choice of Motive Powers in City Service

Economic Merits of Electric Railway, Trackless Trolley and Motor Bus Operation Charted by Dutch Engineer

GRAPHICAL presentation of the conditions under which each of the three modes of city transit, namely, electric railway, trackless trolley and motor bus, would be the most economical under any given set of conditions has been essayed by P. M. Montijn of the Hague, Holland, Tramway company. In an article in *Verkehrstechnik* for Nov. 26 he works out the basic formulas. In doing this he has taken the costs of the various items as they apply in Holland, but explains that the method is applicable to other conditions if the constants used are changed to fit the particular problem considered. In converting Mr. Montijn's financial data and conclusions to dollars, the Dutch florin has been taken as worth 40 cents. His initial assumptions follow:



This chart shows the fields of the electric railway, trackless trolley and bus under Holland double-track operation conditions

A_s = cost per mile of track, overhead line and feeders for street railway
- (a) single track in paved streets............$22,400
- (b) single track over own right of way (including real estate)............... 32,000
- (c) double-track line in paved streets........ 38,400
- (d) double-track line over right of way...... 51,200

A_t = cost per mile of overhead line and feeders for trackless trolley
- (a) single line with two overhead conductors.$14,080
- (b) double-track lines with two overhead conductors 18,560

t_s = interest and sinking fund on A_s
- (a) when laid in paved streets.......... 8 per cent
- (b) when over private right of way. .... 7 per cent

t_t = interest and sinking fund on A_t......... 9 per cent

t'_s = interest and sinking fund on first cost of the street railway cars............. 7 per cent

t'_t = interest and sinking fund on first cost of the trackless trolley buses............12 per cent

t'_a = interest and sinking fund on first cost of the motor buses......................16 per cent

p_b = cost in cents per gallon of gasoline (or "benzine")* ....19.8 to 25.8

c_s = kilowatt-hours per car-mile for the street railway 0.8

c_t = kilowatt-hours per bus-mile for the trackless trolley 1.6

c_a = gallons of gasoline per bus-mile for the motor bus 0.17

m = average distance in miles covered by each vehicle in a day.......................................109

Reserve rolling stock for time spent in shops and extra trips of 20 per cent is assumed for all three types of transit, although the author says that actually a smaller reserve would be required for the railway than for either bus system. The assumption is made that the street car will have a life of 30 years, the trackless trolley of twelve years and the motor bus of eight years, with an average daily performance for each of 109 miles as already mentioned. No charge for the use of the streets by the buses is included, but the railway track maintenance expense includes the paving charges paid at present by the Hague Street Railway.

From these data the author develops a series of formulas for the yearly cost of operation with each kind of motive power, and on the basis of these formulas two charts were prepared. One is for single-track operation and the other for double-track operation. The latter is reproduced on this page. That for single-track operation has a somewhat similar form.

In discussing the double-track chart the author points out that it shows that even with energy as low as 0.4 cent per kw.-hr. the field of the trackless trolley, as compared with the street railway, would lie only between headways of 17 and 26 minutes for the railway built over private right of way and between 20 and 26 minutes as compared with the railway laid in paved streets. Hence, even at this low cost of energy, the area of the field for the trackless trolley is so small and restricted that a slight change in the headway of the service given would throw the trackless trolley into the field of economic disadvantage. Of course with these long headways the railway would probably be single track, not double track, and the opportunity for the trackless trolley would be even less. Finally, with electrical energy costs at the usual figure of from 2 to 3.6 cents per kw.-hr. the choice really lies between the electric railway and the motor bus.

The author then discusses the fields of the motor bus and trolley and also calls attention to the rectangle in the lower right-hand side of the chart marked "City operation." It will be noticed that this rectangle includes all headways of less than nine minutes where electrical energy can be purchased within the limits of from 2 to 3.6 cents per kw.-hr. These are the customary rates in Holland, so that this area represents the usual conditions of city operation. The author points out that it is well within the area on the chart representing the field of the street railway. Still another advantage of railway operation, not shown in the chart because the chart is based on the use of single units only, is the railway's far greater adaptability to the operation of trailers.

---

*The figures in this calculation are based on the use for fuel of benzine which is the customary fuel in Europe instead of gasoline. The word "gasoline" is used in the chart and elsewhere in this article so as to make the formulas more easily usable by American users.

In conclusion, the author compares the results of his study with those reached by Victor Topping in an article in the ELECTRIC RAILWAY JOURNAL for Aug. 25, 1923. Although the basic conditions in the Canadian example discussed by Mr. Topping vary considerably from those in Holland, the conclusions reached by the two investigators are considered by Mr. Montijn to be not very far apart.

North Carolina Public Service Builds Construction Truck

BELIEVING that a construction truck body containing certain unusual features could be built cheaper in the company's shop, led C. M. Seawell, master mechanic of the North Carolina Public Service Company, Greensboro, N. C., to design and construct such a body.

A General Motors Corporation truck chassis, model K-32, having a weight of 3,943 lb., was purchased. A semi-inclosed body made of well-seasoned oak timbers was erected on this chassis and reinforced with heavy angle braces, bolted securely to the chassis. The roof consists of ⅜-in. pine boards fastened to 1-in. x 3-in. oak cross-beams and covered with heavy canvas, finished with several coats of paint to make it weatherproof. The flooring is made of 1-in. oak planking. Suitable drop curtains on either side of the body inclose the sides during inclement weather.

A multiplicity of strong hooks and racks inside and outside of the body provide for carrying all of the necessary working tools and equipment, such as ladders, rope and shovels. Spacious weatherproof oak tool boxes, extending the entire length of either side of the body as well as under the driver's seat, provide storage for additional tools and equipment. A 6-in. steel channel erected at the back end of the roof, and a similar channel installed on the chassis extension at the end of the floor provide a strong support for a chain hoist or a pole-lifting boom and gaff when required. The completed body weighs 1,200 lb. and the truck has a capacity of 8,143 lb. This truck, with its attractive appearance, spacious interior, complete tool equipment and speed, has met every purpose for which it was designed.

Rear view of truck showing rugged construction and spacious interior

This Advertising Should Draw

RAILWAY advertising in Australia has a new form. The railway stations on the Sunday suburban lines have earthen platforms built up to about the height of the floors in the car. These platforms run the full length of the trains and are usually finished with white gravel, little garden plots and ornamental shrubs, which are tended by the station staff. About a quarter of the space of each platform is under shelter for protection against bad weather, the remainder being open.

These advertising cabinets usually stand on the central platform of suburban stations and the advertisements can be seen by people waiting for trains or in passing trains, some of which stop at the station. The cabinets are of wood with a tiled roof and a little garden plat at the foot, with hanging baskets of ferns, etc. They are glazed, the glass being held by a nickeled frame, and have a stylish look. The advertisements are painted or on printed cards, which can be changed as desired by unlocking the glass frame, which swings out on hinges. The cards are narrow strips of various colors, with a good deal of small sign writing on them. the idea being that people who are waiting for trains will have time to read the small type, though people any distance away could not do so.

Most of the frames now are divided into four spaces on each side and rectangular cards, about 30 x 40 in. occupy each space. The colored designs behind glass look very well.

The advertisements are used mostly by the theaters and for sports meetings and other "topical events." Many of the people who work in Sydney live in the suburbs and a very large number of them travel by train, so that the advertisements reach a large clientele.

The advertising rights are let to an agency, which sublets to advertisers, and frequent changes of advertisements are the rule.

Maintenance Notes

Motors Rebuilt to 95 Per Cent Condition

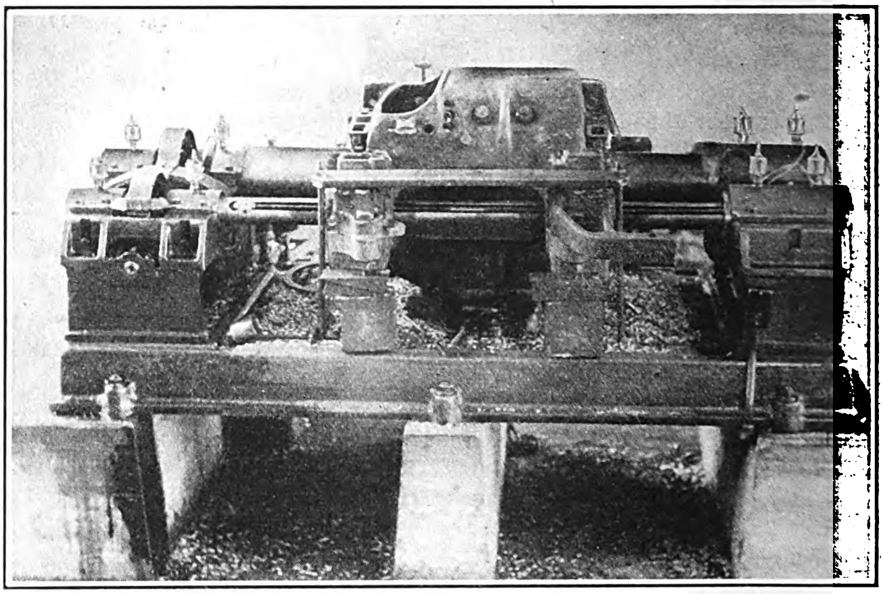
SPLIT-FRAME motors which have seen years of service on the Los Angeles Railway are so reconditioned in the shop that the machines, which are Westinghouse 306-L, are comparable with new. Armatures are completely rebuilt, shafts straightened and bearings refinished. The split frame requires considerable reconditioning. The adjoining faces of the two halves are built up by electric welding and then planed off so that the frame when finished is exactly the original size and shape.

The two halves are bolted together, with 0.006-in. liners between, and placed on a double spindle boring mill, which machines the fits for axle bearings and armature housings. These openings are bored to ⅛ in. oversize. It is necessary to furnish oversize axle bearings and armature housings to fit the reconditioned motor case.

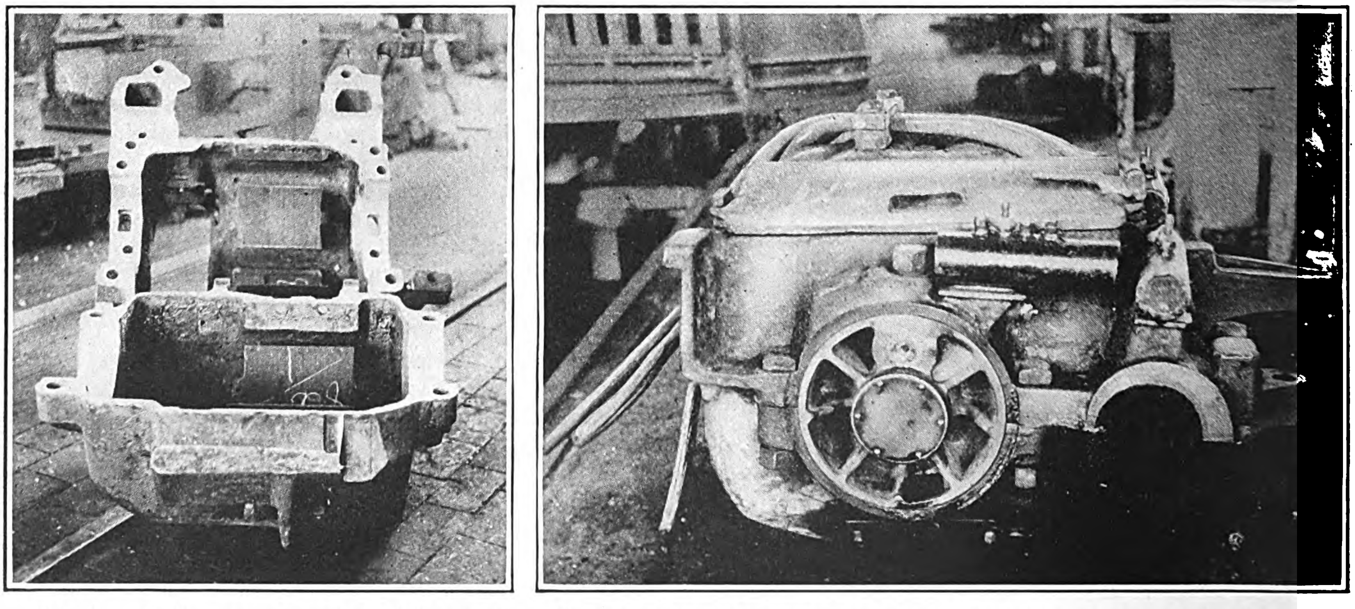
After the case has been finished Rico automatic oilers are fitted to armature bearings and axle bearings. Installation of this type of oiling equipment is standard on the property as this type of motor goes through for reconditioning.

The machine on which the case is bored was constructed in the shop to do this particular job. It is small, compact and simple. This latter feature is made possible with the split case to be bored. The spindles which carry the boring bits revolve in large bearings. These spindles are driven by a worm gear from a small electric motor mounted at one end of the machine. The four cutting bits are held in collars, each driven by its shaft through a single spline, in which is the feed screw. Both right and left hand threads are cut on these feed screws, one-half of the length being cut with each. This makes it possible to feed both cutting tools from the outside of the work to the center with one feed screw. A five-pointed star carried on the end of the feed screw serves as a pick-up for advancing the tool into the work. A dog on the frame of the machine engages a point of the star pick-up every time the main boring shaft makes a revolution.

Particular attention was paid to obtain approximately the same cutting speeds of the tools working on



Motor cases being reconditioned in Los Angeles have openings for axle bearing and armature bearing housing bored on double-end horizontal boring machine



At left, split-frame motors have joints built up by electric welding and then refinished by planing and boring. At right, completely reconditioned No. 306-L split-frame motor with Rico oilers on armature and axle bearings the large diameter cut, or the armature housing, and the tools cutting the small bore, or the axle bearing. The larger bore is 11⅝ in., while the smaller is 5⅞ in. Therefore, the boring bar working on the axle bearing opening was to run at twice the revolutions of the armature bearing housing boring bar. The feed screw for the smaller boring bar is ⅝ in. with eleven threads to the inch, while the other is ¾ in., with ten threads to the inch. As the length of bore for the smaller hole is approximately twice that of the larger hole, the machine takes care of itself automatically once it is started.

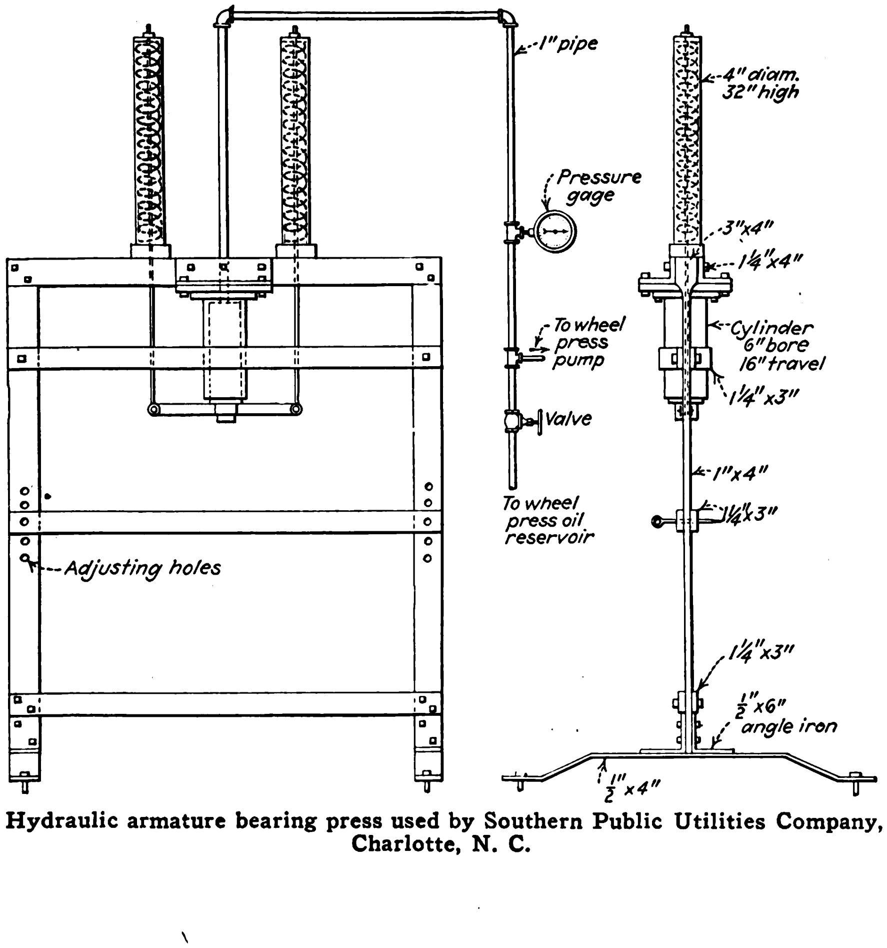
In setting up the machine a disk carried at the center of the large boring bar is clamped between the four pole pieces of the motor case. This centers the hole for the armature bearing housing accurately with the large boring bar. The small boring bar is aligned by raising that side of the case by small jacks. After final alignment the case is clamped to the base of the machine. These clamps are clearly shown in the accompanying illustration of the machine.

Don't be a "pacifist," but be "prepared."
Keep your "snow fighting" equipment repaired.

Armature Bearing Press Operated by Oil Pump from Wheel Press

PRESSING out armature bearings was a very slow and tedious process in the shop of the Southern Public Utilities Company, Charlotte, N. C., until the master mechanic, W. D. Osborne, designed and constructed a hydraulic press in the shop.

This press is operated by the oil pumping equipment of the wheel press. The framework consists of two uprights of 1-in. x 4-in. steel bars that are tied together by steel bars 1¼ in. x 3 in. and 1¼ in. x 4 in. These cross bars are horizontal and are bolted to the uprights. A pressure cylinder having an outside diameter of 12 in., an inside bore of 6 in. and a 16-in. travel is fastened to the two 1¼-in. x 4-in. top cross braces. Two 1¼-in. x 3-in. steel bars encircling the circumference of the cylinder, one on either side and fastened to the uprights, act as steadying clamps for the cylinder. When the pressure is released from the cylinder the ram is returned to the release position by two 3½-in. diameter coil springs, 32 in. long, which are incased in a cast-iron cylinder. Each of these springs is connected to the ram by means of a ¾-in. round iron rod passing through the center and connecting with a ½-in. x 2½-in. clamp fastened to the ram. These connecting rods are threaded on one end and are provided with a nut to permit of adjustment. A 1-in. pipe line between the armature bearing press cylinder and the wheel press pump has a valve mounted near the armature bearing press, which allows for a gradual pressure application. A gage in the pressure line indicates the pressure being applied.



Hydraulic armature bearing press used by Southern Public Utilities Company, Charlotte, N. C.

Each upright is drilled with five adjusting holes to allow for the raising or lowering of the tailstock bars to take care of various sizes of armature bearing heads. The press framework is fastened to two ½-in. x 4-in. U-shaped brackets by means of ½-in. x 6-in. angles. The press is designed to have a maximum capacity of 30 tons.

Aluminum Covering for Stanchions

By H. S. WILLIAMS
Assistant Superintendent of Equipment Department of Street Railways, Detroit, Mich.

MAINTAINING iron pipe stanchions on the older cars has been an annoying problem for many years. No paint has proved adequate to protect them, and complaints from passengers and crews regarding rust getting on clothing have been most annoying. The Department of Street Railways of Detroit has recently developed what seems a very effective plan for overcoming this difficulty.

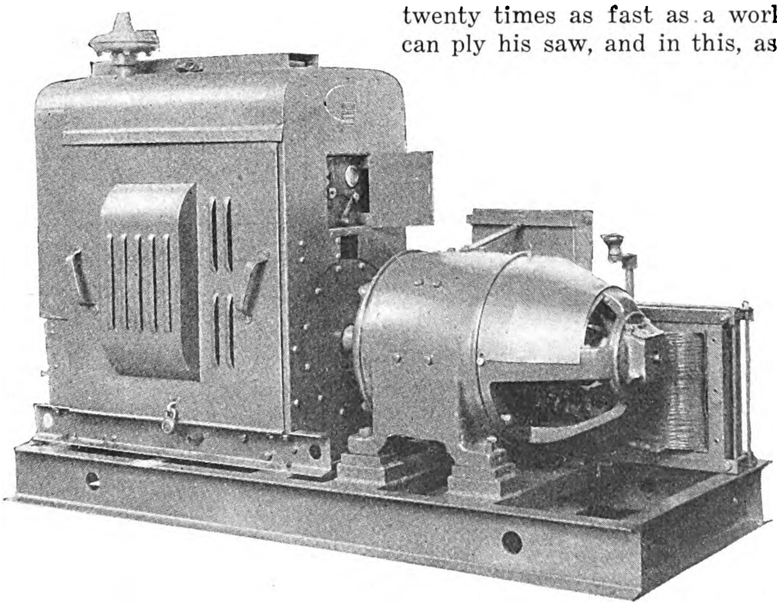
Not wishing to go to the expense of replacing the stanchions on old cars that are near their time of retirement with aluminum or a vitreous enameled pipe and yet being desirous of securing a non-rusting stanchion, the practice has been adopted of slipping a piece of thin aluminum tubing over the old iron pipe. This aluminum tube has a 0.022-in. wall and is just the right diameter to slip over the old stanchion. The old fittings are retained, but before the aluminum tube is placed the outer end of the threaded part is chamfered with an ordinary burring reamer just sufficiently to give a socket effect to receive the end of the tubing. This furnishes a finish to the tube and assists in holding it tightly when the fittings are in place. The fittings are painted with aluminum bronze. It is not necessary to cover any part of the stanchion except that coming in contact with the passenger's hands. Short sections may be covered, if desired, a collar being used at either end to hold the tube and give proper finish.

New Equipment Available

Small Gas-Engine-Driven Welder

PARTICULARLY for shop and garage use where electric power is not available, a small gas-engine-driven outfit incorporating the WD-11 generator with a continuous rating of 150 amp., a one-hour rating of 200 amp. and a welding range from 50 to 250 amp. is announced by the General Electric Company, Schenectady, N. Y.

The generator is driven by a Continental P-20 power unit rated 18.22-hp. S.A.E. and capable of developing 23.5 hp. at 1,400 r.p.m. The generator is equipped with a control panel, rheostat and self-adjusting stabilizing reactor. The engine accessories include a strongly constructed radiator, pressure fed lubricating system with oil pressure gage and indicator, vertical tube gravity feed carburetor, air cleaner, centrifugal governor, starting crank, 10-gal. gasoline tank, tool box and sheet metal hood with sheet metal side panels which can be locked in place.



Shunt generator direct connected to a gas engine

Among the advantages of this combination are low first cost, light weight and reliability. It is stated that tests have shown the outfit capable of standing up under hard service and overloads. The set is mounted complete on a structural steel base so designed as to facilitate easy moving from place to place.

Air-Driven Portable Hand Saw

FIVE times the work of an ordinary hand saw is the ability of a compressed-air operated portable saw devised by the Ingersoll-Rand Company, New York, N. Y. By a shift of blades, the pneumatic hand saw may be put to work in sawing wood, soapstone, Bakelite, wallboard, cables, copper and other materials. Cross-cut or rip blades for different types of work are available. It cuts timber, does trimming work on buildings and scaffolding and can be used by railroads in car repair work.

In sawing wood the portable air-driven hand saw can be operated twenty times as fast as a workman can ply his saw, and in this, as well as in all other work, it can be operated continuously without fatigue to the operator. Its weight is such that it can be carried about and handled easily by the workman. The 8-in. size weighs only 23 lb.

One outstanding feature of this new air saw is its safeguard against accidents. The design combines the Ingersoll-Rand three-cylinder type of air motor, long in use in I-R grinders and lightweight drills, with the Crowe safety saw guard.

The air-driven hand saw speeds work and reduces accidents

The safety guard is of a telescopic nature. It opens when the saw is applied to the material and it closes automatically and locks in position as the cut is completed. It affords complete protection against accident or damage to the blade. The saw guard has an adjustable stop so that the saw can be set for the required depth of the cut.

The three-cylinder air motor is of the balanced type, smooth running and free from breakdowns. All wearing parts, including the cylinders, are renewable. The cost of upkeep of this safety saw is almost negligible. It is being manufactured in three sizes, known as B6, B8 and B12 and takes 6-in., 8-in. and 12-in. blades, respectively.

Joints Sealed Against Oil Leaks

PAINT which is said to seal effectively joints against oil leaks has been developed by the General Electric Company and is sold by its merchandise department at Bridgeport, Conn. The product, known as G-E No. 880 red protective paint, also prevents water and gas leaks. It can be used for many purposes that require red lead or white lead, and is less expensive than either.

The paint, which is dark red in color, requires no priming and can be applied by brushing or dipping. Denatured alcohol is used as a thinner. It dries rapidly and produces a hard, smooth, glossy film that is cleaned easily and that prevents excessive collection of dirt and conducting material, thereby decreasing surface leakage and subsequent carbonization of the surface when used with electrical apparatus.

Car Maintenance and Shop Practices*

By J. D. Barnhart
Superintendent of Shops Illinois Traction System, Decatur, Ill.

UNTIL other means were provided, it was our practice to raise one end of a car with a stirrup attached to the hook of a 15-ton traveling crane and to move the trucks from underneath the car with pinch bars. This required the men to be under the car while it was suspended in the air, and as the weight of some of the trucks is as high as 30,000 lb. considerable time was required to do this work.

All our truck work is done on two parallel pits, each 150 ft. long and 16 ft. between centers. This arrangement lent itself quite naturally to the installation of an endless rope haulage system for moving trucks back and forth. This consists of an endless ⅝-in. steel cable, a driving engine, a tension adjuster, guiding sheaves, cable supports and a clutch.

The driving engine has a base of structural steel on which is mounted the brass bearings for the drum and gearing shafts. Two drums, 24 in. in diameter, are grooved for passing the cable three times around in the elliptical arrangement to obtain sufficient friction for driving. The driving power for operating the drums is furnished by a Westinghouse D-2-EG compressor motor driving through a triple reduction gearing so as to move the cable no faster than 20 ft. per minute.

Details of Drive

The tension adjuster is made up of two 12-in. stationary sheaves and an adjustable sheave which is anchored to a fixed position by a screw that takes up the slack as the tension demands. The driving engine is located in a pit between tracks at one end of the car pits and the tension adjuster is located in another pit at the other end. The cable is located 28 in. below the top of the rail and 3½ in. from the face of the pit walls on the near sides of the two parallel pits. It is far enough below the trucks so that there is no interference. Four 12-in. sheaves are used at the four corners where the cable passes out of the pits. At distances in the pit of 6 ft. hard wood blocks with grooves cut in them are used to support the cable.

A steel bar with a cable grip which can be closed or released with a lever serves as the connecting link between the truck and the cable. The controller for operating the motor is located in a small pit between tracks and midway between the ends so that the operator is as close as possible to the truck being moved and the man giving signals for his guidance.

Another outfit which has proved worth while at our shops is the air lift used for removing and replacing compressors. Up to the time of the installation of this lift it was our practice to crib up under the compressors, which weighed as high as 1,600 lb., and spend from an hour and fifteen minutes to an hour and 30 minutes of four men's time in removing and replacing one of these compressors. With the lift two men can remove and replace a compressor in twenty minutes. The lift is located under the near rail of the track at a point opposite the door to the air brake department. Four 8-in. x 12-in. cylinder bodies bolted together in pairs are mounted on a 10-in. supporting concrete wall, one pair on each side of the wall. Two cylinders are used on account of the height of lift required.

The lift is sunk in the ground so that it does not interfere with the traffic over the track. In using the lift it is necessary to remove a 4-ft. section of rail and its supporting sill. When these pieces are removed the top of the lift table is about 10 in. below grade. A concrete ramp 7 ft. long extends from the floor of the air brake department to the table of the lift and a roller bearing carriage 4½ in. in height is provided for moving the compressors over this ramp from the track to the air brake department, or vice versa.

COMING MEETINGS
OF
Electric Railway and Allied Associations

April 4—Birney Club, regular meeting, Missouri Athletic Club, St. Louis, Mo., 6:30 p.m.

April 13-14—National Automobile Chamber of Commerce, meeting, Chicago, Ill.

April 20-22—American Society of Civil Engineers, spring meeting, Kenilworth Inn., Asheville, N. C.

April 26-29—Southwestern Public Service Association, convention, New Orleans, La.

April 27-29 — American Welding Society, eighth annual meeting, Engineering Societies Building, New York City.

May 6—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

May 31—June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

June 29-30—Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.

Oct. 3-7—American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.

Our babbitt furnace includes two 1,000-lb. pots set side by side in a cast-iron top that rests on the brick walls of the coke burning furnace. A hood over the pots connects with the furnace flue and provides a means of escape for the fumes from the pots. One of these pots is used for melting babbitt and the other for the tinning alloy. Our babbitt furnace does not have the automatic control, yet the babbitting of our armature bearings has been uniformly successful.

Thin Babbitt Lining Used

We have our own brass foundry and cast our own armature bearings, so that we babbitt both new and worn bearings. New bearings are made special for each armature. The babbitt lining is limited in thickness to 1/16 in. and as the armature shaft journals vary, it is necessary to make the bronze shells special for each motor. One-sixteenth of an inch is the limit of wear allowed on armature bearings and a greater thickness of babbitt is not needed; in fact, it is not desired, for with too thick a lining of babbitt it would be possible, should a hot bearing develop, for the armature to get down on the pole piece and be ruined before the hot bearing was discovered. The boring of the babbitt lining is also special for each bearing; the bore is made 0.012 in. larger than the shaft diameter.

While the bearing shell is still warm from the tinning process it is placed in the jig for babbitting. This jig is a device for centering the mandrel in the bearing shell. The gate, which fits the bearing opening closely, is clamped in position and the tapered steel mandrel, heated to a point just below that at which water sizzles on it, is painted with a solution of graphite and water and put in place. The bearing is then ready for babbitting. When the temperature of the shell is held at a sufficiently low degree it is not necessary to block the chinks around the gate, for the babbitt solidifies immediately on passing through these crevices. A self-skimming ladle of sufficient capacity to pour a bearing without stopping is used.

In the machine shop the bearings are bored out for the particular journals they are to fit and the oil grooves cut in them. Except for the GE-69 motors, we have found that these bearings pressed into the frame heads are ready for service without any additional work done to them. When bearings are pressed into the frame heads there is a slight corrugation of the babbitt along the window side of the bearing. A micrometer adjustment expansion reamer is run through these bearings after they are in the heads and the ridges of metal in the corrugations removed.

---

*Abstract of paper read before the Illinois Electric Railways Association, Springfield, Ill., March 17, 18, 1927.

Spray Gun System of Painting

The spray gun system of painting is now used at our shops for painting all classes of car equipment. Before adopting this method of painting, we learned that painters generally were not kindly disposed toward its use, so we broke some laborers into the use of the spray paint gun. When this apparatus was first put in operation considerable difficulty was experienced by the operator in getting a somewhat uniform coat and avoiding piling up paint and causing curtains and runs in the work. To overcome this difficulty a helper followed the operator and brushed out the paint with an 8-in. wall brush. However, as the operator became more experienced in handling the gun it was found that there were fewer curtains and it was not long till the helper's assistance was no longer needed.

As practically all our freight car work is done in the open, the freight car painting is confined to the summer months. The season extends through three months, and during this time two men, the spray gun operator and the stenciler, turn out on an average 100 cars per month. Flat cars, flat bottom and side dump coal cars, hoppers, box cars, express type trailers, refrigerators and cabooses are run through together.

In the last two years the adoption of the spray gun in applying lacquers to automobile bodies has brought to our painters the realization that they must learn the use of this new tool if they are to keep abreast of the times in their trade. When we decided to adopt the spray gun system of painting our passenger cars we brought to our shops an experienced spray gun operator and had him stay on the job a week to show the men the use of the spray gun in applying primer, surfacer, enamel and varnish to the cars. The great saving in time required for the various operations was a revelation to the men, and from the start they welcomed the opportunity to duplicate the feats of the expert. The men doing the spray gun painting of our passenger cars are old, experienced painters, who were accustomed to turn out a high-class job with the brush, and since they have proved to themselves that they can do as good a job with the spray gun in much less time the brush has been abandoned for work on the outside of cars except for color varnishing the sash. A comparison showing the time required and the amount of material used in the operations where the spray gun has been substituted for the brush is shown below.

The figures for the spray gun do not include the time required in filling the paint pressure tank nor the time required to clean the apparatus after it is used. When the same operation is carried out on a number of cars cleaning is required after the last operation only. Under any condition, however, three-quarters of an hour is sufficient time for doing this work thoroughly.

In this work no guards are used at the windows. It is much more satisfactory to coat the window lights with a good coat of glycerine, which, we find, can be removed more quickly with gasoline than with alcohol or a vinegar solution.

COMPARATIVE STATEMENT OF LABOR AND MATERIAL REQUIRED FOR HAND AND SPRAY GUN PAINTING

	By Hand		Spray Gun	
	Labor, Hours	Material, Gallons	Labor, Hours	Material, Gallons
Painting roof, one coat	4	1½	1	2
Applying surfacer, two coats	8	2	3	2½
Applying colored sealer, one coat	6	1	1¼	1½
Enameling, one coat	9	1	2	1½
Varnishing, one coat	9	1	2	1½
Painting underframe, one coat	9	2½	¾	2½
Painting trucks	6	1½	½	2
Total	51	10½	10½	13¼

Track Maintenance*

BY JONATHAN WOLFE

Assistant Superintendent of Track and Roadway Chicago Surface Lines

Our track and roadway department handles both maintenance and all renewal and construction work and is in charge of a superintendent of track and roadway with an assistant. There are four division superintendents, with a total of thirteen maintenance sections. In every division there are two construction gangs, each under a general foreman, these gangs handling construction and renewal work.

There are 31 switch cleaning districts, each taken care of by a switch cleaner reporting to the section foreman of his district. His duties include cleaning all switches and curves, testing mechanical switch protection devices, cleaning drain boxes and inspecting the tracks while riding between locations. These switch cleaners inspect every switch in their district daily.

Emergency men are kept on duty during the night hours at logical locations, the dispatcher reporting any trouble to the man located closest to the trouble, sending the emergency man to make the necessary repairs. When he finds he is unable to handle the trouble himself he calls out other men. If the track is dangerous for car operation, he stays there to flag the cars, having the train crew call necessary help to make the track safe until permanent repairs can be made.

The value of our power tools and equipment has increased 200 per cent in the last four years and we feel that we are entirely justified in carrying this large item because of the great savings accomplished. There is scarcely a machine which does not save its original cost in less than a year's time. The principal power equipments in use are as follows:

We use two sizes of air compressors. The larger unit, of 360 cu.ft. capacity, primarily for large construction jobs, mounted on a four-wheel rubber-tired trailer, operates eight tie tampers or four concrete breakers continuously. When breaking out concrete foundation this equipment, with an operator and four men, will do the work of 25 to 30 men. Each of our four track divisions employs these large compressors.

A smaller unit, mounted at present on a 1-ton truck chassis, operates four tie tampers or two concrete breakers. This equipment is valuable for cutting in rails to repair broken joints, renewing frogs, switches, etc., or for any work where paving or concrete must be removed on a small stretch of track. Being mounted on a truck, this equipment is moved quickly from one location to another and has greatly expedited maintenance repairs where concrete must be chipped out. We propose to add to this equipment for our work this year.

Mixermobiles Place Concrete

For placing concrete we employ Mixermobiles, each mounted on a 1-ton truck chassis, the concrete mixer being run by the engine of the truck, having 20 hp. available. The levers on the Mixermobile are so arranged that they can be operated either from the driver's seat or from the ground. The capacity of the mixer is 7 cu.ft., one batch of thoroughly mixed concrete being made per minute. This mixer will not only handle the concrete required for rail cut-ins and small jobs, but will take care of large installations of special trackwork. We also use this machine on rail renewals, as the amount of concrete to be replaced around the base of the rails is not sufficient to warrant use of the large mixers.

For our extension and reconstruction work we use Chicago mixers mounted on cars and Drake continuous mixers, both running on the tracks, so that concrete can be placed as desired. With the Drake mixers we also use bucket loaders for raising the concrete materials from the street to the belt of the machine, these materials being spread beforehand in a continuous pile along the street.

We have also a large number of grinding equipments, all electrically driven, using for each class of work the type of equipment which we believe proves most efficient. For grinding electric seam-welded joints and electric welds on special trackwork, both manganese and high carbon, rotary grinders, with 7-hp. motors, of the Atlas type are used. For thermit welds reciprocating grinders of the Vulcan type give a smooth surface free from any hollows.

Electric hand grinders are used for grinding the throatways of manganese mates and frogs where one run is used much more than the other. Thus emergency curves, of which there are a great many, particularly in and adjacent to the Loop district, are kept in good operating condition. We never know when emergency operation may be started—a large fire or an accident in the Loop, a bridge out of service—any of these things may cause the cars to be rerouted, frequently with no advance notice given to the track department.

---

*Abstract of paper read before the Illinois Electric Railways Association, Springfield, Ill., March 17, 18, 1927.

In each of our two frog shops we have a flexible shaft grinder which is proving valuable for grinding the welded throatways for flange bearing in shop-built frogs. These grinders are several times as fast as the hand grinders and do away with the necessity for bringing in larger grinders from the street.

Rail Corrugations Ground

For the removal of rail corrugations we have six Kerwin grinder cars. All of these have been double-ended and 40-hp. motors installed to operate the double-ended machines efficiently. The subject of rail corrugation is one in itself and is being investigated thoroughly by a committee of the A.E.R.A., which recognizes the seriousness of it fully. Therefore, I will merely summarize our practice with regard to corrugations, which if not removed will destroy the entire track structure and greatly increase car maintenance costs. Some years ago these corrugations were on the increase, but by expanding our grinding equipment we have caught up with the corrugations, removing them when they develop to a stage that warrants grinding. In the last three years we have removed approximately 160 miles of single-track corrugation, the average depth being 1/64 in. These heavy grinders are worked in sets of two or three, usually between temporary sliding crossovers placed a block or more apart, operating on two shifts, from 8 a.m. to 4:30 p.m., and from 8:30 p.m. until 5 a.m. When a street becomes corrugated we start at one end and work through by this method to the other end or as far as the corrugation extends. By speeding up the work in this way we reduce the interference with service to the public to a minimum and also do the work at a considerable saving in final cost.

Motor truck equipments for hauling materials and excavated materials have been increased rapidly and two years ago supplanted entirely the use of the slow and uneconomical teams and wagons on trackwork. Five-ton trucks are used for the heavy hauling, each equipped with a dump body. These trucks are also fitted with rail racks, so that in addition to other materials, rails can be hauled from the yard to the job. We also have some 4-ton trailers, used for hauling excavated materials, the trailers being placed on the job by the 5-ton trucks and later, when loaded, hauled away. Smaller trucks—1 to 3½-ton capacity—are used for lighter hauling. These trucks are also used for hauling the large air compressors, welding equipments, the use of the trucks being under the direct supervision of the track division superintendents.

For trackwork, electric boring and spike driving machines are used for the screw spikes which hold the rails to the ties. Hand work is done on only the smallest of jobs where there is insufficient work to warrant taking out the power equipments. Tie rod holes and fish plate holes, where required at cut-ins and special trackwork (these are normally drilled by the manufacturers) are made with Duntley track drills. One or more of these are in use on each division and at each of the frog shops.

We also have an asphalt road repair outfit, which is used to a great extent on maintenance work. During the winter this is used for heating concrete materials on small jobs and for special trackwork installations and at other times for heating asphalt for repairs alongside our right-of-way (we do not have much asphalt paving inside our tracks). Another use for this outfit is for heating natural rock asphalt that is being used to replace oak plank paving in crossings with steam railroads. Not only does this rock asphalt make a very considerable saving over oak plank, which in a railroad crossing usually lasts only from one to two years, but it gives a better paving and a safer one, as the danger of accidents is always present from loose or broken planks. This rock asphalt is easily laid and kept in repair and can be relaid when removed for crossing repairs. Plank pavings in grade crossings are being replaced by the natural rock asphalt on a slag foundation.

We also have larger power equipments, such as electric shovels, which are mounted on caterpillar tractors; a steam shovel, derrick or crane cars, supply cars, etc., which are used more or less for track maintenance, although primarily for construction work.

Use Manganese Coated Electrodes

The electric welding of special trackwork, particularly on manganese steel, has almost unlimited possibilities. We started the use of high manganese coated electrodes (11 per cent to 14 per cent manganese) in 1921 and have been uniformly successful from the start. Due to the nature of manganese steel it is necessary to treat the welds while still red hot with cold water. Care must be taken to see that the part to be welded is cleaned thoroughly and, in addition to frequent quenching, peening the weld with a small hammer to remove scale before proceeding. Welds are ground to a smooth surface with an Atlas or other grinder. We are also using a special grade of coated rod for welding high carbon on battered shop-built frogs and rail ends that has improved our results on such work. Manganese welding alone has increased the life of our special trackwork several years, some of the original 1921 welds still being in service. We are now using approximately 9 tons of high manganese electrodes a year and have not yet reached the limit for producing savings.

Wise Traffic Regulations Vital to Modern Communities*

By E. J. McIlraith
Staff Engineer Chicago Surface Lines, Chicago, Ill.

Regulation of the use of streets and highways, and not merely the regulation of vehicles, should be the interpretation of the term "traffic regulation" which should create the greatest advantage or usefulness for the streets to the community. This does not always mean the greatest advantage to any one class or the greatest freedom of movement for the majority of the vehicles. It means, rather, that the purpose for which the streets are necessary should be served in the most satisfactory way. It means a variety of answers suitable to the various times and places.

No Parking in Congested Areas

For instance, it is obvious that at least during rush hours busy thoroughfares, that are needed to capacity, should not be congested by parking or by slow service vehicles. It is also obvious that in a business district during most of the business day service vehicles must be able to load and unload express packages or make quick deliveries necessary to the conduct of business. However, it would be quite unreasonable for a warehouse or department store on the busiest streets to have trucks continuously loading or unloading at the curb so that the street and sidewalks would be largely or almost entirely blockaded by such use. In a warehouse district this might be perfectly acceptable.

The greater the tendency toward congestion the more restrictions must be placed to prevent certain practices or customs, thus creating restraint on individual liberty. Good traffic regulation keeps these restrictions appropriate to the time and place, and yet simple and understandable in application. The need for restriction on the rights of individuals to use the streets is perfectly evident and is acceptable as being basically in the interests of public policy.

There are good reasons why we are confronted with an ever-present threat of street congestion. Definite economic advantages to the country and to the individual citizens are clearly evident because of the concentration of certain kinds of business in large cities. Similarly, there are definite clearly established advantages created by the concentration of certain activities of a large city within a small central area. Likewise, there is good reason for the creation of secondary business centers, which concentrate in small areas here and there throughout a city. The theory of decentralization is only partially sound. Decentralization of some activities to small communities or to outlying sections of large cities can be justified, but the basic plan of one concentrated business center, and a large number of small secondary centers in city development, as is well typified in the city of Chicago, is fundamentally sound. It is not a mere happening or based on a false sense of values.

---

*Abstract of paper presented before the Illinois Electric Railways Association, Springfield, Ill., March 17, 18, 1927.

Practically all cities are confronted with street systems that for the most part consist of streets of 80 ft. or less in width. With modern twenty-story to forty-story buildings, some of which house between 8,000 and 10,000 regular employees, this street system that was laid out primarily for four-story buildings must be used very intensively and wisely. The only limitation that needs to be placed upon the building heights in Chicago is the limit that still permits adequate light and ventilation. The problem of transportation and of accessibility can be solved at a cost that is reasonable, considering the values created by the need for such business concentration. Accessibility to a business district is what creates and maintains its value.

Individual Rights Give Way Before Community's Needs

Yet it is not necessary to permit each individual to use the streets leading to or in the busy district according to his own individual desires. The smaller the city the greater the liberty that can be granted to the individual to do what he chooses in making use of the streets. As the city grows the natural effect of the greater density of movement is to cause a larger percentage of citizens to see the folly of continuing, for example, to use their own private automobiles in going to and from business. Over 350,000 automobiles are registered in Chicago, and yet only about 90,000 vehicles cross the boundary line to the central district within a single day, although more than 800,000 persons enter this central district per day. It is not possible then to give the right of individual transportation to each person entering this district, neither is it necessary. Certain business vehicles must use the streets, public carriers are necessary to handle such large numbers, and street regulation should be so carefully developed as to provide the greatest possible speed and comfort for those using the public vehicles, who are the great majority, to those service vehicles necessary to the conduct of business and to as many private automobiles as can possibly be served by the street system existing.

It is not desirable to make the use of private automobiles impossible or difficult, but the greatest permissible freedom in the use of this highly appreciated modern convenience or luxury in American life should be one of the aims of traffic regulation.

The city of Chicago must provide subways and elevated railroads within the limit of its financial power, so as to create new street levels for the electric trains in order to leave the maximum of street space available for the other vehicles that must remain on the open streets. Since the streets cannot be widened horizontally in the central district and in many of the other busy areas, there must be an increase in capacity both by regulation of street use and by creating new levels on which the most effective carriers, namely, the electric trains, will operate.

Pending this development much can be done to improve on the existing usefulness of the streets, to increase speed, reduce costs of operation and to make more convenient all street use. Much has already been done in Chicago, as in other cities, such as regulation of parking in the rush hours, elimination of the left hand turns at the busier intersections, creation of through streets and boulevards for faster and freer operation, by installation of safety zones for street car passengers and by placing automatic signal control. Yet tremendous improvements may yet be made to increase the usefulness of the street system.

The creation of through streets and boulevards can make material improvements in the convenience of motor traffic, if laid out wisely and if rights of way are established equitably. Care should be taken, however, that traffic on important streets is not penalized unnecessarily or unfairly by being made to stop at a crossing with a through street or a boulevard, which at that particular intersection is serving a much less important purpose than the intersecting street. There has been a marked tendency everywhere to abuse the through street idea by creating through street or boulevard priority at points where such priority is harmful to the majority.

Many Factors Affect Traffic

Although much has been done in piecemeal fashion, more remains to be done, and the serious problems have not yet been answered. The recommendations of the Chicago Association of Commerce as embodied in the code written as a part of the McClintock report and presented to Council in December, 1926, are likely to be adopted soon. The principal value from this new code will be:

1. Simplification of existing regulations.
2. Authority given to eliminate parking when necessary on the busy streets. Parking will be abolished in the central area throughout the entire business day and may be abolished wherever necessary in business districts throughout the city, and on petitions from 75 per cent of the registered voters along any section of street may be eliminated on that section during hours asked for by the petition. This is done to protect residents from being overrun by patrons of theaters or other amusements in the neighborhood.
3. Establishing a time limit of twenty minutes for loading or unloading of delivery vehicles.
4. Eliminating the standing for loading or unloading with end of vehicle to the curb.
5. Control of mid-block turns.

The McClintock report did not make sufficient study of, nor definite recommendations covering, certain obvious practices, which are very serious factors in creating street congestion. Some of these are:

The use of the streets by building contractors.

(a) For storage of materials.

(b) For temporary sidewalks.

(c) For standing of trucks during unloading, loading or hoisting.

(d) The blocking off by ropes during hoisting of materials to the upper levels.

Elimination of slow moving vehicles from business streets.

Parking of taxicabs in taxicab stands.

Cruising of taxicabs.

Cruising by chauffeurs of private automobiles.

Street repair work, work on underground structures, or underground utilities during the business day.

Sprinkling or washing the streets during business periods.

Delivery or acceptance of passengers by taxicabs at places other than at the curb or within street intersections.

Location of bus loading zones.

Development of detour trucking routes around busy centers.

Delivery of merchandise and heavy materials outside of business hours.

Obstructions on sidewalks near street intersections such as hydrants, newsstands, postal boxes, rubbish boxes and light poles.

Each of these items might be discussed at length. Obviously each one represents a restriction that must some day be given attention in the interest of the greatest good to the greatest number.

It seems always difficult to get good police enforcement of traffic regulation. Police departments in this country are unfortunately forced to be responsive to political pressure. Perhaps part of their laxity is due to faulty judicial practices, and the importance that judges attach to the need for votes instead of to creating public respect for existing laws and regulations. Carelessness and deliberate evasion of responsibility by the enforcing agencies are creating a great public indifference. Many drivers are totally ignorant of the rules of the road, and seem to have no thought of ordinary courtesy to others when driving. Most of the accidents that occur on the streets and highways would be avoided if those using the streets would extend reasonable courtesy and consideration to each other.

Transportation Companies Should Lead Way

In developing better traffic regulation electric railway executives should take the most prominent part. Correct treatment of the traffic problem is of vital importance to the railway business and no other business has more at stake than the electric railways in developing safety and increased usefulness for the streets. It may seem to some that improving operating conditions for automobiles will be detrimental to the railway business, yet may we put it the other way. Unless operating conditions are improved on the streets used by electric railways the decrease in income to the railroad and the increase in expense of its operation will produce an impossible operating ratio. The railways cannot hope to prevent the competition of private automobiles and should not expect to gain business by increasing the discomforts of the users of private cars. If the railway service can be made attractive by adequate speed and reasonable freedom of movement, much more business will be attracted than if the cars are lost in street congestion.

Advantage to the railway operation is in these days of commission control of public utilities merely advantage to the car riders and the public officers can easily be made to understand that in arranging for improvements in street car operation they are arranging for advantages to all the individual citizens or voters whom they represent. The development of the spirit of fair play, a willingness to be helpful to all interests as well as skilled ability when solving the problems that interest and affect the community and active leadership in directing and developing public discussion or consideration of these problems should be considered obligations upon the railway management. Such activities present rare opportunities for creating public good will and for improving materially the street railway business.

The problems encountered cannot be attacked or answered by casual study. There is need for men thoroughly skilled in the principles underlying traffic regulation. Some one within the organization should be carefully trained, or competent outside assistance should be brought in to assist the management. Much nuisance prevails in methods of traffic control and in signal installation. Many serious mistakes are being perpetrated, and not everyone who claims to be advised is competent. Some of our largest cities have the most glaring defects in their traffic regulation methods, and many imitations of these plans are producing great inconvenience in the smaller cities that are accepting such plans without due attention to correct control principles.

Modernization of Cars*

By M. J. Oswald

Sales Representative, St. Louis Car Company

MUCH has been said and written recently about this subject, so there is bound to be repetition of considerable data which may sound familiar, which is due to the constant recurrence to this subject, whenever and wherever street railway men congregate, and is in itself another indication of the importance of this subject and the realization that modern cars are a dominant factor in the progress desired in successful street railway and interurban operation.

Looking at the situation from a cold-blooded business standpoint, the exhaustive survey made of twenty properties before and after modernization by the ELECTRIC RAILWAY JOURNAL shows that there is a reduction of 8 cents per car-mile in operating costs with 50 per cent modern cars. Before modernization the operating cost was 36.41 cents per car-mile and after 50 per cent modernization 28.29 cents per car-mile.

NEW CAR SAVINGS

In the case of five out of these twenty roads practically all cars were purchased new during recent years, and after the acquisition of the new cars the reduction shown is 16 cents per car-mile instead of 8; i. e., the average operating costs of these five roads prior to installing new cars was 39.56 cents and afterward 23.64 cents per car-mile.

Another interesting fact brought out by this survey was that on a different group of twenty properties with approximately the same total number of cars, the same range of sizes, the same total population served, the same mileage and about the same proportion of city and interuban service, practically no new equipment has been purchased during the past ten years. The average operating cost is 37.94 cents per car-mile, or practically the same (in fact about 1½ cents higher) as the different group of twenty referred to above before their equipment was modernized.

These above figures speak for themselves as to the financial betterment in the use of modern cars, and it is evident that the scrapping of obsolete cars is profitable; furthermore, from the additional data given below, taken from the same survey, it is apparent that new cars pay for themselves.

As previously indicated, the saving of a group having all modern light-weight equipment is about 16 cents per car-mile in comparison with operating costs on old equipment—it was also mentioned on a larger group having about 50 per cent modern cars was half of this amount. Similarly, the cost on a property having an average car age of ten years is taken to be about 8 cents per car-mile more than a road having all modern equipment. If excess operating costs between these two points are taken in proportion to age of equipment, the results would be in dollars, based on 82,450 cars comprising the entire industry, a total of $181,707,000, which is equivalent to 12,000 new cars at $15,000 each; to be ultra-conservative, cut these figures in half and it would still show operating losses on present equipment more than enough to pay for a greater number of new cars per year than have ever been inaugurated by the entire industry in any single year in the past twenty.

Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, in his article in connection with the compilation of these statistics, mentions "that there may be operating conditions on various properties that would make it impossible to obtain the average savings shown, but the conditions covered by the properties studied are sufficiently general to warrant most careful consideration by every operator."

Also, please bear in mind that no account whatever is taken or even estimated of the effect of improved modern cars on increasing revenue. Unless some fallacy can be shown in the figures presented—and we invite discussion on same by those operating members present—the conclusion reflected resolves itself into an axiom, namely, "That obsolete equipment costs far more to maintain than new equipment costs to buy."

Granting that the foregoing has demonstrated that the substitution of new cars for old at certain periods is not only an economical gesture but a necessary part of the program of a progressive and successful railway system, why not incorporate in the new cars all the features which are consistent with modern standards of living, and so popularize this mode of transportation that the appeal to ride in the electric car is so strong that it stands first in the minds of the public. Unfortunately, the attitude in many places at present is, "Well, I suppose I will have to take the street car, as there is no other way to go!"

MODERNIZED CARS NEEDED

An operating expert about a year and a half ago said: "One of the greatest needs of the traction lines today is the modernized cars to replace equipment which not only fails to attract business, but actually repels it in many instances." Based on such a statement, what a wonderful opportunity there is to so change and improve the antiquated street car and its accessories to counteract the last part of the above statement to the effect that it "actually repels business in many instances."

It has been said, and we have to admit it, that one of the most noticeable features of modern life is the gradual awakening in the last decade or two of the American people to the perfection of form resulting from the harmonious combination of diverse elements in unity.

Architecture shows a marked improvement; houses are better plumbed, but more often built with an eye to form and pleasing appearance; contrast the cupolas and ginger-bread gimcracks of a "mansion" of the early Grover Cleveland or Benjamin Harrison period, or the boxlike plainness of a less pretentious home of yesterday, with the Colonial, Spanish or English adaptation of the residential sections of today.

Interior decoration is also infinitely more colorful and artistic than yesterday. Even automobiles have improved quite as much in line and design as in power and upholstery. So-called "Beauty Shops" thrive and turn over millions of dollars yearly because women are eager to make their faces or figures attractive, and this is not confined to any particular class, but the patrons are from every walk of life. This is just another phase of popular taste; it is true that people long to have attractive and pleasing surroundings and will patronize and popularize the vehicle that plays up this appeal to their taste.

In selling city or interurban car rides we cannot overlook the fact that a transportation vehicle which was designed merely for "utility" in order to keep pace with the trend of the times must become a thing of beauty with pleasing lines, attractive painting, easy riding trucks, no unsightly equipment showing, particularly in the interior, comfortable seats, neat floor covering and modern lighting fixtures with plenty of illumination. Heating is another item that should be given careful consideration.

Plate glass throughout the car also adds much to the pleasing appearance and perhaps really would be the economical thing in the long run, provided, of course, that the replacement of ordinary glass is a considerable item of maintenance and could be substantially reduced by the substitution of the heavier and less fragile plate glass. On the regulation city car the cost of ⅛-in. plate glass, as far as I can determine, is about four times that of the ordinary glass now universally used.

---

*Abstract of paper presented before the Illinois Electric Railways Association, Springfield, Ill., March 17, 18, 1927.

Mr. Gordon mentions in his article the Grand Rapids cars, which reflected a great many of the features mentioned above, and therefore it might be in order to mention the figures which are quoted below from *Electric Traction* of February, 1927, concerning the annual report of the above road, as follows: The gross earnings of the company increased $37,978 over 1925, while operating expenses decreased $45,170, largely due to the placing in service of the 27 new cars last June. In 1925 the company showed a deficit of $67,541 while for the year ended Dec. 31, 1926, a net income of $9,929 was shown.

You might also be interested in the following extract from Mr. DeLamarter's paper read at the C.E.R.A. convention at Toledo a few weeks ago: "During each month since the Grand Rapids rail coaches were placed in service the proportion of increase in passenger revenue on the three lines so equipped has been considerably higher than the increase shown on the balance of the lines. During seven months from June to December, 1926, passenger revenue increased 3.21 per cent over the corresponding period in 1925, while the passenger revenue for the same period on all other lines increased only 1.91 per cent."

HIGH-SPEED CARS SHOW RESULTS

By increasing the speed and installing modern cars a number of interurban railways, such as the Buffalo & Lake Erie, Pennsylvania-Ohio Electric, North Shore, Illinois Valley Division of the Illinois Traction System and numerous others have shown remarkable improvement as to increased revenue and popularizing the electric cars, and you all no doubt have had this called to your attention by various articles and figures that have been published.

It may be rather a broad statement, but personally I do not know of any city or interurban railway system in the United States that has not greatly improved its financial standing and public relations by replacing old equipment with new and modern cars. Furthermore, I heartily agree with these sentiments of City Manager Hopkins of Cleveland, Ohio, brought out in his address at the A.E.R.A. convention at Cleveland last year: "The American people are not an ungenerous or mean people. The American people, by and large, unless they are provoked or irritated or don't understand the situation, mean to pay anybody a fair return for anything he gives them."

Do not forget that the car is the "show window of the industry," and it has been demonstrated in merchandising that you must have an attractive show window in order to draw your customers inside. Incidentally, after he gets inside see to it that he is met by a courteous operator so that he will come again and tell his friends to patronize the electric railway line, and so popularize this method of transportation that it always stands first in the minds of the discriminating public of this progressive age.

Governor Fuller Decries Legislative Meddling

CAR riders are not getting a fair break because of the legislative burdens placed on transportation companies, according to Alvan T. Fuller, Governor of Massachusetts, speaking at the annual banquet of the New England Street Railway Club, held March 24 at the Copley Plaza Hotel, Boston. The cost of building subways should not be paid entirely by the car riders, he said, because subways are built for the convenience of other users of the street as well as for the railway passengers. Moreover, the extension of a subway into the new district benefits the property owners. He referred also to the construction of a new bridge, the cost of which must be paid in part by the Boston Elevated Railway. All persons other than the car riders will use this bridge free of cost. Why, he asked, should the car rider have to pay for what is provided without cost to the users of other vehicles? In the Governor's opinion the problem is one of educating the public to appreciate the rights of the car riders.

Adequate transportation facilities are a necessity, he said. What other industry is so essential, he asked, that public trustees would be appointed by the state to operate the property when it became involved in financial difficulties, as was done some years ago for the Boston Elevated Railway and Eastern Massachusetts Street Railway. That portion of the public which uses electric railways is unorganized and inarticulate. For that reason it does not always receive fair treatment. The opportunity to improve transportation is an inspiring opportunity for public service, the Governor said. A beginning should be made by striking off the shackles of unfair charges that legislation has heaped upon the car rider.

Street railways in New England have put their houses in order and have come to understand by experience that the public is willing to pay for good service, according to Fred Gordon, retiring president of the club. He said that the rate of fare is incidental, and cited the case of a man who does not hesitate to use a taxicab and tip the driver far more than the entire cost of a comparable car ride would be. R. B. Stearns, incoming president of the club, expressed his gratification at being chosen for this post, and assured the members that he would do his utmost to make the coming year a successful one for the club.

Other speakers at the banquet included Malcolm E. Nichols, Mayor of Boston; Benjamin F. Cleaves, former chairman Maine Public Utilities Commission, and Frank P. Sibley, special correspondent Boston *Daily Globe*. Edward Dana, general manager Boston Elevated Railway, officiated as toastmaster.

At a business meeting held in the afternoon new officers were elected. Those chosen were:

President, Robert B. Stearns, Boston, Mass.

Vice - presidents: Massachusetts, Howard F. Fritch, Boston; Connecticut, J. K. Punderford, New Haven; New Hampshire, John B. Crawford, Concord; Vermont, T. B. Jones, Burlington; Maine, Edward M. Graham, Bangor; Rhode Island, Walter C. Slade, Providence.

Secretary, John W. Belling, Boston, Mass.

Treasurer, Fred F. Stockwell, Cambridge, Mass.

Executive Committee: H. M. Steward, Boston, Mass; George E. Haggas, Portland, Me.; H. R. Whitney, Springfield, Mass.; C. B. Pierce, New Bedford, Mass.; H. S. Day, Boston, Mass.; E. W. Davis, Boston, Mass.; George Acker, Boston, Mass.

90,000 Vehicles in Chicago Loop

IN REPORTING Mr. McIlraith's discussion of traffic conditions, on page 579 of the March 26 issue, it was stated that 800,000 vehicles enter the Chicag Loop district in twelve hours. This should have read—"more than 800,000 people enter the Loop district in twelve hours." The statement that 90,000 automobiles enter the business district in twelve hours is correct.

American Association News

Power Transmission and Distribution

PROGRESS reports were considered at the second meeting of the power transmission and distribution committee of the Engineering Association held in Chicago, Ill., on March 8. There were present at this meeting the following: F. McVittie, chairman; C. H. Jones, sponsor; J. W. Allen, C. Bailey representing C. L. Hancock, M. J. Cooke, H. Casey representing G. Wennegal, J. H. Drew, Mr. Daiman representing W. H. Bassett, D. D. Ewing, S. S. Hertz, W. Heeley, A. J. Klatte, K. J. Keith, J. Leisenring, H. S. Murphy, J. F. Neild, W. J. Quinn, M. B. Rosevear, D. L. Smith, A. Schlessinger, W. Schaake and R. D. Wade.

R. H. Rice, board of supervising engineers, Chicago, and C. Smith, Chicago Rapid Transit Company, were guests.

The chairman requested suggestions of subjects to be considered next year. The following three subjects were submitted: (1) Economics of electric track switches; (2) use of braking devices on reels, in stringing trolley wire; (3) reclamation of corroded steel poles.

The distribution representative on the special committee on current collecting devices requested the members of the power distribution committee to give freely any information on this subject which might be asked of them, since the subject was considered to be of considerable importance.

Each of the sub-committees presented a progress report. Sub-committee No. 3 on trolley wire wear will carry on the study of trolley wire breaks and will prepare data which will supplement that published in last year and in previous years. Sub-committee No. 4 on specifications for high-strength trolley wire showed that negotiations with the American Society for Testing

Materials were being continued and that a compromise on the points of issue in connection with this specification was very probable. Sub-committee No. 5 on radio interference stated that more study should be given to the previous reports on this subject by those experiencing this difficulty. The subcommittee investigating the possibility of establishing a standard by which various methods of operating and maintaining overhead lines may be compared has drawn up forms for collecting the necessary information. These forms will be filled in by the members of the committee and will then be summarized for discussion at the next meeting. The standardization of trolley reels has advanced to the point of a tentative size grouping of these preliminary dimensions and will be submitted to manufacturers and users of trolley reels for criticism before any attempt at standardization is made.

The next meeting will be held in New York on June 16 and 17.

Unification of Car Design

Engineering Association Committee Presents Progress Report for the Information of the Industry

WHEN the committee on unification of car design of the Engineering Association was appointed last fall one of the subjects assigned was to follow through the work begun last year by the committee on essential features of modern cars of the American Association. This latter committee made a report at the 1926 convention giving the requirements of present-day car designs, which was abstracted in ELECTRIC RAILWAY JOURNAL for June 26, 1926, page 1086.

The committee on unification of car design has now submitted a progress report, an abstract of which appears below:

In replies from member companies commenting on the report of the committee on essential features of modern cars, there seemed to be some question as to whether particular problems could be met by the recommendations contained in the report of the committee on essential features of modern cars. It was decided, after discussion, that the committee on unification of car design, acting through the secretary of the association, would be glad to take up for analysis the different problems of any of the operators that care to submit them, and will assist to the best of their ability in arriving at a solution of the problems that may arise as to car designs and necessary equipment details in connection therewith.

The car designs submitted were arrived at after careful study of a weighted average of representative cars that have been in successful operation throughout the country. The designs cover fundamental dimensions that are of the utmost importance to the car builder, if he is to place the building of cars on a production basis. No attempt has been made to present a completely designed car that would be adaptable to all properties. The details covered, however, are adaptable to practically all properties, subject to some few modifications in special cars, where physical limitations require changes. It is recommended that member companies contemplating the purchase of new cars give careful study to the 1926 report of the committee on essential features of modern cars before a definite decision is made.

By using these fundamental recommendations, with supplemental detail to meet the individual properties' requirements, the builders will be able to reduce materially their engineering and special equipment requirements, group their production operations, and thus facilitate the building of equipment, with its attendant lowering of costs. Any saving thus obtained by the builder is of twofold advantage to the user—a lowering of first cost and an earlier delivery of equipment. It is also a step toward standardization of equipment, which embodies the best features from not one but a large number of operating properties.

WHY SOME COMPANIES DID NOT FOLLOW COMMITTEE'S RECOMMENDATIONS

As a result of the committee's discussion a number of points were brought out as to the reasons why some companies adopted, and others did not adopt, the recommendations of the committee. In one case, a company made an earnest attempt to follow out completely the recommendations of the committee on the fundamental dimensions and weights. This company submitted its plans and specifications to the association, asking that they be compared with the recommendations made in the 1926 report. In various instances the design and dimensions submitted differed from the recommendations, as a result of which several conferences were held with officials of the company, to see if the design could be modified to embody all of the committee's recommendations. This was at first believed impossible, due to the peculiar character of the service, which was a combined city and interurban service, and due also to rather limited clearances on curves.

Following these conferences, this company made a careful analysis of the design and shortly after was able to modify it so that the car body between corner posts in every way met the committee's recommendations as to the design of interurban car. Since this car operated through a number of small communities, where operating conditions require rapid loading and unloading of passengers, it was considered advisable to adopt a platform design substantially the same as that recommended by the committee for city cars.

The result of all this is that the company now has a car that can be said to meet with the committee's recommendations and that is in every way satisfactory to the operating company, although at first it was not believed that this was possible.

Another instance was discussed wherein an operator of one of the small properties was in the market for a few cars. Considerable time and money had been spent in preparation of specifications for a car that was considered necessary for the individual conditions. The specifications, however, as prepared, were not sufficiently different in the salient features to preclude the adoption of the recommended A.E.R.A. car. The car builders, therefore, offered this company cars of the dimensions and arrangement recommended by the committee for general use, at a saving of from 15 to 20 per cent in cost, due to the possibility of using existing engineering data, drawings and templates. The operating company, however, after much consideration, decided to purchase cars in accordance with its original specifications, and forego the saving in investment and the possibility of securing the cars at an earlier date.

This illustrates a case where a small company could have obtained every desirable feature of style and furnishing which was considered necessary to make the cars attractive in appearance, and at the same time comfortable and convenient for the patrons, at a material reduction in cost. The manufacturer, at the same time, was willing to guarantee that this car, built in accordance with the recommendations of the 1926 committee, would be at least equal in attractiveness to the customer's own design, and was entirely willing to guarantee every feature of the construction. This is one example where individual tastes are working as a detriment to the activities of the association as a whole, in its endeavor to bring about conditions which will tend to lower the cost of cars.

The committee has the assurance of the car builders in general that they are willing to proceed with the manufacture of cars built in conformity with the designs recommended by it. It believes that if the member companies will use cars built in conformity with these general recommendations a definite saving will be made in the cost of cars. The car builders have pointed out that the cost of engineering alone, for a group of cars, runs on the average anywhere from $1,500 to $2,000. In the purchasing of cars as covered by the committee's recommendation, this cost of engineering would be materially reduced. This cost alone, for a lot of ten cars, amounts to $150 to $200 a car. The time of delivery, also a very great factor with cars of special design, will be shorter for cars built in conformity with the recommendations of the committee.

In order that some definite designation be given to the types of cars as covered by the 1926 report of the committee on essential features of modern cars, it was decided, after discussion, to recommend that the designs for the city cars be known as "A.E.R.A. City Car Design" and that the designs for the interurban cars be known as "A.E.R.A. Interurban Car Design."

The report was signed by J. A. Brooks, C. A. Burleson, W. J. Clardy, L. J. Davis, C. Gordon, J. W. Hulme, G. L. Kippenberger, J. Lindall, V. Willoughby, A. P. Jenks, A. L. Kasemeter and H. H. Adams, chairman.

The News of the Industry

New Lines Suggested for Boston "L"

Legislative Committee Suggests Construction of Tunnels—Termination of Public Control Debated

A new rapid transit extension plan has been adopted by the committees on metropolitan affairs and street railways of the Massachusetts Legislature for new lines to be built on the Boston Elevated Railway system. This bill, which has been reported in the Senate, provides for carrying out the plans for rapid transit extensions which the Legislature two years ago directed the planning board to study and report upon. The bill calls for the construction and operation of two rapid transit lines through the center of Boston, one of the lines starting at North Cambridge, extending through Somerville to Lechmere Square, and thence utilizing the existing viaduct to the North station, the Tremont Street subway to the present terminus of that subway at Broadway and Tremont Street, thence by new construction to a point near the corner of Huntington Avenue, and Tremont Street, Roxbury, with stations near the Back Bay station, West Newton Street, Massachusetts Avenue and the Opera House.

Five Years to Complete

The other line provides for an extension of the East Boston tunnel in East Boston, and starting from the terminus of that extension trains would run through the East Boston tunnel and a new tunnel connecting with the westerly tracks of the Tremont Street subway at Park Street, thence to Boylston Street, and through the Boylston Street subway to Governor's Square, and by new construction under Governor's Square, and out Commonwealth Avenue, to Harvard Avenue or some terminal beyond. The present plans of the planning division are that the extension in East Boston would connect with the Revere Beach & Lynn at the Wood Island station. It is estimated that it will require five years to complete the construction of these two new rapid transit lines. No new rapid transit extensions have been made, with the exception of the Shawmut branch, since the opening of the Cambridge subway in 1912. It is true, however, that the short extension from Sullivan Square to Everett was opened in 1919, but this extension was of minor importance; were it not for the development of the automobile during the past ten years the present transportation system would have long since been totally inadequate.

This bill ties up somewhat with the other Elevated bill for the 25 year extension of public control, because the financing of the extensions is provided for in that public control bill.

Strong opposition is developing to the public control bill. A substantial minority from the metropolitan affairs and street railway committees has decided to urge termination of public control and the return of the Elevated to its stockholders. It has filed a bill to that effect, to give the Elevated notice of the return to private ownership by July, 1929. A legislative hearing on this general subject was given on March 29, and it was expected that the Elevated stockholders, directors and trustees would express themselves regarding the plan for a 25-year extension of public control. But these three groups remained silent, except for one small stockholder who told the legislative committees that he did not care whether the Elevated property were returned, or the public control extended; he said that the stockholders can run the property now if it is given back to them without any stranglehold from the Legislature.

Mayor Signs Amended Parking Ordinance for Philadelphia

The amended parking ordinance providing one-hour parking on Broad, Market, Arch and several other central city streets of Philadelphia, Pa., became a law when Mayor Kendrick signed the measure on March 28. Comment on the change in the parking regulations was made in the ELECTRIC RAILWAY JOURNAL in the issue of March 26, page 560.

Passage of the amendatory ordinance came as the result of organized opposition by central city business men to the drastic measure which banned parking in a large downtown area. The new law limits the affected area to the district bounded by Vine and Pine Streets and Delaware Avenue and 23d Street.

Under the terms of the ordinance no parking is allowed within 100 ft. of any street intersection where a trolley-loading platform or safety zone is established, and 40 ft. from any other street intersection; no parking is allowed at any time on any street less than 20 ft. wide for a period longer than necessary to load or unload in the restricted area; no parking is permitted anywhere in the city between 3 a.m. and 6:30 a.m.

Proposed Change in New Jersey Fares Suspended

Further suspension was directed by the Board of Public Utility Commissioners of New Jersey on March 26 of proposed changes of fare zones by the Public Service Railway and the Public Service Transportation Company. The new rates were to have become effective on Jan. 1, but the board suspended the change until April 1. The further suspension will be for a period not exceeding three months from April 1, unless the board disposes of the case sooner.

United Suburban Railway Takes Form

New Lease on Life for Michigan Company Celebrated at Enthusiastic Meeting—All Grandville There

In Grandville, Mich., one of the smallest villages in the state, the shortest interurban railway with the longest list of stockholders in the United States was born recently when the United Suburban Railway came into being. The new company will take over and operate the defunct Grand Rapids, Holland & Chicago Interurban line between Grand Rapids and Jenison, a distance of 8.3 miles. Representatives of 700 families along the railroad, all stockholders of the company, and six Grand Rapids bankers and business men attended the birthday party when organization of the company was completed, by-laws adopted, directors elected, contract of purchase ratified and $7,000 additional stock subscribed to bring the total subscriptions up to $50,600, the amount required to close the deal.

Drive for Sufficient Funds

By a peculiar circumstance the Rev. J. P. Battema, pastor of the Wyoming Park Christian Reformed Church, was chosen temporary chairman of the meeting. It was he as a minister who spoke the last words over the old line when it quit business last November and it was he at this meeting who spoke the first words over the new line. The six Grand Rapids bankers and business men, Dudley E. Waters, president of the Grand Rapids National Bank; Gilbert L. Daane, president of the Grand Rapids Savings Bank; Benjamin S. Hanchett, one of the promoters of the original Grand Rapids, Holland & Lake Michigan Railway; Arthur E. Wells, Eugene Richards and Harold M. Braudy, the latter being purchasing agent of the defunct line, injected pep and enthusiasm into the meeting. Their efforts brought the drive for sufficient funds to a successful culmination. They were among the first to subscribe for ten shares of stock when the call for additional shares was issued, increasing their bids to fifteen shares to insure the quota.

Harold T. Slaght, cashier of the Grandville State Bank, who has been the prime mover and guiding spirit in the rejuvenation of the road, was elected director-at-large. Other directors elected from a field of twenty candidates from the different communities to be served by the line are: A. Dick and William Huizenga of Galewood, Paul Gezon of Wyoming Park, E. F. McCarrick of Hamilton and Edward Miller and Gerritt Zuidema of Grandville. Officers will be elected later.

Conditions of the contract of purchase as ratified call for the payment of $30,000 for the old railroad. The Consumers Power Company, the owner, has offered to lease the right-of-way to the new railroad at an annual rental of $1,000 plus taxes, while the Michigan Railway has offered the use of its tracks from Grandville Avenue junction, at the southwestern limits of the city, to its terminal in the heart of Grand Rapids, for 20 cents a car-mile and a terminal charge of $4,500 a year.

During the meeting Y. Groendyke, chairman of the nominating committee, termed the project as "a railroad owned by the people, operated by the people and patronized by the people." He said if the line fails to pay it will be because the people of Wyoming township have a grudge against themselves.

Wages on Interborough Advanced 5 Per Cent

A 5 per cent increase in pay for its employees who are members of the Brotherhood of Interborough Rapid Transit Company Employees was announced on March 29 by the Interborough Rapid Transit Company, New York, to be effective on April 1. This means an extra annual expenditure by the company of approximately $1,500,000. The advance will affect nearly 15,000 employees, members of the operating, mechanical and clerical departments.

The announcement was made by Frank Hedley, president of the company, following action by the board of directors at which Mr. Hedley read a letter from M. J. Mangan, secretary of the brotherhood, requesting the increase, and suggesting a two-year contract with the brotherhood at the increased rate. This contract will be drawn up and signed shortly. A statement by Mr. Hedley said:

> By this increase the company makes the second of the 5 per cent readjustments in pay following the voluntary reduction of 10 per cent to which the employees agreed in 1921 as their contribution to the plan to keep the Interborough out of receivership. The first 5 per cent was restored in 1923 and the second at this time. This is in accordance with the company's pledge that wages would be raised just as soon as finances permitted.
>
> The Interborough is able to grant this increase, which amounts to approximately $1,500,000 a year, by the utmost economy in other directions and by the most careful management of every department. For a long time we have all realized that these employees should have more money and our aims and hopes in this direction are now achieved to the very limit of our financial ability. Every cent which might be utilized for this purpose is absorbed by the new agreement.

At present motormen receive 82 cents an hour and guards 54⅜ cents as the top rate or $4.37 for a day of eight hours.

New Suggestions Offered on Rainier Project

Requests that it be permitted to have a monopoly of transportation in the district which it serves and no longer be required to pay the city a franchise tax featured proposals made to the Seattle, Wash., City Council recently by the Seattle & Rainier Valley Railway, through M. E. Samsell of Chicago, its president. The conference was secret and the only statement was that of E. L. Blaine, finance chairman and official spokesman for the Council.

Plans to have the city take over the railway on a leasing arrangement were discarded as impractical.

Through Service Between Chicago and Central Illinois Awaited

With the completion about May 1 of a short stretch of connecting track in the city of Joliet, Ill., through interurban railway service will be established for the first time between Chicago and central Illinois valley points, according to a statement issued March 21 by J. R. Blackhall, vice-president of the Chicago & Joliet Electric Railway. A joint operating agreement recently consummated by the Chicago & Joliet line and the Valley division of the Illinois Traction System calls for the operation of the latter's cars from the Chicago terminal of the Chicago & Joliet at Archer Avenue, by way of Joliet, Morris and Ottawa through to Princeton, Ill., a distance of more than 110 miles. From Chicago to Joliet the cars would use the tracks of the Chicago & Joliet line and the Illinois Traction System rails from Joliet westward. Tentative plans provide for four round trips daily, two in the morning and two in the afternoon and evening.

The Illinois Traction system's popular new "Tangerine" light-weight, one-man interurban cars will be operated in this service, stopping only at the larger towns and providing "limited" service over the Illinois Valley division for the first time.

Although the project was approved by both companies last December, actual construction work, which will be undertaken by the Chicago & Joliet line, has been delayed for several months due to the municipal primary election on April 19, Mr. Blackhall explained. He added, however, that permission to make the physical connection between the two lines would undoubtedly be granted by the city commissioners immediately after the election and that he hoped service could be started by May 1. All materials for the work are now on hand.

Power Cost Condition in Seattle Not Obligatory for Deal

Negotiations between the city of Seattle and the Puget Sound Power & Light Company for a reduction in the annual payments on the purchase of the Seattle Municipal Street Railway have advanced a step further with the assurance by A. W. Leonard that he will not insist on a ½-cent rate for power furnished by the city lighting department to the railway for its operation. In the power company's offer to the city for an extension of time on the purchase bonds, Mr. Leonard had imposed a condition that the present rate charged for electric railway power be lowered to ½ cent, but he now states that if this means that the city light department would be supplying the power at less than cost of production, he will not insist upon this condition.

The present rate charged is 1 cent a kilowatt-hour. City officials have tentatively agreed upon a ¾-cent rate. This they plan to suggest to Mr. Leonard, and it is understood that the latter will be satisfied with this rate if he is convinced that the city cannot furnish the power at a cheaper rate without loss. Meantime a report on production costs is being prepared by the lighting department, upon which the Council will decide a rate to be submitted for further dealing with the Puget Sound company.

The litigation involving the railway pending in the federal court is no nearer settlement than it was weeks ago. Various delays have continued the hearings from time to time. The only litigation in which the city is involved now is the Von Herberg suit, which seeks an order restraining the city from paying any further money on bond redemption and interest until all labor and operating costs have been met.

Fare Petition Formally Presented in Macon

The formal petition of the Macon Railway & Light Company, Macon, Ga., for increased fare, rerouting of lines and other concessions was presented to the City Council on March 15 and referred to the public utilities committee. The company wants a 10-cent cash fare with three tickets for 25 cents: lifting of paving assessments and gross receipts tax; permission to change schedules and to reroute nearly every line. In return it proposes to rehabilitate the entire system, building new track and sidings, buying ten new cars, and spending in all a total of $314,000. The present fare is 7 cents.

Transit Matters in Philadelphia Passed Upon by Commission

The Public Service Commission of Pennsylvania on March 29 rejected the proposed new lease of the Frankford Elevated to the Philadelphia Rapid Transit Company and approved the Chestnut Street subway agreement with the city. The latter provides for construction of a surface car subway by the municipality to be leased to the transit company until such time as rental payments equal cost of construction, when title will pass to the Philadelphia Rapid Transit Company. Consent of commission to Frankford "L" lease was withheld because of conviction that no lease for that line should be signed which does not include provision for rental to the transit company of the Broad Street subway.

Ordinance Against One-Man Cars in Buffalo Overruled

The city ordinance at Buffalo, N. Y., which makes it unlawful for the operator of a street car to engage in the performance of any other duty while the car is in motion, aimed primarily against one-man cars in operation by the International Railway, is unconstitutional. City Court Judge Peter Maul so ruled in a decision handed down in a test case when the police department arrested an operator of a one-man car in an action to recover $50 penalty for violating the new rule.

Judge Maul cited the opinions of higher courts upholding the regulatory authority of the Public Service Commission with respect to the railway and held that the city is without authority to legislate against one-man car operation. The city's case was dismissed.

Paving Measure Passes in Utah

House bill No. 120, recently passed by the Utah Legislature and signed by Governor Dern, provides that every electric railway in Utah shall, at its own expense, restore the pavement, including foundation thereof, of every street disturbed by it in the construction, reconstruction, removal or repair of its tracks, in the same condition as before the disturbance thereof, to the satisfaction of the Board of City Commissioners or City Council having charge of such street. The obligation imposed by this act shall, in cites of the state of Utah, other than cities of the first class, be in lieu and substitution of any and all other obligations of any such company to pave, repave or repair any street, or to pay any part of the cost thereof.

When any street of any city, other than cities of the first class, occupied by the tracks of the railway is to be paved or repaved, the Board of City Commissioners, or the Mayor, and City Council of said city is vested with authority to assess the entire cost of paving or repaving such street, including the portion occupied by said tracks, against the abutting property.

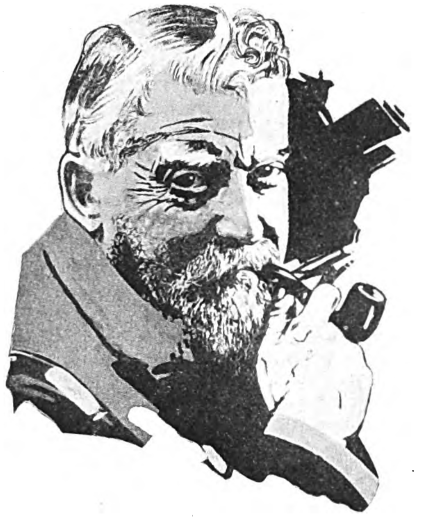
Railway in Saginaw Oil Boom Area

Oil has been struck in Saginaw, Mich. As a result that city has taken on the appearance of a new El Dorado. And the discovery doesn't seem to be a flash in the pan, either. Many of the big companies have begun operating. The Sun Oil Company is on the ground, so is the Ohio Oil and a host of others. So is the Saginaw Transit Company, for some of its property is believed to be in the "strike" area. It is too early to attempt to predict to what extent the railway and bus company will become an oil producer, but its management doesn't propose to miss any bets.

Every acre included in the present field, which extends 2½ miles northwest of the Saginaw business district and is 1½ miles wide, is under lease to the pioneer companies. There is a derrick within a block and a half of the city's largest office building. The flow is there, but there are no gushers. After the initial tumult and shouting has died, a sane appraisal of the prospects will be in order. Then will the transit company know to just what extent it will be a participant in an oil boom that for the present at least has set the whole city topsyturvy.

Houston Company Educates Riding Public

The Houston Electric Company, Houston, Tex., is running a series of newspaper advertisements in its campaign to educate the riding public to the need for an increased fare. One advertisement, entitled "The Future of Public Transportation—Street Cars vs. Buses," stated that the new schedule of rates proposed would provide a lower rate for the constant user and a somewhat higher rate for the infrequent user. The company's fare petition was digested in the JOURNAL recently.



"Will Livelong"

"Will Livelong" in Philadelphia—Make April Safe

Municipal authorities of Philadelphia, Pa., have viséd the passport of "Will Livelong," the safety sage, who as the guest of the Philadelphia Rapid Transit Company will spend the month of April in the Quaker City with the promise to augment the happiness of Philadelphians by reducing the accident hazards of the streets. This kindly, wise old gentleman will be on hand, if not in person at least in picture, to caution children not to play in busy streets; to advise pedestrians to have a care when inclined to indulge in the dangerous practice of jay-walking, and to urge motorists to think for the other fellow as well as for themselves.

Behind this safety campaign are lined up a great many aggressive factors in the community life, including such organizations as the citizens' safety committee of the Chamber of Commerce, the public and parochial schools, the Automobile Club of Philadelphia, the Keystone Automobile Club, the Safety Patrol, the Boy Scouts and Girl Scouts. All other organizations in the city are being asked to lend their active support to the campaign and to contribute to its success by urging the idea and practice of safety upon their members.

A special safety Sunday will be set aside later in the month, at which time the various churches and religious organizations of the city will be asked to co-operate by emphasizing the importance of street safety and by discussing ways and means of reducing the accident hazard.

Each week of April will be devoted to special phases of the campaign. The first week, from April 3 to 9 inclusive, will be devoted to accidents involving children. This phase of the activity is advanced in an effort to reduce the 134 fatal accidents and 4,284 non-fatal accidents involving Philadelphia children during 1926. Later in the month will come periods devoted to pedestrian accidents and automobile accidents.

Headquarters of the "Will Livelong" safety campaign are located on the thirteenth floor of the Hotel Touraine, 1520 Spruce Street.

Subway Proposed in Fulton Street, Brooklyn

The route and plan for a subway in Fulton Street, Brooklyn, N. Y., was adopted on March 31 by the Board of Transportation, which sent a resolution to that effect to the Board of Estimate for approval. The plan calls for a four-track subway which will be the main trunk line of the city's new subway system in Brooklyn. It is expected that the new subway, which is to be constructed from Lafayette Avenue to Alabama Avenue, will hasten the removal of most of the elevated railroad in Fulton Street.

Another resolution was adopted by the board directing Robert Ridgway, chief engineer, to report on the cost of extending the Fulton Street subway from Alabama Avenue to the county line between Kings and Queens and to study the availability of other lines for this extension. A report was also requested on the best method of transfer connection with the Atlantic Avenue division of the Long Island Railroad and best methods of eliminating grade crossings over the railroad tracks.

One-Man Cars on Barberton Run

One-man car operation has become effective on the Barberton-Wadsworth line of the Northern Ohio Power & Light Company. The change is made for two reasons—safety and economy. More than a year of one-man operation in Akron has demonstrated the value of one-man car operation from the standpoint of safety and the company believes that as soon as the public becomes accustomed to the change it will fully approve the move.

The pay-enter plan has been adopted and passengers will board and leave cars at the front. The center exit will not be used. Zone checks are being used. Passengers boarding cars westbound in Akron will not pay as they board the cars, but pay as they leave. Eastbound passengers boarding cars between Wadsworth and Sherman will also pay as they leave. Passengers in the other zones pay as they board cars and secure a check showing destination to which fare is paid.

Thank You Aids in New Brighton

Think you, "thank you" deserves no praise?
It may not directly get you a raise
But it does spread cheer
So at the end of the year
You'll have no fear
But lots of good will, piled up for you, Bill,
And a great big THANK YOU—
from the Beaver Valley Board.

Have you heard a thank you? Jot it down. It's contagious with the Beaver Valley Traction men. Each man in the company is a thank you scout, and when he hears a fellow worker praised by a patron for some little kindness or courteous act he takes this as his clue, writes it down in his notebook and at the end of the day transmits it to some member of the board—the dispatcher, superintendent, commercial manager or even the general manager, himself—who passes it on to the original man.

This is the gist of the latest bulletin of C. D. Smith, general manager.

Unusual Publicity Campaign in Grand Rapids

In the campaign literature used by the Grand Rapids Railway, Grand Rapids, Mich., in connection with the paving referendum submitted to the voters at the March 7 primary four stunts were especially interesting and served as evidence of the efforts of the company to win approval to its idea of relief from the cost of paving between the tracks. The measure, which was lost by a vote of 3,375 for and 4,612 against, was referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 26, page 586.

A convincing piece of publicity literature was a bulletin sent out with a letter from the secretary of the Chamber of Commerce to all members of that organization and to factory employees. Factory owners used the material for tack-ups near the time clocks in their shops. The bulletin read that a "yes" vote had been unanimously approved and indorsed by the Grand Rapids Civic Round Table. Another idea was the distribution to the railway organization of pledge cards to help get out the vote. It was called "Votes I Can Secure." Another device was the slip-in connection with the employees' pay checks. On this paper nine results of a "yes" vote were listed. A departure from the usual form of advertising was the issuance of cards by all drivers of the Yellow Cab Company of Grand Rapids in helping the railway in its campaign. The message of the Yellow Cab Company recognized the Grand Rapids Railway as a competitor, but was "happy to co-operate with any movement or enterprise that will help Grand Rapids progress." Invisibly written on the card was the name of Bert Kenyon, manager of the Yellow Cab Company, who apparently believes that working with Mr. DeLamarter means the growth of his city.

News Notes

Would Suffer the Little Children.—A reduction in fare from 7 cents to 5 cents for children under 15 years of age was authorized on March 25 on the lines of the Johnson City Traction Company, Johnson City, Tenn., by the State Railroad & Public Utilities Commission. The commission also authorized the company to issue weekly passes to sell for $1.25 and allowed the sale of fifteen tickets for $1. The Johnson City Traction Company recently raised fares by the consent of the commission and discovered that it lost the business of the school children, who walked rather than pay 7 cents. It is with the desire of restoring the patronage of the children that the fare has been reduced.

Would Abandon Franchise Rights.—The Key System Transit Company has applied to the California Railroad Commission for authority to abandon its franchise rights on East Sixteenth Street between Second Avenue and Fourteenth Avenue in the city of Oakland and for a certificate declaring public convenience and necessity require construction and operation of a connection between applicant's Eighteenth Street line and its East Sixteenth Street line on and along Fourteenth Avenue. The railway sets forth that the city of Oakland proposes to pave East Sixteenth Street, throwing an expense of $88,000 on it, which is not warranted by the traffic on the lines.

New Caps and Badges in Kansas City.—The old style caps and badges worn by transportation employees of the Kansas City Railway, Kansas City, Mo., were replaced on Feb. 1 by new headgear similar in design to that worn by motor coach operators. The new caps are blue and have a larger and more loosely fitting crown. The badges of the new Kansas City Public Service Company are also of a different design. The expense of the new equipment was borne by the company.

Talks on Safety to Students.—Safety talks will be given to the school children of Atlanta, Ga., by a selected group of trainmen of the Georgia Power Company. Under plans outlined by Safety Director W. J. Rountree and H. Reid Hunter, assistant superintendent of the Atlanta public schools, every school will be visited. All addresses will be centered about three major points—conduct in street cars, on streets and hazards of bicycle riding.

Hearing Held on Oneida Fares.—Commissioner Van Voorhis held a hearing on March 25 on the application of the New York State Railways to the Public Service Commission for permission to increase fares from 7 to 10 cents, with three tickets for 25 cents, in the Oneida district between Sherill and Wampsville. Corporation Counsel Scoville, representing Oneida, withdrew opposition to the increase in fare on the stipulation by the railway to give a 30-day commutation ticket from Oneida to Wampsville for $2.50 for 50 rides; a round-trip ticket for 15 cents between Oneida and Wampsville, and to continue the sale of the workmen's tickets as at present at 11 cents.

Another Store Gives Free Rides.—The Reps store of Springfield, Mo., recently held a sale and provided free transportation on the local cars of the Springfield Traction Company between the hours of 9 and 10 o'clock on a Monday morning. As a result of this enterprise, coupled with judicious advertising, the store broke all records for sales during 28 years of business. The store's advertising for that sale day covered ten full pages in the Springfield *Daily News*, Sunday issue.

Amended Fare Order in Syracuse.—The Public Service Commission amended its order of Feb. 2, 1927, on March 24, in reference to fares on the Syracuse line of the New York State Railways by permitting the railway to sell six tickets for 45 cents on its cars and to establish at least fifteen stations in Syracuse where tickets or tokens will be on sale at the rate of four tickets or tokens for 30 cents, provided these stations can be established without expense to the company. This amended order is to become effective on April 1 and to remain in effect for 60 days thereafter or until otherwise ordered by the commission.

Cars Carry Falls Illumination Display.—A large display sign calling attention to the nightly illumination of Niagara Falls, N. Y., was carried in more than 700 city and interurban cars of the International Railway, Buffalo, on March 28. The sign, centrally located in the interior of the cars, shows a night view of the American Falls at Prospect Point, together with the announcement of the time of the illumination. The wide display on all cars with the suggested beauty of the falls at night is expected to stimulate travel to Niagara Falls.

Pamphlet on Railways Distributed.—"He profits most who serves best" is peculiarly applicable to an electric railway and finds its exemplification in the history of every successful street railway. This statement was made the conclusion of a paper read before the Memphis Engineers Club on March 7 by A. D. McWhorter, general superintendent of the Memphis Street Railway, and copied for distribution in pamphlet form with the compliments of the Memphis Street Railway. In some 20-odd pages Mr. McWhorter traces the history of street railways as a factor in transportation and gives some details on the Memphis system. Comment from the *Daily Post*, *Daily Argus* and the *Public Ledger* of May 30, 1866, on the inception of railway operation is reproduced.

Employee's Right Upheld.—The Indiana Public Service Commission on March 18 overruled a motion filed earlier in the week by attorneys for the Indianapolis Street Railway to dismiss the petition of James Green, an employee, that the commission act as a board of arbitration to effect a new wage scale agreement. Mr. Green filed a petition for redress of grievances as provided in a working agreement he said he signed with the company. Attorneys for the company then filed a motion to dismiss the petition, contending that his move was not made in good faith as he represented no one but himself and that the commission had no jurisdiction. The order issued March 18 said in part that "the contract under which this proceeding was instituted was, among other things, for the purpose of guaranteeing to the employees of the respondent signing the contract an effectual and constantly available remedy to adjudicate all controversies which may at any time arise." No date was set for hearing the employee's petition.

Foreign News

Automatic Substations for Cape Town Suburban Railway

When the electrification now in progress on the Cape Town Suburban Railway is completed it will be the first line in South Africa to have all its substation equipment automatically operated and remote-controlled. The line runs from Cape Town to Simonstown, a distance of about 30 miles. It will have six substations, each of which will contain one or more pairs of

1,000-kw. rotary converters by which three-phase current at 33,000 or 12,000 volts from the Salt River power station will be converted to 1,500 volts direct current for operation. The load dispatcher at the central station will be able to start or stop the rotary converters at any of the substations and will be assured by means of visual indications that the machines have done what he wishes and are working properly. For this purpose the all-relay tandem supervisory system of power control of the General Electric Company of England has been adopted. The twelve pairs of rotary converter sets, with automatic starting equipment, high-speed circuit breakers, etc., are being made at the company's Witton Engineering Works, Birmingham. Supervisory control equipment, really a telephone engineering job, is being supplied by the Peel Connor Telephone Works, Coventry.

Lack of Funds Halts French Electrification Program

Electrification of the seven regions in France as outlined in the rather extensive program which started at the conclusion of the World War has been halted because of lack of funds. Unison of these lines began to show progress two years ago, because the regions lying closest to the Alps and Pyrenees having the most available water power were developed first. Five or six years is the length of time to erect hydraulic-electric generating stations. For this reason the cost of construction is enormous, since long-term loans have risen in cost from 5 per cent to 13 and 14 per cent. Several proposals for construction of the program have been made, but the only reasonable solution seems to be the stabilization of the franc, according to industrial authorities.

Success of 2d. Maximum Fares in Glasgow.—The 2d. maximum fare for any distance beyond the 1d. stage, introduced on the Glasgow Tramways in the middle of last year, continues to produce higher traffic receipts. From the beginning of the financial year on June 1, 1926, until Feb. 7, 1927, there was an increase in revenue of £2,255 after wiping out a decrease of £10,000 when the old graded fares were in operation.

Escalators Increase Traffic in London Stations—Traffic has increased in tube railway stations in London since escalators have replaced stairs. The reconstructed station at Picadilly Circus will have at least eleven of them and will handle an annual traffic of 50,000.000 passengers. At the present time there are 64 of these moving stairs in 30 of the city's stations. When the present scheme of extension is completed 85 escalators will be installed at 34 stations. One up and down escalator is said to have the capacity of five stairways. The speed of the individual escalator is little more than 1 m.p.h., but the total number on the system in the course of a twenty-hour day travel about 1,500 miles. When the scheme is completed the daily performance will be 2,000 miles.

Recent Bus Developments

Allentown Problem Solved

Lehigh Valley Transit Official Discovers Efficacy of Schedule Cards in Education of Potential Bus Riders

"Getting the people to know your schedule is the same thing as advertising your service. The cost is a comparatively small one—the result is big, in our case, at least." This is the opinion of Henry F. Dicke, assistant to the president of the Lehigh Valley Transit Company, Allentown, Pa., who was confronted with the problem of selling the bus to the riding public. The idea was brought forward that a substantial, hard-wearing time-table would be an ever-present reminder of the bus lines. Accordingly celluloid cards were printed and 20,000 distributed through the bus passengers and among the big plants and stores. Upon one side was the picture of the new bus in its natural colors, topped by the caption "Turner Street Bus Line," and below, "The Lehigh Valley Transportation Company." On the reverse side was the schedule, telling of the time of arrivals at each of the important intersections, daily and nightly, eastbound and westbound. The card fitted nicely into a wallet or a vest pocket. The schedule card proved to be not only a convenience and reminder but also the final and necessary touch to the company's campaign for the installation of bus service.

When the Lehigh Valley Transit Company, under the title of the Lehigh Valley Transportation Company, recently added four large Mack buses to the organization it became noticeable that although the bus fleet covered the major part of its route through a section which needed additional transit facilities many potential passengers waited upon a spot where there were rails and trolley wire. Years and years of habit were driving them to walk varying distances to ride upon a car, while they might as well have saved the walk and taken the bus, which was being run directly for their convenience. A survey among the people of the territory covered by the bus lines revealed the fact that those who had clamored for the service knew nothing of the schedule of the buses, although the time-table had been published frequently in the papers. It was soon learned that the average person as he scanned the printed page would not cut out such a list because the paper soiled quickly and the wear and tear destroyed it in a short time.

In addition to the company's scheme to print the schedule card the buses were routed along Hamilton Street, the main thoroughfare. The buses stopped at the same loading platform as did the trolleys. The bright red and yellow coloring of the buses was distinctive and it created attention. People began to notice the buses. Presently the number of bus passengers began to mount.

A service has been started for parties and clubs, carrying them everywhere. This phase of the service received a most decided impetus when the Allentown Chamber of Commerce was convinced of the practicability of using two buses to transport its party on a recent "Good Fellowship Tour" to Wildwood and Atlantic City.

Substitution of Buses Being Approved

Permission has been granted the Morris County Traction Company by the Borough Council of Wharton, N. J., to substitute buses for the electric railway in the borough. The terminus, however, will not extend northward beyond the Central Railroad station, which is two blocks farther than the present terminal. The railway had asked permission to extend its lines to North Main Street, in the Luxemburg section, but residents of that section affirmed, in a petition, their belief that the present bus service given by F. B. Sheldon & Son is satisfactory. A 5-cent fare was proposed by the railway as an incentive to permit the extension of the line to Langdon's corner.

With one or two exceptions all communities along the railway have approved the change of transportation and within a few months it is likely buses will be in operation over the entire length of the old railway route.

Long Island Utility Should Be Preserved

The Public Service Commission denied on March 25 the petition of the Northport Transportation Company, Inc., for a certificate of public convenience and necessity for a bus line between Halesite and Huntington Station, Long Island, N. Y. The petitioner is now and has been for some time operating a bus line about 8 miles long from Vernon Valley, Northport and Cole Spring Harbor. The proposed route is about 3 miles long and directly competes with the Huntington Traction Company, which opposed this petition.

Investigation by the commission's engineers revealed that the tracks and equipment of the traction company were well maintained and in safe condition to operate; some maintenance work, however, was required. At the hearing it developed that bus transportation service rather than electric railway service was preferred by many residents. Under a special act passed by the Legislature in 1926 authorizing the substitution of bus service for the electric railway with the consent of the local authorities, the railway secured such consent. The commission in denying the bus petition ruled that competition on this line, if permitted, would mean that neither company would be able to operate with financial success and probably the existing utility would be destroyed.

Prospective Competitor in Buffalo Heard

Ernest M. Howe of the Buffalo Motor Coach Corporation, which is seeking a certificate of convenience and necessity from the New York State Public Service Commission for the operation of four bus lines in Buffalo, outlined details of the company, its financial status and its proposed plans at a series of hearings before Commissioner Pooley in Buffalo.

Mr. Howe said the new bus company will start operations with approximately $325,000 in assets, against $250,000 in subscribed capital. He said there will be an unfunded debt of $75,000. The company expects to operate 1,000,000 bus-miles annually with an average passenger pick-up per bus-mile or five or more passengers at an 8-cent cash fare. On that basis the minimum number of passengers carried annually, Mr. Howe said, would be 5,000,000. The estimated operating costs per mile, figuring in 20 per cent depreciation of vehicles, supervision and other items, would be 32 to 32½ cents per bus-mile. Mr. Howe said the company will buy 25 buses at $10,000 each, paying down $175,000.

After reviewing the railway situation in general President Youngbluth of the International Railway said in substance:

> Buffalo is in the same case with many other cities, and International Railway has the same troubles and problems faced by almost all other systems. Things are getting a little better, generally and locally. In 1926 this system, for the first time in many years, earned its depreciation reserve.
>
> Now comes the Buffalo Motor Coach Company proposition. Any independent bus system, of necessity, must be competitive, and this one would be highly competitive. It was laid out so that its three lines would reach one-fourth of the city population. Of course, it could not serve that population without connecting and cross-town lines. Mr. Howe estimates that it will take in at least $400,000. Whatever it takes in will be subtracted from International Railway, because this proposed competition will not generate new business of any appreciable amount.
>
> If the community wants a railway system, and in the present state of the transportation industry it is certain that the city needs such a system, it cannot afford to expose that system to ruinous competition which robs it of the most profitable business. Short, straight rides, without transfers, are the rides which make money. These rides are the ones which the Buffalo Motor Coach Company plans to take away.
>
> Co-ordinated service of railway and bus, with one fare and universal transfer, is better than cut-throat competition and two fares for one ride. It is not possible to have one good city-wide service with competition for the part of the business that absorbs losses and furnishes profits.

Substitution Decision Rests with Marinette

Substitution of bus service for railway service looms in Marinette and Menominee. At the hearing recently held in Marinette by the Wisconsin Railroad Commission to ascertain the extent to which the Menominee & Marinette Light & Traction Company would be willing to share in the cost of new bridges over the Menominee River between the Twin Cities, J. P. Pulliam, vice-president and general manager of the company, disclosed that street railway service was supplied at a loss of $80,000 last year in Marinette and Menominee. This makes the total operating deficit close to $500,000 since the company purchased the system. In the light of these disclosures and the additional explanation that any attempt to recoup these losses through increased rates would require prohibitive fares, discussion at the hearing switched to the substitution of buses as the facts submitted clearly indicated the company's inability to share in the cost of the new bridges. On this point Mr. Pulliam declared that the company would gladly surrender any railway or bus rights it has in these cities, but if some common ground could be reached by all parties the company would be willing to contract to maintain bus service in and between the two cities.

It will be recalled that the ELECTRIC RAILWAY JOURNAL reported in its columns a few months ago that the City Council of Marinette rejected the proposal of the company to substitute bus service on a four months trial basis, railway service to be restored if the change did not meet with approval.

Profit-Sharing for Fifth Avenue Employees

Directors of the Fifth Avenue Coach Company, New York, have approved the principle of profit sharing and the installation of a profit-sharing plan for the benefit of the employees has been authorized. Under a plan effective April 1, 1927, 10 per cent of the net income from the transportation business will be allotted to employees at the end of the year as follows:

1. To present employees who are still in service Dec. 31, 1927.
2. To persons hereafter employed who are still in service on Dec. 31, 1927. Such new employees, however, must serve three months before they begin to participate in the profits.

To give an idea of what this arrangement means, 10 per cent of the net earnings from the transportation operation as applied to the last three years would have been

$115,000 in 1924
115,000 in 1925
97,000 in 1926

Under present conditions approximately 1,850 men will benefit.

The officers, executives and heads of departments will not share in the 10 per cent of the profits above mentioned.

The company says:

> The management recognizes that the present high character of its service is due in large part to its employees. Their deep interest in their work is reflected in a very low annual labor "turnover." By this plan each man by doing his part well can increase the patronage of the company, heighten the usefulness of the service to the public and at the same time increase his own earnings.

Further studies, now under way, will be completed about April 15.

Substitution in Eugene Unlikely

Despite the fact that the Oregon Commission some time ago granted an application of the Eugene Street Railway to substitute service by bus for electric railway service, there has been no noticeable decrease in the operation of the railway. Reports filed with the commission indicate, in fact, that more cars are being added to the service and that patronage has improved greatly since the announcement of the proposed change to motor vehicles. In the event of continued fair patronage, officials state that railway service in Eugene will not be discontinued.

More Bus Substitutions in Westchester

Abandonment of railway lines and the substitution of buses in southern Connecticut and Westchester County are sought in petitions which the New York, New Haven & Hartford Railroad and affiliated companies are preparing to file with the Public Utilities Commission. Everett Miller, president of the New York & Stamford Railway, disclosed that the petitions were to be filed as "the result of negotiations initiated nearly a year ago by the Traffic Commission of the Greenwich Chamber of Commerce." The New York & Stamford uses an interstate railway line which, in part of its territory, leases and operates lines owned by the petitioners. This company had announced that on April 3 the railway operating locally in Portchester would be abandoned and buses installed sufficient to afford a twenty-minute service. It is understood that if the petitions are granted the companies will cancel their present leases with the New York & Stamford Railway and will release their rights-of-way to this company for the motor coach routes.

Seeks Interurban Substitution.—The Mesaba Railway, Virginia, Minn., is planning to abandon its line between Gilbert and Hibbing as authorized by the federal court. At present public conveyances between the two towns are a rail and a bus line. Committees representing eleven range towns are seeking assurance from the Mesaba Railway Coach Company that transportation facilities will be adequate after the rail line has been abandoned. The bus and railway line are jointly owned.

Bus Operation Results in Loss.—Operation of buses in and between Superior and Duluth failed to net a profit for the Duluth Street Railway during 1926, according to the report filed with the Wisconsin Railroad Commission on the activities of the Superior-Duluth Coach Company, a subsidiary. The report revealed a loss of $6,379 last year. Operating revenues were $101,679 and expenses $103,256, a loss of $1,577, to which must be added taxes of $4,802. Operating expense covered $10.486 in bridge tolls for the use of the interstate bridge between Superior and Duluth. If the company had been relieved of this expense, the profit in 1926 would have been $4,089.

Will Continue Bus Operation—Despite reports that the New England Transportation Company would take over buses now operated by the Worcester Consolidated Street Railway, Worcester, Mass., Howard R. Whitney, vice-president of the railway, said his company would continue to operate the lines where they have developed the business. The railway will continue to operate in the sections where bus and railway service have been given.

Bus for Churchgoers.—The Boston Elevated Railway, Boston, Mass., has established a special Sunday bus service between the Park Street subway station and the Old North Church for the accommodation of churchgoers. The service was started March 27. So popular was the idea that the bus made three trips to serve 75 passengers.

Financial and Corporate

$494,471 Carried to Surplus

Market Street Railway, San Francisco, Reduces Debt $634,000—Showing Good All Elements Considered

Operating revenues of the Market Street Railway, San Francisco, for the year 1926 remained practically the same as the previous year. Due principally to increased wages of trainmen, effective early in the year, net earnings decreased as compared with 1925. Funded debt in the hands of the public was reduced $634,000 and there was no increase in the amount of capital stock outstanding. No dividends were paid. Capital expenditures during 1926 were $244,564. The sum of $1,346,243 was expended for maintenance of way and structures and rolling stock and equipment. A balance of $494,471 was carried to surplus.

The company operates its properties under a number of franchises, some of which expire in 1929, while others continue as long as 1952. In view of this situation the Board of Supervisors of the city and county of San Francisco has appointed a committee to study transportation problems and formulate a comprehensive program for future development.

SUMMARY OF INCOME STATEMENT OF MARKET STREET RAILWAY FOR 1926

Operating revenue		$9,891,667
Operating expenses and taxes except federal income tax		8,019,093
Net operating revenue before provision for depreciation		$1,872,574
Other income		53,453
Gross income		$1,926,027
Income charges:		
Interest on funded debt	$845,148	
Discount on funded debt	53,113	
Provision for 1926 federal income tax—company's estimate	74,423	
Depreciation of railroads and properties	500,000	
Other	25,628	
Total		$1,498,312
Net income		$427,715
Other profit and loss credits		66,756
Surplus		$494,471

Operating revenue for 1926 was $9,891,667, a decrease of $11,100 under 1925. The slightly reduced passenger receipts were due partly to a building trades strike, which continued through most of the year, and partly to the fact that the previous year was benefited by the celebration of California's 75th anniversary as a state.

Operating expenses, including taxes other than federal income tax, were $8,019,093, an increase of $344,285, or 4½ per cent, over 1925. This increase was mainly due to an increase in the wages of employees effective on March 1, 1926.

Thirty new cars were built in the company's own shops, and a number of others cars were remodeled to provide open-air sections in response to popular demand. During the year the company started a bus line through the rapidly growing Excelsior district.

Expenses incident to injuries and damages were 30.18 per cent less than in 1925. Statistics indicate that collision accidents per car-mile were reduced 26 per cent. This result is attributed largely to the company's policy, started during the year, of painting the front and rear ends of all cars white, and indirectly lighting them at night, to increase visibility. About one-half of the cars have been processed in this fashion and the remaining cars will be given white ends during 1927.

The company owns 773 passenger cars, operates 274 miles of single track, and during 1926 carried 265,563,016 passengers.

Montreal Tramways & Power to Be Liquidated

A special meeting of shareholders of the Montreal Tramways & Power Company, held at Montreal, Que., on March 19, virtually marked the passing of that company from existence, a resolution being passed appointing a liquidator who will wind up the affairs of the company. Another meeting will be held on April 4, but this is merely a matter of routine to comply with the English laws, under which the company was incorporated.

Inasmuch as United Securities, Ltd., owns practically all shares of the common stock of the Montreal Tramways & Power Company, Ltd., it follows that this company will receive practically the entire stock of the Consolidated Securities, Ltd., so that United Securities, Ltd., will automatically hold the control through the new medium of the shares of the Montreal Tramways as it has done previously through the medium of the Montreal Tramways & Power Company, Ltd., the English company.

$534,308 Profit in Louisville

Annual Report Discloses Decline in Traffic—Company Awaits Decision on Bus Competition—Review of Matters Affecting Railway

Passenger traffic on lines of the Louisville Railway, Louisville, Ky., dropped 479,705 riders in 1926 on account of an increase of about 5,000 autos. However, the company finished the year with a net profit of $534,308 against $480,557 for 1925, or an increase of $53,756. These facts were disclosed by James P. Barnes, president, at the recent stockholders' meeting.

Railway passenger traffic fluctuated through the year. January, February (when the rate was increased to a 7-cent straight fare under the terms of Ordinance No. 330, then in effect), May, June, July and September showed increases in passengers carried, which offset the decreased riding in March, April and August. The entire year showed a decrease of 479,705 passengers carried, compared with 1925, all of which decrease occurred in the last three months of 1926, due to unemployment and industrial depression. Total passenger traffic, which includes revenue, transfer and free passengers, compared with the four preceding years, was as follows:

	1922	1923	1924	1925	1926
January	7,600,072	7,861,986	8,435,464	8,297,839	8,633,543
February	6,830,188	7,371,936	7,957,906	7,562,261	7,590,218
March	7,760,463	8,498,345	8,515,182	8,354,832	8,274,959
April	7,686,732	8,341,493	8,422,780	8,214,226	8,145,383
May	8,170,426	8,920,188	8,844,856	8,469,877	8,603,531
June	8,659,721	8,211,428	8,097,217	7,837,978	7,905,530
July	7,401,345	7,943,088	7,712,320	7,648,982	7,697,183
August	7,333,738	7,827,996	7,549,678	7,744,573	7,471,624
September	7,735,517	8,125,974	7,850,813	7,995,353	8,004,341
October	7,976,451	8,257,865	8,334,069	8,395,428	8,235,552
November	7,731,835	8,059,261	7,720,786	8,048,480	7,894,275
December	8,013,257	8,250,837	8,298,196	8,564,736	8,189,721
Total	91,899,745	97,670,397	97,739,267	97,134,565	96,654,860

The negotiations in January, 1926, with the Board of Public Works turned largely upon certain differences of opinion with regard to construction of certain sections of Ordinance No. 330, which became effective in September, 1922, and under which the so-called barometer fund plan of service-at-cost had been carried out for three years. The differences were amicably adjusted and under the provisions of that ordinance a 7-cent fare went into effect on Feb. 1, 1926. A large and carefully planned publicity campaign resulted in

COMPARATIVE INCOME STATEMENT OF LOUISVILLE RAILWAY

	1926	1925
Operating revenues:		
Revenue from transporation	$4,665,693	$4,239,571
Other operating revenues	197,612	189,544
Total operating revenues	$4,863,305	$4,429,115
Operating expenses	3,275,786	2,962,512
Net revenue from operations	1,587,518	1,466,602
Taxes	461,000	431,000
Railway operating income	1,126,518	1,035,602
Bus operating income	31,566	....
Total net operating income	$1,094,952	$1,035,602
Non-operating income:		
Louisville & Interurban Railway net income	82,903	88,637
Other non-operating income	10,228	10,432
Total non-operating income	$93,131	$99,070
Gross income	1,188,083	1,134,673
Deductions from gross income:		
Interest on bonds and notes	651,750	651,750
Miscellaneous debits	2,025	2,366
Total deductions	$653,775	$654,116
Balance available for dividends on stock	$534'308	$480,557

the adoption of Ordinance No. 361, Series 1926, which follows the principles of regulation embodied in the federal transportation act of 1920. Thus the city committed itself to the definite policy of a regulated transportation service at a rate such as to yield to the investor a reasonable return upon the value of property used and useful in the public service. In determination of the value of the property so used the ordinance provides for a valuation, and the Beeler Organization was selected to conduct this appraisal, a work upon which it is now engaged.

Ordinance No. 361, Series 1926, which became effective on Sept. 13, 1926, contemplates a co-ordinated bus and railway service, with motor coaches serving as feeders and connections to railway lines in territory not presently served by street cars. This service is conducted at a 10-cent bus fare with transfer to and from street cars.

Move to Prevent Unfair Competition

On Jan. 17, 1927, an organization incorporated under the name of Peoples Transit Company started competitive bus operations. This operation competed with one of the railway's best lines and was carried on under jitney bus license. As these coaches operated between fixed terminals, on a regular schedule and over a regular route, the railway felt a franchise was necessary for their operation and suit was immediately filed for an injunction restraining the Peoples Transit Company from operating without such franchise. A temporary injunction was granted under date of Jan. 28, 1927, and operations of the competitive bus lines immediately stopped, pending decision of the Court of Appeals. The injunction has been made permanent and the case is being prepared for final argument in the Court of Appeals.

During 1926 the current dividends were paid on preferred stock, 2½ per cent on April 1 and 2½ per cent on Oct. 1. On Oct. 1, 1926, $2 a share was paid on common stock, the first dividend paid on this class of stock since July 1. 1918, and on Jan. 3, 1927, a dividend of $1 a share was paid on common stock. These dividends were paid out of the 1926 net earnings, a balance of $109,600 over and above dividend requirements being carried to the company's surplus account.

The work of the safety department in decreasing preventable accidents has progressed remarkably during the past five years, as reflected in the following figures:

STATEMENT SHOWING ACCIDENT TREND ON LOUISVILLE RAILWAY

	1922	1923	1924	1925	1926
Accidents	3,272	3,404	1,825	1,534	1,157
Miles operated per accident	3,323	3,380	6,390	7,432	10,386

This improvement was made in spite of the tremendous increase of motor vehicles on the streets. The safety dinners were continued throughout the year, given monthly to the carhouse operating the greatest number of miles per accident. The system average has increased from 1,800 miles per accident in 1920, prior to the start of the accident elimination contests, to 10,386 miles per accident in 1926. Two hundred and sixteen employees operated during 1926 without an accident, compared with 179 in 1925 and 136 in 1924.

Of the 1,634 employees of the Louisville Railway, the Louisville & Interurban Railroad and the Kentucky Carriers, Inc., on Dec. 31, 1926, 1,320 were enrolled in the Co-operative Association. There was a decrease in death and sick benefits in 1926 compared with 1925, as indicated in the following tabulation:

	1925	1926
Death benefits paid	$8,250	$6,300
Sick benefits paid	13,243	12,789
Nursing service	514	458

There was added to the surplus of the association during the year $9,904.

In his report Mr. Barnes referred to the Anthony F. Connelly award, established in 1925, in memory of Anthony F. Connelly, chief inspector, who died on Dec. 3, 1925, with a service with the company extending over 50 years. This award brought forth 50 nominations for the award, as outlined in the 1925 annual report. From these 50 names the Connelly award committee selected three employees whose records were of outstanding merit. George W. Kenn, a conductor at Thirteenth and Main carhouse, was awarded the Anthony F. Connelly award gold medal and $75 in cash, which is furnished from the fund set up by one of the directors of the company, and a trip to the annual American Electric Railway Association convention at Cleveland, Ohio. Two other employees were given bronze medals of honorable mention. Announcement of the winner for 1926 will be made in the near future.

Other subjects listed and discussed by President Barnes in his report are power, way, overhead department, jitneys, grade crossing elimination and equipment.

Sale at Foreclosure Ahead for Morris County Traction

Application will be made soon to the federal court for permission to sell the property of the Morris County Traction Company, Morristown, N. J. Elmer King of Morristown, counsel for the receivers of the company, will make the application before Judge Runyon. The sale plan was mentioned by Mr. King in opposing a motion to direct the receivers to pay a judgment. Mr. King said there were no funds with which the receivers could pay the claim. In the sale and reorganization of the company it is planned to convert it into a bus line. Forty-two buses, costing more than $400,000, are expected to be used. The road has been in the hands of Joseph P. Tumulty and Joseph K. Choate as receivers for four years. The progress of the plan to change to buses is discussed elsewhere in this issue.

U. G. I. Buys Into the National Public Service

Announcement has been made that the United Gas Improvement Company, Philadelphia, Pa., has acquired a minority interest in the common stock of the National Public Service Corporation, control of which passed recently from the Fitkin interests to Day & Zimmermann and their associates. Despite the construction placed on this event in some of the daily papers, there is no change involved from the status of affair with respect to this company reflected in the article in the ELECTRIC RAILWAY JOURNAL for March 19, page 553. Day & Zimmermann will continue through the General Engineering & Management Corporation to manage and operate the properties included in the National Public Service group.

Terms of Sale of Coral Gables Road Approved

The Florida Railroad Commission recently approved the sale of the Coral Gables Rapid Transit Corporation and all its properties to the city of Coral Gables, Fla. The sale was conditioned upon the assumption by the purchaser of all fines, dues, obligations and liabilities of the company. The purchase price was given as $1,782,000. Reference was made to the sale in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 19, 1927, page 359. According to City Engineer Friedman, the extension of the Coral Gables Rapid Transit System has been completed into central Miami. The line eventually will be extended to the proposed Seaboard Railway station.

Dividend Omitted by Chicago City Railway

Omission of the regular quarterly dividend by the Chicago City Railway of 1½ per cent on the capital stock was announced in a letter to stockholders from Leonard A. Busby, president, on March 27. The dividened of $1.50 per share is payable on April 1, but the board of directors at a recent meeting decided to defer action, due to the unsettled relations of the company with the city.

Among the reasons for this action, the letter stated, is the fact that the operating rights under the company's franchise expired on Feb. 1, and while an extension of six months has been granted by the city, the agreement can be terminated on 30 days notice.

Another difficulty, the statement points out, is "the question of enabling legislation necessary to bring unification of the traction properties and to enable the city to grant a modern type of franchise, which is still pending in Springfield. Our first mortgage bonds, amounting to $33,926,000, are past due and unpaid. In this situation the board felt that the declaration of a dividend at this time would not be warranted."

As the company now is situated, it is impossible either to refund or extend the period of the life of the funded debt.

Last year the company earned 10.15 per cent on the capital stock, the closing year under the old franchise being the best in the history of the Chicago traction properties from the standpoint of both revenue and traffic handled. The Chicago City Railway paid off its $786,744 in bank loans and the profit and loss surplus was increased to $4,074,987.

In conclusion, the latter said:

> We wish to assure stockholders that the earnings of the company, over and above our first mortgage bond requirements, will be conserved for their benefit.

The Chicago City Railway operates all the south side lines composing the Chicago Surface Lines system.

Reorganization Committee Reviews Kansas City Affairs

Affairs of the Kansas City Railways, Kansas City, Mo., are discussed in a circular addressed by the reorganization committee to the holders of deposit for first mortgage 5 per cent bonds, three-year 7 per cent collateral notes and two-year 6 per cent collateral notes. Much of the information contained in the circular recapitulates news of the events in connection with the reorganization recorded from time to time in the ELECTRIC RAILWAY JOURNAL. It has seemed well to repeat at this time the fact that under the terms of the reorganization plan the preferred stock and the common stock issued by the Kansas City Public Service Company, the successor company, have been deposited under a voting trust agreement dated July 1, 1926, and extending for five years. Voting trust certificates in temporary form are in process of issuance for ultimate distribution to depositors.

On the subjects of rehabilitation, litigation and distribution of securities the circular says:

> Since taking over the property on Oct. 15, 1926, substantial progress has been made in the rehabilitation and improvement program. Approximately 10 miles of track on important trunk lines has been completely rebuilt, together with new concrete foundations and paving. The elevated railroad in the so-called "West Bottoms," condemned as unsafe and abandoned in 1923, is being restored as a combined elevated and surface line, with necessary inclines, thereby giving much needed service to the industrial district along the Kaw River. The rolling stock is being thoroughly reconditioned, and numerous other improvements installed over the system. This work should show substantial results in 1927 and subsequent years through decreased costs and increased earnings.
>
> There is now pending in the federal Circuit Court of Appeals for the Eighth Circuit, four appeals by junior bondholders, other creditors and stockholders from various decrees of the court entered in the receivership proceedings. The preferred stockholders and the holders of certain notes have appealed from the final decree of foreclosure, and the second mortgage bondholders and preferred stockholders have appealed from the decree confirming sale.
>
> In view of the franchise situation and the pending litigation, the committee has deemed it inadvisable to proceed to an immediate distribution of the new securities (bonds and preferred and common stock, or voting trust certificates therefor) provided for depositors in the plan of reorganization, but anticipates that such distribution can be properly accomplished during the next few months, together with such interest and dividends as may have been paid thereon in the interim. It is expected that the new bonds issued in reorganization will be dated and will bear interest from July 1, 1926, or, if dated later, will carry warrants entitling the holder to an amount of cash equivalent to interest at the rate of 6 per cent on the principal amount from July 1, 1926, to such later date.

$105,968 Increase in West Penn Net

System Near Pittsburgh Does Well—Marked Progress Made in Reducing the Funded Debt

Net income of the West Penn Railways, Pittsburgh, Pa., for the year ended Dec. 31, 1926, was $2,604,331 compared with $2,498,363 for the previous year. In general, the year's operations were most satisfactory. A. M. Lynn, president, explains that the revisions of line and other improvements made during recent years enabled these results to be achieved, in some instances having reduced the number of cars without change in headway. Proposed revisions in line, rehabilitation of tracks and installation of improved signal systems are expected to result in further improvements in service. The general tendency of the public to relieve electric railways from burdensome franchise obligations, particularly as they appertain to maintenance and replacement of paving, is becoming more pronounced. The company has under negotiations franchises in many municipalities which will no doubt result in substantial relief.

CONSOLIDATED INCOME ACCOUNT OF WEST PENN RAILWAYS EXCLUDING INTER-COMPANY ITEMS

	1926	1925
Gross earnings from all sources	$22,157,054	$20,206,221
Operating expenses, including maintenance, taxes and rentals	11,594,947	11,169,278
	$10,562,107	$9,036,942
Less:		
Interest and amortization	3,690,278	3,375,715
Preferred dividends of subsidiary	1,173,152	909,195
Income applicable to minority interest	1,092,500	587,889
	$5,955,931	$4,872,800
Balance	4,606,175	4,164,141
Reserved for renewals, replacements and depletion	2,001,843	1,665,778
Net income	$2,604,331	$2,498,363

The co-operation of the State Highway Department in Pennsylvania has made possible in several instances the removal of tracks to private right-of-way alongside highways, resulting in safer operation, more economical maintenance and improved service and running time.

Freight service between Pittsburgh and important coke region towns, started in 1924, is growing to be an important factor in the company's revenues. In addition to the larger and more adequate freight house erected in Greensburg, improvements have been made to facilities in Uniontown, Pa.

The use of the "Sunday pass" for long interurban rides, first adopted in 1925, has been extended and placed on a permanent basis. Weekly passes for local city service have also been started. Both of these show very satisfactory results. The company has entered into the bus business in certain localities where service can be undertaken and rendered supplementary to the railway lines.

In July, 1926, the company consummated its agreement made in 1916 by the sale of Connellsville power station to the West Penn Power Company. The proceeds of this sale were placed with the Equitable Trust Company, New York, trustee of the first mortgage of April 1, 1905. The trustee called for tenders and retired to Dec. 31, $1,497,500 of 5 per cent first mortgage gold bonds of the company, due Jan. 1, 1931, leaving on hand for further redemption of bonds the sum of $1,496,300. Mr. Lynn explains that if further purchases can be made at satisfactory prices, the company will continue to redeem bonds to the exhaustion of the fund, temporarily invested in United States government obligations, with any balance utilized for improvements and extensions of its physical properties.

On Sept. 1, 1926, the company called and retired all of its outstanding three-year 6½ per cent gold debentures, due April 1, 1927, aggregating $3,500,000, funds having been made available to its treasury through reimbursement by certain subsidiary companies to which temporary advances had heretofore been made for construction, now funded. All of the company's outstanding first equipment trust 8 per cent notes of 1921, aggregating $120,000, were retired on Oct. 1, 1926.

During the year there were purchased $102,000 principal amount of 5 per cent first mortgage gold bonds of the Pittsburg, McKeesport & Greensburg Railway, now a direct obligation of West Penn Railways, reducing the amount of these bonds outstanding in the hands of the public to the sum of $271,000. The company also purchased through the trustee $7,000 principal amount of first mortgage 5 per cent gold bonds of West Penn Traction Company, issued under first mortgage of that company dated June 1, 1910. The amount of these bonds now outstanding has been reduced to $4,847,000.

As they matured from time to time during the year the West Penn Railways retired or purchased and retained in its treasury the following bonds of the Wheeling Traction System:

Wheeling Traction Company five year 8 per cent Wheeling Bridge collateral gold notes (retired)	$90,000
Twenty-year 5 per cent first mortgage gold bonds of the Wheeling & Western Railway ($2,000 yet to be presented)	182,000
Twenty-year 5 per cent first mortgage gold bonds of the Bellaire-Southwestern Traction Company	50,000
	$322,000

Mr. Lynn points out that the retirement of $5,548,500 of funded obligations of the company and its subsidiary railway companies during the year 1926, in almost all instances in anticipation of their maturity, will prove to be of advantage in handling its financial affairs in future years.

Refunding Plan in Cincinnati.—The Cincinnati Street Railway, Cincinnati, Ohio, is said to be arranging to refund an issue of $4,500,000 short term notes and supplant them with long term bonds. The notes are of three years duration and pay 6 per cent interest. The bonds are to bear a rate of interest lower than the notes, but it is expected that their longevity will attract note holders and other investors.

Legal Notes

INDIANA.—*Company Suspends Uninsulated Wire at Peril.*

The electric company owned and operated a line of poles along a public highway, on which were strung bare uninsulated wires carrying 6,000 volts. Plaintiff was engaged in moving his house along the highway and in order that the house might pass under certain guy wires which were not far enough from the ground to permit passage of the house, he climbed on the roof and accidentally came in contact with one of the uninsulated electric wires which was about 3 ft. above the guy wire and roof of the house, thereby receiving an electric shock which resulted in a serious injury. Under the state law the defendant is required to provide full and complete insulation of wires transmitting electricity at points where the public is liable to come in contact with such wires. It was held that in suspending an uninsulated wire across the highway the company does so at peril, and judgment for p'aintiff was affirmed. [Linn Grove L. & P. Co., vs. Fennig, 154 N. E., 877.]

MARYLAND. — *Carriers — Taxation of Easements.*

Street railroad's right in street is an easement, subject to taxation, but in fiixing the value of such easement in street for purpose of rate basis, the Public Utilities Commission cannot consider such value as is dependent on use to which franchise of corporation permits easement to be put. [Miles vs. West, et al, 135 Atl., 579.]

MICHIGAN.—*Plaintiff Was Allowed to Express Views.*

In an action against the street railroad for personal injuries and damages to auto struck by street car, plaintiff was properly permitted to express opinion as to the speed of the street car, under evidence showing he saw the car when he turned on the track, and also showing that he had driven automobiles for some time. [Mills vs. Michigan Elec. Ry. Co., 212 N. W., 75.]

MINNESOTA. — *Fog Should Prevent Usual Speed of Car.*

A single track of the railway company was laid west of the center of the road. A northbound car, traveling at its usual speed through a heavy fog, struck a southbound auto, killing two of its occupants. A verdict in behalf of the next of kin of one of the occupants was affirmed, the court stating that weather conditions often demand increased vigilance on the part of those who use highways not only for their own but for the safety of others, and under the above conditions it was negligence for the operator of the trolley car to travel at the usual speed. [Kimpell vs. Duluth St. Ry., 211 N. W., 955.]

NEW JERSEY. — *Truck Helper Was Guilty of Negligence.*

Plaintiff was a helper on a truck proceeding on a road where there were tracks on both sides of the highway. A trolley was going in the same direction. Driver of truck drew it up alongside and quite near the trolley road on the right side. The plaintiff jumped off the truck and was immediately struck by the trolley car. Held that plaintiff was guilty of contributory negligence and verdict in his favor set aside. [Markowski vs. P. S. Ry. Co., 135 Atl., 783.]

NEW YORK.—*Receivership Does Not Exempt Street Railroads from Penalties.*

A street railroad corporation is not exempt from penalties for failing to pay certain percentage of gross income to city as required by its contracts under Railroad Law, N. Y. Sect. 175, because it is operated by a receiver appointed by the court. [City of New York vs. Brooklyn, Q. C. & S. R. Co., 219 N. Y. S., 399.]

NEW YORK.—*Stock Ownership Is Insufficient to Hold Dominant Company with Liability for Injuries of Subsidiary.*

Plaintiff was injured while leaving a car, through the negligence of the motorman. The franchise to operate a street railroad along the route on which the car was traveling belongs to the 42d Street, Manhattanville & St. Nicholas Avenue Railway. Substantially all of the stock of that company is owned by the Third Avenue Railway, which has its own franchises along other streets. An attempt was made to hold the latter company liable for the injury on the theory that under the screen of this subsidiary and others it operates for itself the entire system of connected roads, and is therefore liable for the torts of the consolidated enterprise. Held that stock ownership alone is insufficient to charge dominant railroad with liability for torts of the subsidiary. [Berkey vs. Third Ave. Ry., 155 N. E., 58.]

NEW YORK —*Power of State in Rate Fixing Defined.*

A state, through its proper agencies, has power to increase or lower rates charged by public service corporation, notwithstanding the existence of a contract providing for lesser or higher rate, and exercise of that power does not violate state or federal constitution. [Niagara, Lockport & Ontario Power Co., vs. Seneca Iron & Steel Co., 219 N. Y. S., 418.]

OHIO.—*Injuries at Safety Zones.*

A ten-year-old girl, standing in a safety zone, was struck by the rear end of a trolley car which was passing her. The allegations of negligence were that the car was going at a high rate of speed; that the motorman failed to ring his gong, and that the car did not stop in time to avoid the accident. There was no allegation that there was any projection on the rear of the car which might have produced the injury. Testimony showed the child had seen the car approaching, and it was accordingly held that recovery could not be based on the failure of the motorman to ring his gong and that such allegations were not therefore material. [Steinman vs. Cleveland Ry., 155 N. E., 149.]

OHIO.—*Casual Service Not Proper Subject of Certificate of Convenience and Necessity.*

A bus company received from the Public Utilities Commission a certificate of public convenience and necessity to operate motor transportation passenger service on irregular routes, "over all public highways, roads and streets in the state of Ohio." The law requires publication of all applications for such certificates in a newspaper of general circulation, published at the county seat of each county through which the applicant proposes to operate, or in a newspaper of general circulation throughout the territory in or through which the applicant proposes to operate. Publication in five newspapers issued in different parts of the state was held by the Commission to be "substantial compliance" with this part of the law, but it was held inadequate by the Court. The Court also held that such a certificate over highways already traversed by regular routes is unauthorized, where it is not shown that the regular lines in that section are not furnishing reasonable facilities and that casual and unusual service of the kind proposed is not proper subject matter of a certificate of public convenience and necessity. [Lake Shore Electric Railway vs. Public Utilities Commission of Ohio and other cases. 154 Northeast. Rep., 239.]

OKLAHOMA.—*Bus Line Must Justify Certificate of Convenience and Necessity.*

To warrant licensing of additional public utility, it must appear that present facilities are inadequate and inconvenient to traveling public. That proposed bus line, serving same territory as railroad, may accommodate few individuals, does not justify certificate of "convenience and necessity." [Chicago, R. I. & P. Ry., vs. State, 252 Pac., 849.]

PENNSYLVANIA. — *Expert May Testify on His Own Examination.*

A medical expert may testify as to symptoms and sensations narrated by patient for the purpose of securing correct diagnosis and give his professional judgment as to the effects of injury, based on his own physical examination of injured party, but not on what others have told him, though he was fully advised of history of case. [McMinis vs. Phila. Rapid Transit Co., 135 Atl., 722.]

PENNSYLVANIA. — *Pedestrian Should Cross Street Only When Action Does Not Seem Hazardous.*

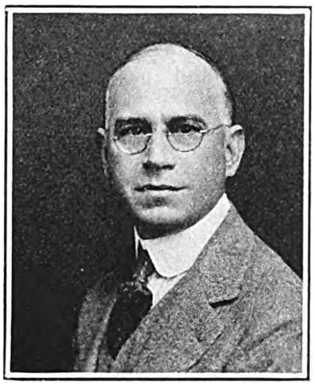
A young man in full possession of his faculties was held guilty of contributory negligence as a matter of law. barring recovery for injuries sustained as a result of stepping in front of a moving street car which was in plain sight in broad daylight, with nothing to obstruct his view or distract his attention when he started across the street from a wagon on the opposite side. A pedestrian may properly attempt to cross a street car track on which a car is approaching when there appears to be sufficient opportunity to do so safely, but not when to do so appears hazardous. [Schuchalter vs. Phila. Rapid Transit Co., 135 Atl., 739.]

Personal Items

R. B. Stearns Honored

Operating Head of Eastern Massachusetts Company Made President of New England Club

Because of his outstanding accomplishments in the West, especially in Milwaukee, R. B. Stearns received a commission in the East ten years ago as vice-president in charge of operating one of the important systems in Massachusetts. And now he has just been elected president of the New England Street Railway Club. R. B. Stearns, vice-president and general manager of the Eastern Massachusetts Street Railway, certainly is well known in New England and is recognized as an important influence in general utility enterprise.



R. B. Stearns

In the summer of 1917 he was elected senior vice-president in charge of operation of the Bay State Street Railway in Boston, to become in 1919 the Eastern Massachusetts Street Railway, relinquishing his position as vice-president of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. At that time P. F. Sullivan, president of the Bay State property, said that Mr. Stearns had been asked to join the Bay State because of the conspicuously successful work he had done in the West. In Milwaukee he had charge of a property with 400 miles of track, doing a business then in excess of $6,000,000 a year. In his six years of service with the Milwaukee company he had done a great deal toward rehabilitating and reconstructing the property. In addition he had started the Employees' Mutual Benefit Association and other employee benefit associations looking toward the development of the cooperative spirit.

Mr. Stearns' Early Work

Prior to his affiliation with the Milwaukee property, Mr. Stearns had been actively engaged in work in Chicago. He was employed in the construction of the Northwestern Elevated Railroad, the Union Loop and extensions to the Lake Street Elevated Railroad, Chicago, later known as the Chicago & Oak Park Elevated Railway, as assistant chief engineer and superintendent of construction. After that, he was appointed chief engineer and superintendent in charge of the operation of the Northwestern Elevated Railroad. At one time he was general manager of the Chicago & Milwaukee Electric Railroad.

Mr. Stearns was graduated from Purdue University, class of 1889. He was engineer in connection with the Columbian Exposition in Chicago in 1893, and subsequently was engaged in the United States Engineers Service on the Chicago drainage canal and the Hennepin Canal.

A decade ago, when Mr. Stearns went to Boston, the roads there were in a somewhat perilous state. What was needed, many felt, was a broad view of the railway question, followed by legislation to the end that electric railway investment might again become attractive to capital. The hope was expressed that Mr. Stearns' entry in New England would help the railway companies in the solution of their problems. He at the very beginning urged the railway companies to co-operate, and stressed particularly the assistance which the trainmen could give in explaining the needs of the railways to the public. He introduced the zone fare system on the Bay State lines.

Adolf Blunk Leaves St. Joseph

Adolf Blunk, associated with the St. Joseph Light, Heat & Power Company, St. Joseph, Mo., since November, 1925, and for the past year general superintendent of the railway department, was transferred recently to the Toledo Edison Company. His change is in the nature of a promotion, although his duties with the Toledo Edison have not been specified.

Mr. Blunk first worked for the Union Pacific Railroad in the maintenance of way department. Then he went to the Toledo Railway & Light Company, as junior engineer. It was at this time in his career that the war broke out and he entered the military, becoming first lieutenant in the army air service. After the armistice Mr. Blunk returned to the Doherty organization as railway engineer with the Durham Public Service Company, Durham, N. C. Then for a time he was with the Toledo & Western Railway, Sylvania, Ohio, as master mechanic, trainmaster and purchasing agent. His next post was with the Ohio Public Service Company, Mansfield, Ohio, as railway engineer and superintendent of the gas department. The Portsmouth Public Service Company, Portsmouth, Ohio, claimed him next, and from there, following a short stay in the New York office, he went to St. Joseph, taking the position as assistant general superintendent. In February, 1926, he was made general superintendent of the railway department. Mr. Blunk was educated at the University of Nebraska.

Niles Persons Goes to Brooklyn

Niles Persons, who for the past four years has been master mechanic of the Schenectady Railway, Schenectady, N. Y., has accepted a position with the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., with the title of superintendent of surface lines shops. In this capacity he will fill a new opening in the mechanical department, reporting to W. G. Gove, superintendent of equipment. The new position was made necessary on account of the rapid expansion of the system and the need for directing surface maintenance work as a complete unit separate from rapid transit work.

Niles Persons

Mr. Persons' first connection in electric railway work was in the armature department of the United Traction Company, Albany, where he remained for thirteen years as foreman, general foreman, assistant master mechanic and master mechanic. He has also been in charge of the mechanical department for the Hudson Valley Railway, Glens Falls; New York State Railways, Rochester; Gary & Interurban Railway, Gary, Ind., and the International Railway, Buffalo.

Mr. Persons was born in Albany in 1888. He was educated in the public schools of that city and at the State Normal School. He is a member of the New York Electric Railway Association, American Electric Railway Association and the Schenectady Chamber of Commerce.

Thomas Miller Promoted in Schenectady

Following the resignation of Niles Persons as master mechanic of the Schenectady Railway, Schenectady, N. Y., Thomas Miller, formerly assistant master mechanic, succeeds to the vacated post. Mr. Miller's present position will be filled by William Golden, long identified with the Schenectady Railway shops.

Mr. Miller's first experience with railway work was gained with the Quincy & Boston Railway as an electrical inspector. He was connected at one time with the Bay State Street Railway as foreman and general foreman and later served the New York, New Haven & Hartford Railroad as general foreman of electrical operation at Pemberton, Mass. Mr. Miller went to Schenectady in 1910 as general foreman of the McClellan Street carhouse and has since held positions as general foreman and assistant master mechanic. Mr. Miller was born in Preston, England, in 1879.

Oklahoma Association Elects E. R. Ernsberger

Earl R. Ernsberger of Oklahoma City, Okla., president of the Southwestern Light & Power Company, was elected president of the Oklahoma Utilities Association on March 9. For many years Mr. Ernsberger has been what is known as an electric light and power man, but he will be recalled to railway men as the former chief engineer and general manager of the Mount Hood Railway & Power Company, Portland, Ore. This was an electric railway and hydro-electric power development. Mr. Ernsberger went with this property just after the construction was started, and completed that work and operated the property until it was sold to the Portland Railway, Light & Power Company in 1913.

E. R. Ernsberger

This, however, was not his only railway connection, for in 1913 he went with the Charles City Western Railway, Charles City, Iowa, as vice-president and general manager. During Mr. Ernsberger's management the road was electrified, extended and put on a paying basis and operated as such until the time he severed his connection with it in January, 1922. It was from this property that he went in February, 1922, as president and general manager of the Southwestern Cities Electric Company, a holding organization for the Lawton & Duncan Electric Company, Mangum Electric Company and the Lawton Gas Company in Oklahoma, and the Quanax Light & Ice Company, operating in Texas, also the Pecos Valley Gas & Electric Company in New Mexico. These are all properties now included in the Southwestern Light & Power Company. He is also president and general manager of the Keyes Corporation, owning and operating oil and gas fields at Walters, Okla.

Mr. Ernsberger's experience has covered a wide range of engineering activity. The project at Portland, Ore., to which reference has been made before, consisted of the 20,000-hp. hydro-electric plant at Bull Run, with a 500-ft. head. The work there included the building of 3 miles of tunnel conveying the water from one river to another, 5 miles of flume with a 280-acre reservoir reserve with two auxiliary steam plants in Portland, 66,000-volt high-tension transmission lines and a 20-mile railway which had to be built before the machinery could be transported to the power plant site and installed.

Mr. Ernsberger is a graduate civil engineer. His first experience after leaving school was with the Pennsylvania Railroad in the engineering department with headquarters at Pittsburgh. He left that company to accept a position as assistant to the chief engineer of the Wheeling & Lake Erie Railroad, Cleveland, Ohio, but later became engineer and superintendent of track elevation for the Chicago, Milwaukee & St. Paul Railway in Chicago. This last position he held for eight years, during which time several million dollars worth of construction work was done under his direction each year. As a part of his work at Chicago Mr. Ernsberger helped supervise the electrification of the Northwestern Elevated Railroad from Wilson Avenue to the Central Street Station in Evanston, Ill.

Mr. Ernsberger was a pioneer among utility men with engineering training who recognized the value of good public relations. The very nature of his work has compelled him to be exact in his dealings, but the practice of the Golden Rule has been his motto, with the result that he has found in all cases that the public in turn has treated the property which he represented as it would like to be treated.

Changes at International Annual Meeting

T. E. Mitten was elected chairman of the board of directors of the International Railway and J. A. Queeney chairman of the executive committee at the annual meeting of the board of directors, held on March 28. Dr. A. A. Mitten, son of Mr. Mitten, was added to the executive committee, the other members being Mr. Queeney and President B. J. Yungbluth. Mr. Queeney becomes vice-chairman of the board.

Harold P. Lesswing was elected a director of the company, taking the place of George L. Burgain, retiring president of the I. R. Co-operative Association. Mr. Lesswing is the newly elected vice-president of that association. He was born in Tonawanda, N. Y., and has been employed by the company continuously since April, 1916. His first job was as helper in a construction gang. He is now an electrician.

The complete list of directors elected by the stockholders includes T. E. Mitten, J. A. Queeney, C. J. Joyce, Harold P. Lesswing, Dr. A. A. Mitten, W. E. Murphy, Nelson Robinson, H. G. Tulley and B. J. Yungbluth.

G. W. Welsh Heads Illinois Association

G. W. Welsh, vice-president of the East St. Louis & Suburban Railway, East St. Louis, Ill., was elected president of the Illinois Electric Railways Association at the meeting in Springfield, March 17. A little more than a year ago, when W. H. Sawyer, president, departed for Australia for the purpose of making the electrical survey, Mr. Welsh was elected vice-president of the East St. Louis Railway, which included the East St. Louis & Suburban Railway and the St. Louis & Belleville Electric Railway. Before that promotion Mr. Welsh had been assistant to the president of all the railway companies in the group.

G. W. Welsh

It was in 1914 that Mr. Welsh became connected with the East St. Louis & Suburban group of properties in East St. Louis as superintendent of power. He continued in that position until 1919, when he was made chief engineer. He has been identified with the General Electric Company, the New York Central Railroad, the Southern Pacific Company at San Francisco, where he was interested in electrification work, as he was on the New York Central. Mr. Welsh was educated at Lehigh University, where he was graduated with a degree of electrical engineer in 1901.

Obituary

Albert Ball

Albert Ball, chief mechanical engineer of the Sullivan Machinery Company for nearly 50 years, died at his home in Claremont, N. H., on Feb. 7, at the age of 91 years and nine months. Mr. Ball was born in Boylston, Mass., on May 7, 1835. His schooling ended at the age of 16 years, when he became a machine shop apprentice. His first employment was with L. W. Pond at

Worcester, Mass. In 1863 he brought out his first important invention, a combined repeating and single loading rifle, and in the same year he perfected a machine for polishing flat surfaces. Mr. Ball was sought out by E. G. Lamson, of the firm of Lamson, Goodnow & Yale, manufacturer of the Ball gun, many of which were sold in Germany and used by the Prussian army in the war against Austria.

It was while Mr. Ball was with the Windsor firm that he invented the first cartridge greasing machine, an indirect outcome of his visit to the Springfield, Mass., arsenal for the purpose of discussing contracts for the Ball rifle. Mr. Ball went to Claremont in May, 1868, to become affiliated with the J. P. Upham & Company machine shop, which later became the Sullivan Machinery Company. It was after he became associated with the Sullivan Machinery Company that his full power as an inventor was attained. Beginning in 1869 with the diamond channeler and gadder, his genius was responsible for the development of many important improvements in mining and quarrying machinery.

Development of the Sullivan diamond core drill brought to Mr. Ball a lasting fame, and the romantic history of the opening up of the rich gold fields in the South African Transvaal is closely linked with the history of Mr. Ball's diamond drills. Mr. Ball's inventions during his life in Claremont were not limited to mining machinery.

Following his retirement from the Sullivan company in 1914, Mr. Ball turned his time and efforts to an avocation in which he had taken great interest, namely, the making of violins. He produced many instruments of beautiful design, praised by experts for their tone and finish, and developed special machinery for executing unique wood patterns. He continued active until his last illness.

Edward C. Niles, former chairman of the New Hampshire State Public Service Commission, reporter of Supreme Court decisions and special counsel for New Hampshire in its railroad cases, died in Concord on Feb. 16. He was born in Hartford, Conn., on March 28, 1865.

Fred W. Reitz, for many years president of the Evansville Traction Company, which later became the Evansville & Ohio Valley Railway, Evansville, Ind., died recently. The Evansville & Ohio Valley Railway operates from Evansville west to Mount Vernon, east to Rockport and Grandview and south to Henderson, Ky. Mr. Reitz was 69 years old.

Charles H. Alexander, pioneer electric railway man of Texas, died at his home in Dallas on March 21. Mr. Alexander retired from business several years ago. He went to Dallas in 1888 from Tennessee and organized the Standard Light & Power Company and the Dallas Consolidated Street Railway. In the organization of the street railway he consolidated and electrified the lines in Dallas. His property was the first electric railway in that part of the state of Texas. Mr. Alexander was 68 years old.

Manufactures and the Markets
